This is not, however, the ſimpleſt manner of employing the formulæ that have been deduced, becauſe it requires the knowledge of two conſecutive roots, whereas it will be ſufficient to have the roots of numbers equidiſtant from each other, and by means of which the firſt and ſecond differences may be readily obtained, and the ſucceſſive extractions will thus become ſo many different checks upon each other. Suppoſe, for example, that we know the cube roots of 2000 and 2008; that is, $\sqrt[3]{2000}=a$, and $\sqrt[3]{2008}=b$; and it were required to find the roots of all the intermediate numbers; calling the firſt difference $=d$, and the ſecond difference $=\frac{2}{9a^5}=c$; then the cube roots will ſtand thus:

$$\sqrt[3]{2000}=a$$
$$\sqrt[3]{2001}=a+d$$
$$\sqrt[3]{2002}=a+2d-c$$
$$\sqrt[3]{2003}=a+3d-3c$$
$$\sqrt[3]{2004}=a+4d-6c$$
$$\sqrt[3]{2005}=a+5d-10c$$
$$\sqrt[3]{2006}=a+6d-15c$$
$$\sqrt[3]{2007}=a+7d-21c$$
$$\sqrt[3]{2008}=a+8d-28c=b.$$

And ſince this laſt root ought to be equal to the known root b, we have a ſecure check upon all the preceding part of the operation; or more properly, this condition may be employed for finding the firſt difference d, and the check be made upon the ſubſequent difference; for ſince $a+8d-28c=b$, we have $d=\frac{b+28c-a}{8}$. This operation will be better underſtood from the following work at length.

Given the cube root of 6280 = 18.449582727, and of 6288 = 18.45741356, to find all the intermediate roots between thoſe numbers.

By logarithms we find $\frac{2}{9\sqrt[3]{6280}}=000000105=c$, and hence $\frac{b-a+28c}{8}=.00979222=d$; hence, again, the following operation.

Cube root 6280 = 18.449582727
979222 difference

6281 = 18.450561949
979117 difference

6282 = 18.451541066
979012 difference

6283 = 18.452520078
978907 difference

Cube root 6284 = 18.453498985
978802 difference

6285 = 18.454477787
978697 difference

6286 = 18.455456484
978592 difference

6287 = 18.456435076
978487 difference

6288 = 18.457413563

And thus may the extraction be carried on at pleaſure, by ſimple addition and ſubtraction; the cube roots of certain periodical terms being firſt known: it is unneceſſary to obſerve that the above ſucceſſive differences are found by ſubtracting always .000000105 from the foregoing one.

At preſent we have only conſidered the mere elementary principles on which the theory of interpolation is founded; it will be proper, however, before we conclude this article, to give ſome idea of the general formulæ and reſults obtained from theſe ſimple and obvious truths, by Newton in his "Methodus Differentialis;" and by Stirling, in his tract entitled "Tractatus de Summatione et Interlopatione Serierum Infinitarum," publiſhed in 1730, both of which works are worthy of their celebrated authors.

Let us imagine a right line given in poſition, on which let there be erected any number of ordinates parallel to one another, and at equidiſtances, which ordinates may be conceived to repreſent the terms of a regular ſeries, continually increaſing or decreaſing; and one and the ſame curve will paſs through all their extremities, the equation of which will be determined from the given equation to the ſeries; that is, from the equation expreſſing generally the relation between any two or more ſucceſſive ordinates: and if this equation be finite, the equation of the curve will alſo be finite, and conſequently an abſolute interpolation of the ſeries may be effected; for this is nothing more than aſſigning to every particular abſciſs, its correſponding ordinate, and this will always be the caſe if any order of the differences become equal to zero; thus, in all kinds of figurate numbers, as *triangulars*, *ſquares*, *pentagonals*, &c. the curve paſſing through their ſummits will be the common conical parabola. But if, as is frequently the caſe, no order of differences become zero, then the algebraic equation of the curve cannot be found, and conſequently no interpolation can then be made, except by means of an infinite ſeries, the quadrature of ſome curve, or ſome other approximation.

Let there be propoſed, for example, the ſeries 1, 8, 27, 64, &c. the general interpolation of which is required. This ſeries is no other than that of the natural cubes, and therefore the method that we are about to follow is wholly unneceſſary in this caſe, but the example is choſen in order to illuſtrate the general method, which is applicable in all caſes, even when the terms of the ſeries appear to follow no certain law. We firſt write the terms of the propoſed ſeries in one line, then the differences of theſe in the next, and then again the differences of theſe, and ſo on, till the laſt order of differences become all equal, or ſuch that no ſenſible error will ariſe in conſidering them as ſuch; then conſidering z as any abſciſs, the firſt terms of theſe ſucceſſive differences will be the co-efficients of the ſeries of terms

$$1,\ z,\ \frac{z(z-1)}{1\,.\,2},\ \frac{z(z-1)(z-2)}{1\,.\,2\,.\,3},\ \&c.$$

which expreſſion will then repreſent the correſponding ordinate to the abſciſs z; and conſequently the interpolation of the ſeries may be made general. Thus in the example propoſed,

Series	1		8		27		64
1ſt diff.		7		19		37	
2d diff.			12		18		
3d diff. conſt.				6			

Therefore, conſidering y as the correſponding ordinate to the abſciſs z, we have

$$y = 1 + 7z + \frac{12 . z (z - 1)}{1 . 2} + \frac{6 . z (z - 1) (z - 2)}{1 . 2 . 3}, \text{ or}$$

$$y = 1 + 3z + 3z^2 + z^3,$$

as it ought to be, from the nature of the ſeries. If, therefore, now we had to interpolate a term between each of the given ones, theſe terms would be $(1\frac{1}{2})^3$, $(2\frac{1}{2})^3$, $(3\frac{1}{2})^3$, $(4\frac{1}{2})^3$, &c.

And the ſame method is applicable in all caſes, but it ſometimes admits of abbreviation, if the law of the ſeries can be determined, and therefore this ſhould be the firſt conſideration when the law is not evident.

Let there now be propoſed the ſeries

$$1, \frac{1}{2}, \frac{3}{8}, \frac{5}{16}, \frac{35}{28}, \text{ \&c.}$$

where the law is not obvious, the interpolation of which is required.

By a little attention it will be ſeen that the ſeries is produced from the ſucceſſive multiplication of the terms of the ſeries $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{6}$, $\frac{7}{8}$; in which the order of formation is manifeſt, and the interpolation of this, except for the term between 1 and $\frac{1}{2}$, is evident; the other interpolated terms being $\frac{2}{3}$, $\frac{4}{5}$, $\frac{6}{7}$, &c.: let then the term between 1 and $\frac{1}{2}$ be x, then the ſeries after interpolation will be

$$1, x, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \frac{5}{6}, \frac{6}{7}, \text{ \&c.}$$

and as the propoſed ſeries is generated from the continued multiplication of the ſeries 1, $\frac{1}{2}$, $\frac{3}{4}$, $\frac{5}{6}$, &c.; ſo will the interpolated terms required, be generated from the continued multiplication of the interpolated terms of this laſt ſeries, which will therefore be

$$x, \frac{2}{3}\, x, \frac{2 . 4}{3 . 5}\, x, \frac{2 . 4 . 6}{3 . 5 . 7}\, x, \text{ \&c.}$$

All, therefore, that is required, is to find the value of x, from which any interpolated term may be determined; and it may be further obſerved, that the term x of the above generating ſeries muſt neceſſarily be the ſecond term of the required ſeries after interpolation, or that term which falls between 1 and $\frac{1}{2}$. Let therefore the differences be taken as follows, *viz.*

Series	1		$\frac{1}{2}$		$\frac{3}{8}$		$\frac{5}{16}$		$\frac{35}{28}$		$\frac{63}{256}$ &c.
1ſt difference		$-\frac{1}{2}$		$-\frac{1}{8}$		$-\frac{1}{16}$		$-\frac{5}{128}$		$-\frac{7}{256}$ &c.	
2d difference			$\frac{3}{8}$		$\frac{1}{16}$		$\frac{3}{128}$		$\frac{3}{256}$ &c.		
3d difference				$-\frac{5}{16}$		$-\frac{3}{128}$		$-\frac{7}{256}$ &c.			
4th difference					$\frac{35}{128}$		$\frac{7}{256}$ &c.				
5th difference						$-\frac{63}{256}$ &c.					

Hence aſſuming y for any ordinate correſponding to any propoſed abſciſs z, the equation of the curve paſſing through the ſummits of the ordinates, will be

$$y = 1 - \tfrac{1}{2} z + \frac{3}{8} . \frac{z (z - 1)}{1 . 2} - \frac{5}{16} . \frac{z (z - 1) (z - 2)}{1 . 2 . 3} + \frac{35}{128} . \frac{z (z - 1) (z - 2) (z - 3)}{1 . 2 . 3 . 4} - \frac{63}{256} . \frac{z . (z - 1) (z - 2) (z - 3) (z - 4)}{1 . 2 . 3 . 4 . 5}.$$

But as the object of our inquiry is more particularly directed to the finding of the firſt interpolated term, repreſented above by x, we muſt make $z = \frac{1}{2}$; whence the above is reduced to

$$x = - \frac{1}{4} A + \frac{3}{16} B + \frac{15}{36} C + \frac{35}{64} D \text{ \&c.}$$

In which ſeries the order of formation of the co-efficients is obvious, A, B, C, D, &c. being repreſentatives of the preceding terms; and hence, by the ſummation of the ſeries, the value of x is found equal to 0.64052, and conſequently from what has been before obſerved, the interpolation of the propoſed ſeries is now complete, being as follows:

$$1, x, \tfrac{1}{2}, \frac{2}{3}\, x, \frac{1 . 3}{2 . 4}, \frac{2 . 4}{3 . 5}\, x, \frac{1 . 3 . 5}{2 . 4 . 6}, \frac{2 . 4 . 6}{3 . 5 . 7}\, x, \text{ \&c.}$$

If it had been required to interpolate two terms between each of the given terms, it would have only been neceſſary to have aſſumed $z = \frac{1}{3}$, and $\frac{2}{3}$, as is evident; and therefore needs no illuſtration.

Hence we ſee that the general equation of any curve, made to paſs through the ſummits of any number of equidiſtant ordinates, a, b, c, d, e, f, &c. will be

$$y = a + (b - a)\, z + (c - 2b + a) \frac{z (z - 1)}{1 . 2} + (d - 3c + 3b - a) \frac{z . (z - 1) (z - 2)}{1 . 2 . 3} \text{ \&c.}$$

which is Newton's formula in his "Methodus Differentialis." The limits of our article will not admit of a farther developement of the theory of interpolations, we muſt therefore refer the reader, who wiſhes for more complete information,

formation, to the work of Newton above quoted; to Stirling's "Tractatus de Summatione," &c. or to the tranſlation of the ſame by Holliday, publiſhed in 1749; and to the other tracts mentioned in the preceding part of this article, by Lalande, Mayer, &c. See alſo SERIES.

INTERPOSED ATTIC. See ATTIC.

INTERPOSITION, the ſituation of a body between two others, ſo as to hide them, or prevent their action.

The eclipſe of the ſun is occaſioned by an interpoſition of the moon between the ſun and us; and that of the moon by the interpoſition of the earth between the ſun and moon.

INTERPRETATION *of Laws* depends on more equitable and excellent principles than thoſe which prevailed among the Romans, who, when any doubt aroſe upon the conſtruction of their laws, ſtated the caſe to the emperor in writing, and took his opinion upon it. To interrogate the legiſlature, ſays judge Blackſtone, to decide particular diſputes, is not only endleſs, but affords great room for partiality and oppreſſion. The faireſt and moſt rational method to interpret the will of the legiſlator is by exploring his intentions at the time when the law was made, by ſigns the moſt natural and probable. Theſe ſigns are either the words, the context, the ſubject-matter, the effects and conſequence, or the ſpirit and reaſon of the law. *Words* are generally to be underſtood in their uſual and moſt known ſignification. If words are dubious, their meaning may be eſtabliſhed from the *context.* Thus the preamble often ſerves to aid the conſtruction of an act of parliament; and the compariſon of one law with other laws, made by the ſame legiſlator, and bearing ſome affinity or relation to the ſubject, will anſwer a ſimilar purpoſe. As to the *ſubject-matter,* words are always to be underſtood as having a regard to it. With reſpect to the *effects* and *conſequence,* the rule is, that where words bear either none, or a very abſurd ſignification, if literally underſtood, we muſt a little deviate from the received ſenſe of them. But after all, the moſt univerſal and effectual way of diſcovering the true meaning of a law, when the words are dubious, is by conſidering the *reaſon* and *ſpirit* of it; or the cauſe which moved the legiſlator to enact it. For when this reaſon ceaſes, the law itſelf ought likewiſe to ceaſe with it. From this method of interpreting laws by the reaſon of them, ariſes what we call *equity;* which ſee.

INTERPRETER, a perſon who explains the thoughts, words, or writings, of ſome other, which before were unintelligible.

The word *interpres,* according to Iſidore, is compoſed of the prepoſition *inter,* and *partes,* as ſignifying a perſon in the middle betwixt two parties, to make them mutually underſtand each other's thoughts. Others derive it from *inter,* and *præs, i. e. fidejuſſor, q. d.* a perſon who ſerves as ſecurity between two others, who do not underſtand one another.

There have been great debates about interpreting ſcripture. The Romaniſts contend, that it belongs abſolutely to the church; adding, that where ſhe is ſilent, reaſon may be conſulted; but, where ſhe ſpeaks, reaſon is to be diſregarded. The Proteſtants generally allow reaſon to be the ſovereign judge, or interpreter, though ſome among them have a ſtrong regard to ſynods, and others to the authority of the primitive fathers. Laſtly, others have recourſe to the ſpirit within every perſon to interpret for them; which is what Bochart calls ἀπόδειξις τȣ πνεύματος. It is, or at leaſt ought to be, the fundamental principle of all Proteſtants, and indeed of all Chriſtians, that every man ſhould interpret ſcripture for himſelf, admitting no compulſory or controlling authority, but at the ſame time availing himſelf of all the aſſiſtances which others may afford for directing his inquiries and determining his judgment. "Let every man," ſays ſcripture itſelf, "be fully perſuaded in his own mind."

INTERREGNUM, the time during which a throne is vacant, or a kingdom without a head.

In hereditary kingdoms, as England, there are properly no interregnums. (See *Right of* CROWN.) In elective kingdoms, the interregnums are extremely liable to factions and diſorders.

INTERREX, a magiſtrate who governs during an interregnum, or in the interval between the death of a monarch and the election or inauguration of his ſucceſſor.

This magiſtrate was eſtabliſhed in old Rome, and was almoſt as ancient as the city itſelf. After the death of Romulus there was an interregnum of a year, during which the ſenators were each interrex in their turn, five days a-piece.

After the eſtabliſhment of conſuls, and a commonwealth, though there were no kings, yet the name and function of interrex were ſtill preſerved; for when the magiſtrates were abſent, or when there was any irregularity in their election, or they had abdicated, ſo that the comitia could not be held, provided they were unwilling to create a dictator, they made an interrex, whoſe office and authority were to laſt five days; after which they made another. To the interrex was delegated all the regal and conſular authority, and he performed all their functions. He aſſembled the ſenate, held comitia, or courts, and took care the election of magiſtrates was according to the rules. Indeed, at firſt it was not the cuſtom of the interrex to hold comitia; at leaſt we have no inſtance of it in the ancient Roman hiſtory.

The patricians alone had the right of electing an interrex. This office fell with the republic, when the emperors made themſelves maſters of every thing.

INTERRMENT, INTERMENT, or *Enterment,* the act of *interring, i. e.* burying, or laying a deceaſed perſon in the ground. See BURIAL.

The excommunicated are not to be interred in holy, *i. e.* in conſecrated ground. The ancients did not interr their dead; they burnt them, as the Indians do at this day. See BURNING.

The Abyſſinians, in lieu of interring their dead, ſhut them up in the bodies of trees, dug hollow for this purpoſe.

Gardeners alſo interr, or earth up, celery, endive, and lettuce, to blanch, or whiten, and make them the tenderer.

To interr wild ſtocks in ditches, is what Columella calls *deponere ſemina ſcrobibus.* There are ſome ſeeds, as willows, olives, &c. which grow very well, by *interring* their truncheons, *i. e.* cutting a truncheon, or piece, off at both ends, and planting it in the ground; which is what the Latins call *inhumare taleas, taleis ſerere.*

INTERROGATE, a judiciary act, performed by a judge, or commiſſioner deputed to examine or queſtion a party; who firſt gives his oath, that he will anſwer truly to every thing he is interrogated.

INTERROGATION, in *Rhetoric.* See EROTESIS.

As to the difference between *interrogation* and *exclamation,* (which ſee) we may obſerve, that interrogations are often employed with propriety in the courſe of no higher emotions than naturally ariſe in purſuing ſome cloſe and earneſt reaſoning; whereas exclamations belong only to ſtronger emotions of the mind, as ſurpriſe, admiration, anger, joy, grief, and the like. Both interrogation and exclamation, and all paſſionate figures of ſpeech, being natural ſigns of a moved and agitated mind, when properly uſed, operate upon us by means of ſympathy. Hence it follows, that the great rule with regard to ſuch figures is, that the writer attend to the manner in which nature dictates to us to expreſs any emotion or paſſion, and that he give his language that turn and no other; above all, that he never affect the ſtyle of a paſſion which he does not feel. Interrogations may be uſed with freedom; but nothing has a worſe effect than the frequent and unſeaſonable uſe of exclamations to which raw and juvenile writers are addicted. They render compoſitions frigid to exceſs.

INTERROGATION, in *Grammar*, is a point which ſerves to diſtinguiſh ſuch parts of a diſcourſe, where the author ſpeaks as if he were aſking queſtions. Its form is this (?).

INTERROGATORIES, in *Law*, are particular queſtions demanded of witneſſes brought in to be examined in a cauſe, eſpecially in the court of chancery. And theſe interrogatories muſt be exhibited by the parties in ſuit on each ſide; which are either direct for the party that produces them, or counter on behalf of the adverſe party; and generally both plaintiff and defendant may exhibit, direct, and counter or croſs interrogatories. They are to be pertinent, and only to the points neceſſary; and either drawn or peruſed by counſel, and to be ſigned by them. See COMMISSION *to examine witneſſes*, and EXAMINATION *of witneſſes*. See alſo CONTEMPT.

INTERRUPTED SUTURE, in *Surgery*. See SUTURE.

INTERRUPTION, in *Matters of Proportion*, denotes the ſame with *disjunction*.

It is noted thus (::), and ſignifies the breaking off of the ratio in the middle of four disjunct or diſcrete proportionals: as A : B :: C : D; that is, as A is to B ſo is C to D. See RATIO, PROPORTION, &c.

INTERRUPTION is alſo a figure in *Rhetoric*, wherein a perſon breaks off his diſcourſe ſuddenly, to ſhew ſome paſſion.

INTERSCENDENT, in *Algebra*, is applied to quantities, when the exponents of their powers are radical quantities. Thus $Z^{\sqrt{2}}$, $z^{\sqrt{m}}$, &c. are interſcendent quantities. See FUNCTION.

INTERSECTION, in *Mathematics*, the cutting of one line or plane by another; or the point or line wherein two lines, or two planes, cut each other.

The mutual interſection of two planes is a right line. The centre of a circle is in the interſection of two diameters. The central point of a regular or irregular figure of four ſides, is the point of interſection of the two diagonals.

The equinoxes happen when the ſun is in the interſections of the equator and the ecliptic.

INTERSOILING, in *Huſbandry*, the laying one kind of ſoil, or mould, upon another; as clay on ſand, ſand on earth, &c.

INTERSPERSUM VACUUM. See VACUUM.

INTERSPINALES, in *Anatomy*, are ſmall muſcles placed in the intervals of the ſpinous proceſſes of the vertebræ, and diſtinguiſhed as belonging to the neck, back, or loins.

Interſpinales colli, interſpiniens, epineux du cou, are arranged in pairs, as the proceſſes, to which they are connected, are bifurcated. There are ſix pairs, of which the firſt is placed between the ſpinous proceſſes of the ſecond and third cervical vertebræ, the ſecond between the third and fourth, and ſo on to the ſixth, which is found between the laſt cervical and firſt dorſal vertebræ. Their ſurfaces are flattened, and they have ſome reſemblance to lengthened ſquares; on the outſide, they are in contact with the multifidus ſpinæ; on the inſide, the two muſcles compoſing the pair are in contact; their upper and lower edges are fixed to the ſpinous proceſſes which bound the intervals containing them. With the exception of a few ſhort aponeurotic fibres at their extremities, they are entirely fleſhy. By approximating the ſpinous proceſſes, they extend the cervical portion of the ſpine.

Interſpinales dorſi, epineux du dos. Small muſcles are ſometimes placed between the ſpinous proceſſes of the lower lumbar vertebræ; but they are more frequently abſent.

Interſpinales lumborum, epineux des lombes. Theſe are ſix in number, ſeldom deficient, tendinous at their extremities, and attached above and below to the ſpinous proceſſes of the lumbar vertebræ. They are covered at the ſides by the multifidi ſpinæ. The firſt is placed between the twelfth dorſal and firſt lumbar vertebra; the ſixth between the laſt lumbar and the ſacrum. They produce in the loins the ſame effect as the correſponding muſcles do in the neck.

INTERSTELLAR, a word uſed by ſome authors to expreſs thoſe parts of the univerſe that are without, and beyond, the limits of our ſolar ſyſtem.

In the interſtellar regions are ſuppoſed to be ſeveral other ſyſtems of planets moving round the fixed ſtars, as the centres of their reſpective motions; and if it be true, as it is not improbable, that each fixed ſtar is thus a ſun to ſome habitable orbs, that move round it, the interſtellar world will be infinitely the greateſt part of the univerſe.

INTERTIES, or INTERDUCES, in *Architecture*, thoſe ſmall pieces of timber which lie horizontally betwixt the ſummers, or betwixt them and the ſell, or raiſing plate.

INTERTRANSVERSI, in *Anatomy*, or *intertranſverſarii*, or *intertranſverſales*, are ſmall muſcles belonging to the ſpine, placed in the intervals of the tranſverſe proceſſes of the vertebræ, and diſtinguiſhed in the different regions of the ſpine by the additional terms of colli, dorſi, and lumborum.

Intertranſverſi colli, intertranſverſiens, petits tranſverſaires du col. Theſe muſcles are diſtinguiſhed into anterior and poſterior, as the tranſverſe proceſſes to which they are attached, are bifid at their ends. The anterior ones are ſix in number; the firſt is placed between the tranſverſe proceſſes of the firſt and ſecond vertebræ, and the ſixth between thoſe of the ſixth and ſeventh. They are flattened in their figure, and the firſt is longer than the ſucceeding ones. On the front, they are covered by the rectus capitis major anticus; behind, they are in contact with the anterior branches of the cervical nerves; their upper and lower margins are attached to the tranſverſe proceſſes.

The poſterior intertranſverſi are five in number, the firſt being placed between the tranſverſe proceſſes of the ſecond and third vertebræ, and the fifth between thoſe of the ſixth and ſeventh. They very much reſemble the preceding muſcles. They correſpond in front to the anterior branches of the cervical nerves, and are covered behind by the ſplenius, tranſverſalis colli, and ſacrolumbalis. Their margins are fixed to the tranſverſe proceſſes. They are almoſt entirely fleſhy. By drawing the tranſverſe proceſſes together, theſe muſcles will inflect the neck laterally.

Intertranſverſi dorſi, petits tranſverſaires du dos. Theſe reſemble in the back the correſponding muſcles of the loins, but are ſmaller; they are placed between the points of the tranſverſe proceſſes. Some of the lower ones are of a conſpicuous ſize; they become gradually more ſlender and tendinous, and, in the upper part of the back, appear more like thin tendons than muſcles. In the latter ſituation they often do not exiſt. In front they lie on the intercoſtal muſcles, and they are covered behind by the longiſſimus dorſi and ſacrolumbalis; above and below they are fixed to the tranſverſe proceſſes. They produce the lateral inflexions of the dorſal vertebræ.

Intertranſverſi lumborum, tranſverſaires des lombes. Theſe are ſmall muſcular planes filling the intervals between the tranſverſe proceſſes of the lumbar vertebræ. Their number is five, the firſt being placed between the laſt dorſal and the firſt lumbar vertebra, and the laſt between the fourth and fifth lumbar vertebræ. They are thin, flattened, and quadrilateral. They correſpond in front to the quadratus lumborum, and behind, to the ſacrolumbalis; their upper and lower edges are fixed to the tranſverſe proceſſes. They are almoſt entirely fleſhy. Their office is that of inclining the vertebral column towards one ſide, or of reſtoring it to the erect ſtate after it has been ſo inclined.

INTERTRIGO, in *Medicine*, παρατριμμα of the Greeks, ſignifies an erythematous affection of the ſkin, a ſmooth, ſhining redneſs and tenderneſs of the part, chiefly from friction.

The *intertrigo* moſt commonly ariſes in thoſe parts of the ſurface, which lie in contact with each other, and are liable therefore to conſiderable attrition during motion; or in thoſe which are ſubject to friction and preſſure from other cauſes; and more eſpecially when, at the ſame time, any acrid fluid is preſent. Whence it is very frequent about the top of the thighs and the perineum of infants, when the cloths in which they are wrapped become wetted with the urine. Similar affections of the ſkin are alſo liable to occur in perſons who take exerciſe on horſeback, or in the feet of thoſe who have walked a conſiderable diſtance, eſpecially in tight ſhoes, and in the backs and ſhoulders of ſick perſons, long confined to bed. The firſt of theſe varieties, which occur in the *plicæ* or duplicatures of the ſkin, or originate from the attrition of the bandages impregnated with urine, &c. Sauvages has called *Erythema intertrigo*; the latter from friction of the clothes, or bed, he denominates *Erythema paratrimma*. See his Noſol. Method. Claſs i. Genus 11. ſpec. 5 and 6.

Dr. Willan alſo treats of the former varieties of the diſorder under the ſame head. When ſpeaking of erythema, he ſays, we may rank under the preſent article that ſpecies of intertrigo which is produced in ſome perſons by the attrition of contiguous ſurfaces, as beneath the breaſts, round the *axillæ*, in the groin, and at the upper part of the thighs, and is attended with a glairy and fetid ſecretion. The intertrigo is moſt troubleſome when it affects the thighs; it commences where they are in contact with the ſcrotum, and extends upwards to the groin and *nates*, round the *ſcrotum*, and down the hollow of the thigh In places where the friction is ſtrongeſt, the redneſs is continuous, but it terminates at the edges in a mixed colour, ſuch as characterizes effloreſcences generally. This complaint is moſt frequent in very warm weather, and affects perſons of the ſanguine temperament, eſpecially thoſe who are corpulent. It ſometimes terminates in the *prurigo*, or *pſoriaſis ſcrotalis*. An appearance analogous to the intertrigo, is produced by acrimonious diſcharges in perſons labouring under dyſentery, gonorrhœa, &c.; in females affected with fluor albus, or uterine ſcirrhus, and in infants, from the ſtimulus of the urine, &c. with which their clothes are almoſt conſtantly wetted. (See Willan on Cutaneous Diſeaſes, p. 481.) He refuſes to claſs this morbid ſtate of the ſkin with excoriation, or ſuperficial ulceration, as ſeveral writers both ancient and modern have done; and therefore excludes from the intertrigo thoſe excoriations included in the 6th ſpecies, or *Erythema paratrimma*, of Sauvages.

Frequent ablution with tepid water is neceſſary to allay the heat and uneaſineſs which attend this complaint, to remove the viſcid ſecretion from the ſurface, and to prevent excoriation. When the ſkin is fretted by the diſcharge of an acrimonious fluid, ſome relief is obtained by the application of dry abſorbent powders; in caſe of abraſion and fiſſures, the elder-ointment may be applied with much advantage.

INTERTWISTED Suture. See Suture.

INTERVAL, the diſtance or ſpace between two extremes, either in time or place.

The word comes from the Latin *intervallum*, which, according to Iſidore, ſignifies the ſpace *inter foſſam et murum*, between the ditch and the wall: others note, that the ſtakes or piles, driven into the ground in the ancient Roman bulwarks, were called *valla*, and the interſtices or vacancy between them *intervalla*.

Interval, *Angle of*. See Angle.

Intervals, *Lucid*. See Lucid.

Interval, in *Muſic*, the difference between two ſounds, in reſpect of acute and grave; or that imaginary ſpace terminated with two ſounds differing in acuteneſs or gravity. When two or more ſounds are compared in this relation, they are either equal or unequal in the degree of tune: ſuch as are equal are called *uniſons*, with regard to each other, as having one tune; the other, being at a diſtance from each other, conſtitute what we call an *interval* in muſic; which is properly the diſtance in tune between two ſounds.

Intervals are diſtinguiſhed into *ſimple* and *compound*.

Interval, *Simple*, is that without parts, or diviſion: ſuch are the octave, and all that are within it; as the ſecond, third, fourth, fifth, ſixth, and ſeventh, with their varieties.

Interval, *Compound*, conſiſts of ſeveral leſſer intervals: ſuch are all thoſe greater than the octave; as the ninth, tenth, eleventh, twelfth, &c. with their varieties. But this diſtinction, it is to be obſerved, regards practice only, becauſe there is really no ſuch thing as a leaſt interval. Beſides, by a *ſimple* interval is not meant here the leaſt practiſed, but ſuch as though it were equal to two or more leſſer, which are in uſe, yet when we would make a ſound move ſo far up or down we always paſs immediately from one of its terms to the other. What is meant then by a *compound* interval will be very plain: it is ſuch, whoſe terms are in practice taken either in immediate ſucceſſion, or ſuch where the ſound is made to riſe and fall from the one to the other, by touching ſome intermediate degree; ſo that the whole becomes a compoſition of all the intervals from one extreme to the other.

What we here call a *ſimple* interval, the ancients called a *diaſtem*, and the *compound* they call a *ſyſtem*.

Each of theſe had its differences; even of the ſimple there are ſome greater, and others leſs: but they are always diſcord; but of the compound, or ſyſtems, ſome are concord, others diſcord. Uniſons, it is plain, cannot poſſibly have any variety; for where there is no difference, as in uniſonance, which flows from a relation of equality, it is plain there can be no diſtinction: uniſons therefore muſt all be concords. But an interval depending on a difference of tune, or a relation of inequality, admits of variety; and ſo the terms of every interval, according to their particular relation or difference, make either concord or diſcord. Some indeed have reſtrained the word *concord* to intervals, making it include a difference in tune: but this is precarious; for as the word concord ſignifies an agreement of ſounds, it is certainly applicable to uniſons in the firſt degree. Intervals, it is plain, may differ in magnitude, and there may be an infinite variety, according to the poſſible degree of tune; for there is no difference ſo great or ſo little, but a greater or a leſs may poſſibly be conceived. It is true, with regard to practice, there are limits, which are the greateſt and leaſt intervals our ears are judges of, and which may be actually produced by voice or inſtrument.

The degrees of tune are proportional to the number of vibrations of the ſonorous body in a given time, or the velocity of their courſes and recourſes. Now theſe differences in tune conſtitute, as has been already ſaid, the intervals in muſic; theſe therefore muſt be greater or leſs, as the differences are; and it is the quantity of theſe which is the ſubject of the mathematical part of muſic. Thoſe intervals are meaſured, not in the ſimple differences, or in arithmetical ratios of the numbers expreſſing the lengths or vibrations, but in their geometric ratios; ſo that the ſame interval depends on the ſame geometrical ratio, and *vice verſâ*. It is, however, to be obſerved, that in comparing the equality of intervals, the ratios expreſſing them muſt be all of one ſpecies; otherwiſe this abſurdity will follow, that the ſame two ſounds may make different intervals. To deſcribe the particular methods of meaſuring the inequality of intervals would be too tedious: this one rule may be obſerved, that, to determine in general which of two or more intervals are the greateſt, take all the ratios as proper fractions, and the leaſt fraction will be the greateſt interval.

The ancients were extremely divided about the manner of meaſuring intervals. Pythagoras and his followers meaſured them by the ratios of numbers. They ſuppoſed the differences of gravity and acuteneſs to depend on the different velocities of the motion which cauſes ſound; and therefore concluded, that they could only be accurately meaſured by the ratios of thoſe velocities. Which ratios are ſaid to have been firſt inveſtigated by Pythagoras, on occaſion of his paſſing by a ſmith's ſhop, and obſerving a concordance betwixt the ſounds of hammers ſtriking on the anvil.

Ariſtoxenus oppoſed this. He thought reaſon and mathematics had nothing to do in this caſe, and that ſenſe was the only judge in the diſpute; the other being too ſubtile to be of any uſe. He therefore determined the octave, fifth, and fourth, which are the moſt ſimple concords, by the ear; and by the difference of the fourth and fifth he found out the tone; which, once ſettled as an interval the ear could judge of, he pretended to meaſure every interval by various additions, and ſubtractions, made of theſe mentioned, one with another: but this method is very inaccurate.

Ptolemy keeps a middle courſe betwixt the two: he finds fault with the one for deſpiſing reaſon, and with the other for excluding ſenſe; and ſhews how theſe two may mutually aſſiſt each other in this matter. Malcolm.

Intervals are founded on certain ratios or proportions expreſſible in numbers, which may all be analyſed into the prime numbers 2, 3, and 5. And all intervals may be found from the octave, fifth and third major, which reſpectively correſpond to thoſe numbers. Theſe are the muſician's elements, from the various combinations of which all the agreeable variety of relations of ſounds reſults.

This is the modern ſyſtem; and a late author aſſures us, it may be looked on as the ſtandard of truth; and that every interval that occurs in muſic is good or bad, as it approaches to or deviates from what it ought to be, on theſe principles. He obſerves, that the doctrine of ſome of the ancients ſeems different. Ptolemy, for inſtance, introduces not only the primes 2, 3, 4, 5, but alſo 7 and 11, &c. Nay, he ſeems to think all fourths good, provided their component intervals may be expreſſed by ſuper-particular ratios. But theſe are juſtly exploded conceits; and it ſeems not improbable, that the contradictions of different numerical hypotheſes, even in the age of Ariſtoxenus, and their inconſiſtency with experience, might lead him to reject numbers altogether. Dr. Pepuſc. ap. Phil. Tranſ. N°481. p. 267, 268.

M. Euler defines an interval, the meaſure of the difference of an acute and grave ſound. Tentam. Nov. Theor. Muſic, p. 72 and p. 103.

Suppoſe three ſounds a, b, c, of which c is the acute, a the moſt grave, and b the intermediate ſound. From the preceding definition it appears, that the interval between the ſounds a and c is the aggregate of the intervals between a and b, and between b and c. Therefore, if the interval between a and b be equal to that between b and c, which happens when $a : b :: c : d$, the interval between a to c will be double the interval a to b, or b to c. This being conſidered, it will appear that intervals ought to be expreſſed by the meaſures of the ratios conſtituting the ſounds forming thoſe intervals. But ratios are meaſured by the logarithms of fractions, the numerators of which denote the acute ſounds, and the denominators the grave. Hence the interval between the ſounds a and b will be expreſſed by the logarithm of the fraction $\frac{b}{a}$, which is uſually denoted by $l\frac{b}{a}$, or, which comes to the ſame, $lb - la$. The interval therefore of equal ſounds, a to a, will be null, as $la - la = 0$. The interval called an octave, or diapaſon, will be expreſſed by the logarithm of 2: and the interval of the fifth or diapente, will be $l3 - l2$. From whence it appears that theſe intervals are incommenſurable: ſo that no intervals, however ſmall, can be an aliquot part, both of the octave and fifth. The like may be ſaid of the intervals $l\frac{3}{2}$, and $l\frac{5}{4}$, and others whoſe logarithms are diſſimilar. But intervals expounded by logarithms of numbers, which are powers of the ſame root, may be compared. Thus, the interval of the ſounds 27 : 8, will be to the interval of the ſounds 9 : 4, as 3 is to 2: For $l\frac{27}{8} = 3l\frac{3}{2}$, and $3l\frac{9}{4} = 2l3$. Euler, ibid. p. 74.

But though the logarithms of numbers, which are not powers of the ſame root, be incommenſurable, yet an approximating ratio of ſuch may be found. Thus the meaſure of the octave is $l2 = 0.3010300$, and the meaſure of the fifth is $l3 - l2 = 0.1760913$. Hence the interval of the octave will be to that of the fifth, nearly as 3010300 to 1760913; which ratio being reduced to ſmaller terms, in the method explained under the head Ratio, will give us theſe ſimple expreſſions for the ratio of the octave and fifth: 2 : 1, 3 : 2, 5 : 3, 7 : 4, 12 : 7, 17 : 10, 29 : 17, 41 : 24, 53 : 31, which laſt is very near the truth. Euler, ibid. p. 75.

In like manner intervals may be divided into any number of equal parts: for this purpoſe we need only divide the logarithm of the propoſed interval into the ſame number of parts, and then find its correſpondent number by the tables. The ratio of the number ſo found, to unity, will give the required ratio of the divided interval to its propoſed part. Thus let the third part of an octave be required; its logarithm will be $= 0.1003433 = \frac{1}{3}l2$. The ratio correſponding nearly to this will be 63 : 50, or leſs accurately, 29 : 23, or 5 : 4, which laſt expreſſes the third major; and this is by the leſs knowing taken for the third part of an octave, and ſeems to be ſuch on our harpſichords and organs, where from C to E is a third, from E to G ※ another, and from G ※ or A♭ to c another third. But the more intelligent know, that G ※ and A♭ ought not to be reputed the ſame ſound, ſince they differ by a dieſis enharmonica, which is nearly equal to two commas.

M. Euler has inſerted a table of intervals in his "Tentamen Novæ Theoriæ Muſicæ:" he ſuppoſes the logarithm or meaſure of the octave to be 1.000000, whence the logarithm of the fifth will be 0.584962, and the logarithm of the third major will be 0.321928: from theſe the meaſures of all other intervals may be found. But as it has been cuſtomary for muſicians to meaſure their intervals by commas, we ſhall here inſert a table of intervals, with their meaſures in commas; where we ſuppoſe the logarithm or meaſure of the comma $\frac{81}{80}$ to be 1.00000: hence the logarithm of the octave $\frac{2}{1}$ will be 55.79763, that of the fifth 32.63952, and laſtly, that of the third major 17.96282. From theſe all the other intervals may be found in the manner expreſſed in the table; where the firſt column ſhews the names of the ſeveral intervals; the ſecond, the proportions of ſounds forming theſe intervals; the third, the compoſition of theſe proportions from the primes 2, 3, and 5. The ſmaller figures marked above, and ſomewhat to the right of the larger, indicate the power to which the number expreſſed by the larger figures is raiſed. Thus $\frac{2^{17}3}{5^{8}}$ ſhews that the ſeventeenth power of 2 multiplied by 3, and divided by the eighth power of 5, will produce $\frac{393216}{390625}$ in the ſecond column, and that this is the proportion expreſſing the interval called *eſchaton* in the firſt column. The fourth column of the table contains ſome ſimple ſigns of ſome of the intervals, as *h* for *hyperoche*, *d* for *dieſis*, &c. and the fifth column ſhews how the intervals ariſe from others: thus over againſt ſemitone major, I find in the fourth column *S*, which is here only an arbitrary mark for this ſemitone; and in the fifth column I find $s + d = \text{IV} - \text{III}$, which ſignifies that the ſemitone major is equal to the ſum of the ſemitone minor and dieſis, or to the difference between the fourth and the third major. Obſerve, that the comma is marked by a dot (·); when this is placed over the letter or other ſymbol, it ſignifies that the interval is ſuppoſed to be heightened by a comma; and on the contrary, when the point is placed below, it ſignifies that the interval muſt be diminiſhed by a comma; thus $\dot{t} = T$ ſignifies that the tone minor increaſed by a comma is equal to a tone-major, and *vice verſâ:* $\underset{\cdot}{T} = t$ ſhews that the tone-major diminiſhed by a comma is equal to the tone-minor. The ſigns +, −, =, are here taken in the ſame ſenſe as in algebra, to ſignify addition, ſubtraction, and equality. So likewiſe the dot placed between two numbers, or between a number and the ſymbol of an interval, ſignifies that the interval is to be multiplied by the number. Thus 2. IV ſhews that the fourth is doubled; and thus $7^{b} = \text{VI} + S = 2.\,\text{IV} = \text{VIII} - T$, ſhews, that the leſſer flat ſeventh is equal to the ſixth major and ſemitone-major, or alſo to two fourths, or to the octave when the tone-major has been taken from it. Laſtly, the ſixth column of the table ſhews the meaſures, or logarithms of the ratios in the ſecond column. Theſe are not the common logarithms of the tables where 1.0000000 is the logarithm of 10. But here 1.00000 is aſſumed as the logarithm of $\frac{81}{80}$, or of the comma, as before mentioned. Theſe logarithms are eaſily derived from the common, of the large tables of Vlacq, or Briggs: thus the logarithm of 2, or the octave = 0.3010299957; the logarithm of $\frac{3}{2}$, or of the fifth = 0.1760912590: and laſtly, the logarithm of $\frac{5}{4}$, or of the third major = 0.0969100130. Now theſe logarithms being ſeverally divided by the logarithm of $\frac{81}{80}$, or the comma = 0.0053950139; the quotients will give the number of commas in an octave = 55.79763; in a fifth = 32.63952; and in a third major = 17.96282. Hence all the reſt may be found by addition and ſubtraction only. Here follows the Table.

A Table of the Muſical Intervals with their Meaſures.

Names of the Intervals.	Proportions expreſſing the Intervals.	Compoſition of the Proportions from 2, 3, and 5.	Simple Signs.	Complex Signs to ſhew the Compoſition of Intervals.	Meaſures by Commas.
Eſchaton of Henſling - -	$\frac{393216}{390625}$	$\frac{2^{17}3}{5^{8}}$		$l - h = 2d - s = 3d - S$	0.53222
Diaſchiſma of Euler - - -	$\frac{2048}{2025}$	$\frac{2^{11}}{3^{4}\cdot 5^{2}}$		$\underset{\cdot}{l}$	0.90917
Comma - - - - - -	$\frac{81}{80}$	$\frac{3^{4}}{2^{4}\cdot 5}$		$T - t$	1.00000
Comma of Pythagoras - - -	$\frac{531441}{524288}$	$\frac{3^{12}}{2^{19}}$		$6\,T - \text{VIII}$	1.09083
Hyperoche - - - - -	$\frac{3125}{3072}$	$\frac{5^{5}}{2^{10}3}$	*h*	$s - d = S - 2d$	1.37695
EnharmonicDieſis, or diminiſhed ſecond	$\frac{128}{125}$	$\frac{2^{7}}{5^{3}}$	*d*	$S - s$	1.90917
Semi-toned Minor, or leaſt Chromatic Dieſis - - - -	$\frac{25}{24}$	$\frac{5^{2}}{2^{3}\cdot 3}$	*s*	$t - S = d + h = \text{III} - 3^{b}$	3.28612

Superfluous Seventh	$\frac{125}{64}$	$\frac{5^3}{2^5}$		$\text{VII} + s = \text{VIII} - d$	53.88846
Octave	$\frac{2}{1}$	$\overset{2}{\cdot}$	VIII	$\text{VIII} = \text{V} + \text{IV}$	55.79763

The limma, apotome, trihemitone, ditonus, ſemidiapente, and tritonus, mentioned in this table, by the names of limma, apotome, &c. of the Greek ſcale, are ſuch as are either mentioned by the ancients, or at leaſt occur in their ſcale, where fourths are divided into two tones and a limma, and where the octave conſiſted of five tones and two limmas.

The term *redundant*, in the table, is applied to ſuch intervals as exceed the truth by a comma; and ſuch as fall ſhort of the truth by a like quantity, are called *deficient.* Intervals that exceed true diatonic intervals, by a ſemitone minor, are ſaid to be *ſuperfluous;* and thoſe which fall ſhort by the ſame quantity, are ſaid to be *diminiſhed.* Where an interval exceeds a true diatonic interval by the quantity of two ſemitones minor, we have called it an *extreme ſuperfluous* interval: and if it falls ſhort by the ſame quantity, the appellation of *extreme diminiſhed* interval is given it. Thus, if from A to D aſcending be a true fourth, and from D to *a* a true fifth, then if D be ſuppoſed raiſed by a comma, from A to $\dot{\text{D}}$ will be a redundant fourth, and from $\dot{\text{D}}$ to *a* a deficient fifth. From A to D ※ will be a ſuperfluous fourth, and from D ※ to *a* will be a diminiſhed fifth. In like manner, from A to D^{b}, will be a diminiſhed fourth; and from D^{b} to *a* a ſuperfluous fifth. From A to D ※※ (D double ſharp) will be an extreme ſuperfluous fourth, and from A to D^{bb} (D double flat) will be an extreme diminiſhed fourth. In like manner from D ※※ to *a* will be an extreme diminiſhed, and from D^{bb} to *a* an extreme ſuperfluous fifth. Such intervals are not to be met with in the practice of muſic; but if the diviſion of the octave into 31 parts were once eſtabliſhed, as it ought for the perfection of muſic, ſuch intervals as theſe here mentioned will neceſſarily occur in the ſcale. Vide Phil. Tranſ. N° 481. p. 273, 274. See Genus.

This table, among other uſes, will facilitate the examination of any propoſed ſcale, or interval. Suppoſe, for inſtance, it were required to examine ſome of Ptolemy's diviſions of the fourth, as his diatonicum molle, which he makes $\frac{8}{7} + \frac{10}{9} + \frac{21}{20} = \frac{4}{3}$. Take the logarithm of $\frac{8}{7}$ from the common tables, and divide it by the logarithm of $\frac{81}{80}$, the quotient will be 10.75, which gives the meaſure or number of commas, and its parts contained in an interval expreſſed by $\frac{8}{7}$. Look for the neareſt meaſure of intervals to 10.75 in the table, it will be found to be 10.39058, which anſwers to the interval of two ſemitones major, or of the diminiſhed third, as practitioners call it. But Ptolemy's exceeds this by 0.36, or about $\frac{1}{3}$d of a comma. The next interval in Ptolemy's diviſion is $\frac{10}{9}$, which is a true tone minor. The third is $\frac{21}{20}$, which will be found to be 3.93 commas, that is, a ſemitone minor and 0.64 of a comma, or a ſemitone minor redundant by near $\frac{2}{3}$ds of a comma. But this is much out of tune. In the common, and in Huygens's temperatures, the ſemitone minor is increaſed only by about $\frac{1}{4}$th of a comma. Vide Ptolemy's Harmon. p. 92. apud Wallis Opera, tom. v.

Intervals, *Concinnous*. Diſcords are diſtinguiſhed into *concinnous* and *inconcinnous* intervals: the *concinnous* are ſuch as are fit for muſic, next to, and in combination with concords; being neither very agreeable nor diſagreeable in themſelves; but having a good effect, as by their oppoſition they heighten the more eſſential principles of pleaſure; or as by their mixture and combination with them, they produce a variety neceſſary to our being better pleaſed. See Concinnous.

The other diſcords that are never uſed in muſic, are called *inconcinnous*.

Interval, *Diminiſhed*, is a defective interval, or an interval which is ſhort of its juſt quantity by a leſſer ſemitone. Thus from C ♮ to E being a third major, if E be lowered by a ſemitone minor, we ſhall have E ♭, and then from C ♮ to E ♭ is called a *diminiſhed* third, in the language of practical muſicians, and occurs frequently in their works. But, ſtrictly ſpeaking, in this caſe, the note E muſt be lowered more than a ſemitone minor.

Interval, *Harmonical*, is an interval, or difference of two ſounds which are agreeable to the ear, whether in conſonance or ſucceſſion.

Harmonical intervals, therefore, are the ſame with *concords*; which ſee.

They are thus called, as being the only eſſential ingredients of harmony.

Intervals, in the *New Method of Huſbandry*, denote the wide ſpaces, commonly about five feet, which are left between any two of the double, treble, or quadruple rows. See Husbandry.

Intervals, in the *Military Art*, are the ſpaces left between each regiment in camp, and likewiſe between each tent.

INTESTATE, a perſon who dies without making a will. An heir *ab inteſtato*, is a perſon who inherits an eſtate by ſome other right than that of will or teſtament.

Heretofore, thoſe who died inteſtate, were held infamous, and accurſed; in regard, by the canons of ſeveral councils, every perſon was enjoined to bequeath a part of his eſtate (and Matthew Paris ſays it was at leaſt to be a tenth part) to the church, for the ſafety of his ſoul; which a perſon who neglected to make a will, and to leave this legacy to the church, was judged to have abandoned. Several councils took on them to command the prieſts to ſolicit dying perſons to be charitable to the church; and this they did ſo earneſtly, that abſolution and the viaticum were denied to thoſe whom they could not prevail on; ſo that they made no difference between theſe inteſtates and ſelf-murderers; and they were alike denied Chriſtian burial. Du Cange adds, that all who died without abſolution, without receiving the viaticum, and without leaving alms to the church (even though they died ſuddenly), had their effects ſeized, and confiſcated to the uſe of the church, biſhop, &c. See Administrator and Testament.

In the Engliſh law there are two kinds of inteſtates: the one *de facto*, which are thoſe who make no will at all; the other *de jure*, called alſo *quaſi inteſtati*, which are thoſe who make a will; but ſuch an one as is null and void, either from the executors refuſing to act, or from ſome other cauſe: in which caſe they are judged to die as inteſtate, *quaſi inteſtati*.

And the 22 & 23 Car. II. c. 10. commonly called the ſtatute of diſtribution, appoints a diſtribution of inteſtates' eſtates, (except of femes covert, which are left as at common law, ſtat. 29 Car. II. c. 3. § 25.) after debts and funeral expences are paid among the wife and children of the deceaſed; or for want of ſuch, among the next of kin, &c. and the act of parliament doth immediately upon the death of the inteſtate veſt an intereſt in the perſons entitled: ſo that if any one dies before the diſtribution, though within the year, his ſhare ſhall go to his executors and adminiſtrators; and not to the ſurvivors or next of kin to the inteſtate. (1 Lil. Abr. 487. See Administration.) By this ſtatute the mother, as well as the father, ſucceeded to all the perſonal effects of their children who died inteſtate, and without wife or iſſue: in excluſion of the other ſons and daughters, the brothers and ſiſters of the deceaſed. And ſo the law ſtill remains with reſpect to the father; but by ſtatute 1 Jac. II. c. 17, if the father is dead, and any of the children die inteſtate without wife or iſſue, in the life-time of the mother, ſhe and each of the remaining children, or their repreſentatives, ſhall divide his effects in equal portions. See Custom *of* London.

By the ſame ſtatute it is enacted, that one-third part of the ſurpluſage of the eſtate of any perſon dying inteſtate, ſhall be diſtributed to his widow, and the reſidue amongſt his children by equal portions, or among ſuch perſons as legally repreſent his children, in caſe any of them be then dead, excepting ſuch child or children (not being heir at law) who ſhall have any eſtate by the ſettlement of the inteſtate, or ſhall be advanced by the inteſtate in his life-time, by portion or portions equal to the ſhare which ſhall by ſuch diſtribution be allotted to the other children, and in caſe their portions have not been equal, they ſhall be made ſo as nearly as poſſible out of the ſame ſurpluſage. But the heir at law is to have an equal part in the diſtribution with the reſt of the children, without any conſideration of the value of the land which he hath by deſcent or otherwiſe from the inteſtate. In caſe there be no children nor legal repreſentatives, one moiety of the ſaid eſtate ſhall be allotted to the widow of the inteſtate, and the reſidue diſtributed equally to every of the next kindred of the inteſtate, who are in equal degree, and thoſe who legally repreſent them ; provided that there be no repreſentations admitted among collaterals, after brothers and ſiſters children : and if there be no widow, the ſaid eſtate ſhall be wholly diſtributed in equal ſhares among the children ; or if there be no child, to the next of kindred in equal degree, and their legal repreſentatives. But no ſuch diſtribution of the goods of an inteſtate ſhould be made till after one year be fully expired after his death, and thoſe to whom diſtribution is made, are required to give bonds with ſufficient ſureties, to refund in caſe of debts.

This ſtatute of diſtributions bears a near reſemblance to our ancient Engliſh law, " de rationabili parte bonorum," which ſir Edward Coke himſelf (2 Inſt. 33.), though he doubted the generality of its reſtraint on the power of deviſing by will, held to be univerſally binding (in point of conſcience at leaſt) upon the adminiſtrator or executor, in the caſe of either a total or partial inteſtacy. It alſo bears ſome reſemblance to the Roman law of ſucceſſion " ab inteſtato ;" which, and becauſe the act was alſo penned by an eminent civilian (ſir Walter Walker), has occaſioned a notion that the parliament of England copied it from the Roman prætor, though it is little more than a reſtoration, with ſome refinements and regulations, of our old conſtitutional law ; which prevailed as an eſtabliſhed right and cuſtom from the time of king Canute downwards, many centuries before Juſtinian's laws were known or heard of in the weſtern parts of Europe. Judge Blackſtone obſerves, however, that the doctrine and limits of repreſentation, laid down in the ſtatute of diſtributions, ſeems to have been principally borrowed from the civil law ; whereby it will ſometimes happen that perſonal eſtates are divided " per capita," and ſometimes " per ſtirpes ;" whereas the common law knows no other rule of ſucceſſion but that " per ſtirpes" only. Bl. Com. b. ii.

INTESTINA, in the *Linnæan Syſtem*, an order or diviſion of worms (ſee VERMES) ; the characters of which are, that they are ſimple naked animals without limbs : ſome are pierced with a lateral hole or a kind of pore ; and others are imperforated and have no lateral pore. The ſubordinate genera of this diviſion of worms are the *aſcaris*, *trichocephalus*, *uncinaria*, *filaria*, *ſcolex*, *ligula*, *linguatala*, *ſtrongylus*, *echinorhynchus*, *hæruca*, *cucullanus*, *caryophyllæus*, *faſciola*, *myxine*, *tænia*, *furia*, *gordius*, *hirudo*, *lumbricus*, *ſipunculus*, and *planaria.*

INTESTINE MOTION. See MOTION.

INTESTINE *War.* See WAR.

INTESTINES, in *Anatomy*, are portions of the membranous tube, in which the converſion of the food into chyle, and the expulſion of its reſidue in the form of feces is effected. They are two in number, and are diſtinguiſhed by epithets derived from their relative ſize ; the *ſmall* inteſtine (*int. tenue*) ſucceeds the ſtomach, and is immediately followed by the *large* (*int. craſſum*). The uſe of the word in the plural, with either of theſe epithets, is incorrect ; ſince each of theſe diviſions of the alimentary canal is a ſingle tube.

The changes which the food undergoes in the ſtomach and inteſtines, and the functions of theſe organs, have been fully diſcuſſed under the article DIGESTION : at preſent our object is merely anatomical, and conſiſts in preſenting to the reader the details concerning the forms, ſituation, connections, and ſtructure of the inteſtines.

The ſmall inteſtine is that part of the alimentary canal which extends from the pylorus to the valve of the colon. It is the longeſt diviſion of the canal, and is ſuppoſed to be three or four times the length of the body. It is naturally divided into two parts : the firſt of theſe, placed between the two layers of the tranſverſe meſocolon, has a fixed ſituation in the abdominal cavity, and is called *duodenum :* the other floats looſely in the abdomen, and is diſtinguiſhed by an ambiguous and arbitrary diviſion into jejunum and ileum. It is generally, but not always, ſmaller in ſize than the large inteſtine ; yet, when it is diſtended with air or other contents, it exceeds the empty large inteſtine in diameter. The cells and folds of the latter give to its coats in the collapſed ſtate a feel of greater thickneſs, although they are not actually thicker than ſome parts of the ſmall inteſtines. A ſuperficial view would lead us to deſcribe it as a cylindrical tube ; but more accurate examination and actual meaſurement will ſhew that it is conical, largeſt at its commencement, ſmalleſt at its termination, and diminiſhing very gradually between theſe points. When diſtended, the outline of its ſection is circular : in the empty ſtate its ſides fall together, ſo that it repreſents an oblong oval.

The ſtructure of the tube is the ſame, in all eſſential points, throughout its whole extent ; and the diſtinctions of anatomiſts regard only points of ſituation and connection. The excretory tubes of the liver and pancreas open into the canal, near its beginning.

The *duodenum* is that part of the inteſtine included between the pylorus and the point at which the canal eſcapes from the tranſverſe meſocolon. It is placed in the neighbourhood of the vertebral column, between the two layers of the meſocolon, which are connected to it by a looſe cellular ſubſtance. The large end of the pancreas is very cloſely attached to it. From the pylorus it turns backwards, and to the right, under the neck of the gall-bladder, which touches it : hence it frequently has a yellow tint in the dead ſubject. This, which may be called the firſt portion of the duodenum, forms a diſtinct angle with the ſecond, which deſcends almoſt perpendicularly behind the upper layer of the meſocolon connected to it by a looſe cellular medium. Its poſterior ſurface correſponds to the right ſide of the vertebral column, and to the front of the right kidney : its inner edge to the pancreas. The third part makes a turn at the lower end of the kidney, or about the third lumbar vertebra, paſſes from right to left acroſs the vertebral column, in front of the aorta and vena cava, behind the ſuperior meſenteric veſſels, and below the pancreas. At the left ſide of the abdomen it again turns forwards and towards the right, eſcapes from behind the inferior layer of the meſocolon, and takes the name of jejunum. Thus this diviſion of the inteſtinal canal forms a kind of half circle, of which the convexity is towards the right, and the concavity to the left : the pancreas is included within it.

The anterior ſurface of the inteſtine only is covered by peritoneum ; the poſterior aſpect being attached to the neighbouring organs by cellular ſubſtance. In the part near the pylorus, the covering membrane adheres cloſely to the muſcular part of the inteſtine, as it does in the jejunum or ileum : but in the reſt of its courſe, the adheſion is much more looſe, and in the third portion the meſenteric veſſels are interpoſed between the membrane and the inteſtine. A fold of membrane produced from the neighbourhood of the right kidney, and from the tranſverſe fiſſure of the liver, is ſometimes deſcribed as the ligamentum duodeni renale or hepaticum : the reſt of the canal is included within the ſpace left between the layers of the meſocolon.

Its length is about that of twelve fingers' breadths. The united pancreatic and biliary ducts have their opening on the poſterior ſurface, at the angle formed between the firſt and ſecond portions of the duodenum.

The peculiarities of the duodenum are its incomplete peritoneal covering ; its circumſcribed and fixed ſituation ;

its connection to the pancreas, and receiving the ſecreted fluid of that gland and the liver. Its figure is perhaps leſs regularly cylindrical, and there are ſome differences in the mucous membrane.

The arteries of the duodenum are derived from the gaſtroduodenal branch of the hepatic, and from the ſuperior meſenteric: the veins join ſome of the trunks, which contributed to the formation of the vena portarum. The abſorbing veſſels paſs to the glands at the root of the meſentery. The nerves come from the cæliac ganglia.

Second Diviſion of the ſmall Inteſtines.—This part of the canal, which is very looſe and moveable, forms numerous turns, and its convolutions fill up the ſpace between the bladder and uterus below, and the large inteſtine above and at the ſides: the latter part almoſt encircles the ſpace in which this diviſion of the canal lies. As the cæcum and the ſigmoid flexures of the colon do not touch below, the ſmall inteſtine deſcends in their interval, in greater or leſs quantity, into the pelvis. The umbilical and hypogaſtric regions of the abdomen are chiefly occupied by theſe convolutions: which accommodate themſelves, by their perfect mobility, to the numerous changes produced in this ſpace. A diſtended ſtate of the ſtomach cauſes them to deſcend: when the bladder, rectum, and uterus are empty, much of the inteſtine is found in the pelvis; but when theſe organs, and particularly the latter, are diſtended, the inteſtine aſcends: in a word, it paſſes into any ſpace that remains open for it. The tranſverſe arch of the colon bounds the ſpace occupied by the ſmall inteſtine above: the lumbar portions of the large inteſtine, fixed to the back of the abdomen, allow the convolutions to paſs in front of them, and to correſpond immediately to the abdominal parietes. The latter limit and confine it in front, and are ſeparated from it only by the great omentum.

A broad fold of peritoneum, called the meſentery, connects it in its ſituation to the abdominal cavity; this conſiſts of two layers, which receive the inteſtine between them, and give it a ſmooth external coat. This fold is attached to the back of the abdomen, in an oblique line, extending from the left lumbar to the right iliac regions: here it is about ſix inches broad. It expands ſo conſiderably as to be broad enough on the oppoſite or front margin, to be attached to the whole length of the jejunum and ileum. In conſequence of this great breadth of the anterior part, the meſentery itſelf, in this ſituation, forms a vaſt number of longitudinal plaits. The flat ſurfaces of the meſentery are ſmooth, and contiguous to the inteſtinal convolutions. The depth of the meſentery, from its poſterior or fixed, to its anterior or looſe edge, is greateſt in the middle, and gradually diminiſhed towards either end. Its ſtructure and attachments are ſuch as to preſerve the inteſtinal convolutions in a certain relative poſition, and at the ſame time to allow in the whole a conſiderable liberty of motion; it prevents the inteſtines alſo from becoming entangled in the motions of its individual parts.

It is compoſed of two membranous layers, produced from the peritoneum. The latter membrane, after lining the poſterior and right portion of the abdomen, when it arrives at the root of the meſentery, is reflected from behind forwards, inſtead of being continued to the left ſide. That, which has lined the poſterior and left diviſion of the cavity, is alſo reflected from behind forwards, inſtead of paſſing in front of the vertebræ. Theſe laminæ, turned towards each other, form the two ſurfaces of the meſentery; they ſeparate at the inteſtine, and leave a cylindrical tube, in which that canal is contained. They are connected by a layer of cellular membrane, containing more or leſs fat, and the arteries, veins, and nerves of the jejunum and ileum, as well as the lacteal veſſels and their glands.

The inteſtinal convolutions have no fixed ſituation, but are formed, deſtroyed, and renewed, carried upwards, downwards, &c. according to the general or particular motions of the canal: yet the concavity of each turn is always at the meſenteric edge, and its convexity at the looſe margin of the gut. The very looſe attachment to the ſides of the cavity, and the apparently irregular order in which the convolutions of the inteſtines are diſpoſed, ſeem at firſt ſight to prevent us from aſſigning any particular direction to this part of the canal. But if we put out of the queſtion the great maſs of the turns, and examine the parts where it begins and ends, and conſider at the ſame time the direction of the meſentery, we ſhall find that the canal altogether paſſes obliquely from above downwards, and from the left towards the right ſide. It begins in fact on the left ſide of the tranſverſe meſocolon below the ſuperior meſenteric veſſels, and it terminates in the right iliac region, where it is fixed to the ſide of the cæcum.

A tranſverſe ſection of the inteſtine preſents an elliptical area; of which the ſmaller circle correſponds to the meſentery, and the larger to the looſe edge of the inteſtine. Conſidered in its whole length, the meſenteric or attached edge is concave; the looſe margin convex. The ſmall trunks of the blood-veſſels enter on the former; their minute ramifications, and the fine origins of the abſorbents, are obſerved on the latter.

Sometimes ſmall blind proceſſes, or appendices, varying in length from a few lines to three or four inches, are connected to the ſmall inteſtine. It is very uncommon to ſee more than one in a ſubject. They are cylindrical or conical towards the extremity, communicate freely with the reſt of the canal, and completely agree with it in ſtructure. There can be no doubt that they are originally formed parts, and not produced by any morbid extenſion of the inteſtinal parietes. They are often mentioned under the name of diverticula.

When moderately diſtended, the inteſtine meaſures more than an inch at its largeſt diameter, and leſs at the ſmalleſt. When it is completely diſtended, the figure is circular.

The coats are thinner than in the ſtomach or in the large inteſtine: they are thickeſt at the beginning, and grow gradually thinner to the end. They appear proportionally thicker, when the inteſtine is in a contracted ſtate. It is more fleſhy, elaſtic, and dark coloured; in a word, firmer and thicker in perfectly healthy men than in women or valetudinarians. When it is aſſerted that the canal is ſo many times the length of the body, we only mean to give a general notion of its extent: for there is no relation between the ſtature of individuals and the volume of their gaſtric viſcera.

The diſtinction of the jejunum and ileum is quite arbitrary: there are no marks ſhewing the termination of one, and the beginning of the other: but the two ends of the canal differ obviouſly in ſeveral points. Winſlow gives the former name to the upper two-fifths of the tube, and the latter to the lower three-fifths.

Organization of the ſmall Inteſtine.—It conſiſts, like the ſtomach, of three diſtinct ſtrata or coats, connected by cellular ſubſtance: theſe are moſt clearly ſeen on the cut edge of the part, after a ſimple inciſion, when the difference of colour and denſity enables us to diſtinguiſh them eaſily. Boiling and maceration in proof ſpirit render the diſſection of the inteſtinal coats more eaſy.

The firſt or external coat is a ſerous membrane, conſiſting of a production of peritoneum. The two layers of the meſentery ſeparate at the concave edge of the inteſtine, ſurround it, and are continued into each other at the convex ſide. It covers, therefore, the whole external ſurface, excepting the narrow ſtrip where the two layers are ſeparated.

This ſerous membrane is very thin, ſo as to be nearly tranſparent, and poſſeſſes no fibres: the muſcular fibres and the blood-veſſels can be ſeen through it. Its external ſurface is moiſt, and perfectly ſmooth; while the internal, connected to the ſubjacent fibres by cellular ſubſtance, has a rough appearance.

The muſcular or ſecond coat of the inteſtine conſiſts of two ſtrata of fibres. The external, which is thin and ſmall, has a longitudinal direction, but their fibres can hardly be ſeen except at the convex edge of the gut. The internal is much more conſiderable; its fibres are more numerous, and they ſurround the inteſtine in a circular manner, ſo as to cut the former at right angles. Theſe fibres are the moſt diſtinctly marked about the duodenum: they grow more ſlender, poſſeſs leſs colour, and are therefore hardly obſervable near the valve of the colon.

The third or internal covering is a mucous membrane, generally called by anatomiſts the villous coat of the inteſtine: it is always covered in a greater or leſs degree with a mucous fluid. This is connected to the muſcular ſtratum by a very copious, white, and rather looſe cellular ſubſtance, the *nervous* coat of many anatomiſts. The trunks of the blood-veſſels and abſorbents of the mucous ſurface are contained in this in great numbers, and give to it the appearance of conſiderable vaſcularity. It not only connects the mucous and muſcular coverings together, but alſo unites the duplicatures of the former. Through the intervals of the muſcular fibres it joins the cellular ſubſtance connecting the ſerous and muſcular coats. When carefully ſeparated, it has the appearance of a fine cotton on both ſurfaces: and this appearance may be ſtill more ſtrikingly produced by cutting off the meſentery cloſe to the inteſtine, inverting the tube and inflating it forcibly, when the air will penetrate into the whole cellular ſtructure of the organ. If the part be macerated, after ſeparating by diſſection the mucous and muſcular coats, the water diſtends the cells and exhibits the ſtructure very clearly.

The mucous membrane is much longer than the two other coats, and it is conſequently collected, throughout the whole canal, into folds, by which the difference of length is compenſated. Theſe are not like the rugæ of the ſtomach, formed only in the contracted, and diſappearing in the diſtended ſtate of the organ; but they belong to the eſſential ſtructure of the part, and exiſt therefore under all circumſtances. They are moſtly tranſverſe in their direction; that is, they cut the long axis of the gut at right angles; and they are called valvulæ conniventes, although they have not, nor can poſſibly exert any thing like the action of a valve. They begin about an inch from the pylorus, are ſmall, and longitudinally diſpoſed in the duodenum. They then aſſume a more regular arrangement, are numerous and large, and nearly parallel; towards the end of the inteſtine they gradually become ſmaller and fewer, and have again in great part of the ileum a longitudinal diſpoſition. Near the valve of the colon the gut is almoſt ſmooth.

The valvulæ conniventes may occupy from one to three-fourths of the diameter of the canal, but rarely extend through the whole circle: they are often joined by ſmall communicating folds, and frequently are bifurcated at their extremities. When ſhort, they are narrow, and are broader in proportion as they are longer: they are broadeſt in the middle and narrower at the extremities. Their breadth may be from half a line to three lines. They are ſo completely unreſiſting, that they yield readily in either direction to any impelling force, and are applied againſt the ſurface of the canal. As they depend entirely on the cellular ſubſtance, they are deſtroyed by ſeparating the mucous membrane and drawing it out: the ſurface then becomes ſmooth, and very much exceeds the length of the other coats.

The ſituation, length and breadth, direction, number and form of the valvulæ conniventes, can be very well obſerved in a gut inflated and dried; but their natural appearance, their thickneſs, ſoftneſs, &c. are beſt ſeen in an inverted inteſtine floating in water.

When the ſurface of the mucous membrane is attentively examined, it is found univerſally covered with very delicate and minute folds and projections, ſo as to give it a flocculent appearance; theſe are named villi. They are more numerous and large in the commencement of the canal, and decreaſe in number and ſize towards the oppoſite end. In ſome animals, as the dog, theſe villi are remarkably long and numerous, ſo that the ſurface of the mucous membrane completely reſembles velvet.

When the blood-veſſels have been ſucceſsfully injected, microſcopical examination diſcovers other irregularities on theſe villi, and ſhews us that the whole conſiſts of a cloſe net-work of vaſcular communications. Each villus contains moreover numerous abſorbing veſſels, ſo that they have been regarded as the great organs of abſorption, containing the mouths by which the lacteals take up the chyle from the inteſtine. Anatomiſts have buſied themſelves much with attempts to detect the actual openings of the lacteals upon the villi. Lieberkuhn thought that he could ſee, by the aid of the microſcope, an opening into each villus leading into a ſmall veſicular cavity in the centre, which he called the ampulla. Hewſon did not admit this ſtructure, but conceived that the veſſels begin by ſimple apertures, in the number of one or more on each villus. Mr. Cruikſhanck met with a ſubject, in which the lacteals and villi were remarkably loaded with chyle, and he examined theſe parts with the microſcope. Many of the villi were ſo full that they ſeemed like white veſicles, without any diſtinction of particular veſſels. "In ſome hundred villi," ſays he, "I ſaw a trunk of a lacteal, forming or beginning by radiated branches. The orifices of theſe radii were very diſtinct on the ſurface of the villus, as well as the radii themſelves, ſeen through the external ſurface, paſſing into the trunk of the lacteal: they were full of a white fluid. There was but one of theſe trunks in each villus. The orifices on the villi of the jejunum, as doctor Hunter himſelf ſaid, (when I aſked him, as he viewed them in the microſcope, how many he thought there might be,) were about fifteen or twenty on each villus: and in ſome I ſaw them ſtill more numerous." Anatomy of the Abſorbing Veſſels, chap. 11, and plate 2.

It has been calculated, that the ſurface of this mucous membrane, when allowance is made for all its inequalities, exceeds that of the common integuments.

Numerous mucous glands are ſituated on the external ſurface of the mucous membrane of the ſmall inteſtine: their ducts open on the internal ſurface of the organ. Theſe parts are always ſmall, and in many caſes are not demonſtrated without ſome difficulty. They are moſt advantageouſly examined by ſlitting up the gut, and holding it againſt the light; they are diſtinguiſhed by their comparative opacity. Several exiſt in the duodenum; in the jejunum they are fewer, but they increaſe in number again in the ileum, are collected into conſiderable maſſes, and are particularly numerous towards the end of the inteſtine. They vary in ſize: ſome are rounded, others compreſſed; the larger are generally placed ſingly, the ſmaller are placed cloſe together in collections of different extent. The openings of the excretory ducts of the larger ones on the mucous ſurface of the inteſtine are ſufficiently conſpicuous. They ſeem to poſſeſs a very ſimple ſtructure; we can obſerve in them merely a net-work of minute vaſcular ramifications, which depoſit their ſecreted mucus in a ſimple excretory tube.

According as theſe bodies are found ſingle, or in collections, they have been called glandulæ *ſolitariæ* or *agminatæ*. Again, they have been named in different parts, after perſons who firſt deſcribed them, glandulæ Peyeri and Brunneri.

The arteries of the jejunum and ileum are derived from the trunk of the ſuperior meſenteric: the veins all end in the meſenteric root of the vena portarum. The blood in theſe veins has been obſerved to have white ſtreaks in it; but this is not peculiar to the meſenteric veſſels. Fluids injected into the meſenteric veins eaſily tranſude on the mucous ſurface of the inteſtine.

The ſuperficial abſorbing veſſels have their origin in the ſerous membrane, anaſtomoſe very frequently with each other, and with the deepſeated ones, paſs through the meſentery in a ſuperior and inferior ſet, and enter the meſenteric glands. The deeper-ſeated abſorbents, ariſing from the villi of the mucous ſurface, are called the lacteal or chyliferous veſſels; they are often diſtended in a varicoſe manner to a conſiderable ſize: their trunks accompany thoſe of the blood-veſſels in the cellular ſubſtance on the ſurface of the mucous membrane, anaſtomoſe very frequently with each other, and with the ſuperficial ones, both here and in the meſentery, ſo as to form a complete net-work, and then proceed to the glands. They are very numerous in the duodenum and jejunum; but are fewer in the reſt of the canal; they form a plexus in the meſentery, proceed from gland to gland, becoming larger and larger, and ſtill communicating together. Collected into large trunks, they arrive at the under and back ſurface of the pancreas, and are united with the abſorbing veſſels of the ſtomach, ſpleen, and liver in the glands and plexuſes ſituated about this part. They then bend downwards, forming new plexuſes, and arrive at the glands placed about the aorta, uniting with all the trunks from the other abdominal viſcera, from the pelvis and lower extremities: they then aſcend again to terminate in the thoracic duct.

The meſenteric glands, amounting in number to one hundred or more, even to one hundred and fifty, are chiefly placed on the ſuperior meſenteric artery, either ſcattered and ſeparated, or in a more cloſe arrangement. They are fewer and ſmaller towards the lower part and right portion of the meſentery and inteſtine, than on the upper and left part. They are moſtly flattened, with a round or oval circumference: and the larger are placed irregularly among the ſmall ones. They have a browniſh red colour, but are paler and ſmaller in adults than in infants. When full of chyle they are whiter.

The nerves of the ſmall inteſtine are derived from the cæliac ganglia; they form net-works adhering very cloſely to the arteries. The animal ſenſibility of the inteſtines is probably very ſlight under ordinary circumſtances; the functions of theſe parts are performed without our conſciouſneſs. Diſeaſe, however, develops a moſt acute animal ſenſibility. Animal contractility is entirely deficient: no exertion of the will can either accelerate or retard the action of the inteſtine. But the moſt ſtriking phenomena of the inteſtinal functions are derived from their organic ſenſible contractility, which reſides in their muſcular coat; theſe may be witneſſed in living animals by expoſing the abdomen, or in thoſe recently dead, and ſometimes in the inteſtines expoſed by accident or ſurgical operations. The whole canal is obſerved to be in motion, and this is called *periſtaltic*, which term ſignifies merely contracting. One part of the tube is ſeen to be contracted, while another is dilated; one aſcends, while another deſcends; one is extended, another rendered ſhorter: thus a general twiſting and creeping is produced, compared to the motion of worms, and hence called *vermicular*. Touch a part of the gut with a ſharp inſtrument, or with any chemical ſtimulus, and it will be ſo contracted as to cloſe the canal. A ſimilar effect follows the application of ſtimuli, ſuch as air, or other fluids, to the internal ſurface. This is not confined to the mere ſpot irritated, but the neighbouring parts partake of the affection. This ſenſibility continues ſome time after death, and is manifeſted even in the inteſtine when removed from the body.

The ordinary and natural ſtimuli, by which the organic contractility of the inteſtine is excited, are, the chyme or aliment as it comes from the ſtomach, the air mixed with and accompanying this, and the bile. The artificial and unuſual ones are purgative medicines, worms, cold applied to the abdomen. Cold to the feet, and terror ſometimes act ſympathetically.

Phyſiologiſts have diſtinguiſhed three kinds of motion in the inteſtine; the deſcending or regular one, proceeding from the ſtomach to the large inteſtine; the aſcending or inverted, the reverſe of the former; and the mixed, which partakes of both theſe.

The following phenomena may be obſerved in the motion of the inteſtine. Parts of the canal are alternately diſtended and contracted; moved in various directions; rendered tenſe and looſe to the touch; diſtended with air or chyme; incurvated or extended; appear longer or ſhorter according as the longitudinal or circular fibres act; are filled or emptied; in ſhort, they are alternately at reſt and in motion.

The longitudinal fibres ſhorten the canal lengthwiſe: the circular ones produce an oppoſite effect. The latter admit of diſtention, until the gut exceeds an inch in diameter; they contract it again to half a line, or even cloſe the canal entirely.

The antiperiſtaltic action ſeems juſt ſufficient in degree, in a healthy animal, to retain the chyle for the action of the abſorbing veſſels. In diſeaſes, or when an inſuperable obſtacle exiſts to the natural paſſage of the aliment, this inverted motion is carried to a great degree, ſo that the contents of the ſmall and even large inteſtine are conveyed into the ſtomach, and expelled by vomiting.

The *large inteſtine* is that portion of the alimentary canal, which extends from the end of the ſmall inteſtine to the anus, and is ſo named becauſe its diameter conſiderably exceeds that of the ſmall. It is diſtinguiſhed from the latter, not merely by its ſituation, connections, external form and functions, but alſo in its minute ſtructure, ſo that a very ſmall portion of it might be diſtinguiſhed from a ſimilar piece of the ſtomach or ſmall inteſtine.

Its ſituation is more defined and conſtant than that of the ſmall inteſtine. Beginning in the right iliac region, it riſes in front of the right kidney, goes backwards under the liver, and then turns forwards and towards the left (the firſt or hepatic flexure of the colon). It continues in a tranſverſe direction, from right to left, under the gall-bladder, the ſtomach, and the notch of the ſpleen, below and behind which it turns again, and forms a large angle (the ſecond or ſplenic flexure). It deſcends on the left ſide of the abdomen, in front of the left kidney, forms in the left iliac region a large a large and looſe fold, reſembling in its form the letter S; paſſes over the left ſacro-iliac ſymphyſis into the pelvis, runs along the concave ſurface of the ſacrum and os coccygis, and ends a little beyond the anterior extremity of that bone, at the anus.

We may diſtinguiſh ſix portions of the large inteſtine: 1, the *cæcal*, which is commonly named ſimply the cæcum: 2, the vermiform, ordinarily called proceſſus or appendix vermiformis cæci: 3, the *right* part of the colon, or the aſcending portion: 4, the *tranſverſe* part, or the arch: 5, the left part, including the deſcending colon and the ſigmoid or iliac flexure of the gut: 6, the *rectum*. Very commonly the tube is divided into the three parts, cæcum, colon, and rectum. Theſe different names, as in the ſmall inteſtine, have led to the employment of the phraſe large *inteſtines* in the plural, as if there were more than one tube.

We cannot aſſign any exact limits to theſe diviſions, as the poſition of the inteſtine, on which they are founded, varies in its different ſtates of diſtention or emptineſs. The right colon deſcends lower, and appears longer when it is full than when empty. The tranſverſe portion, when filled, may deſcend, from the looſeneſs of its attachment, to the umbilicus or pelvis: if it be longer than uſual, it forms an arch with the concavity upwards, or it may make one or two turns. When removed from the body, all diſtinction of particular diviſions is loſt, and the gut forms a ſtraight uninterrupted tube. It is from three to five times ſhorter than the ſmall inteſtine, and they are to each other nearly as five to twenty-five. In individuals of good proportions it meaſures about ſeven feet. The connections of the inteſtine are more firm in ſome ſituations, and more looſe in others. In many parts the peritoneum does not entirely ſurround the tube, but covers its anterior portion only, leaving the poſterior part to be affixed by cellular ſubſtance to the contiguous organs. The term meſocolon is applied generally to the peritoneum covering the large inteſtine.

The meſocolon dextrum paſſes from the under and back part of the liver, from the apex of the laſt rib, from the right quadratus lumborum, and iliacus internus, in front of the right colon and cæcum. Thus theſe parts, which are only covered on their anterior ſurface, are firmly bound to the iliac muſcle, the kidney, liver, and duodenum, and conſtantly held in this ſituation. The appendix has its peculiar ſmall and falciform meſentery.

The tranſverſe meſocolon is a broad and looſe fold, by which the tranſverſe part of the inteſtine is uniformly covered, except juſt at the ſeparation of its two laminæ. The left meſocolon is inflected towards the right, nearly at a right angle, and is then continued behind and below the ſtomach and liver, in a tranſverſe direction to the left kidney, under the name of meſocolon tranſverſum. Together with the arch of the colon, it forms a kind of tranſverſe partition or diaphragm, looſe at the anterior edge, and ſeparating the ſtomach, duodenum, ſpleen, and liver from the other abdominal contents. It is generally horizontal, as its name denotes; but it is ſometimes ſo broad and long as to deſcend with the inteſtine into the pelvis. It is made up of two laminæ of peritoneum, including between them, beſides the blood-veſſels, the abſorbents with their glands, and the nerves of the inteſtine, connected and covered by more or leſs fat, the duodenum, and pancreas. The latter parts are placed quite at the root of the fold.

The upper lamina deſcends from the ſplenic fold of the peritoneum, the pancreas, the upper lumbar vertebræ, the external covering of the duodenum, and the neighbourhood of the kidney and vena cava. The inferior lamina, which is more ſimple and ſtrong, comes on the left from the ſituation under the ſpleen, where it ſurrounds the duodenum by a kind of ſemilunar fold; then from the right kidney, and from a fold placed between the liver and kidney.

The breadth of this meſocolon leaves the arch of the inteſtine quite moveable, ſo that its ſituation is by no means conſtant; the diſtended ſtomach puſhes it downwards, and the repletion of the ſmall inteſtine has the contrary effect. The great omentum covers the front of the tranſverſe colon, and paſſes between this and the ſtomach: but does not tend at all to fix it.

The meſocolon ſiniſtrum is continued over the inteſtine, from the iliac veſſels and pſoas magnus to the left kidney: covering only the anterior ſurface. The back of the inteſtine is connected by cellular ſubſtance to the diaphragm, the pſoas, and the kidney, ſo that its ſituation is very fixed. Sometimes, however, there is ſomething like a meſentery belonging to this part of the tube.

The meſorectum is a duplicature, varying in breadth, produced from the ſide of the pelvis to the ſigmoid flexure of the colon, and the commencement of the rectum. It is broadeſt above, where it is continuous with the meſocolon ſiniſtrum, and ends in an acute point below. It is made up, like the meſentery, of two laminæ of peritoneum, including between them the blood-veſſels, &c. of the inteſtine, and fat, and ſeparating to cover the rectum. It allows the inteſtine a conſiderable liberty of motion. Below the termination of the meſorectum, the gut has no peritoneal coat; but is united by cellular ſubſtance to the ſurrounding organs: that is, to the ſacrum and os coccygis, to the vagina in the female, to the bladder and proſtate in the male. Its extremity is ſtill further fixed by the attachment of the muſcles of the anus, and by its continuity with the common integuments.

The diameter of the tube, when moderately diſtended, is about two inches or two and a half.

The ileum deſcends gently to the right iliacus internus muſcle, and is inſerted obliquely into the left and poſterior ſide of the large inteſtine, between the cæcum and right colon, having its muſcular and mucous coats continuous with thoſe of the large inteſtine. This extremity of the ſmall inteſtine forms an acute angle with the cæcum, and a right angle with the colon: its upper half is placed tranſverſely, the lower aſcends. On opening the large inteſtine, we find the communication to be of a valvular nature, and compoſed of two folds (*alæ* or *labia*), a ſuperior and an inferior one: it is prominent, ſoft, and of courſe moveable. Each of theſe folds is compoſed of a ſmaller internal lamina, which is the mucous lining of the ſmall inteſtine, and an external larger one, compoſed by the correſponding coat of the large. Theſe laminæ, connected by cellular ſubſtance, and continuous with each other at the ſides of the opening, form the valvula coli (valvula ilii, or ileo-colica, or ileo-cæcalis). The ſuperior fold, placed nearly tranſverſely, is ſhorter and narrower than the inferior, which riſes the higheſt of the two. A kind of ſtricture or fold of the large inteſtine bounds the valve on each ſide. Between the two folds compoſing this valve, the orifice of the ſmall inteſtine opens tranſverſely; its figure is an oblong oval, and its dimenſions are much leſs than the diameter of the ileum. The length and breadth of the folds, and conſequently the ſize of the interpoſed aperture, vary greatly. Sometimes the lower fold is very long and broad, the upper ſhort and narrow, ſo that the inteſtine opens obliquely by a very ſmall aperture. This ſtructure admits of the opening being very completely cloſed. Sometimes both folds are but ſlightly prominent, and their diſtinction not clearly marked. Here the opening is more nearly circular, and cannot be ſo perfectly ſhut.

The external or peritoneal coat paſſes over the communication between the two inteſtines, with a ſmooth ſurface, making no fold, and confining the parts in their relative ſituation to each other. The muſcular and mucous coats, and the cellular ſubſtance of the two inteſtines, are continuous, and this continuity retains the folds of the valve in their ſituation. When the peritoneum and muſcular parts are cut through, the mucous lining which forms the valve is no longer retained; the ileum may be withdrawn from the colon, the two folds being deſtroyed, the communication has a circular appearance, and its dimenſions are equal to thoſe of the ſmall inteſtine.

The ſtructure of this part is moſt advantageouſly obſerved by diſſecting it under water. When the inteſtine is inflated and dried, the general figure and direction of the two folds, and of the aperture between them, can be clearly ſeen: but they are rendered rigid, ſmooth, and ſhorter than is natural, and their margins are too far ſeparated.

As the two folds, which compoſe the valvula coli, repreſent two oblique planes, converging in ſuch a manner as to form a convexity towards the large, and a concavity towards the ſmall inteſtine, whatever preſſes againſt them in the concave ſurface will ſeparate them, and open more widely the interval between them: whatever comes againſt them on their convex aſpect will approximate them, and tend to deſtroy the opening. The contents of the ileum, paſſing in their natural courſe, are in the former caſe; and thoſe of the colon in the latter. Hence they prevent the admiſſion of feces into the ſmall inteſtine; as we can generally prove by diſtending the large inteſtine with air or water: thoſe fluids do not eſcape by the ileum. Yet this experiment does not always ſucceed perfectly: and probably under particular circumſtances in the living body, a retrograde paſſage takes place: hence vomiting of feces and of matters thrown up in clyſters. We muſt recollect, in arguing from the reſult of trials with air or water, that the feces, of which the return is prevented, poſſeſs uſually conſiderable conſiſtence.

The large inteſtine is compoſed of three coats or layers of the ſame nature, and diſtinguiſhed by the ſame names as thoſe of the ſmall.

The external, or ſerous covering, according to what we have ſaid concerning the connections of the organs, is a partial one in ſome diviſions of the tube. This is elevated at intervals into ſmall proceſſes, containing fat, and completely reſembling portions of omentum. For an account of theſe parts, which are called appendices epiploicæ, and are peculiar to the large inteſtine, ſee Epiploon.

The muſcular covering of the inteſtine is made up of two orders of fibres: thoſe of the interior ſtratum are circular, and uniformly extended over the mucous membrane, as in the ſmall inteſtine: they are connected to that coat by a ſimilar copious cellular ſubſtance, deſcribed often as a nervous coat. The longitudinal fibres are collected into three bands having the appearance of ligaments, and placed at equal diſtances from each other on the ſurface of the tube. Theſe bands are much ſhorter than the other coverings, which are therefore puckered up and form cells between them. The three commence at one point about the appendix vermiformis, diverge and grow broader as they aſcend over the cæcum: are continued through the whole length of the colon; grow broader and ſtronger on the rectum, and are united into a continuous muſcular ſheath, including about the ſix laſt niches of the gut. One band is on the unattached part of the inteſtine: another is covered on the arch by the omentum; and the third is found at the attachment of the meſocolon. The ſurface is level, tenſe, and rather depreſſed in the ſituations occupied by theſe bands; in their intervals the ſurface conſiſts of a ſeries of elevations, ſeparated by tranſverſe folds, the cells being ſo placed as to cut the long axis of the gut at right angles: externally, therefore, the tube ſeems made up of a triple ſeries of hemiſpherical elevations, internally of the ſame number of rows of cells. This appearance is peculiar to the large inteſtine: it exiſts no longer in the rectum, where the bands are united into an uniform ſtratum.

The ſerous and mucous coats with the circular fibres are ſo plaitable in conſequence of the arrangement juſt deſcribed, as to form on the inſide very conſiderable tranſverſe folds: theſe are largeſt at the beginning of the tube, become ſmaller, and are entirely loſt in the rectum. The folds are of different ſizes, and variouſly intermixed: between two of them a cell is formed of an elliptical figure, narrower at its oblong orifice, and larger about the middle. If the inteſtine be inflated, and the longitudinal bands cut through in ſeveral parts, the whole inteſtine may be extended into a much greater length, the folds and cells diſappear, and the tube becomes nearly cylindrical.

The mucous coat forms various folds in the cells of the inteſtines when in its contracted ſtate, ſimilar to the folds occurring in the ſtomach: they diſappear on diſtention. Its ſoft and pulpy ſurface is covered with a tenacious mucus. It differs from that of the ſmall inteſtine in poſſeſſing no villi. Numerous ſingle mucous glands are found over the whole large inteſtine: they lie on the outer ſurface of the mucous coat, which is penetrated by their ducts.

The arteries of the large inteſtine come from the ſuperior and inferior meſenteric trunks; the veins join the inferior meſenteric branch of the vena portarum. The abſorbents, both ſuperficial and deepſeated, paſs through glands which lie cloſe to the inteſtine: theſe are ſmaller than the meſenteric glands, and fewer in number, being reckoned from 25 to 50, and are nearer to the gut. After paſſing through ſeveral of them, the abſorbents terminate, near the kidneys, inferior meſenteric artery and pancreas, in the ſame glands at which the lacteal veſſels of the ſmall inteſtine arrive. They are, on the whole, much fewer and ſmaller than thoſe of the ſmall inteſtine.

The nerves come from the plexuſes of the great ſympathetics, and from the ſeveral branches, and are connected to the arteries. The end of the large inteſtine is a point at which the organic and animal lives are united; here we have very obvious animal ſenſibility, and the muſcular actions are conſiderably influenced by the will. Where the ſmall inteſtine joins the large, the latter is produced, below the opening of communication, into an obtuſely conical proceſs, two or three inches in length, having the ſame unequal ſurface as the reſt of the tube, and terminating in a blind extremity; this is the part called the cæcum. Uſually this is larger in ſize than the continuation of the tube, and has been therefore called caput coli. It is covered almoſt entirely by peritoneum, but is connected on its right ſide, for a ſmall extent, to the iliacus internus, by cellular ſubſtance. It varies much in ſize, form, and poſition; ſometimes it is ſcarcely one inch, ſometimes nearly four in length. It may be larger or ſmaller, more or leſs irregular on the ſurface, &c.

From the poſterior part of the cæcum, a ſmall inteſtine, about the ſize of a quill, cylindrical in its figure, and terminating after one or two turns in a rounded and blind extremity, is continued obliquely towards the left. This is the appendix vermiformis. It is rather larger at its commencement than in its progreſs, and is held by a ſmall fold of peritoneum, like a meſentery. Its coats contain numerous mucous glands, and its cavity, which communicates freely with that of the cæcum, is generally filled with a thickiſh mucous fluid. It ſeldom contains feces in the adult. Its length, ſize, figure, and direction vary greatly: it may be from one to ſix long, and from one to three lines broad. It very frequently adheres to the ſurrounding parts.

The rectum deſcends in an arched courſe, of which the convexity is turned downwards and backwards, from the laſt lumbar vertebra to the anus. Its curve is moſt clearly obſerved when the part is conſidered in a lateral view. In the infant, on account of the ſmall ſize of the pelvis, it is continued for the greateſt part in the abdomen. Its external ſurface is uniform. The peritoneal covering is a partial one, and belongs only to the ſides and anterior part of the inteſtine: behind it is connected to the pelvis by cellular ſubſtance. This membrane forms two lateral folds, continued, in the male ſex, to the ſides of the bladder; in the female to the vagina and the poſterior ſurface of the broad ligaments of the uterus. From the anterior part of the inteſtine the peritoneum paſſes in men to the poſterior and inferior part of the bladder, and in women to the under ſurface of the vagina. Beyond this point the inteſtine is continued, ſtill in a curved courſe, with the convexity downwards, for an inch or more, united by cellular ſubſtance in the male ſubject to the veſiculæ ſeminales, urinary bladder and proſtate, in the female to the vagina. The ſerous coat has appendices epiploicæ.

The muſcular covering conſiſts of a thick and ſtrong layer of longitudinal fibres, and of a ſtrong ſtratum of circular ones: the latter form an oval tumid ring at the end of the gut, called the ſphincter ani internus.

The cellular ſubſtance is continued, at the end of the gut, into the general ſubcutaneous ſtratum; and the mucous lining is gradually, and in the European imperceptibly, loſt in the common integuments. But in the negro the boundary is more clearly marked by the ceſſation of the black rete mucoſum.

The mucous coat is marked with longitudinal ſerpentine folds, and covered with a copious viſcid mucus: the latter is ſecreted by glands, whoſe ducts perforate the membrane, and the largeſt of which are near the termination of the gut.

The extremity of the inteſtine is provided with certain muſcles concerned in the motions performed for the expulſion of the feces: theſe are the levatores ani, ſphincter ani, tranſverſi perinei, and coccygei.

The *levator ani* is a thin, broad, and flat muſcular plane, of an irregularly quadrilateral figure, rather curved in its inner ſurface, and forming a ſeptum, which cloſes the pelvis below, and completes the abdominal cavity. Its origin extends from the pubes to the ſpine of the iſchium: it commences by ſhort aponeurotic fibres, juſt behind the arch of the former bone, and continues its origin from a broad and thin aponeuroſis which covers the obturator internus. The anterior fleſhy fibres paſs obliquely downwards, backwards, and inwards, and are loſt on the proſtate and ſides of the rectum, where they are intermingled with the ſphincter. The larger portion, which is behind theſe, paſſes downwards in the ſame direction, is partly united to the oppoſite muſcle, by an aponeurotic expanſion, between the rectum and coccyx, and partly fixed to the ſide of that bone. The external ſurface of the levator is in contact with the obturator internus, the gluteus magnus, the tranſverſus perinei, and lower down with a large quantity of cellular and adipous tiſſue. The inner ſurface correſponds to the proſtate, bladder, and rectum. For the deſcription of the coccygeus, ſee Coccygæus.

The *ſphincter ani* ſurrounds the termination of the inteſtine juſt under the integuments, and is commonly divided into the ſphincter cutaneus, or externus, and the internus. The latter, as we have already mentioned, is to be regarded rather as the termination of the circular muſcular fibres of the gut, than as a diſtinct muſcle. It is a pretty thick muſcular ring, about half an inch in breadth. Externally, the longitudinal muſcular fibres of the rectum cover it: on the inſide it covers the mucous membrane of the inteſtine. The ſuperior margin is continuous with the circular fibres of the gut: the inferior is placed between the opening of the external ſphincter and the membrane of the inteſtine.

The ſphincter externus, or cutaneus, is placed more ſuperficially than the former, and extends from the apex of the coccyx to the poſterior part of the perineum. It is flattened, elliptical, with its long axis inclined from behind forwards, and perforated in the middle. We diſtinguiſh in it a ſuperior and an inferior ſurface, a right and left edge, and an anterior and poſterior extremity. The thin ſkin ſurrounding the anus covers the under ſurface: the upper correſponds to the levator ani, being at firſt ſeparated from it by cellular tiſſue, but having its fibres completely blended with thoſe of that muſcle on the rectum. The front end forms a ſharp point, extending more or leſs under the back edge of the accelerator urinæ, to which, as well as to the tranſverſi perinei, it is cloſely connected. The poſterior extremity is alſo pointed, and attached to the coccyx by a denſe cellular matter approaching to the nature of ligament. The margins are partly covered by the ſkin, and partly by a maſs of cellular and adipous ſubſtance.

The ſphincter conſiſts wholly of fleſhy fibres, which deſcribe concentric arcs of circles: thoſe of the two ſides are united at acute angles before and behind the anus.

The front end of the muſcle is leſs elongated and acute in the female than in the male ſubject. In both its fibres are intimately blended with thoſe of the internal ſphincter.

The *tranſverſus perinei* is ſituated towards the back part of the perineum, between the tuberoſity and ramus of the iſchium, and the middle of the ſpace compriſed between the bulb of the urethra and the anus. It is thin, flattened, and ſomewhat triangular. The anterior ſurface is inclined downwards, and correſponds to the erector penis and accelerator, and to the fat which fills the intervals between theſe. The poſterior, inclined upwards, lies againſt the levator ani: cellular tiſſue, and the deepſeated branch of the internal pudic artery, ſeparate them. The outer edge is attached to the inner ſurface of the tuberoſity and ramus of the iſchium, above the erector penis and the root of the crus penis. The inner edge is united to that of the oppoſite muſcle, to the front of the ſphincter ani, and to the back edge of the accelerator. The tranſverſus is ſeparated from the ſkin in front by a conſiderable quantity of fat: behind it is confounded with the reddiſh cellular tiſſue found in the angle between the bulb of the urethra, and the root of the corpus cavernoſum. The origin is aponeurotic; and the termination is uſually in a tendinous line.

The *tranſverſus perinei alter* is not conſtantly found. It is a ſlender elongated faſciculus, running parallel to the iſchium, on the inner edge of the erector penis. The origin is derived from the tuberoſity of the bone, near to that of the erector; it terminates above in a thin aponeuroſis connected to the bulb of the urethra, or corpus cavernoſum.

Motions performed by theſe Muſcles.—The muſcular organs juſt deſcribed have two principal offices: 1 They move the whole pelvic viſcera together. 2. They act on the rectum in particular. The levator and coccygeus are principally concerned in the former caſe. They repreſent a muſcular plane capable of elevation and depreſſion, and of moving the organs which it ſupports in various directions. This plane is oppoſed in ſituation and action to that of the diaphragm: thus two ſtrata, concave in oppoſite directions, and capable of contracting or enlarging, at the will of the animal, the perpendicular diameter of the abdomen, are placed at the oppoſite ends of this diameter. The moſt ſignal contraction is obſerved in the violent efforts employed for expelling the feces, urine, &c.: and the moſt marked enlargement in ſtrong exſpirations, as in coughing, ſneezing, &c. But theſe effects are produced much more by the depreſſion of the diaphragm contracting the abdomen from above downwards, than by the elevation of the other muſcles. The latter ſupport the parts, and enable them to reſiſt the efforts of the former: the impulſe may be felt very plainly by placing the hand on the perineum during any ſtrong exertion of the abdominal parietes. The power of reſiſtance is much leſs in theſe parts than in the ſides of the abdomen, becauſe the bony ſides of the pelvis, and the contained viſcera, ſupport great part of the effort.

The action of the ſphincter ani has the effect of contracting the opening of the rectum: it is conſtantly exerted for the purpoſe of maintaining the aperture permanently cloſed. Other openings furniſhed with ſphincters, ſuch as thoſe of the mouth and eyelids, are often open for a conſiderable time, becauſe there are various muſcles which antagoniſe the ſphincters; no ſuch muſcles exiſt about the anus. The only antagoniſt power is in the longitudinal fibres of the rectum, and in the contraction of the abdominal parietes; and theſe are only exerted when the feces are evacuated. An obvious advantage ariſes from the permanent conſtriction of the rectum, in preventing the eſcape of its contents: they are retained in the large inteſtine until their quantity produces irritation. When the ſphincter is paralyſed, they eſcape involuntarily as they arrive in the rectum. This permanent action of the ſphincter reſembles that of parts belonging to the organic life, as it is completely independent of the will: yet we have the power, by means of volition, of conſtringing the opening more completely. The feces are evacuated in oppoſition to the reſiſtance of the ſphincter, which is overcome by an exertion of the abdominal parietes. The harder they are, the greater dilatation is required, and the greater difficulty is conſequently experienced; and *vice verſâ*. When they are very fluid, they may eſcape in a ſlight degree by the longitudinal plaits into which their contraction collects the ſkin of the anus.

The action of the longitudinal fibres of the rectum, and the preſſure of the abdominal viſcera, urged downwards by the reſpiratory muſcles, occaſion the inteſtine to deſcend ſlightly when the feces are voided. The levatores ani, coccygei, and tranſverſi perinei, ſupport the parts under this effort, limit the deſcent, and then reſtore them to their former ſituation. The levatores probably may be concerned in the functions of the generative organs by compreſſing the veſiculæ ſeminales and proſtate; and the tranſverſi, by fixing the poſterior end of the accelerator, may concur with that muſcle in the expulſion of the ſemen.

The large inteſtine of the fœtus is rounder and ſmaller than in the adult, hardly marked by any cells in young embryos, and not exceeding the ſmall in diameter. The cæcum is gradually diminiſhed into the appendix vermiformis, which is conſiderably larger than in the adult, and diſpoſed by its meſentery into a ſpecial arrangement. It is much more conſiderable in ſize compared to the cæcum. This is the appearance of the part at birth, when it uſually contains fecal matter. Soon after, the diſtinction between the cæcum and appendix is more ſtrongly marked: the latter, inſtead of coming from the middle of the former, is produced from its left ſide; and as it is not increaſed while the cæcum is growing in ſize, the proportions of the adult are gradually eſtabliſhed.

After what we have obſerved concerning the action of the ſmall inteſtine, the reader will immediately perceive how the muſcular fibres of the large muſt act.

Intestines, *Inflammation of.* See Enteritis.

Intestines, *Protruſions of.* See Hernia.

Intestines, *Wounds of.* See Wounds.

Intestines *of Birds.* See *Anatomy of* Birds.

Intestines *of Fiſh.* See Fish.

INTIRE Tenancy. See Tenancy.

INTONARE, to touch in the cathedral ſervice a ſingle key on the organ, to pitch for the prieſt, the choir, and the congregation, the reſponſes.

INTONATION, in canto fermo, implies an eccleſiaſtical tone or mode.

INTONAZIONE, *Ital.* intonation, a ſound or tone. A vocal performer who ſings in tune, is ſaid to have a good intonation, the firſt of all vocal virtues. Singing out of tune, falſe intonations, the Italians call *intonationi perfidi.*

INTOUR, in *Geography*, a town of Hindooſtan, in the circar of Cuddapa; 35 miles N.W. of Gandicotta.

INTOXICATION. See Drunkenness.

INTRADA, Intrata, or *Entrata*, *Ital.* an entry, introduction, prelude. In the 17th century, an overture in France was termed *entrée.*

INTRANSITIVE Verbs, in *Grammar*, ſuch whoſe action does not (*tranſire*) paſs on an object, or ſubject. See Verb *Neuter.*

INTRENCHMENT, in the *Art of War*, all ſorts of works made to fortify a poſt againſt an enemy. See Retrenchment.

They uſually conſiſt only of a bank of earth and a ditch, and are of two ſorts; ſuch as the trenches carried on in a ſiege, where the bank is between the ditch and the enemy or town; and where the earth is thrown up againſt the town; and ſuch as ſerve to incloſe a town or camp, ſecure a paſs, cover the entrance into a country or other places, &c. In theſe the ditch is between the bank and the enemy. The firſt ſort are uſually called *trenches* or *approaches;* and the ſecond are generally called *lines.*

It was a maxim amongſt the Romans, that even in their moſt haſty marches they intrenched every night.

INTRESSIN, in *Geography*, a town of the duchy of Warſaw; 40 miles S. of Poſen.

INTRIGUE, or Intreague, an aſſemblage of events, or circumſtances occurring in an affair, and perplexing the perſons concerned in it.

The word is French, *intrigue*, formed from the Latin *intricare;* which, according to Nonius, comes from *tricæ, entanglements;* and that from the Greek τριχες, *hairs: quod pullos gallinaceos involvant et impediant capilli.* Which conjecture is adopted by Tripaud, who will have the word intrigue to be primarily and properly underſtood of chickens, which have the feet entangled in hair; and to be derived from the Greek ἐν, and θριξ, *hair.*

Intrigue is more particularly uſed to ſignify the plot of a play, or romance; or that point wherein the principal characters are the moſt embarraſſed, through the artifice and oppoſition of certain perſons, or the unfortunate falling out of certain accidents and circumſtances.

In a tragedy, comedy, or epic poem, there are always two deſigns; the firſt and principal is that of the hero of the piece; the ſecond contains the deſigns of all thoſe who oppoſe him. Theſe oppoſite cauſes produce oppoſite effects, to wit, the efforts of the hero for the execution of his deſign, and the efforts of thoſe who thwart it. As thoſe cauſes and deſigns are the beginning of the action, ſo thoſe efforts are in the middle, and there form a knot or difficulty, which we call an intrigue, that makes the greateſt part of the poem. It laſts as long as the mind of the reader or hearer is ſuſpended about the event of thoſe oppoſite efforts: the ſolution or cataſtrophe commences when the knot begins to unravel, and the difficulties and doubts begin to clear up.

The intrigue or plot of the Iliad is two-fold; the firſt comprehends the three days fighting in Achilles's abſence, and conſiſts, on the one ſide, in the reſiſtance of Agamemnon and the Greeks, and on the other, in the inexorable temper of Achilles. The death of Patroclus unravels this intrigue, and makes the beginning of a ſecond. Achilles reſolves to be revenged, but Hector oppoſes his deſign; and this forms the ſecond intrigue, which is the laſt day's battle. See Iliad.

In the Æneid there are alſo two intrigues: the firſt is taken up in the voyage and landing of Æneas in Italy; the ſecond in his eſtabliſhment there. The oppoſition he met with from Juno, in both thoſe undertakings, forms the intrigue. See Æneid.

As to the choice of the intrigue and the manner of unravelling it, it is certain they ought both to ſpring naturally from the ground and ſubject of the poem. Boſſu gives us three manners of forming the intrigue of a poem; the firſt is that already mentioned; the ſecond is taken from the fable, and deſign of the poet; in the third, the intrigue is ſo laid, as that the ſolution follows from it of courſe.

Intrigue, in common language, is uſed to denote a plot; a private tranſaction in which ſeveral parties are engaged, and uſually an affair of love. Johnſon.

INTRINSIC, a term applied to the inner, real, and genuine values, properties, &c. of any thing; in oppoſition to their extrinſic, apparent, or popular values, &c. See Extrinsic.

INTROBIO, in *Geography*, a town of Italy, in the department of the Montagna; 7 miles N. of Lecco.

INTRODUCTION, in *Rhetoric*, is the firſt part of an oration or diſcourſe, deſigned to prepare the minds of the hearers for the ſuitable reception of the ſucceeding parts: and for this purpoſe it is neceſſary that the orator gain the good opinion of his hearers, ſecure their attention, and give them ſome general notion of his ſubject. In order to gain the good opinion of his hearers, the orator, when he introduces the diſcourſe with his own perſon, will be careful to do it with modeſty, and ſeem rather to extenuate his virtues and abilities, than to magnify them: when he ſets out with the perſons of thoſe to whom the diſcourſe is addreſſed, it is not unuſual to commend them for their virtues, and thoſe eſpecially which have a more immediate relation to the preſent ſubject. The other topics which are to be inſiſted upon for gaining eſteem, are principally taken from the ſubject, as its juſtice, importance, advantage, or pleaſure. In ſpeaking of gaining the attention of the hearers, Cicero ſays, we ſhall be heard attentively by one of theſe three things; if we propoſe what is great, neceſſary, or for the intereſt of thoſe to whom the diſcourſe is addreſſed. Some account of the ſubject ſhould always make a part of the introduction. As to the compoſition of this part of a diſcourſe, it ſhould appear eaſy and natural, and connected with the reſt of the diſcourſe: it ſhould be ſuited to its length: the language of it ſhould be juſt, eaſy, and pleaſant: it ought neither to be wholly without paſſions, nor too violent and impetuous. It ought not to be too general. The introduction, however, is not an eſſential part of a diſcourſe, and is ſometimes omitted by the beſt orators. Ward's Or. vol. i. lect. 12.

INTRODUCTOR, in *Antiquity*, was particularly uſed for an officer, who introduced the athletæ to the ſtadium, or place where they were to contend.

INTROITUS, in the *Roman Ritual*, as ſettled by St. Gregory, is an introduction to high maſs on great feſtivals, preceding the uſual pſalms.

INTROMISSION, in *Natural Hiſtory*, is a term relating to the petrifaction of organic ſubſtances, in which mineral ſubſtitution takes place, during the removal of the organic particles, (the mineral being gradually introduced into the animal or vegetable body,) ſupplying the place, and taking the form of the matter loſt. By this mode of petrifaction the internal fabric, as well as the external figure of the original is preſerved. Petrified wood has uſually partaken of this kind of change. See W. Martin's Outlines, p. 55. Petrifactions formed by intromiſſion, are ſometimes ſaid to be ingenerate. Outl. p. 67.

INTRONATI, the name of an academy at Sienna, in Italy.

The members of this academy contented themſelves, at their firſt inſtitution, with eſtabliſhing the following ſix ſhort laws: 1. To pray. 2. To ſtudy. 3. To be merry. 4. To offend nobody. 5. Not to credit too lightly. 6. To let the world-talk.

INTROSUSCEPTION, in *Surgery*. See Intussusception.

INTRUSION, in the *Canon Law*, ſignifies the enjoyment of a benefice, or exerciſe of an office, without a good title to it.

The word is derived from *intrudere*, to *thruſt in*, or *enter by force*.

Intruſion diſqualifies the party from ever holding the benefice.

Intrusion, *Information of*, in *Law*, is a method of ſuit, by information on behalf of the crown, filed in the exchequer by the king's attorney-general, for any treſpaſs committed on the lands of the crown, as by entering thereon without title, holding over after a leaſe is determined, taking the profits, cutting down timber, or the like. See Information.

Intrusion alſo denotes the entry of a ſtranger, after a particular eſtate of freehold is determined, before him in remainder or reverſion. This entry and interpoſition of the ſtranger differ from an abatement in this; that an abatement is always to the prejudice of the heir, or immediate deviſee; an intruſion is always to the prejudice of him in remainder or reverſion. An intruſion is always immediately conſequent upon the determination of a particular eſtate; an abatement is always conſequent upon the deſcent or deviſe of an eſtate in fee-ſimple. And in either caſe the injury is equally great to him whoſe poſſeſſion is defeated by this unlawful occupancy. See Ouster.

INTRUSIONE, a writ brought againſt an intruder, by him that hath fee-ſimple, &c. See *Writ of* Entry.

INTUITION, among *Logicians*, the act whereby the mind perceives the agreement or diſagreement of two ideas, immediately by themſelves, without the intervention of any other: in which caſe the mind perceives the truth, as the eye doth the light, only by being directed toward it. Thus the mind perceives that white is not black, that three are more than two, and equal to one and two. See Idea.

This part of knowledge, ſays Mr. Locke, is irreſiſtible, and, like the ſunſhine, forces itſelf immediately to be perceived, as ſoon as the mind turns its view that way. It is on this intuition that all the certainty and evidence of our other knowledge depends: this certainty every one finds to be ſo great, that he cannot imagine, and therefore cannot require, a greater. See Judgment, Knowledge, Demonstration, &c.

INTUITIVE Evidence, is that which reſults from intuition. Dr. Campbell diſtinguiſhes different ſorts of intuitive evidence: one reſulting purely from intellection, or that faculty which others have called intuition; another kind ariſing from conſciouſneſs; and a third ſort from that new-named faculty *common ſenſe*, which this ingenious writer, as well as ſeveral others, contend to be a diſtinct original ſource of knowledge; whilſt others refer its ſuppoſed office to the intuitive power of the underſtanding. Campbell's Rhetoric, vol. i. book i. chap. 5.

INTURKI, in *Geography*, a town of Lithuania, in the palatinate of Wilna; 18 miles N. of Wilna.

IN-TURN, among *Wreſtlers*, is when one puts his thigh between thoſe of his adverſary, and lifts up his thigh.

INTUSSUPCEPTION, or Introsusception, a term in *Surgery*, expreſſive of a very dangerous diſeaſe, which ariſes from the paſſage of one portion of an inteſtine into another. The word is derived from *intus*, within, and *ſuſcipio*, to receive. The diſorder is alſo frequently named a *volvulus*. It happens moſt commonly in the firſt fifteen years of life, older perſons not being nearly ſo ſubject to the affliction.

When the upper part of an inteſtine paſſed into the lower, that is to ſay, when the introſuſception was downwards (as generally happens), Mr. Hunter called the caſe *progreſſive*; but when the diſeaſe aroſe from the paſſage of a lower portion of bowel into an upper one, he named this example *retrograde*.

Introſuſceptions are probably far more frequent caſes than many ſuppoſe, and numerous infants and young ſubjects, no doubt, are victims to the diſeaſe, without its exiſtence being in the leaſt ſuſpected. The affection may indeed be leſs ſevere; and we are informed, that the greateſt part of three hundred children who died, either of worms, or during dentition, at the Hôpital de la Salpetrieré, and were examined by M. Louis, had two, three, four, and even more volvuli, without any inflammation of the parts, or any circumſtances leading to a ſuſpicion that theſe affections had been injurious during life. M. Louis thought ſuch caſes proved that an introſuſception might be formed, and deſtroyed again, by the mere action of the bowels; an opinion which is confirmed by the obſervation of Dr. Baillie, that "in opening bodies, particularly of infants, an intus-ſuſceptio is not unfrequently found, which had been attended with no miſchief; the parts appear perfectly free from inflammation; and they would probably have been eaſily diſentangled from each other by their natural periſtaltic motion." See Mem. de l'Acad. de Chirurgie, 4to. edit. tom. iv. p. 222, and Baillie's Morbid Anatomy, 2d edit. p. 162.

Mr. Hunter thought that the manner in which an introſuſception may be formed, is, by one portion of a looſe inteſtine being contracted, and the part immediately below relaxed and dilated; under which circumſtances the contracted portion ſlips a little way into that which is dilated. He ſuppoſed alſo, that this change was not the effect of any action in either portion of inteſtine, but might be the conſequence of ſome additional weight in the upper part of the bowel. How far the periſtaltic motion, by puſhing the contents on to the contracted parts, might force theſe into the relaxed ones, Mr. Hunter was unable to determine, though he was inclined to think that nothing of the kind could happen.

Suppoſing the foregoing explanation to be true, an accidental introſuſception may take place either upwards or downwards; but if a continuance or an increaſe of the diſeaſe really ariſes from the action of the inteſtine, it can only be when the caſe is downwards. Yet this does not explain thoſe inſtances in which a conſiderable portion of inteſtine is carried into the gut below. In order to underſtand theſe, the different parts which form the introſuſception muſt be conſidered. We muſt recollect that every introſuſception is compoſed of three folds of inteſtine; *viz.* the *inner*, which paſſes down, and being reflected upwards, forms the *ſecond*, or *inverted* portion, which, being reflected down again, makes the *third*, or *containing* part. This latter is the outermoſt, and is always in its natural poſition.

According to Mr. Hunter, the outward fold is the only one which is active, the inverted portion being perfectly paſſive, and ſqueezed down by the outer, which inverts more of itſelf, ſo that the angle of inverſion, in the caſe, is always at the angle of reflection of the outer into the middle, or inverted fold, while the innermoſt is drawn in. Hence we may ſee how an introſuſception, once begun, may have any length of gut drawn into it.

The external portion acting upon the other folds in the ſame way as upon any extraneous matter, will, by its periſtaltic motion, urge them further; and if any extraneous ſubſtance is detained in the cavity of the inner portion, that part will become a fixed point for the outer, or containing inteſtine to act upon. Thus it will be ſqueezed on, till at laſt the meſentery, preventing more of the innermoſt part from being drawn in, will act as a kind of ſtay; yet, without entirely hindering the inverted outer fold from going ſtill further. For ſince it is the middle fold which is acted upon by the outer, and this action continues after the inner portion becomes fixed, the gut is thrown into folds upon itſelf; ſo that a foot of inteſtine may not form an introſuſception more than three inches long.

The outer portion of inteſtine is alone active in increaſing the diſeaſe when once begun; but if the inner one were capable of equal action in its natural direction, the effect would be the ſame, *viz.* that of endeavouring to invert itſelf, as, indeed, happens in a prolapſus ani. The outer and inner portions would then tend to draw in more of the gut, while the intermediate part only would, by its action, have a contrary tendency.

Although capable of producing a prolapſus ani, the action of the abdominal muſcles cannot aſſiſt, either in forming or continuing this diſeaſe, ſince the effect of it muſt be to make equal compreſſion both above and below.

The manner in which the inteſtines are connected with the meſentery, would lead one to conſider it impoſſible for any portion of the bowels to paſs far within another, particularly as the increaſing quantity of meſentery, that is drawn into the introſuſcepted part, muſt render the further paſſage of inteſtine more and more difficult. The large inteſtines, being alſo more cloſely confined in their natural ſituations, would ſeem to be far leſs liable to the diſeaſe. One of the largeſt introſuſceptions ever known, however, was in the colon, as related by Mr. Whately in the Phil. Tranſ. vol. lxxvi. p. 305. The introſuſception appeared to have begun at the inſertion of the ileum into the colon, and to have carried in the cæcum with its appendix. The ileum paſſed on into the colon, till the whole of the aſcending colon, the tranſverſe arch, and deſcending colon, were carried into the ſigmoid flexure and rectum. The valve of the colon being the leading part, it at laſt got as low as the anus; and when the perſon went to ſtool, he only emptied the ileum, for one-half of the large inteſtines being filled up by the other, the ileum alone, which paſſed through the centre, diſcharged its contents. The diſeaſe, when it thus begins at the termination of the ſmall inteſtines in the large, is particularly apt to proceed to a conſiderable extent, and moſtly proves fatal. Many inſtances of this kind are upon record. In the Edinburgh Medical and Surgical Journal, vol. iii. p. 263, Mr. Langſtaff has publiſhed an intereſting example. The caſe is that of a child three months old, where, upon examination after death, there was an extenſive introſuſception in the uſual direction, together with a ſmaller one of the retrograde deſcription, ſimilar to what occurred in the inſtance related by Mr. Spry in the Med. and Phyſical Journal, No. 11.

Retrograde introſuſceptions are much leſs common than ſuch as are named progreſſive. In the Medical and Chirurgical Tranſactions, vol. i. Mr. Home has inſerted the account of a retrograde introſuſception, which happened in a cabin boy, who had previouſly ſwallowed arſenic. The caſe was alſo rendered remarkable by a ſmall worm, which was found coiled up round the introſuſcepted portion of the inteſtines.

A prolapsus ani is, in ſome reſpects, ſimilar to an introſuſception, and may poſſibly begin in the ſame way; but it is always continued by the action of the abdominal muſcles, and never by that of the bowel itſelf. It differs from an introſuſception in not being included in an inteſtine; for inſtead of having a containing bowel, inverting itſelf by its own action, there is an incloſed inteſtine protruded by the action of the abdominal muſcles, while the paſſage of the feces through it, and the point of inverſion, are at the extremity of the protruſion; and as it becomes inverted, it projects out of the body. Med. and Chir. Tranſ. vol. i. p. 112.

With regard to the ſymptoms of introſuſception, they very much reſemble thoſe attendant on inflammation of the inteſtines, hernia, and any obſtruction in the alimentary canal. In ſeveral of the caſes upon record, the ſeat of the diſeaſe was plainly indicated by a hard tumour upon the left ſide of the abdomen. Sometimes it has been found impoſſible to inject more than a trivial quantity of fluid as a clyſter; a circumſtance which would ſtrengthen the ſuſpicion of what the diſorder really is. If, alſo, (obſerves Mr. Langſtaff,) the invaginated portion deſcended ſo low as to form a protruſion at the anus, and we could aſcertain, that it was not an inverſion of the rectum itſelf, the caſe might be conſidered as clear, and we ſhould have no heſitation in delivering a prognoſis, which, by preparing the friends for the fatal termination, would exonerate us from all blame on its occurrence.

Introſuſception, like moſt other diſeaſes, which are furtheſt from the reach of medical and ſurgical aſſiſtance, has been treated in a great number of different ways.

Former practitioners very commonly exhibited for its relief, a large quantity of crude mercury; a plan which certainly could never have accompliſhed the deſirable object of diſentangling the affected part of the bowels.

It has even been propoſed to perform gaſtrotomy, and M. Hevin, in his "Recherches Hiſtoriques ſur la Gaſtrotomie dans le Cas du Volvulus," has examined, with much ability, the queſtion concerning the prudence and propriety of ſuch a proceeding. After many intereſting obſervations, he expreſſes his decided condemnation of the propoſal. The operation, indeed, is rendered quite unwarrantable by the great uncertainty and obſcurity which almoſt conſtantly prevail in regard to the actual nature of the caſe; but even were the exiſtence of the diſeaſe poſitively known, the project would not be allowable. In the firſt place, cutting into the abdomen, with a view of diſentangling a portion of the bowels, would be of itſelf a ſource of the moſt dangerous and probably fatal conſequences. And in the ſecond place, the ſcheme of diſentangling the bowels would generally be altogether impracticable, by reaſon of the different folds of the inteſtine having become inſeparably agglutinated to each other. This connection, in fact, is ſo ſtrong, that the contained parts can hardly be withdrawn after death. In other inſtances, the ſtricture on the introſuſcepted part cauſes it to inflame and even mortify, in either of which ſtates gaſtrotomy would be quite inadmiſſible.

The forcible injection of clyſters was tried by Dr. Monro, without any beneficial effect.

Others have ſuggeſted the introduction of long bougies and pieces of whalebone within the anus, for the purpoſe of mechanically puſhing back the introſuſcepted portion of the bowels. But after it is known that adheſions are formed in the manner already deſcribed, what ſucceſs can be expected from any plans of this kind? And what inſtrument could be invented, which would follow the windings of the bowels, a conſiderable way, without piercing their coats, and doing the moſt fatal miſchief?

The manner in which the parts are agglutinated, explains why none of the methods hitherto deviſed for the relief of an introſuſception, can be of any material ſervice. Were a caſe to be ſubmitted to ſome kind of treatment, before adheſions had taken place, perhaps the forcible injection of glyſters, and the exhibition of vomits to invert the periſtaltic action of the containing bowel, as propoſed by Mr. Hunter, would be as rational ſteps as any which could be purſued.

We muſt reluctantly acknowledge, however, with Mr. Langſtaff, that, in general, all the modes of treatment, hitherto propoſed, will be found utterly inefficient. "Yet here, as in many other inſtances, the reſources of nature are exhibited in a moſt wonderful and aſtoniſhing manner, while thoſe of art completely fail. The invaginated portion of inteſtine ſometimes ſloughs, and is diſcharged *per anum*, while the agglutination of the parts preſerves the continuity of the inteſtinal canal. The annals of medicine furniſh numerous inſtances, where long pieces of gut have been diſcharged in this manner, and the patient has quite recovered. At the ſame time that we recognize the inefficacy of art, theſe caſes will teach us to repoſe a juſt confidence in the powers of nature, and to retain ſome hope of a favourable event, under the moſt unpromiſing circumſtances." Langſtaff in Edin. Med. and Surgical Journal, vol iii. p. 267, 268.

This gentleman has greatly enriched his paper by numerous references which will be deemed exceedingly valuable by any perſon deſirous of being more particularly acquainted with the preceding ſubject.

INVADIATUS, in our *Old Writers*, a perſon accuſed of any crime, which not being fully proved, he was put *ſub debita fidejuſſione*, and called *invadiatus*.

INVALID, a perſon wounded, maimed, or diſabled for action by age.

At Chelſea and Greenwich are magnificent hoſpitals, or rather colleges, built for the reception and accommodation of invalids, or ſoldiers and ſeamen worn out in the ſervice. See Hospital.

We have alſo ſeveral independent companies of invalids, diſperſed in the ſeveral forts and garriſons.

Of theſe the 41ſt regiment was compoſed in 1719, but it has ſince been put upon the ſame footing with the other regiments of the line. In 1782 there were likewiſe 36 independent companies, forming the garriſons of Jerſey, Guernſey, Scilly, Portſmouth, Plymouth, Cheſter, Hull, and other forts and caſtles; and there were alſo ten independent companies of invalids in Ireland. Invalids have been known in this kingdom ever ſince the reſtoration of Charles II. The invalids are armed like other regiments of infantry; their uniform red, faced with blue, and plain button holes.

At Paris is a college of the ſame kind, called *les invalides*, which is accounted one of the fineſt buildings in that city.

INVASION, in *War*, the entrance or attack of an enemy in the dominions of another ſovereign.

INVECTED, in *Heraldry*, denotes a thing fluted, or furrowed.

Invected is juſt the reverſe of *engrailed*, in which the points are turned outward to the field: whereas in invected they are turned inward to the ordinary.

INVECTIVE, in *Rhetoric*, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the perſon reproved; whereas invective is the work of an enemy, and entirely deſigned to vex and give uneaſineſs to the perſons againſt whom it is directed.

INVENTION denotes the act of finding any thing new; or even the thing thus found.

Thus we ſay, the invention of gunpowder, of printing, &c. The alcove is a modern invention owing to the Moors.

The Doric, Ionic, and Corinthian orders are of Greek invention; the Tuſcan and Compoſite of Latin invention.

Janſon ab Almeloveen has written an Onomaſticon of inventions, wherein are ſhewn, in an alphabetical order, the names of the inventors, and the time, place, &c. where they are made. Pancirollus has a treatiſe of old inventions that are loſt, and new ones that have been made; Polydore Virgil has alſo publiſhed eight books of the inventors of things. (De Inventoribus Rerum.) Beckman has alſo publiſhed a "Hiſtory of Inventions and Diſcoveries."

INVENTION is alſo uſed for the diſcovery of any thing hidden.

The Romiſh church celebrates a feaſt on the fourth of May, under the title of "Invention of the Holy Croſs."

INVENTION is alſo uſed for ſubtilty of mind, or ſomewhat peculiar to a man's genius, which leads him to a diſcovery of things new.

In which ſenſe we ſay a man of invention: Wolfius has made ſome eſſays towards an art of invention.

INVENTION, in the *Arts of Deſign*, is that peculiar quality, which, being of all others the moſt rare, is alſo the moſt eſtimable in an artiſt. Without it the painter or ſculptor riſes not above the ordinary labouring mechanic, nor are his productions ſo uſeful to mankind.

Whether the power of invention be an immediate gift of God, or the offspring of cultivation, has been queſtioned by philoſophers; and while ſome have traced its origin, or fancied they could, to a continued ſeries of acquirements, begun at an early age, and carefully ſtored in the mind, others have regarded it as not attainable by any exertions of man, and no other than a direct impulſe imparted by the omnipotent Creator to his more favoured children.

Whichſoever of theſe abſtruſe opinions be correct, one thing none will be inclined to diſpute, *viz.* that, be the power of imagination, which is the baſis of invention, as vivid as poſſible in the mind of an artiſt, it muſt have materials to work upon; and if the power of combining ideas be originally given, they muſt firſt be collected: that power can never operate if the poſſeſſor does not lay by a ſtore of obſervations upon the nature of things as they paſs before his eyes. Invention is not creation, except as far as relates to the ſenſes and perceptions of man. To him new combinations effectively create new objects; but in fact, it is only the power of combining, in new and previouſly unknown forms, things known individually before. It graſps within its range whatever is poſſible, probable, or already certain; and the artiſt is at liberty to apply and combine whatever appertains to either of theſe qualities in any manner, which, producing novelty, ſtill bears the appearance of truth, and does not wound the common perception of propriety; that is, the propriety which belongs to the nature of the ſubject treated of.

The exerciſe of invention will be more or leſs productive accordingly as the native vigour of fancy or imagination be accompanied by a conſtant and lively obſervation of nature, and a ſtrong remembrance of her various productions under all the different circumſtances in which they are found. A vivid imagination, being thus ſtored with images, requires but the ſlighteſt hint to call forth the moſt brilliant effects, and by contraſt or combination produce new images. Sir Joſhua Reynolds, in his 6th diſcourſe, has obſerved, that "there can be no doubt, but that he who has the moſt materials has the greateſt means of invention; and if he has not the power of uſing them, it muſt proceed from a feebleneſs of intellect, or from the confuſed manner in which they have been laid up in his mind;" and again, "it is vain for painters or poets to endeavour to invent without materials on which the mind may work, and from which inventions muſt originate. Nothing can come of nothing."

In the ſame lecture he remarks, that "the mind or genius has been compared to a ſpark of fire, which is ſmothered by a heap of fuel, and prevented from blazing into a flame. This ſimile, which is made uſe of by the younger Pliny, may be eaſily miſtaken for argument or proof; but there is no danger of the mind's being over-burthened with knowledge, or the genius extinguiſhed, by any addition of images. On the contrary, theſe acquiſitions may as well, perhaps better, be compared, if compariſons ſignified any thing in reaſoning, to the ſupply of living embers, which will contribute to ſtrengthen the ſpark, that, without the aſſociation of more fuel, would have died. The truth is, he whoſe feebleneſs is ſuch as to make other men's thoughts an incumbrance to him, can have no very great ſtrength of mind or genius of his own to be deſtroyed."

Theſe excellent remarks are made by ſir Joſhua when treating of imitation; of the aſſiſtance an artiſt may acquire in his progreſs by ſtudying the productions of other men; and to prove, that no ſource of information, either in nature or art, ſhould be neglected by him who covets the title of a great inventor, or, as it is uſually called, an original genius. He will find it requiſite to be a conſtant obſerver of nature in all her ſteps, whether of the grand, the beautiful, the dreadful, expreſſive and intereſting, or commonplace; the varieties of character among men, their modes of action, the powers of their paſſions, and the various ways in which they exhibit the impulſe derived from them. In ſhort, no object whatever ſhould eſcape his eye without notice; no moral ſentiment or feeling, his mind; and he will thus be beſt qualified to embody and illuſtrate whatever ſubject he may be called upon to repreſent.

This doctrine holds equally true of poetry, and indeed of all purſuits by which men are led, in which their neceſſities or their pleaſures call for the exertion of their talents. But each art or ſcience, having its peculiar end to anſwer, requires the obſervance of peculiar objects. In painting, invention requires the mind of the artiſt to be occupied in calling forth recollections of thoſe circumſtances he may have ſeen in nature, or in works of art, of a character conſonant with that of the ſubject undertaken to be repreſented, and endeavouring to inſpire every part of the compoſition with an uniſon of effect. If, for inſtance, the ſubject be pathetic, the painter will recal to his memory thoſe ſcenes and varied actions and combinations of heads and figures, and that diſtribution and degree of light and ſhade which he may have obſerved in nature to be moſt affecting; and, placing them in ſituations proper for his purpoſe, he will endeavour to carry their effect to the higheſt point of perfection. His principal difficulty will be, as far as relates to the invention, to clear his work of whatever is not neceſſary to diſplay its character effectively; to ſeize upon the moſt juſt and powerfully deſcriptive moment in the occurrence, and, collecting together only what juſtly belongs to it, impart to thoſe materials he ſelects the utmoſt degree of intereſt poſſible within the boundary of his art.

He who tells his ſtory in the moſt natural, and at the ſame time, dignified method; who brings forth images at once intelligent and correct; and, combining them in an agreeable manner, impreſſes the mind of an obſerver with the full ſcope of his intention, without evidently exhibiting the art he has employed, is certainly entitled to the praiſe of the greateſt inventor: not he, who, to be ſtriking and impoſing, compoſes attitudes for paſſions, inſtead of allowing feeling and nature to govern him; and fancies, when he has ſurpriſed by ſtrong contraſt or brilliant colouring, that he has effected the purpoſes of art.

Sometimes, indeed, the painter is called upon, like the poet, to tread in fairy ground, and illuſtrate his ſubject by images of beings found only in the regions of imagination; but he is not at liberty to indulge his fancy ſo freely as the poet. Forms deſcribed do not make ſo ſtrong impreſſions on the ſenſe as thoſe preſented to the eye by lines and colours; and many a high-flown indulgence of the inventive faculty which paſſes current, nay, is even allowable in poetry, would dwindle into pure groteſque if laid upon canvas, or wrought in ſculpture; and would more diſguſt and diſappoint, than gratify a ſenſible mind. Such is Milton's deſcription of Death. The obſcurity of the language in which this deſcription of the all-ſubduing ſon and paramour of Sin is enveloped, alone renders it effective in the poem. In painting, it is idle waſte of time to attempt it.

————" The other ſhape,
If ſhape it might be called that ſhape had none
Diſtinguiſhable in member, joint or limb,
Or ſubſtance might be called, that ſhadow ſeemed,
For each ſeemed either,"

is language ſublimely effective of the intention of the poet, and conveys in its no meaning (when ſtrictly examined) an indiſtinct and vague idea of the nature of the monſter, juſt as the deſcription itſelf is contradictory and indiſtinct. Still the mind of the reader is filled with figure and idea ſufficient for the poet's purpoſe, and the degree of intereſt excited by the appalling tremendous circumſtances of the moment and in ſucceſſion, draws off his attention from dwelling long enough to diſcover the illuſion. But once embody the idea it is made to convey in a picture, where every image remains for examination, and meets the eye, not vaguely, for then it would be no image, but apart and diſtinct, and it becomes abſurd; the ſhadow, ſubſtantial, or ſublimity is overpowered by obſcurity.

The inventor is at liberty to combine all that is poſſible or probable with all that is real; or dwell in poſſibilities or probabilities alone. There is a limit, however, to his exertions, which is, that whatever be the nature of his ſubject, it ſhould have ſuch a degree of uniſon with our ideas of exiſtence, convey ſuch an air of real ſemblance, or be ſo compounded in its parts, as not to ſhock us with an apparent violation of the laws of nature, or the appearance of total impoſſibility. Mr. Opie, in his Diſcourſe on Invention delivered in the Royal Academy, ſays upon the ſame point, "that in the exerciſe of invention in the imitative arts, all poſſible licence may be granted, and any degree of the extraordinary be indulged, which does not incur the cenſure of being extravagant: provided that the trains of ideas be perfectly connected, and the whole conſiſtent with itſelf; that there be nothing ſuffered to intermix which checks the progreſs of the imagination, expoſes the contrivance or illuſions, and recals a different ſet of principles to the mind." To the verge of this limit the artiſt may indulge his fancy, and exert his powers. When he goes beyond it, and launches forth into a world of mere fanciful imagery, he may flatter himſelf that he is working wonders, but in fact he will be regarded as a dealer in legerdemain, as one falſifying his intellectual powers; and will only excite ridicule and mere ſurpriſe, inſtead of that admiration which men of ſound ſenſe can alone enjoy. The true inventor will ſeek only for the moſt natural and direct means of diſcloſing his ideas, of imparting that information he wiſhes to convey, be it of what nature it may. Thus Hogarth ranks with the very firſt among the poſſeſſors of this almoſt god-like quality; notwithſtanding his ſubjects were of a low and frequently vulgar caſt. How admirably ſimple, and yet how completely effective, is his figure of a Woman ſetting fire to the Map of the World in the Bagnio Scene in the Rake's Progreſs! He evidently meant to convey the idea of the miſchievous power of female beauty when the poſſeſſor of it is ſordid, ſelfiſh, treacherous, and baſe! Can words convey it more explicitly? It would be almoſt endleſs, and certainly needleſs, to point out the numerous inſtances with which his works abound of the ſame effective ſimplicity and truth of imagery, which render them ſo admirably attractive and uſeful. Sir Joſhua Reynolds, in his picture of the death of cardinal Beaufort, has been equally ſucceſsful. Shakſpeare informs us that he died in the utmoſt agonies of conſcience without any truſt in God, any hope of ſalvation; the tortures of his mind convulſing him more than the agonies of body. The painter would only repreſent a man writhing with violent pain; and therefore, to give another character and ſentiment to the repreſentation, having effected the appearance of ſuffering, he introduced the fiend, "grinning horribly a ghaſtly ſmile," which at once informs the obſervers of the agency under which the dying man is tortured. Without this figure, which has been ſo loudly reprobated by many who probably regarded beauty rather than ſentiment, the work would have been merely a repreſentation of a ſick man dying in pain, and an aſſemblage of beautiful colours. The fiend decidedly ſtamps its character with his own; and perhaps by a ſimilar figure alone, can we be informed of the nature of the torments the cardinal endured, without reſorting to the original Gothic mode, of introducing a label from the mouth or over the head of the figure.

In every branch of the art invention is demanded, and without it, tameneſs and inſipidity will be the reſult of the artiſt's labours. In drawing, in colouring, and in chiaroſcuro, ſelection, or that ideal beauty of form, force and effect on which all lovers of the arts alone delight to dwell, is entirely an effort of invention. To it we owe the beautiful and ſublime forms of the ſtatues of the heathen gods, and the grand ſtyle of deſign of which Michael Angelo and Lionardo da Vinci are the parents: the rich, deep, and harmonious ſtyle of colouring of Titian, Giorgione, and Rubens; the magic ſweetneſs of effect, or chiaro-ſcuro, in Correggio, and the force and brilliancy of it in Rembrandt. To Raphael, however, it is that the art is indebted for the nobleſt uſe of invention. His object always appears to have been the illuſtration of his ſubject, not the exhibition of his art. Of this none ever appear to have been ſo capable, none ſaw ſo fully the whole force of it, entered ſo immediately into the very heart, and throwing all trifling or indifferent occurrences aſide, applied his force to ſtrengthen what was ſo uſeful, or feeling what was wanting, was fertile in expedients to ſupply its deficiency. We have mentioned one inſtance under the article ENERGY, in *Painting*, which exhibits ſtrongly the native vigour of the mind of Raphael, *viz.* the Cartoon of Ananias ſtruck dead: wherein we have ſhewn his invention not only to have been capable of delineating the fact, but alſo of informing us in ſome meaſure of the preceding and ſubſequent circumſtances connected with it. The ſame power may be pointed out in others of his works, particularly in the cartoon of the ſacrifice to St. Paul and Barnabas at Lyſtra. The great perfection of the inventive faculty in the mind of this extraordinary man is exhibited in the purity, ſimplicity, and truth of the images he ſelects. It is very ſeldom indeed that his ideas require explanation, he never appears to have wandered from the ſubject of his work in ſearch of ſomething abſtruſe or rare, but truſts to the growth of ideas which appear naturally to have ſprung up in his mind upon conſideration of the nature and object of it. Yet ſo well ſtored was he with nature and art, that he is rarely inſipid or deficient of illuſtration, either as relates to beauty, elegance, and grace of compoſition, or expreſſion and ſentiment.

Invention in the works of Michael Angelo Buonarotti is exhibited in a very different mode. Inſtead of treading in the beaten path of common life, or adopting the labours of others, he, breathing the ſpirit of the epic poet, invents his ſubject; and clothes it with the ideal grandeur which breadth of form, flowing lines, and bold and difficult actions can give it. Taking his own conception of the generic character of the human body for his model, he perfected, if not invented, a ſtyle of deſign entirely new, of a ſublime and dignified nature, though bordering upon the extravagant, and rendered truly ſo by moſt of his imitators. Of this ſtyle Lionardo da Vinci is perhaps properly the parent, but he had not the full force of M. Angelo, and his invention in art was engaged in a middle way between thoſe of the two great men we have mentioned.

In Titian we find the ſame faculty operating in a manner totally different. To him it was moſt grateful to ſeek after and develope the power of colours in brilliancy, depth, and clearneſs: and maintaining their full powers, to unite them by arrangement or contraſt, in a manner harmonious and agreeable to the eye. Add to this application of his invention, a very extraordinary degree of perception of grandeur and dignity in deſign and effect, and he will be found to have extended the boundaries of art in no inferior degree.

To this talent in Correggio and Parmegiano we are indebted for whatever is grateful, ſoft, and amiable in the art of painting; and to Rembrandt for bold vivid effects of the chiaroſcuro: whilſt Rubens, endowed by providence with almoſt ſuper-human powers, revelled in the utmoſt luxury of imagination, and produced works repreſentative of almoſt all the varied objects of creation, with a gaiety of action and a ſplendour of colouring and effect unknown, in ſo extenſive a combination, to any artiſt before or after him.

It is only by a conſtant ſtudy of the works of nature and of art that a mind poſſeſſed with the power of invention can ever be enabled to exert itſelf either extenſively or uſefully. The impreſſions made upon it by the common intercourſe of life, without a preciſe direction of ſtudy, would be ſoon exhauſted; and one poorly gifted by nature with the fire of imagination, but anxiouſly and ſteadily purſuing the ſtudies recommended, would ſoon ſurpaſs the former, be he never ſo richly endowed if he neglected the neceſſary cultivation.

INVENTION, in *Muſic.* Having no objects, melody, or harmony in nature to copy, except the common chord ariſing from the diviſions of a ſtring or ſounding body into its harmonics, a muſician has more to invent than the profeſſor of any other art. Every paſſage, every combination, every motivo or ſubject, that has not been uſed before, is invention. There is ſo little invention in ſome compoſitions, that whoever has heard or ſeen much muſic, could point out the prototype of every bar. There is, on the contrary, ſuch an ambition in ſome authors of being new, that the ear is teazed and diſappointed by the conſtant ſtruggle and labour to be unnatural. Haydn's invention, which is ſo unbounded, is never puſhed to ſuch exceſs. There is in his moſt original and capricious movements and paſſages, a mixture of natural, graceful, ingenious or ſpirited connecting traits, which relieve the hand of the player, and the attention of the hearer.

There is no infallible receipt for invention; all a maſter can do is to recommend to his diſciples to avoid exceſſes of every kind: too eaſy and common, too hard and uncommon; complaints of pieces being too long are more frequently made than of their being too ſhort, which would be more flattering to a compoſer. When fertility is wanting, paſſages are frequently repeated alla tanta Roſalia, to a degree which now cannot eſcape remark and cenſure. A maſter cannot, nor ought if he could, tell his pupil in compoſition what to adopt; he can only tell him what to avoid. See COMPOSITION, and COUNTERPOINT, to which this article may ſerve as a ſupplement.

INVENTION, in *Poetry*, is applied to whatever the poet adds to the hiſtory of the ſubject he has choſen; as well as to the new turn he gives it.

INVENTION, in *Rhetoric*, ſignifies the finding out, and chooſing of certain arguments which the orator is to uſe for the proving or illuſtrating his point, moving the paſſions, or conciliating the minds of his hearers.

Invention, according to Cicero, is the principal part of oratory: he wrote four books De Inventione, of which we have but two remaining.

This invention of the orators cannot, according to lord Bacon, be properly called invention: to invent, is to diſcover things not yet known, not to recollect thoſe that are; whereas the uſe and office of this rhetorical invention are only, out of the ſtock of knowledge laid up in the mind, to ſelect ſuch articles as make for the purpoſe.

The ſame author divides this faculty of invention into two parts, the one *topical*, the other *promptuary*: the firſt points out the way in which we are to purſue the argument; the latter only lays up and diſpoſes things, for which we have frequent occaſion, in the mind.

Invention furniſhes the orator with thoſe different kinds of arguments and motives which are adapted to the various purpoſes he has in view. The helps of invention are a lively imagination and readineſs of thought, great learning and extenſive knowledge, previous conſideration, and clear enlarged apprehenſions of the ſubject. See ARGUMENTS, COMMON PLACES, and TOPICS, &c.

INVENTORY, in *Law*, a catalogue, or ſchedule orderly made of all a deceaſed perſon's goods and chattels, at the time of his death, with their value appraiſed by indifferent perſons, which every executor or adminiſtrator is obliged to exhibit to the ordinary upon oath, if thereunto lawfully required.

By 21 Hen. VIII. c. 5. executors and adminiſtrators are to deliver in upon oath to the ordinary, intended inventories, one part of which is to remain with the ordinary, and the other part with the executor or adminiſtrator: this is required for the benefit of the creditors and legatees, that the executor or adminiſtrator may not conceal any part of the perſonal eſtate from them. The ſtatute ordains that the inventory ſhall be exhibited within three months after the perſon's deceaſe; yet it may be done afterwards, for the ordinary may diſpenſe with the time, and even with its being ever exhibited, as in caſes where the creditors are paid, and the will is executed.

The uſe of the inventory is borrowed from the civil law: for whereas by the law of the ancient Romans the heir was obliged to anſwer all the teſtator's debts; by which means, inheritance ſometimes became rather prejudicial than profitable; to obviate this inconvenience, Juſtinian ordained, that if the heir would firſt exhibit a true inventory of all the teſtator's effects, he ſhould be no farther charged than to the value of the inventory.

In the Britiſh army, when any commiſſioned officer happens to die, or is killed on ſervice, it is directed by the articles of war, that the major of the regiment, or the officer doing the major's duty in his abſence, ſhall immediately ſecure all his effects or equipage then in camp or quarters; and ſhall before the next regimental court-martial make an inventory thereof, and forthwith tranſmit the ſame to the office of our ſecretary at war, to the end, that the executors of ſuch officer may, after payment of his regimental debts and quarters, and the expences attending his interment, receive the overplus, if any be, to his or their uſe.

When any non-commiſſioned officer, or private ſoldier, happens to die, or is killed on ſervice, the then commanding officer of the troop or company, ſhall, in the preſence of two other commiſſioned officers, take an account of whatever effects he dies poſſeſſed of, above his regimental cloathing, arms and accoutrements, and tranſmit the ſame to the office of the ſecretary at war. Theſe effects are to be accounted for and paid to the repreſentative of ſuch deceaſed non-commiſſioned officer or ſoldier; and in caſe any of the officers, ſo authorized to take care of the effects of dead officers and ſoldiers, ſhould, before they have accounted to their repreſentatives for the ſame, have occaſion to leave the regiment by preferment or otherwiſe, they are ordered, before they be permitted to quit the ſame, to depoſit in the hands of the commanding officer, or of the agent of the regiment, all the effects of ſuch deceaſed non-commiſſioned officers and ſoldiers, in order that the ſame may be ſecured for, and paid to, their reſpective repreſentatives. See Articles of War, ſection XIX.

INVENTORY, in *Trade*, is a liſt, or particular valuation of goods, &c. See VALUE, APPRAISEMENT, &c.

INVER, in *Geography*, a ſmall river of the county of Donegal, Ireland, which is diſcharged into a ſmall bay, to which it gives name. Inver bay may be conſidered as a part of Donegal bay, and has good anchorage. The pariſh is alſo called Inver, and there was formerly an abbey there. There is alſo a village called Inver in the county of Mayo, on the eaſt ſide of Broadhaven, and in the wild barony of Erris.

INVERARY, a royal borough, and the county town of Argyleſhire, Scotland, is ſituated on the ſouthern bank of Loch Fyne, where the river Aray, or Aooridh, falls into the ſea. It conſiſts chiefly of one row of commodious houſes, built with great uniformity, and covered with ſlate. The old town was ſituated on the north ſide of the bay. It ſeems probable, that, prior to the fourteenth century, Inverary was little more than a ſmall village for fiſhermen, who ſubſiſted by their occupation, and erected their huts here. About that period, the family of Argyle fixed on this ſcite as their place of reſidence; and as the hereditary juriſdictions of juſticiary and ſheriff were veſted in them, Inverary became the ſeat of the courts and the county town. The circuit court of juſticiary is held here twice a year for the trial of offences in the counties of Argyle and Bute, and the minor courts are thoſe of the ſheriff, magiſtrates, and juſtices of the peace. It was created a royal borough by charter from king Charles I., and is governed by a provoſt, two bailiffs, and a council, nominated by the duke of Argyle. Its only revenue, about 30*l.* ſterling annually, ariſes from the petty cuſtoms and the rent of a common, which, on the erection of the borough, was beſtowed on it by the Argyle family. About the middle of the laſt century, Archibald, duke of Argyle, ſeeing how inadequate this revenue was to the occaſions of the borough, added to it a perpetual annuity of 20*l.* ſecured on his eſtate.

Inverary is ſo ſituated in the Highlands, that as many of the inhabitants ſpeak Engliſh as Gaelic, and two miniſters officiate in theſe dialects. For which purpoſe, two new churches, under one roof, have been recently built, from a deſign by Mr. Milne. Inverary ſeems tolerably well ſituated for manufactures, yet none are carried on to any great extent. About the year 1748, duke Archibald introduced the linen manufacture, which has been attended with beneficial conſequences. The late duke eſtabliſhed a woollen manufacture; and erected proper buildings and machinery, which he gave to the town; but the buſineſs has not been conducted with any adequate advantage.

Inverary derives its chief ſource of profit from the herring fiſhery in Loch Fyne. This lake, which extends more than 30 miles from the Weſtern ocean into the country, has been, from time immemorial, noted for its herrings, which are ſaid to be ſuperior in quality to any found in the Weſtern ſeas. The fiſhery generally commences in July, and ſometimes continues till the end of the year. During this ſeaſon, the lake is frequented by innumerable ſhoals. The country people expreſs the quantities of herrings abounding here, in very ſtrong language: "At theſe ſeaſons," ſay they, "the lake contains one part of water and two parts of fiſh." In this ſingle bay five or ſix hundred boats are ſometimes employed in the fiſhery; and it is eſtimated, that in ſome ſeaſons, upwards of 20,000 barrels of herrings have been caught and cured; each barrel containing, at a medium, ſeven hundred fiſh. Part of each boat is covered with a kind of ſail-cloth, to ſhelter the four men who compoſe the crew, and who ſeldom quit their boat during the whole ſeaſon. The inhabitants of Inverary, and of the banks of the loch, do indeed ſpend Sunday at home; but as many of the boats come from more diſtant parts, the crews take up their abode entirely in them, ſubſiſting chiefly on herrings. The night is the time of fiſhing; the day is employed in gutting the fiſh, in ſleep, or in ſinging Celtic ſongs to the ſound of the bagpipe. Each boat clears, on an average, from 40 to 50*l.*, and, in very productive ſeaſons, 100*l.* The pariſh of Inverary extends about 18 miles in length, and about three in breadth, on an average. The number of houſes in the late return to parliament was 275, of inhabitants 2045.

At a ſmall diſtance from the town, is the houſe, or caſtle, of Inverary, the principal ſeat of the duke of Argyle, and the chief ornament of the Weſtern Highlands. It is ſituated on a gentle riſe, on the weſtern ſide of Loch Fyne; and is ſurrounded by an amphitheatre of mountains, ſome of which are rugged and broken, and others entirely covered with wood. The loch from this place appears like a large bay, round which are ranged plantations, covering the ground to a vaſt extent, from the lake to the ſummit of the higheſt mountains. The caſtle, rearing its towers above the woods, has a very picturefque effect; to the ſouth-eaſt of which, cloſe to the bay, appears the town of Inverary in its uniform line of handſome buildings. On the right is a fine view of Dunicoich, a ſteep hill, 700 feet in height, covered with wood almoſt to the ſummit. Inverary Houſe, though by no means an old ſtructure, is built in the form of a caſtle, upon the plan of the manſions of ſome of the German nobility. The hall, which is very ſpacious, is hung round with arms and other ornaments adapted to the ſtyle of a Highland caſtle. In the election of a repreſentative to parliament, Inverary is claſſed with Ayr, Irvine, Rothſay, and Campbeltown. Sinclair's Statiſtical Account of Scotland, vol. v.

INVERKEITHING, a royal borough and ſea-port town in Fifeſhire, Scotland, is ſituated on an eminence at the head of the bay which bears its name on the north coaſt of the Frith of Forth. It conſiſts of one principal ſtreet of conſiderable length, with a ſmaller one branching from the middle of the former, and a few lanes. The houſes have an ancient appearance, and almoſt every one has a piece of garden ground annexed to it. The return to parliament in the year 1801, ſtated the number of houſes to be 350; of inhabitants 2228. The borough received its firſt charter from king William, ſurnamed the Lion; ſince whoſe time ſeveral kings of Scotland have granted other charters, all which were ratified and confirmed by king James VI. in a writ bearing date May 4th 1598. The civil government is veſted in a provoſt, two bailiffs, a dean of guild, and a treaſurer, all of whom are annually elected by the counſellors and deacons of trades. The latter, five in number, are alſo elected yearly: but the counſellors hold their office during life and reſidence; theſe muſt not be fewer than twenty, but are not limited to any number. The town-houſe, a neat ſtructure, built in 1770, contains a priſon, and rooms for the town-clerk, and for public meetings and entertainments. The bay of Inverkeithing is large and ſafe, and affords anchorage to veſſels of any burthen in all winds. Here ſhips of war from the Leith roads ſeek ſhelter from the winter ſtorms, and merchant ſhips from the Mediterranean uſed to perform quarantine. The harbour itſelf is a ſmall bay; at the mouth of which, on the weſt ſide, lies a large Dutch built veſſel as a lazaretto; where, inſtead of detaining ſhips from foreign parts, the particular goods ſuppoſed to be infected are immediately received, aired under the inſpection of a proper officer, and delivered within a limited time to the owners. At the head of the bay is the quay, the place for landing and receiving goods; the depth of water at ſpring-tides is thirteen and ſometimes fifteen feet. The chief employment of the veſſels ariſes from the exportation of coal and ſalt. The coal is brought to the ſhore by a waggon road three miles in length; and 25,000 tons are annually ſhipped on an average: the demand is greater than can be anſwered; and veſſels, to the number of forty or fifty, are ſometimes obliged to wait ſeveral weeks for their cargo. The quantity of ſalt annually made is from twelve to fifteen thouſand buſhels. Inverkeithing was a royal reſidence in the time of king David I.; veſtiges of his houſe were viſible within the laſt fifty years. This borough joins with thoſe of Culroſs, Queensferry, Stirling, and Dumferline, in ſending a member to parliament.

On the top of Lethen-hill, near the town, are ſeveral upright ſtones, placed in a circular form, ſaid to have been a druidical temple: and in the northern part of the pariſh is a ſtone ten feet high, called the Standing ſtone, on which are baſſo relieves of ſeveral rude figures of men and horſes. Within the pariſh is alſo the caſtle of Roſyth, a ruinous edifice, built upon a rock, and at high water entirely ſurrounded by the ſea; it was one of the ſeats of the Stuart family, and is now the property of the earl of Hopetoun. The celebrated admiral Greig, commander in chief of the Ruſſian navy, was a native of this pariſh. Sinclair's Statiſtical Account of Scotland, vol. x.

INVERNESS, a royal borough, and the county town of Invernеſsſhire, Scotland, is ſituated on the ſhore of Moray-Frith, and is divided into two unequal parts by the river Neſs, over which is a ſtone bridge of ſeven arches. It is a borough of great antiquity; and according to the beſt authority obtained its firſt charter from king Malcolm Canmore. In ancient times the townſmen maintained many deſperate conflicts with the neighbouring rebellious chieftains and their clans. Traces of this ſtate of hoſtility are ſtill extant, on the weſt ſide, where irruptions were commonly made. At a ſmall diſtance from the town, is a place called *Pallfaire*, that is, "the Watch-Town;" alſo a hill, named *Tomnafaire*, "the Watch-Hill;" and a large ſtone, called *Clachnafaire*, "the Watch-Stone." The laſt charter in favour of the borough was granted by king James VI. From that period to the revolution, the inhabitants were an induſtrious and thriving people; carried on a conſiderable commerce in corn and ſkins; and brought the malting trade to great extent; a conſiderable part of the town conſiſting of kilns and granaries. From the revolution to the year 1746, the borough ſuffered a gradual decline; ſo that, at that period, and for ſeveral years after, the town appeared little better than the ruins of its former ſtate. In the rebellion in 1745, which commenced among the chiefs in the weſtern part of this county, Inverneſs became the centre of all the military operations, and other works carried on by government. Hence it began to revive, and commerce was gradually reſtored. The principal manufactures now are thoſe of hemp and flax. The firſt has been eſtabliſhed about forty years; and at preſent employs above a thouſand perſons in ſpinning, dreſſing, and weaving. The raw material is imported from the Baltic, and manufactured into ſail-cloth and ſacking; which are ſent to various parts of Britain, and the Eaſt and Weſt Indies. A white thread manufactory has been eſtabliſhed nearly twenty years; and employs in its various branches of heckling, ſpinning, twiſting, bleaching, and dyeing, not leſs than ten thouſand individuals in the town and ſurrounding country. The company have, in this and the neighbouring countries, ſeveral agents for the management of the ſpinning departments. The flax is alſo chiefly imported from the Baltic, and the greateſt part of the thread ſent to London, whence it is diſperſed to different parts of the world. The cotton manufacture has been introduced here with ſucceſs. Inverneſs poſſeſſes peculiar advantages for manufactures; the raw material being eaſily imported, and the manufactured goods readily exported. Dearneſs of fuel is the greateſt obſtacle, coal being imported from England. The ſituation of the town is highly favourable. Ships of four or five hundred tons can ride at anchor within a mile of it; and at ſpring tides veſſels of half that burthen can come up to the quay cloſe to the town. The principal part of the veſſels belonging to Inverneſs, is employed in conveying to London the produce of the manufacture, alſo the fiſh caught in the river Neſs, and the ſkins of otters, rabbits, hares, foxes, goats, roes, &c. In return, materials are brought back both for uſe and luxury; particularly hardware and haberdaſhery; with which the traders of this town ſupply the extenſive ſurrounding diſtrict. A ſpacious harbour or baſin has been conſtructed here for veſſels ſailing acroſs the iſland by the Caledonian canal.

Inverneſs is a large and well-built town; many of the houſes are lofty, and aſſume an elegant appearance. It may be conſidered as the capital of the Highlands; being the only town of any importance north of Aberdeen. It was returned, under the act of 1801, as containing 1431 houſes, and 8732 inhabitants. Nearly in the centre of the town ſtands the Court-houſe, connected with the Tolbooth, a handſome modern building, with a tower terminated by a ſpire. An academy, on a very liberal and extenſive plan, was eſtabliſhed here in the year 1790, and is ſupported by voluntary ſubſcription. A piece of ground, containing about three acres, was purchaſed, and an appropriate building erected, conſiſting of a large public hall and ſix ſpacious apartments, for the accommodation of the different claſſes, for a library, and for philoſophical apparatus. The ſeminary is conducted by a rector and four tutors; the number of ſtudents is generally between two and three hundred; who are divided into five claſſes. In the firſt, the Engliſh language is taught; in the ſecond, Latin and Greek; in the third, arithmetic and book-keeping; in the fourth, geometry, trigonometry, menſuration of planes and ſolids; geography, navigation, and practical aſtronomy; naval, civil, and military architecture; gunnery, perſpective and drawing; in the fifth, or higheſt, under the immediate care of the rector, are taught civil and natural hiſtory, experimental philoſophy, and chemiſtry. The rector has a ſmall houſe and a ſmall ſalary; the tutors have ſtill leſs ſalaries; ſo that their chief dependence is on the fees of their ſeveral claſſes, which is an incitement to attention and induſtry.

The civil government of the town is veſted in a provoſt, four bailiffs, and a dean of guild, aſſiſted by a council of twenty-one members, called the town council. The members of the new council are elected every year by the old previous to their ſeceſſion from office: and the former elect from among themſelves the provoſt, bailiffs, dean of guild, and a treaſurer. There are ſix corporations of craftſmen, beſides ſeveral crafts not incorporated. The edifices for public worſhip are, three national or Preſbyterian churches, and one of Epiſcopalians, with chapels for diſſenting congregations.

About half a mile from the town, on the weſtern ſide, is Tmona-heurich, the "Hill of Fairies," a beautiful inſulated hill covered with trees. It is of a ſingular form, nearly reſembling a ſhip with the keel uppermoſt: its baſe is a parallelogram, in length 1984 feet, in breadth 176; from which it riſes above 250 feet above the level of the river. About a mile farther from the town is another hill, called Craig Phatric, rugged and ſteep, and much higher than the former; the elevation of its higheſt part being 1150 feet above the bed of the river: the ſummit is flat, and has been ſurrounded by a wall eighty yards long by thirty broad. The moſt remarkable circumſtance attending it is, that the ſtones are all firmly cemented together by a vitrified matter like lava, or reſembling the flag or ſcoriæ of an iron foundery; and even the ſtones, in many places, ſeem to have been ſoftened and vitrified. The circuit court of juſticiary for the northern diſtrict, comprehending the counties of Inverneſs, Roſs, Caithneſs, Orkney, and Sutherland, is held at this place. Sinclair's Statiſtical Account of Scotland, vol. ix.

INVERNESS, *New*, a town of America, in the ſtate of Georgia, ſituated on the river Alatamaha, and built by a company of emigrants from the Highlands of Scotland, 130 of whom were taken oven by Gen. Oglethorpe in 1734. It is about 20 miles from Frederica.

INVERNESS *and Fort William Canal*, was the parliamentary name firſt given, in the act of 1793, to an important line of canal for the paſſage of large ſhips acroſs Scotland, principally in Inverneſsſhire, of the deſigns for which we gave a full account, under that head, in our article CANAL, and have ſince added, under the topographical articles CLACHNACHARRY and CORPACH, villages at the extremities of the line, ſuch particulars as had occurred to the time of putting theſe articles to the preſs, reſpecting the progreſs of the works: in the preſent article we ſhall have the pleaſure of ſtating the further and ſucceſsful progreſs, to the preſent time, of this very large and important undertaking, now more commonly known by the name of the Caledonian Canal. Seven annual reports have now been made by the commiſſioners appointed to manage this great national work, and printed by order of the houſe of commons; which reports contain the greateſt body of minute information, ſatisfactorily arranged, by John Rickman, eſq. the ſecretary to the commiſſioners, which has, perhaps, ever been given to the public, and ſhew ſtrongly the merit which is due to Meſſrs. William Jeſſop and Thomas Telford the engineers, for the correctneſs of their original deſigns and eſtimates, and to the latter gentleman in particular, for carrying the whole into effect by himſelf and his reſident aſſiſtants. From the laſt of theſe reports (ordered to be printed the 31ſt of May 1810), it appears, that about ſix miles in length at the Clachnacharry, north-eaſtern, or Inverneſs end of the line, were in hand or finiſhed; and about the ſame length, at the Corpach, weſtern or Fort-William end, were alſo in progreſs, except ſome particular parts, preſenting no material difficulties. We ſhall firſt mention thoſe important and expenſive works, the entrance ſea-locks in Loch Beauley, and in Loch Eil.

At Clachnacharry two ſea-mounds, or parallel banks for incloſing the canal, have been extended more than 360 yards into the ſea beyond high water-mark, and have been ſecured by a wall of puddled earth carried up from the bottom: and as the ſhore here is found to conſiſt of wet muddy ſands, capable of conſiderable compreſſion by the weight of theſe artificial banks, the ſame have been extended higher than would otherwiſe have been neceſſary, and at the further extremity they have been joined into a ſolid maſs, by filling up the ſpace in which the ſea-lock is to be conſtructed, and allowing time for this great weight of earth to act, in compreſſing the ſoft bottom, before the digging therein for the lock is commenced; by which the great expence and riſk of a coffer-dam is to be avoided. The ſea-mounds of earth, three hundred and fifty yards beyond high-water mark, and the coffer-dam for the ſea-lock at Corpach, had been ſome months made and erected and ſtood firm, and at the time of making the 7th report the ſteam-engine and drains thereto from the ſcite of the lock were completed ready for commencing the excavation. The ſecond lock at the ſouth-eaſt end of Clachnacharry village had been completed, except the gates, ever ſince 1806; the maſonry of the four connected locks (Nos. 3, 4, 5, 6,) at Muirtown, N. of Inverneſs, were alſo completed, and their joints pointed with Parker's cement, prepared from the Ludus helmontia, or clay-balls of the London clay ſtrata. The two locks at the N.W. end of Corpach village were long finiſhed, all but their gates, and the maſonry of the ſix loweſt of the principal chain of eight locks near Corpach-moſs were about completed. In the next moſt important head, that of aqueduct bridges, road arches, and culverts under the canal, one, only a ſmall culvert, had been found neceſſary in the Clachnacharry diſtrict, and was finiſhed in the lands of Kinmylies: in the Corpach diſtrict, five conſiderable aqueducts had been completed a long time, *viz.* at Lower Banavie, Upper Banavie, Shangan, Muirſhearlich, and Loy, all of which had their arches enlarged and paved at the bottom, or ſide arches conſtructed, in order to ſerve as road arches under the canal, and ſuperſede the expence and great inconvenience of as many communication ſwing bridges over the canal: for which they have been found very complete ſubſtitutes. A large job of maſon's work had alſo been completed in walling the intended wharfs, 113 yards in length, at the ſouth-eaſt end of the large baſin intended for holding the ſhips which trade to Inverneſs, ſuch wharfs being ſituate within leſs than a mile of the town. In the Clachnacharry diſtrict the maſonry of the road bridge at Muirtown had been completed, and a temporary timber bridge laid upon it; the maſonry of Bught bridge was very nearly completed, and a temporary wooden bridge had been laid over the middle of the eight Corpach-moſs locks, for the road to Lochie-ferry and Fort-William, where the maſonry for a ſwing bridge had been prepared.

Of the earth works, the ſtupendous embankments for the ſea-locks at the extremities of the canal have been mentioned: in Kinmylies lands, W. of Inverneſs, a conſiderable embankment, acroſs ſome low ground, had been very nearly completed: a more conſiderable and difficult embankment along the whole courſe of the Neſs river, extends near half a mile in length, under the ſteep bank of Torvaine; a new channel for the river being formed ſouth of this, and the new canal bank effectually faced with looſe rubble ſtone to protect it from the floods: at Molindour a ſimilar embankment along the bed of the old Neſs, and the making of a new channel for it for a quarter of a mile in length, has been completed, under Torremore, a ſteep bank. In the lands of Doughgarroch, near the Smithy, another embankment for the canal acroſs a loop of the river, and enlarging its channel on the further ſide of a gravel iſland were in hand. In the Corpach diſtrict, embankments of earth have been completed over each of the five aqueduct bridges mentioned above, and many ſmaller ones, particularly in the rugged tract between Upper Banavie and Shangan aqueducts. The principal extra cutting, or removing of earth, has been on the S.E. of Clachnacharry, where a baſon of 20 acres extent, being more than one-third of a mile long, has been completed; the principal deep-cutting, partly executed in this diſtrict, being nine feet deep, for about half a mile in length, through the lands of Doughgarroch. The principal work of extra cutting in the Corpach diviſion, has been the baſin next the ſea-lock, great part of which is hard rock-cutting, and was partly completed, waiting for the ſteam-engine to drain it: conſiderable deep cuttings occur on each ſide of the rivulet of Moy, and near ſeveral others of the aqueducts for ſtraightening the courſe of the canal, and finding ſtuff for adjacent embankments, all of which were completed. Having thus enumerated all the principal works which had been entered on or completed, we ſhall preſent an account of the total expenditure from the commencement on the 20th of October 1803, to the third of May 1810, *viz.*

	£.	s.	d.
Purchaſe of lands and buildings, and payments on account of damage for the canal-works, roads, quarries, &c.	16,442	8	6
Labour and workmanſhip paid by meaſurement, or per job, in excavating, puddling, banking, forming temporary rail-roads, ſawing, and carpenters' work	125,186	16	10¾
Carry over	141,629	5	4¾

	£.	s.	d.	£.	s.	d.
Brought over				141,629	5	4¾
Labour and workmanſhip paid by the day or tide, ſetting out and trying the ground, whiſkey for the men working in the water, &c. - - -				5,711	10	11½
Quarries and maſonry work, and for bricks, lime, and cement - - -				70,971	14	1¼
Timber, *viz.* foreign fir and carriage - -	9,310	12	7¾			
Native timber, purchaſed in the neighbourhood, felling, carriage, &c.	11,795	15	5½			
				21,106	8	1¼
Machinery, including four ſteam-engines, a ſaw-mill, dredging-machine, iron rails for all the temporary rail-ways, various tools and utenſils, and repairing of the ſame, carriage, &c. - - -				29,869	15	5¾
Shipping; building and rigging four ſloops and barges, repairs, ſtores, ſeamens' wages, ſhore dues, &c. in fetching part of the ſtone from the diſtant quarries to the works - - -				5,573	18	10¾
Purchaſe and hire of horſes and provender, farriery, &c. for extra and irregular works, the ſuperintendant's nag, &c.				811	18	0
Houſes, compting-houſes, ſheds, ſtables, and other temporary buildings for the uſe of the ſuperintendants, and the work - - - - -				2,345	3	9
Stationery, portage, carriage of parcels, ſeeds for the canal banks, &c. -				434	11	6½
Expences of management, *viz.* expences of ſurveys and obtaining the act, ſurveys and valuations of land, juries, and conveyancing: the ſecretary's, engineer's, and ſuperintendant's ſalaries, keeping and copying accounts, reports, &c., reducing and engraving maps, &c. and travelling expences - -				10,998	12	2½
Total -				£.289,452	18	5¼

The Britiſh public are but little uſed, we are perſuaded, to ſee ſuch effectual checks eſtabliſhed on the expenditure of their money, more real economy exerciſed, or more minute and ſatisfactory accounts produced, than the ſeries of valuable reports furniſh, from which we have principally extracted our accounts of this truly great national undertaking. From a careful re-eſtimate of what remained to be done by Mr. Jeſſop and Mr. Telford, a well-grounded hope is held out that the whole undertaking will be entirely completed, when the ſum of 553,000*l.* is expended, except, perhaps, ſome purchaſes of land in the middle diſtrict, where no works had yet been commenced. Our inquiries further enable us to ſtate, that at the preſent time (April, 1811) the excavation in hard rock for the Corpach ſea-lock has been completed to 20 feet beneath high-water of neap tides, and a great proportion of the maſonry of the tide-lock completed; the maſonry of the great chain of eight locks near Corpach-moſs is completed, and the regulating lock near loch Lochie began: that plan, adopted for avoiding a coffer-dam to the tide lock at Clachnacharry has ſucceeded, a part of the ſpace for it had been excavated, and the water which ſprang in, eaſily commanded by a ſix-horſe engine; and the regulating lock near loch Neſs is in hand; the number of men at preſent employed exceeding 1200. Mr. John Telford, the brother of the engineer, reſided and ſuperintended the works with great ability and integrity until his death, in June 1804; ſince which the works have been ſuperintended by Mr. Matthew Davidſon.

INVERNESS-SHIRE, one of the largeſt counties of Scotland, is ſituated on the weſtern ſide of that part of the kingdom, having numerous bays of the Atlantic ocean to the weſt, the counties of Perth and Argyle on the ſouth, Roſsſhire and part of Moray Frith on the north, and the ſhires of Moray, Elgin, and Aberdeen on the eaſt. The area thus incloſed comprizes a variety of diſtricts, reſpectively named Badenoch, Lochabar, Glenelg, Glengary, Glen-Morriſon, Glenſhiel, &c. Theſe are again divided into 31 pariſhes, and comprehended, in the year 1801, a population of 74,292 perſons. A conſiderable proportion of the Hebrides or Weſtern iſles is alſo annexed to it; particularly the iſles of Sky, Harris, North and South Uiſt, Benbecula, Barra, and Eigg, and the ſmaller iſlets which are ſituated on its coaſts. The mainland, excluding the iſles, extends in length, from the point of Ariſaig on the weſt to that of Arderſeer on the eaſt, where Fort George is built, about ninety-two miles, and its greateſt breadth is nearly fifty. The county is divided into two almoſt equal parts by a valley running from ſouth-weſt to north-eaſt, parallel to the Grampians. This valley is called Glen-more-na-h'Alabin, or the "Great Glen of Albion;" and appears to be a deep fiſſure between the chains of enormous mountains which run in the ſame direction. The glen is, in the greater part of its length, filled with water; or is rather a long chain of lakes ſucceeding each other, and riſing but little above the level of the ſea; a circumſtance which has ſuggeſted the propriety of taking advantage of this valley to form the canal which is now executing acroſs the iſland, *viz.* the Caledonian canal. The freſh water lakes which form the chain from Inverneſs on the Moray Frith to the Sound of Mull below Fort William, are Loch Neſs, Loch Oich, and Loch Lochie. The diſtance, in a direct line, is little more than fifty miles, of which nearly thirty-ſix are occupied by theſe three lakes. The ſalt-water lochs, or arms of the ſea, which occupy the two extremities of the valley, are the Linnhe Loch, which advances from the ſound of Mull, on the weſt, to Fort William at the mouth of the Lochie, and the Moray Frith on the eaſt. The dimenſions of the canal are, in depth 20 feet, in width, at the bottom, 50 feet, at the top 110; the locks are 20 feet deep, 170 long, and 40 broad; frigates of 32 guns may be admitted.

Loch Lochie, the moſt weſtern of the freſh water lakes, is a fine piece of water, in length about fourteen miles, and from one to two in breadth. The mountains on each ſide are very ſteep, and in ſome parts covered with wood. The waters of this loch are chiefly derived from another to the northward, called Loch Archaig, which runs in a northern direction, ſixteen miles in length, and one in breadth. From it flows the river Archaig, which, after running about a mile, falls into the northern ſide of Loch Lochie. The river Lochie, which takes its riſe from this loch, runs weſtward, and falls into the ſea at Fort William; its length being about ten miles, and its medium breadth about two hundred feet. It is navigable by ſmall boats. Next to Loch Lochie, on the eaſtward, is Loch Oich, in length about three miles; its banks form a number of ſmall bays, and include ſome beautiful little iſlands. It gives riſe to the river Oich, which flows eaſtward, and ſoon falls into Loch Neſs. This lake is twenty-two miles long, and from one to two and a half broad; its depth in the middle being from ſixty to one hundred and thirty five fathoms. It ſometimes, eſpecially after long-continued rains, riſes eight or ten feet perpendicularly above low-water mark. The water poſſeſſes a peculiar quality; it never freezes in the ſevereſt winter, and in froſty weather is covered with a thick miſt, which has the appearance of ſmoke. At the time of the great earthquake at Liſbon, Nov. 1, 1755, the water of Loch Neſs was agitated in an extraordinary manner. It roſe rapidly, and flowed up the lake from eaſt to weſt with amazing impetuoſity; the waves being carried more than two hundred yards up the river Oich, breaking on its banks five feet above the level of the river. It continued ebbing and flowing for about an hour; when a wave, much greater than the preceding, terminated the commotion, overflowing the north bank of the lake to the extent of thirty feet. From the eaſtern extremity of Loch Neſs, riſes the river of that name, which, running in an eaſterly direction for ſix miles, falls into the Moray Frith at the town of Inverneſs, of which its eſtuary forms the harbour. This chain of rivers and lakes was made the track of a ſeries of forts, when the Engliſh government was endeavouring to ſubdue the ariſtocracy of the Highlands, and to reduce this mountainous territory under the dominion of law. The waters which fall into the eaſtern part of the chain of lakes, that is, below the head of Loch Oich, come chiefly from the ſouth; the Tarff, the Errick, and the Foyers, and a variety of other torrents, which deſcend from the mountains, where great numbers of lakes are found. The Foyers is remarkable for its celebrated falls. This river takes its riſe among the lofty mountains of Boleſkine and Abertarff, and pouring through the vale of Floyers, falls into Loch Neſs nearly mid-way between the eaſtern and weſtern extremities of that lake. The falls of Floyers are accurately deſcribed by Dr. Garnet in his Tour through Scotland. Reſpecting the upper fall, he ſtates that "from the arch of the bridge to the ſurface of the water, after the loweſt part of the fall, is 200 feet. Height of the fall 70 feet." Of the lower fall, diſtant from the former nearly half a mile, he ſays, "its height, in one continued ſtream, is 207 feet. Down this precipice the river ruſhes, with a noiſe like thunder, into the abyſs below, forming an unbroken ſtream as white as ſnow. Burns has given a beautiful deſcription of this fall. It is undoubtedly one of the higheſt in the world, and the quantity of water is ſufficient to give it conſequence. The ſcene is awfully grand; the celebrated caſcade of Niagara in North America is not much more than half the height of this." The waters which fall into the eaſtern part of the lakes from the north, are chiefly the Garry, the Morriſton, the Enneric, and Coiltie. The lakes may be conſidered as two rivers, which receive the waters of the greateſt part of Inverneſsſhire, and convey them to the eaſtern and weſtern oceans. It is ſaid that pikes are not found in thoſe lochs in the Highlands whoſe waters deſcend into the Atlantic; whereas they are found in thoſe lakes whoſe waters flow eaſtward into the German ocean. The other principal rivers in this county are the Beaulie on the north, and the Spey on the ſouth. The firſt, which is chiefly compoſed of three leſſer ſtreams, runs about eight miles before it enters the Frith of Beaulie. The river Spey riſes towards the ſouth-weſtern part of the county out of a ſmall lake of the ſame name. It receives in its courſe a great variety of mountain torrents; and paſſes through the great fir-woods of Glenmore and Strathſpey; the trees of which are conveyed to the ocean by means of its waters. To the ſouth of Loch Spey is Loch Laggan, which is fifteen miles in length, and, with its environs, forms a large diſtrict in Badenoch. On the ſouth ſide is the Coill More, or Great Wood, the moſt conſiderable remnant of the great Caledonian foreſt. Several arms of the ſea advance into the weſtern ſhore of Inverneſsſhire;

verneſsſhire; ſuch as the ſound of Sky, on which are the barracks of Bernera; Loch Hourn, Loch Neviſh, Loch Morven, Loch Aylert, Loch Sheil, and Loch Eil; the two laſt form part of the boundary between this county and Argyleſhire. Our limits will not admit a particular deſcription of the ſcenery to be met with in this extenſive county; conſiſting, as the whole ſurface of it does, of lofty mountains, which, eſpecially towards the weſt, are piled above each other in towering magnificence; and between which are deep glens of a boundleſs variety of forms, each of which has its ſtream and its lake, and many of which abound in woods. In this county ſtands the celebrated Ben Nevis, the higheſt mountain in the iſland of Great Britain; the altitude being no leſs than 4370 feet. The ſummit of this mountain affords a wide extent of view, from the horizon of the ſea at the Moray Frith on the north-eaſt to the iſland of Colonſa on the ſouth-weſt. (See Ben-Nevis.) In the eaſtern part of the pariſh of Kilmanavaig a ſingular curioſity appears, *viz.* the remarkable parallel roads of Glenroy, which are to be ſeen on the declivities of lofty mountains extending for ſeven or eight miles on each ſide of the water of Roy. Dr. Anderſon, in his View of the Agriculture of Aberdeen, ſays, "theſe roads are carried forward along the ſides of the hills in a direction every where perfectly horizontal. Wherever they come to a vacuity in the hill, there they bend inwards till they find the natural level; and where they come to a river, inſtead of ſinking down to the level of its bottom, or requiring to have a bridge directly acroſs it, to raiſe the ground to its proper level, they turn up the bank of the river, keeping ſtill their horizontal direction, till they thus gradually reach the bottom of the ſtream, when, croſſing it, and altering their direction once more, they purſue the courſe of the ſtream on the oppoſite bank till they reach the ſtrath, when they proceed forward in the ſame horizontal direction as before." Theſe parallel terraces, however, are not works of art, but natural phenomena, as ſuggeſted by Mr. Jamieſon, profeſſor of natural hiſtory in the univerſity of Edinburgh, in his Account of the Mineralogy of Dumfriesſhire. Glenroy muſt, at a former period, have been a lake, the ſurface of whoſe waters ſtood ſome fathoms above the higheſt of the parallel roads. When the river was in flood, great quantities of mud came down into the lake, but chiefly at the ſides, where the current was ſlower than in the middle. At the lower part of the glen, however, the lake, after a lapſe of ages, muſt have burſt its barriers, ſo as to reduce the ſurface of the waters to the level of ſome fathoms above the ſecond terrace. The mud formerly depoſited would now become the uppermoſt terrace. This operation muſt have been thrice repeated, to produce the three parallel roads or terraces; and at laſt the river has burſt for itſelf the channel which it now occupies, and has converted this ancient lake into a glen or deep valley. About eight miles from the mouth of the river Nevis is a remarkable cavern, known by the name of Haigh-t'-Hovile, or "Samuel's Cave;" that being the patronymic of the family of Glenevis. This cave is in the heart of a rock, which appears to be about 70 feet high, and nearly as broad, leaning to the ſide of a mount ſouth of the river, and not far diſtant from it. The cave appears to have been formed by one part of the rock inclining towards the other, and forming between them an arched, irregular, ſhapeleſs kind of grotto, from ſix to twelve or fourteen feet in height, thirty in length, and eleven in breadth. Oppoſite the rock in which the cave is formed, on the other ſide of the river, is a beautiful caſcade, falling by a gradual ſlope from Ben-Nevis, upwards of half a mile before it reaches the bottom of the valley, where it unites its ſtreams with thoſe of the Nevis. About two miles farther up the Nevis, on the cave ſide, is another caſcade, which, after forcing its way through hills and rocks, has a fall 500 feet perpendicular. The whole vicinity, as may be expected from the number of mountains, abounds with caſcades, which produce variety of picturesque ſcenery.

Such is the rude wildneſs of the mountains, rocks, and glens, that it is not wonderful the mountain chiefs and inhabitants of this country ſo long retained their independence. Not more than twenty years ago, a formidable banditti infeſted Inverneſs-ſhire. They conſiſted of deſerters and robbers, leagued together for the annoyance of the country: but the military from the forts on the lakes being ſent againſt them, the leaders were taken, the aſſociation was broken, and tranquillity reſtored.

The north-eaſtern corner of this county, adjacent to the Moray frith, is to be conſidered as a part of the Lowlands of Scotland; but all the reſt of the county belongs to the Highlands. The low country contiguous to Inverneſs is, upon the whole, well cultivated. The reſt of the eaſtern coaſt enjoys a drier climate than is to be found in the weſt. Conſiderable quantities of wheat are ſown here, together with barley, oats, and peas. Potatoes are raiſed in great abundance, and conſtitute the principal food of the poorer claſs of inhabitants. Some rye is ſown, generally mixed with oats, which gives a ſoftneſs to the oat-bread of this country. In the upper parts, and in every quarter where poſſeſſions remain on the ancient ſmall ſcale, agriculture is in a miſerable ſtate. In the remoteſt diſtricts, the harneſs of a horſe ſtill conſiſts of a bridle made of the twiſted twigs of birch; with a ſtick put under the horſe's tail, and tied with twigs, for a crupper: the ſaddle is a pad made of coarſe ſacking, faſtened with twiſted birch twigs, or hair ropes. The mountains and foreſts are inhabited by immenſe herds of red and roe deer, which roam in ſafety, in receſſes almoſt impenetrable to man: the alpine and common hare, and other game, are alſo abundant. The fir woods in Glenmore and Strathſpey, the property of the duke of Gordon and ſir James Grant, are ſuppoſed to be more extenſive than all the other natural woods in Scotland together. Indeed, in every quarter are conſiderable foreſts; and there are natural plantations of great extent near the ſeats of the different proprietors, on the ſea-coaſt or lakes. In the pariſh of Kilmalie alone, near Fort William, the wood-lands are eſtimated at about 14,000 acres. The trees that grow naturally are oak, fir, birch, aſh, mountain-aſh, holly, elm, wild geen, hazle, and the Scottiſh poplar: thoſe planted are larix, ſpruce, ſilver fir, beech, plane, and fruit trees. Lime-ſtone, approaching to the nature of marble, is found in every diſtrict of the county. In Lochaber, near the farm-houſes of Ballachuliſh, is a lime-ſtone or marble rock of an aſhen-grey colour, and of a fine regular grain or texture, capable of being raiſed in blocks or ſlabs of any ſize, and ſuſceptible of a fine poliſh. This ſingular rock is ſprinkled throughout with grains and ſpecks of bright mundic or pyrites, and of lead-ore of a fine texture, which appears to be rich in ſilver. In the farm of Blarmacfuildach, belonging to the duke of Gordon, about three miles to the ſouth of Fort William, in the bed of a river, is a very peculiar kind of marble, conſiſting of a black ground, flowered with white. This ſtone is of a fine cloſe grain, but not very hard; the flowering is light and elegant, like fine needle-work. Many of the mountains are compoſed of reddiſh granite. In the pariſh of Kingurie a rich vein of ſilver was diſcovered, but could never be ſucceſsfully wrought; and in other places, veins of lead, with ſilver intermixed, have been found. Iron ore has alſo been diſcovered, but not in ſufficient quantity to make it an object of manufacture.

This county contains many veſtiges of antiquity. In various parts are to be ſeen remains of Druidical temples. At Corymony, in the northern part of the county, is one in which the middle of the circle is occupied by a cairn of looſe ſtones, on the ſummit of which is one very large ſtone. Such temples are alſo found in the ſouthern parts. Sometimes each great ſtanding ſtone is ſupported by two other large ſtones buried under ground; ſo that where there is a ſingle circle above, there is a double one beneath.

In the pariſh of Kilmanavaig is the ruined caſtle of Inverlochy. There was, at one time, a thriving borough of the ſame name adjacent to this building, which ſome of the old Scottiſh hiſtorians call the emporium of the weſt of Scotland; but of this borough there are no other indications than ſome pavement in different places, which were probably the ſtreets of it. The caſtle has ſurvived the borough, and now ſtands alone, a monument of ancient magnificence. It is a quadrangular building, with round towers at the angles, meaſuring thirty yards every way within the walls. The towers and ramparts are built of ſtone and lime, nine feet thick at the bottom, and eight feet above. It was ſurrounded by a ditch, from thirty to forty feet in breadth, which was ſupplied with water from the river. The whole building, including the towers, covers about 1600 ſquare yards; and within the outſide of the ditch are contained nearly 7000 ſquare yards. At the great gate, between the ſouth and eaſt towers, are ſome remains of a draw-bridge. This gate is nine feet wide, and arched to the ſame height, with abutments of fourteen feet at each ſide. Directly oppoſite was another gate, of nearly the ſame ſize, which probably was deſigned as a water gate. Beſides theſe two principal entries, three of the towers were provided with ſally ports; one from each, well contrived, and cloſe to the arrow-holes, which alſo flanked and defended them. There is a tradition that this caſtle was once a royal reſidence; and that the league betwixt Charles the Great of France and Achaius king of the Scots was ſigned there on the part of the Scottiſh monarch, about the end of the eighth century. Within ſight of Inverlochy caſtle ſtood that of Dundhairdghall, on the ſummit of a hill about 400 yards in height. The traces of the building are ſtill viſible; and the part now remaining runs round the whole top of the hill, the compaſs of which is 150 yards. The part of the hall that now remains is no more than from two to four feet high, and is vitrified all round. On the northern banks of the river Lochie are the remains of an ancient caſtle, which, before the invention of fire-arms, was certainly a very ſtrong place. It ſtands on the brink of a frightful precipice, at the bottom of which the river forces its paſſage through rocks, and has been ſecured on the land-ſide by a ditch and draw-bridge. The traces of the ditch are ſtill viſible. The caſtle of Urquhart, now fallen to decay, ſtands on a rocky promontory, on the weſt ſide of Loch Neſs, of which it commands a view from one end to the other. The loch waſhes the eaſt ſide of the building, and the other three ſides were fortified with a ſtrong rampart, a ditch, and a draw-bridge. Within the walls were accommodations for five or ſix hundred men. This caſtle was a royal fort, and was granted by king James IV. in 1509, with the eſtate and lordſhip of Urquhart, to the laird of Grant, in whoſe family they ſtill continue. Along the chain of lochs are three forts, or military ſtations, deſigned to keep the Highlanders in ſubjection, Fort George, Fort Auguſtus, and Fort William. The firſt is placed at the eaſtern extremity of the lakes, and prevents all entrance up the Moray frith: it is a regular fortification, and covers ten Scottiſh acres. Fort Auguſtus is ſituated in the middle of the chain: it has four baſtions, and barracks for the accommodation of four hundred ſoldiers, with proper lodgings for the officers. On the weſt, to check any attempts from that quarter, ſtands Fort William, which is of a triangular form, with two baſtions: this has fifteen twelve-pounders, ſome mortars, and a conſiderable armoury. It was built during the uſurpation of Cromwell, under the direction of general Monk; and was then more extenſive than at preſent, as it contained two thouſand effective troops.

The remains of old watch-towers, or very ſmall fortreſſes, are to be ſeen on the ſummits of many of the mountains. In the pariſh of Laggan is a rock, upwards of an hundred yards perpendicular height, and of very difficult acceſs; yet on the very ſummit are conſiderable remains of a fortification. The area is about 500 feet by 253; the wall is upwards of fifteen feet in thickneſs. In the middle of Coil-More, the great wood on the ſouth ſide of Loch Erich, is a place called Aiſt-Merigie, or “the height on which a ſtandard was wont to be erected.” It appears to have been held ſacred from the moſt remote antiquity, and is ſaid to be the burial-place of ſeven kings of the ancient Caledonians. On a moor in Badenoch, are the remains of a ſquare encampment; which has ſuggeſted the idea that the Romans advanced into this mountainous diſtrict: in clearing ſome adjacent ground ſome years ago, an urn was found full of aſhes; alſo a Roman tripod.

In the pariſh of Kilmorack, are the ruins of the ancient priory of Beauly, which was founded in the year 1230, by James Biſſet, of Lovat. In the pariſh of Petty are two circular earthen mounds; one cloſe by the church-yard, the other about 200 yards weſt from it. Theſe are evidently artificial, the outſide being ſod or turf, incloſing ſand or light earth. The tradition concerning them is, that they were places for the adminiſtration of juſtice, as their name imports, being called Tom-inhe'it, “The Court-Hill.” In the ſame pariſh are the ruins of the Caſtle Stewart, a large old houſe, belonging to the earl of Moray. In the eaſtern corner of the county, near the Moray Frith, is Culloden-Moor, the ſcene of the memorable battle which terminated the rebellion in 1745.

The modern buildings of this county worthy of obſervation are but few, and chiefly to be found in the north-eaſtern corner. The moſt diſtinguiſhed reſidence in the county is Caſtle Grant, the ſeat of ſir James Grant, bart. It is ſituated on an eminence in the pariſh of Cromdale, on the north ſide of the Spey: the apartments contain a great variety of portraits and other paintings.

The iſlands of Barray, Benbecula, Egg, Harris, St. Kilda, Sky, North and South Uiſt, which are annexed to, or connected with, this county, will be found deſcribed under their reſpective names. Beauties of Scotland.

INVERSE, is applied to a manner of working the rule of three, or proportion, which ſeems to go backward, or contrarily to the order of the common and direct rule.

In the rule of three direct, the firſt term is to the ſecond as the third is to the fourth; that is, if the ſecond be greater than the third, or leſs than the firſt, in any proportion, the fourth is leſs than the third in the ſame proportion. But in the inverſe rule the fourth term is as much greater than the third, as the ſecond is leſs than the firſt.

In the inverſe rule, therefore, the proportion is not as the firſt is to the ſecond ſo is the third to the fourth; but as the fourth is to the firſt, ſo is the ſecond to the third. For inſtance, in the direct rule we ſay, if three yards of tapeſtry coſt twenty pounds, how much will ſix coſt? The anſwer is, forty. In the inverſe rule we ſay, if twenty working men make ten yards in four days, in how many days will forty do it? The anſwer to this, is in two days. See Rule *of Three.*

Inverse *Method of Fluxions*. See Fluxions.

Inverse *Planting*. See Planting.

Inverse *Proportion*. See Proportion.

INVERSION, the act whereby any thing is inverted, or turned backwards.

Problems in geometry and arithmetic are often proved by inverſion: that is, by a contrary rule, or operation.

Inversion, in *Grammar*, is where the words of a phraſe are ranged in a manner not ſo natural as they might be. For an inſtance: "Of all vices, the moſt abominable, and that which leaſt becomes a man, is impurity." Here is an inverſion; the natural order being this: impurity is the moſt abominable of all vices, and that which leaſt becomes a man.

An inverſion is not always diſagreeable, but ſometimes has a good effect.

Inversion, in *Muſic*, is often applied to the complements or ſupplements of intervals to the major eighth or octave; thus the major ſixth is the inverſion of the minor third, the minor ſixth the inverſion of the major third, &c. Intervals which are the inverſion of each other, always have one term of their ratios common to each, and the other terms, are one the double of the other: thus $\frac{3}{5}$ and $\frac{5}{6}$, $\frac{5}{8}$ and $\frac{4}{5}$, are inverſions of each other.

Inversion, in *Rhetoric*, is a method of confutation, by which the orator ſhews that the reaſons offered by the oppoſite party make for him. So when Cæcilius urged that the province of accuſing Verres ought to be granted to him, and not to Cicero, becauſe he had been his treaſurer in Sicily, at the time when thoſe crimes were committed with which he was charged, and conſequently knew moſt of that affair; Cicero turns the argument upon him, and ſhews, that for that very reaſon, he was the moſt unfit of any man to be intruſted with his proſecution; ſince having been concerned with him in his crimes, he would certainly do all in his power to conceal or leſſen them. (See Cæcil. c. 18.) Again, ſometimes the charge is acknowledged, but the crime ſhifted off to another. Thus when Sextius was accuſed of ſedition, becauſe he had got together a body of gladiators, and brought them into the forum, where a warm engagement happened between them and Clodius's faction; Cicero owns the fact, but charges the crime of ſedition upon Clodius's party in being the aggreſſors. (Pro Sext. c. 36.) Another method made uſe of for the ſame purpoſe is to alleviate the charge, and take off the force of it by ſhewing, that the thing was not done with that intention, which the adverſary inſinuates. Thus Cicero in his defence of king Dejotarus (cap. 8.) owns that he had raiſed ſome forces, though not to invade the Roman territories, as had been alleged, but only to defend his own borders, and ſend aid to the Roman generals. See Confutation.

Inversion *of the Uterus*. See Prolapsus *Uteri*.

INVERTED Arch, in *Engineery*, is an arch of ſtone or brick, with the crown downwards, turned in the bottoms of the locks of canals, and in the bottoms of tunnels, and of aqueducts and other bridges whenever the bottom is ſoft or liable to give way or tear up, for ſecuring the ſide walls: in locks and tunnels, the inverted arch ſhould never be omitted. See the account of conſtructing theſe in our article Canal.

Inverted *Creſcent, Point, Volt*. See the ſubſtantives.

Inverted, in *Natural Hiſtory*, is a term applied to ſuch reliquia or extraneous foſſils as have a nucleus of ſtony matter inverted or covered by the reliquium.

INVERURY, in *Geography*, an ancient royal borough in Aberdeenſhire, Scotland, is ſituated on the point of land formed by the confluence of the rivers Don and Ury. It is ſaid to have been made a royal borough by king Robert Bruce, on occaſion of a victory obtained by him, in this vicinity, over the Engliſh forces under Comyn, earl of Buchan. The oldeſt charter, however, extant, is one granted by queen Mary; the preamble of which ſtates, that "Inverury had been a royal borough time immemorial, but the charter of its erection had been loſt during the civil wars." The town is ſmall, and its increaſe and improvement have been retarded by the peculiarity of its ſituation; it being inacceſſible, excepting one ſide, with boats, and even that mode not always practicable. The ſpirited exertions of the earl of Kintore and the provoſt, Dr. Thom, have, in a great meaſure, removed this obſtacle, by promoting a public ſubſcription for building an elegant bridge over the Don, at the expence of 2000*l.*: this was completed in 1791. The borough is governed by a provoſt, three bailiffs, a dean of guild, a treaſurer, and thirteen counſellors. The return to parliament in the year 1801, ſtated the number of houſes to be 194, inhabited by 783 perſons, of whom 641 were employed in agriculture. Inverury does not appear ever to have been a place of trade.

INVESTIGATION properly denotes the ſearching or finding any thing out, by the tracts, or prints of the feet.

Hence, mathematicians, ſchoolmen, and grammarians, came to uſe them in their reſpective reſearches.

Investigation *of a Theme*, is the art, method, or manner of finding the themes of verbs, that is, the primitive tenſe, mood, and perſon, of any verb, far removed from its ſource. To underſtand a Greek author, it is abſolutely neceſſary to be well acquainted with the method of inveſtigating a theme. This theme, in the Greek tongue, is the preſent tenſe of the indicative mood.

Clenard was the firſt who introduced this term into grammar: he gives the title *inveſtigatio thematis* to that part where he teaches the manner of finding whence any perſon, or tenſe, or verb, proceeds, and of reducing it to its primitive word, or finding its indicative.

INVESTING, the act of conferring on any one the right or property of a fee, dignity, or office, or of ratifying and confirming what has been obtained elſewhere.

The emperors pretend to a right of inveſting ſeveral princes both in Germany and Italy. There was formerly a particular ceremony for the inveſting of biſhops. After the election of a knight of the Garter, he is inveſted by the ſovereign with two principal enſigns of the order, the Garter and George. Before his inſtallation he is alſo inveſted with the habit of the order.

Investing, in the *Military Art*, ſignifies the opening a ſiege, and the encamping of an army round the place; to block up its avenues, and prevent all ingreſs and egreſs. In order to do this effectually, the general in chief of the approaching army muſt detach a large body of cavalry, together with the different corps of dragoons, under the command of a lieutenant-general, for the purpoſe of regularly inveſting the place. Sometimes a place is partially inveſted, for the ſole purpoſe of diverting the enemy's attention from the real object, and of inducing him to weaken the garriſon by detaching it to different quarters.

Investing, in *Common Law*, ſignifies the putting in poſſeſſion. A tenant is inveſted by giving him a verge, or rod, into his hands, and adminiſtering an oath.

Others define it thus: *inveſtire eſt in ſuum jus aliquem introducere*, to give livery of ſeiſin, or poſſeſſion. See LIVERY and SEISIN. See alſo FEOFFMENT.

INVESTITURE, is uſed both for the right, and the act, of inveſting a tenant, or vaſſal; that is, of receiving the faith and homage by which a vaſſal becomes ſeiſed, and poſſeſſed of a fee, by his lord. See FEE.

Inveſtitures, in their original riſe, were probably intended to demonſtrate in conquered countries the actual poſſeſſion of the lord; and that he did not grant a bare litigious right, which the ſoldier was ill qualified to proſecute, but a peaceable and firm poſſeſſion. And at a time, when writing was ſeldom practiſed, a mere oral gift, at a diſtance from the ſpot that was given, was not likely to be either long or accurately retained in the memory of byſtanders, who were very little intereſted in the grant. Afterwards they were retained as a public and notorious act, that the country might take notice of and teſtify the tranſfer of the eſtate, and that ſuch as claimed title by other means, might know againſt whom to bring their actions.

Inveſtiture was anciently performed by rehearſing a formula of words; afterwards by the delivery of ſuch things as had the neareſt reſemblance to what was transferred. Thus, land paſſed by the delivery of a turf: and to ſhew the trees were transferred at the ſame time, a bough was cut and delivered along with it.

In after-times, the things by which inveſtitures were made were not ſo ſtrictly obſerved. Many were inveſted by the delivery of a ſtaff, a glove, a knife, a piece of a cloak, of a ſtrap, and a girdle: or by pricking the thumb, by giving the keys, a ſpit, a blow, a ring, a turf, a bough, a ſtraw, &c. The inveſtiture of a kingdom or lordſhip, was performed by a ſtandard, a banner, a cap, a ſword, a bow, arrows, ſpurs, &c.

The ſymbols were ſometimes preſerved in the repoſitories of the houſes, and were annexed to the titles.

INVESTITURES were alſo uſed with reſpect to ſpiritual benefices. Theſe were frequently performed by delivering the croſier and paſtoral ring.

The kings of England and France, the emperor of Germany, &c. had formerly this right; ſo that on the death of a prelate, his clergy ſent the croſier, &c. to their ſovereign, to be uſed at the ceremony of inveſting his ſucceſſor. It is not certain when this cuſtom began; Cardinal Humbert places the commencement of it in the reign of Otho the Great: and it appears, that in the ninth century, the greater part of the European princes made no oppoſition to the right of electing the biſhops, which was both claimed and exerciſed by the clergy and the people. The firſt who diſputed this privilege with the emperors and ſovereign princes, was Gregory VII.; he excommunicated the emperor Henry IV. and forbade all eccleſiaſtics, under pain of excommunication, to receive inveſtiture at the hands of ſecular princes. This occaſioned a long and bloody war; the civil and eccleſiaſtical powers being divided into two great factions, of which one maintained the rights of the emperor, while the other ſeconded the ambitious views of the pontiff. The laws of Gregory for the abolition of inveſtitures were confirmed and renewed by Victor III. and Urban II. the laſt of whom not only confirmed the laws and anathemas of Gregory, in a council aſſembled at Placentia in the year 1095; but publiſhed alſo a prohibitory law in the council of Clermont, forbidding the biſhops and the reſt of the clergy to take the oath of allegiance to their reſpective ſovereigns. Paſcal II. in a council aſſembled at Rome, A.D. 1102, renewed the decrees of his predeceſſors againſt inveſtitures and the excommunications they had thundered out againſt Henry IV. Paſcal, however, was obliged, in 1111, to confirm Henry V. in the right of giving inveſtitures; but repenting what he had done, he aſſembled a council in the church at Lateran, in 1112, which ſolemnly annulled his treaty with the emperor, who was excommunicated in many ſynods and councils, both in France and Germany. At length, however, Calixtus II. engaged him to renounce inveſtiture on certain conditions, and peace was concluded between the emperor and the pope's legates, at a general diet held at Worms, A.D. 1122. This convention was confirmed the following year in the general council of Lateran, and remains ſtill in force.

INVISCATIO, a ſticking of the eye-lids together.

INULA, in *Botany*, ſo named by Pliny. This appellation is contracted or corrupted, ſays profeſſor Martyn, from *Helenium*, Dict. ελενιον; fabled to have ſprung from the tears of Helen. Linn. Gen. 426. Schreb. 557. Willd. Sp. Pl. v. 3. 2089. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 890. Ait. Hort. Kew. v. 3. 222. Juſſ. 181. Lamarck Dict. v. 3. 253. Illuſtr. t. 680. Gærtn. t. 170. (Enula; Cæſalp. and Magnol.—Helenium; Gerard. em. 793. Vaill. Mem. Acad. Paris. 1720.) Claſs and order, *Syngeneſia Polygamia Superflua*. Nat. Ord. *Compoſitæ Diſcoideæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Common calyx* imbricated; ſcales looſe, ſpreading, the exterior ones larger, of equal length. *Cor.* compound, radiated, broad; *florets* of the diſk all perfect, equal, very numerous, funnel-ſhaped, with a five cleft ſtraightiſh limb: thoſe of the radius female, ligulate, numerous, crowded together, linear, entire. *Stam.* (in the tubular florets) Filaments five, thread-ſhaped, ſhort; anthers cylindrical, compoſed of five ſmaller, linear, conjoined ones; each ending below in two ſtraight briſtles, the length of the filaments. *Piſt.* (in the tubular florets) Germen long; ſtyle thread-ſhaped, the length of the ſtamens; ſtigma bifid, ſomewhat erect. The female or ligulate florets differ in having the ſtyle cloven but half way down, and the ſtigma quite erect. *Peric.* none, except the unchanged calyx. *Seeds* in the florets of the diſk as well as the radius, ſolitary, linear, quadrangular. *Down* capillary, the length of the ſeeds. *Recept.* almoſt naked, flat.

Eſſ. Ch. Receptacle nearly naked. Down ſimple. Calyx imbricated. Florets of the radius very numerous, linear. anthers with two briſtles at the baſe.

Obſ. This genus differs not only from *Aſter*, but from moſt others, in having the anthers terminated below by ten briſtles, though this character is not apparent in all the ſpecies. *Inula* is an extenſive genus, Willdenow having enumerated thirty-five ſpecies, from which number we ſelect for deſcription the only four which are natives of this country: theſe are,

1. I. *Helenium*, Elecampane. Linn. Sp. Pl. 1236. Engl. Bot. t. 1546. Woodv. Med. Bot. v. 2. t. 108.—"Leaves claſping the ſtem, ovate, rugged, downy beneath. Scales of the calyx ovate."—Found in moiſt rich paſtures and meadows in various parts of Britain, but not common, flowering in July and Auguſt. *Stems* about four feet high, leafy, downy, branched in the upper part. *Leaves* ovate, ſlightly ſerrated, veiny, downy beneath. *Flowers* large, terminal, of a fine golden yellow.

The ancients entertained a very high opinion of the virtues of this plant, and "in gardens it is ſtill cultivated occaſionally, for the ſake of its root, which is perennial, large and fleſhy, abounding with mucilage, combined with an aromatic,

matic, bitter flavour, and ſome acrimony. Theſe qualities render it uſeful to promote expectoration.

Horace was acquainted with its fame, for we find it celebrated by that poet in two of the ſatires in his ſecond book.

> ——————— cum rapula plenus
> Atque acidas mavult *inulas*. Sat. 2. v. 44.

And alſo in ſat. 8. v. 51.

> Erucas virides, *inulas* ego primus amaras
> Monſtravi incoquere.———

2. I. *dyſenterica*. Common Fleabane. Linn. Sp. Pl. 1237. Engl. Bot. t. 1115. Curt. Lond. faſc. 3. t. 56.—"Leaves oblong, claſping the ſtem with their heart-ſhaped baſe, downy. Stem woolly, panicled. Calyx-ſcales briſtle-ſhaped, hairy."—Native of clear ditches and moiſt places, flowering in Auguſt.—*Root* creeping and perennial. *Stem* branched in a panicled or corymboſe manner. *Leaves* waved and ſlightly toothed at their margin; their under ſide denſely clothed with hoary down. *Flowers* numerous, terminal, of a full bright yellow. The herb is viſcid to the touch, exhaling a peculiar ſharpiſh aromatic ſcent, not unlike that of a peach.

Mr. Relhan mentions a variety of this ſpecies with very ſhort rays, and Linnæus, in the *Flora Suecica*, obſerves that the Ruſſians were cured of the bloody flux by this plant, in their expedition againſt the Perſians, whence its ſpecific name.

3. I. *pulicaria*. Small Fleabane. Linn. Sp. Pl. 1238. Engl. Bot. t. 1196. Curt. Lond. faſc. 3. t. 57.—"Leaves claſping the ſtem, waved. Stem much branched, hairy. Flowers hemiſpherical, with a very ſhort radius."—Found on moiſt ſandy heaths and commons, where water has ſtagnated, and flowering late in autumn.—*Root* annual, tapering and branched. *Stem* generally erect, ſometimes ſpreading or decumbent, zigzag, angular. *Leaves* lanceolate or oblong, hairy on both ſides. *Flowers* ſolitary, of a pale dull yellow. There is a variety of this which has ſcarcely any flowers of the radius.

4. I. *crithmoides*. Samphire-leaved Fleabane. Linn. Sp. Pl. 1240. Engl. Bot. t. 68.—"Leaves linear, fleſhy, generally three-pointed. Calyx ſmooth."—This is a maritime plant, which thrives in a muddy ſoil, and is rather ſcarce. It flowers in Auguſt.—*Root* perennial, fibrous. *Leaves* alternate, ſmooth and ſucculent, ſalt to the taſte, thoſe about the centre of the *ſtem* generally furniſhed with a tooth on each ſide of the tip. *Flower* ſolitary, very handſome, having yellow rays and an orange diſk. *Down* rough, bluſh-coloured.

The remaining ſpecies are *I. odora*, *Oculus Chriſti*, *britannica*, *indica*, *arabica*, *ſpiræifolia*, *japonica*, *ſquarroſa*, *viſcoſa*, *ſalicina*, *grandiflora*, *glanduloſa*, *bubonium*, *hirta*, *ſuaveolens*, *Vaillantii*, *mariana*, *dubia*, *orientalis*, *germanica*, *enſifolia*, *provincialis*, *montana*, *æſtuans*, *bifrons*, *cærulea*, *aromatica*, *ſaturejoides*, *pinifolia*, *fœtida*.

Inula, in *Gardening*, comprehends plants of the herbaceous and ſhrubby kinds; of which the ſpecies principally cultivated are the common inula or elecampane (I. helenium); the creeping-rooted inula (I. britannica); the willow-leaved inula (I. ſalicina); the canary inula (I. canarienſis); the ſavory-leaved inula (I. ſatureioides); and the ſhrubby inula (I. fruticoſa.)

There are ſome other ſorts that may likewiſe be cultivated.

Method of Culture.—The firſt of theſe ſorts may be propagated by ſeeds ſown in autumn, ſoon after they are ripe, on a warm, loamy, rather moiſt border. The plants ſhould be tranſplanted to the places where they are to grow in the following autumn.

But the common practice is to increaſe it by offſets, which, when taken from the old roots carefully, with a bud or eye to each, take root eaſily: the beſt ſeaſon is the autumn, as ſoon as the leaves begin to decay; planting them in rows about a foot aſunder, and nine or ten inches diſtance in the rows. The following ſpring the ground ſhould be kept clean from weeds, and be ſlightly dug over in the autumn following. The roots will be fit for uſe after two years growth, but will abide many years if permitted to ſtand.

The two following ſorts may be increaſed by parting the roots, and planting them in the autumn, in the borders or other places where they are to remain. They ſhould not be removed oftener than every three years.

The fourth and fifth ſorts may be raiſed by planting cuttings of the branches, in the ſummer ſeaſon, in pots of light earth, in ſhady borders. They muſt be removed into ſhelter in autumn, but ſhould have as much free air as poſſible at all times, when the weather is mild. In cold weather the firſt ſhould have but very little water, as the ſtalks and leaves, being ſucculent, are very apt to rot. In ſummer they ſhould be placed abroad with other hardy exotic plants, in a ſheltered ſituation.

The laſt ſort is propagated by ſeeds procured from places where it grows naturally. Theſe muſt be ſown in pots, or upon a hot-bed, and when the plants are fit to remove, be each put into a ſmall pot filled with light earth, and plunged into a freſh hot-bed; treating them in the ſame manner as other ſimilar tender plants. It requires to be kept conſtantly in the ſtove.

The firſt ſort may be cultivated for the medicinal uſe of the roots, or for ornament, in large borders.

The two following ſorts may have places in the ſame way.

The fourth and fifth kinds afford variety among other potted green-houſe plants, and the laſt among ſtove-plants.

Inula *Helenium*, in the *Materia Medica*. See Elecampane.

INVOCATION, in *Theology*, an act whereby we adore God, and call on him for his aſſiſtance.

The Romaniſts alſo practiſe invocation of ſaints, begging them to intercede with God in their behalf. This is one of the grand articles of diſpute between the Romaniſts and the Reformed.

Invocation, in *Poetry*, an addreſs at the beginning of a poem, wherein the poet calls for the aſſiſtance of ſome god, particularly of his Muſe, or the deity of poetry. See Muses.

This part is abſolutely neceſſary in an epic poem, becauſe the poet relates things which he could not be ſuppoſed to know, unleſs ſome deity inſpired him. Beſides, this ſerves his readers as an example of piety and devotion, which ought to be the foundation of this whole work. To theſe it may be added, that the gods themſelves are to have a part in the action; and it is not decent he ſhould ſet them to work, without firſt aſking them leave.

Indeed, in the courſe of an epic poem, there are uſually ſeveral invocations; particularly where any thing extraordinary, or miraculous, comes to be related; as that when Virgil deſcribes the metamorphoſis of Æneas's fleet into ſea nymphs: but the firſt invocation is always the moſt conſiderable.

In the invocation Boſſu conſiders two things: the firſt is what the poet requeſts; the ſecond, to what deity he addreſſes his requeſt. As to the firſt, Homer has joined the invocation ſo cloſely to the propoſition, that he ſeems to invoke his Muſe for the whole work. But Virgil, on the contrary, only requeſts his Muſe to furniſh him with a part of his ſubject; and even mentions what particular part it is he deſires. After propoſing his matter in all its extent, he begs the Muſe to acquaint him with the cauſe of it. See Proposition.

As to the deity invoked, the ſame author obſerves, that it muſt always be, either the divinity that preſides over poetry in general, or that which preſides over the particular ſubject of the work. Ovid's invocation, in the Metamorphoſes, is of the latter kind; and ſo is that of Lucretius; thoſe of Homer and Virgil are of the former kind; they only invoke the Muſes; and thus they diſtinguiſh between the divinities who preſide over poetry, and thoſe who preſide over the actions of the poem, and have parts in it.

By the way, it may be obſerved, that the deities invoked are not looked on, even by the poets themſelves, as divine perſonages from whom they expect any real aſſiſtance. Under the name of Muſe they wiſh for the genius of poetry, and for all the qualities neceſſary for the execution of their deſign. Theſe are mere allegories, or manners of expreſſing themſelves poetically; juſt as when they perſonify and make gods of ſleep, of reſt, fame, and other natural and moral things. And thus the Muſes come to be of all ages, countries, and religions; there are Pagan, Chriſtian, Greek, Latin, and Engliſh Muſes.

INVOICE, or Invoyce, a liſt, or account of commodities, with their value, cuſtoms, proviſion, charges, &c. ſent by a merchant to his factor, or correſpondent, in another country.

Invoice, *Book of.* See Book.

INVOLUCELLUM, in *Botany.* See the following article.

INVOLUCRUM, a term adopted by Linnæus, at the ſuggeſtion of Artedi, for the row of ſmall leaves found at the baſe of the umbels in moſt umbelliferous plants. That of the general umbel is termed the *General Involucrum;* that of each partial one a *Partial Involucrum,* in Latin *Involucellum.* The ſame word is uſed for what might be more properly called Bracteas in *Euphorbia* and other genera, and Linnæus has probably erred in reckoning the *involucrum* a ſpecies of calyx in any inſtance. In ferns, however, we retain this appellation for the membranous covering of their fructification, in preference to a newly invented term *induſium.*

INVOLUNTARY *Diſcharge of Urine.* See Incontinence *of Urine.*

Involuntary *Motion.* See Motion.

INVOLUTE Curve, in the *Higher Geometry.* See Evolute.

INVOLUTION, in *Algebra,* the raiſing any quantity from its root to any height, or power, aſſigned. See Power.

Any quantity multiplied by itſelf, the product is the ſquare of that quantity; the ſquare being again multiplied by the quantity, produces its cube. See Square and Cube.

Thus if $a + b$ were to be raiſed to its ſecond power, it will produce $a\,a + 2\,a\,b + b\,b$.

And if it be involved again, or if that ſquare be multiplied by the root, the cube or third power will be produced; *viz.* $a\,a\,a + 3\,a\,a\,b + 3\,a\,b\,b + b\,b\,b$, &c. ſo that the involution of any compound quantity is performed by a continual multiplication of it by itſelf: if the powers of $a - b$ are required, they will be found the ſame as thoſe of $a + b$, except that the terms in which the exponent of b is an odd number will be negative, becauſe an odd number of multiplications of a negative produce a negative; or, in general, the terms of any power of $a - b$ are poſitive and negative by turns. See Binomial *Theorem.*

If a quantity, conſiſting of three or more terms, is to be involved, it may be diſtinguiſhed into two parts, which are to be raiſed to any power in the ſame manner as a binomial: and then by the ſame rules, the value of theſe compound parts may be ſubſtituted in their ſtead: thus, $\overline{a + b + c}|^2 = \overline{a + b + c}|^2 = \overline{a + b}|^2 + 2\,c \times \overline{a + b} + c^2 = a^2 + 2\,a\,b + b^2 + 2\,a\,c + 2\,b\,c + c^2$. And $\overline{a + b + c}|^3 = \overline{a + b}|^3 + 3\,c \times \overline{a + b}|^2 + 3\,c^2 \times \overline{a + b} + c^3 = a^3 + 3\,a^2\,b + 3\,a\,b^2 + b^3 + 3\,a^2\,c + 6\,a\,b\,c + 3\,b^2\,c + 3\,a\,c^2 + 3\,b\,c^2 + c^3$. The reverſe of involution is called *evolution.* See Extraction *of* Roots, and Root.

JOACHIM, in *Biography,* a celebrated Italian monk, was born at Celico, near Coſenza, in the beginning of the 12th century. After he had received a common education, his father obtained for him a poſt at the court of Naples, in which he ſerved ſome time. After this he took the reſolution of viſiting the holy places in Paleſtine, left Naples, without communicating his deſign to his father, and reached Conſtantinople, where he made a ſhort ſtay. While in this city he was ſo alarmed at the extraordinary mortality produced by a peſtilential diſorder, that he made a vow to renounce the world, and, having aſſumed the habit of a hermit, proceeded barefoot on his journey. On his return he entered into the order of Ciſtercians, and founded ſeveral monaſteries, which he governed with great diſcretion. He was regarded by many of his contemporaries as a prophet, and ſeveral of his predictions were printed, in a book entitled "The Everlaſting Goſpel." He was author of other works, particularly of "A Harmony of the Old and New Teſtament." He died in the year 1202, at the age of 90. His followers wiſhed to perſuade the world that miracles were wrought at his tomb, and applied to the pope to canonize him, but this was rejected on account of the numerous errors contained in his works. Moreri. See Joachimites.

Joachim, George, a celebrated mathematician and aſtronomer in the 16th century, was born, in 1514, at Feldkirk, in the Tyrol. He was educated at Zurich, where he ſoon diſcovered a ſtrong inclination for mathematical purſuits, in the elements of which he was initiated at that place. Afterwards he went to Wittemburg, where he proſecuted his ſtudies with ardour and ſucceſs. In the year 1555 he was admitted to the degree of M. A., and in two years afterwards he was appointed joint profeſſor of the mathematics with Reinhold. He was a zealous and able defender of the Copernican ſyſtem of the world; went into Pruſſia, where he placed himſelf under the tuition of Copernicus himſelf, and became the editor of his great work, entitled "De Revolutionibus." While Joachim continued in Pruſſia, to render aſtronomical calculations more ready and accurate, he began an elaborate canon of ſines, tangents, and ſecants, to fifteen places of figures, and to every ten ſeconds of the quadrant. He did not live to accompliſh this great work, but the canon of ſines for every ten ſeconds, and for every ſingle ſecond in the firſt and laſt degree of the quadrant, computed by him, was publiſhed at Frankfort in 1613, by Pitiſcus; the larger work was perfected and publiſhed after his death in 1596, by his diſciple Valentine Otho. Joachim returned from Pruſſia in 1543, and was again admitted to his profeſſorſhip of mathematics at Wittemburg; he afterwards was elected to fill the mathematical chair at Leipſic. He died in 1576, in the ſixty-ſecond year of his age, leaving behind him "Narratio de Libris Revolutionum Copernici;" firſt publiſhed at Dantzic in 1540. He alſo compoſed and publiſhed "Ephemerides," according to the doctrine of Copernicus, till the year 1551. Moreri. Hutton.

JOACHIM, *St.*, in *Geography*, a town of South America, in the kingdom of Granada, on the Mata; 240 miles E. of Santa Fé de Bogota.—Alſo, a town of South America, in the province of Moxes; 150 miles N.N.E. of Trinidad.—Alſo, a town of Canada, on the river St. Lawrence. N. lat. 47° 5′. W. long. 70° 45′.

JOACHIM *de Omaguas*, *St.*, a town of South America, in the audience of Quito, on the river Amazons; 400 miles S.E. of Quito. S. lat. 4° 40′. W. long. 72° 30′.

JOACHIMITES, in *Eccleſiaſtical Hiſtory*, the name of a ſect, the followers of one Joachim, abbot of Flora, in Calabria, who was eſteemed a prophet while he lived, and left, at his death, ſeveral books of prophecies, contained in his Everlaſting Goſpel, commonly called the book of Joachim, beſides other works; which were condemned, in 1215, by the council of Lateran; and by the council of Arles, in 1260.

One of the ſpiritual friars, named Gerhard, belonging to the order of Franciſcans, undertook to explain the Everlaſting Goſpel of Joachim, in a book publiſhed in 1250, entitled "The Introduction to the Everlaſting Goſpel." In this work St. Francis is declared to be the angel mentioned in the Revelation, xiv. 6. who had promulgated the true and everlaſting goſpel of God: it is alſo aſſerted, that the goſpel of Chriſt was to be abrogated in 1260, and this new goſpel to be publiſhed in its room; and that the miniſters of this ſignal reformation were to be humble and barefooted friars, deſtitute of all worldly emolument. This abſurd book was ſuppreſſed by order of pope Alexander IV. in 1255, and at length publicly committed to the flames.

The Joachimites were particularly fond of certain ternaries: the Father, ſaid they, operated from the beginning till the coming of the Son; the Son from that time to theirs, *viz.* the year 1260; and the Holy Spirit then took it up, and was to operate in his turn. Hence they divided every thing that related to men, time, doctrine, and manner of living, into three claſſes, or ſtates, according to the three perſons in the Trinity; every one of which ſtates either had already, or was hereafter to ſucceed in its turn; and hence they called the diviſions *ternaries*.

The explication given by Joachim, of the Trinity, in oppoſition to Peter Lombard, which was conſidered by many as differing little from the Arian ſyſtem, procured the damnatory ſentence of his doctrine by Innocent III. in the council of Lateran; but notwithſtanding this papal ſentence Joachim has ſtill a conſiderable number of adherents and defenders, more eſpecially among thoſe of the Franciſcans, who are called Obſervants, or Friars obſervant.

JOACHIMSTHAL, in *Geography*, a town of Bohemia, in the circle of Elnbogen, celebrated for its ſilver mines, which were diſcovered in the year 1516, and which yielded from the year 1586, to the year 1601, 305,790 marks of ſilver; 52 miles S.S.E. of Dreſden. N. lat. 50° 20′. E. long. 12° 53′.—Alſo, a town of Brandenburg, in the Ucker Mark; 31 miles N.N.E. of Berlin. N. lat. 53° 5′. E. long. 13° 55′.

JOAG, a town of Africa, in the country of Kajaaga; which Mr. Park ſuppoſes to have contained about 2000 inhabitants. It is ſurrounded by a high wall, in which is a number of port holes, from which muſkets may be fired in caſe of an attack; and every man's poſſeſſion is likewiſe ſurrounded by a wall. To the weſtward of the town is a ſmall river, on the banks of which are cultivated conſiderable quantities of tobacco and onions. N. lat. 14° 25′. W. long. 9° 38′.

JOAL, a town of Africa, in the kingdom of Sin, ſituated on the ſea-coaſt, with a good road and anchorage; where the French had a factory for ſlaves, ſkins, ivory, and wax.

JOAN I., in *Biography*, queen of Naples, eldeſt daughter of Charles duke of Calabria, ſon of Robert king of Naples, was born about the year 1326. Her father died while ſhe was very young, and Robert immediately betrothed her to Andrew, ſecond ſon of Charles king of Hungary, who was her couſin, and who was then ſent to Naples to be educated. On the death of Robert in 1643, Joan was proclaimed queen. She had already conceived a great averſion from her huſband, which was increaſed by the idle tales of her attendants, and was now determined to hold all power in her own hands; but the pope, who was in his intereſt, granted a bull for the coronation of Andrew, as king in his own right. Joan was ſuſpected of harbouring an attachment for Lewis, prince of Tarento; and ſhe was accuſed of being privy to the murder of Andrew, who was taken off at the inſtigation of the princes of the blood, to prevent, as they thought, the kingdom from falling into the hands of the Hungarians. The king of Hungary determined to revenge himſelf upon the perpetrators of his brother's aſſaſſination, and advanced with a large army into Naples; the queen, who had already married the prince of Tarento, fled into Provence, and all Naples fell under the dominion of Lewis the Hungarian monarch. Joan went to Avignon, and was received with great reſpect by pope Clement VI. and the cardinals, before whom ſhe underwent a formal trial on account of her huſband's death. She pleaded her cauſe with eloquence, and was declared not only innocent, but free from all ſuſpicion. With this deciſion the king of Hungary ſeems to have been ſatisfied, and immediately returned to his own dominions. Joan was now invited by the Neapolitan barons to reſume her crown; ſhe accordingly fitted out a fleet, and re-entered Naples with general acclamations in 1348. She was next engaged in a conteſt with the king of Hungary, which proved ſo much againſt her, that ſhe was obliged to ſeek a ceſſation of arms, which was granted by the king, on the condition that ſhe ſhould abide the event of another trial before the papal court. Upon the iſſue of this was to be determined the poſſeſſion of the kingdom of Naples. Joan now had recourſe to a different kind of defence, and ſhe pleaded in excuſe that ſhe was under the influence of witchcraft at the time, which rendered her averſe from her huſband, and encouraged others to conſpire againſt him. This plea ſerved her purpoſe, and ſhe was declared blameleſs of all actions committed ſubſequent to the ſuppoſed faſcination. She was left in the peaceable poſſeſſion of her throne, and was again crowned, with her huſband Lewis, in the city of Naples. Lewis died in 1362, and in the courſe of a few months ſhe married James of Arragon, called the Infant of Majorca, whom ſhe did not allow to aſſume a higher title than duke of Calabria. This prince died in 1375, and in the following year ſhe took a fourth huſband, *viz.* Otho, of the houſe of Brunſwick, an accompliſhed ſoldier and handſome man, on whom ſhe conferred the title of duke of Tarento, with a large eſtate. Having no children, the one by Andrew being dead, ſhe adopted as a ſucceſſor her relation Charles de Duras, who revolted againſt her at the inſtigation of the king of Hungary. She then adopted for her heir Lewis of France, duke of Anjou, which produced a bloody war. Charles, however, was a native prince, and being more agreeable to the wiſhes of the Neopolitans than a foreigner, he marched to Naples, and being joined by the barons, he found little or no difficulty in getting poſſeſſion of the kingdom. The queen was obliged to capitulate, ſhe was impriſoned, and after a few months was put to death. This event occurred in 1382, in the thirty-ninth year of her reign. She was a woman of great accompliſhments, and poſſeſſed many good qualities, though ſullied by early diſſoluteneſs. She was the friend and patron of men of learning. Univer. Hiſt. Bayle.

Joan *of Arc.* See Arc.

Joan, *Pope:* a ſhort notice muſt be taken of this character, as being frequently referred to, though it is now generally regarded as merely fictitious. It is ſaid, that about the middle of the ninth century, a woman named Joan, born at Mentz, and who had received an excellent education, conceiving a violent paſſion for a young monk named Fulda, reſolved to deſert her family and friends to aſſume the male habit, and gain admittance into the monaſtery. The plan ſucceeded, and having long indulged in their amours undiſturbed and unſuſpected; they eloped together, and travelled into moſt of the countries of Europe, availing themſelves of every opportunity for increaſing their knowledge, by engaging the aſſiſtance of the beſt maſters in the different cities through which they paſſed. On the death of her lover, Joan repaired to Rome, ſtill in the dreſs of a man; her addreſs, and engaging manners raiſed her into notice; ſhe commenced the duties of profeſſor, and perſons of the higheſt rank and moſt conſiderable talents enliſted in the number of her diſciples. At length, on the death of pope Leo. X. in 855, ſhe was unanimouſly elected his ſucceſſor to the pontifical throne. So prudently did ſhe conduct herſelf, and with ſo much ability did ſhe perform the duties of her ſtation, that the people had reaſon to congratulate themſelves on their choice. At length ſhe confided her ſecret to a domeſtic whom ſhe took to her bed, the conſequence of which was her pregnancy, and ſhe was taken in labour at one of the moſt ſolemn proceſſions, delivered of a child in the ſtreet, and died on the ſpot. It is likewiſe ſaid, that to perpetuate the memory of ſuch an extraordinary adventure, a ſtatue was erected on the place where it happened; that in abhorrence of the crime, the pope and clergy in their ſubſequent annual proceſſions from the Vatican to the Lateran have turned off from that ſtreet; and that to prevent a ſimilar impoſition, a cuſtom was introduced of examining each pope previouſly to his conſecration, in order to aſcertain his ſex. Such are the particulars of a ſtory that ſeems not to have been called in queſtion till the time of Luther, but which the beſt informed hiſtorians uſually abandon as fictitious. "Till the reformation," ſays Gibbon, "the tale was repeated and believed without offence, and Joan's female ſtatue long occupied her place among the popes in the cathedral of Sienna. She has been annihilated by two learned Proteſtants, Blondel and Bayle, but their brethren were ſcandalized by this equitable and generous criticiſm. Spanheim and L'Enfant attempted to ſave this poor engine of controverſy; and even Moſheim condeſcends to cheriſh ſome doubt and ſuſpicion."

Joan d'Albert, queen of Navarre, daughter of Henry d'Albert, and Margaret of Valois, was born in 1528. In 1548, ſhe married Antony of Bourbon, duke of Vendome, by whom ſhe had, as a third ſon, the afterwards celebrated Henry IV. of France. At the deceaſe of her father, in 1555, ſhe became queen of Navarre, and her huſband took the title of king. They were both favourable to the principles of the reformation, and would probably have openly profeſſed it had they not feared the reſentment of the king of France, but after his death they declared their converſion to Calviniſm, of which Joan was ever after the zealous protector. Antony, on the other hand, was fickle and weak, renounced his new faith, and was a principal commander in the civil war againſt the Proteſtants, in which he loſt his life at the ſiege of Rouen, in 1562. Joan not only eſtabliſhed the Proteſtant religion in her ſtates, but aboliſhed popery, and ſeized the property of the eccleſiaſtics, which ſhe applied to the maintenance of the reformed clergy and the ſchools. In 1568, ſhe quitted her ſtates to join the chiefs of the French Proteſtants, and at Cognac had an interview with the prince of Condè, to whom ſhe preſented her ſon, then of the age of fifteen, with her jewels, as devoted to the ſervice of the cauſe. She next withdrew to Rochelle, whence ſhe wrote a pathetic letter to queen Elizabeth of England, deſcribing the calamities and oppreſſions which had induced the Proteſtants to take up arms. She died in 1572, at Paris, whither ſhe had come to make preparations for the marriage of her ſon with the ſiſter of Charles IX. Her death was not without ſuſpicion of poiſon, though the fact was never aſcertained.

JOANA, in *Geography*, a town on the north coaſt of the iſland of Java, ſituated on a river of the ſame name, which is the largeſt and moſt navigable along this coaſt. It is here more than 20 feet deep, and about 200 feet broad. It flows out of a large inland lake, into which ſeveral ſmall ſtreams diſcharge themſelves, and falls into the ſea about four leagues to the weſtward of Rembang. The town conſiſts of two rows of houſes built along the river, about a quarter of a Dutch mile in length. The fort of Joana is a redoubt, with four demi-baſtions, in which are the rice warehouſes, the barracks for the ſoldiery, and ſome buildings which ſerve for a kitchen and other offices for the reſident. The emoluments of this reſidency amount to 16,000 rix-dollars, or about 3500*l.* ſterling. This town yields rice and timber, a little indigo and cotton.

JOANNA, Johanna, or *Hinzuan*, one of the Comora iſlands, about 30 miles long and 15 broad. The Abbé Raynal deſcribes this iſland in terms of high commendation. Hills, he ſays, that are ever green, and vallies that are always gay, every where preſent a variety of delightful landſcapes. Thirty thouſand inhabitants, diſtributed into 73 villages, ſhare its productions. They ſpeak a corrupt dialect of the Arabic language, and their religion is a corrupt kind of Mahometaniſm: their moral principles are more refined than they uſually are in this part of the globe. Accuſtomed to the plain diet of milk and vegetables, they are averſe from labour. Among perſons of diſtinction, who indulge themſelves in eaſe and indolence, the nails of the fingers are ſuffered to grow to an immoderate length, and in order to give this effect of negligence the appearance of beauty, they tinge their nails with a yellow red, which they obtain from a ſhrub called *Alcanna*, which ſee. Sir Willliam Jones, who touched at this iſland, in his voyage to India, was much pleaſed with the beautiful ſcenery which its verdant hills and mountains, covered with elegant palms and other trees, preſented to his view. He particularly mentions the town of Matſamudo, diſtinguiſhed at a diſtance by the tower of the principal moſque, and another ſmall town called Bantani. For an account of his rambles through part of the iſland, and his intercourſe with ſome of the principal inhabitants, we muſt refer to his "Remarks" on this iſland, in the ſecond volume of the Aſiatic Reſearches. Other voyagers who have viſited this iſland, ſay, that the hills are ſteep, covered with wood, and difficult of acceſs, and that the vallies exhibit a few irregular plantations of cocoa-nuts. The original natives, ſtated at about 7000 in number, occupy the hills in the interior of the iſland; and they are generally at war with the Arabian interlopers, who have eſtabliſhed themſelves by conqueſt cueſt on the ſea-coaſt, and are ſaid to be in number about 3000. Theſe latter are deſcribed as poor miſerable beings, who, not being able to carry on any extenſive cultivation, on account of being expoſed to the depredations of the mountaineer natives, ſubſiſt chiefly by ſupplying the Indian ſhips which touch there for refreſhment, with a few cattle and tropical fruits. Of their ability to accommodate ſtrangers on ſhore, thoſe who have touched at the iſland ſpeak in very degrading terms, as their huts or hovels are filthy and badly conſtructed. The huts of the poorer people are formed of twigs, interwoven with and covered by a ſtrong coat of graſs, and the roof is protected by a kind of mat, made of the leaves of the cocoa trees. People of ſuperior rank have houſes built of ſtone, cemented with tempered clay. The king, as he is called, or chief of the iſland, reſides about nine miles from the town of Joanna, which contains about 200 houſes, many of which are built of ſtone and occupied by perſons of principal diſtinction in the iſland: but they are low and incommodious: the palace of the king excepted, which is high and ſpacious. This chief poſſeſſes an unlimited power over his ſubjects, in all concerns, religious as well as temporal: he ſeldom viſits the town except on the arrival of European veſſels, when he is accompanied by a numerous equipage, and received with great attention and reſpect by the commanders of the ſhips. Every captain finds it his intereſt to treat him in this manner, as his permiſſion muſt be obtained before any traffic can be opened with the inhabitants; and with this view he receives a ſmall preſent of European manufactures. The principal domeſtic animals in the iſland are cattle, ſheep, and hogs; there are ſeveral ſpecies of fowl, and different kinds of game. The ſea abounds with a variety of excellent fiſh; and particularly with a ſort of electrical fiſh, ſeven inches long, 2½ inches broad, with a long projecting mouth, a head of a dark brown colour, the belly of ſea-green, the ſides yellow, and the fins and tail of a ſandy-green; the body interſperſed with red, green, and white ſpots; the eyes large, and the iris red, having its outer edges tinged with yellow. The ſea-coaſt is wholly compoſed of coral rocks, which are in many places hollowed by the ſea; and in thoſe cavities ſeveral of the electrical fiſhes were found. See a deſcription and drawing in the Phil. Tranſ. vol. lxxvi. p. 352. The natives of the iſland are, in general, tall, robuſt, and well-made; the women are inferior to the men; they have all long black hair, piercing eyes, and colour between olive and black. People of lower rank have no other covering beſides a piece of cloth tied round their loins, and on their heads a cap of any ſtuff which they can procure. Thoſe of higher rank wear a ſhirt with large ſleeves, hanging down upon a pair of drawers and covering a ſtuff waiſtcoat; thoſe of ſtill higher orders wear turbans; and they generally have large knives attached to a belt, which paſſes round their middle. The women are clothed in a kind of jacket and petticoat, with a looſe robe, and when they go abroad, they cover the face with a veil: they are very attentive to ornaments for their legs, arms, and ears. Their children, both male and female, are ſuffered to be naked till the age of ſeven or eight years. The inhabitants in general are commended for their ſimplicity, obliging diſpoſition, and hoſpitality. Polygamy is allowed; ſo that each perſon has two or three wives, and as many concubines as he can maintain. S. lat. 12° 13′. E. long. 44° 15′.

JOAO, St., a ſmall iſland near the coaſt of Brazil. S. lat. ° 22′. W. long. 46° 26′.

JOARTAM, a town and kingdom of the iſland of Java, in the N.E. part of the iſland.

JOARYA, a town of Bengal; 55 miles S. of Iſlamabad.

JOB, or *the Book of Job*, a canonical book of the Old Teſtament, containing the narrative of a ſeries of misfortunes, which happened to a man, whoſe name was Job, an inhabitant of the land of Uz, ſuppoſed to be that part of Arabia Petræa which is called Idumæa, as a trial of his virtue and patience; together with the conferences he had with his cruel friends on the ſubject of his misfortunes; and the manner in which he was reſtored to eaſe and happineſs. This book is filled with thoſe noble, bold, and figurative expreſſions, which conſtitute the very ſoul of poetry.

Many of the Jewiſh rabbins pretend that this relation is altogether a fiction; others think it a ſimple narrative of a matter of fact, juſt as it happened; while a third claſs of critics own the ground-work of the ſtory to be true, but that it is wrote in a poetical ſtrain, and decorated with peculiar circumſtances, to render the narration more profitable and entertaining. Others, again, ſuppoſe that, like ſome of our Saviour's parables, it is a fabulous narration deſigned to convey important and uſeful ſentiments reſpecting the ſuperintending providence of God, in a manner more forcible and impreſſive than in the form of abſtract rules and precepts.

See an expreſs diſſertation on the book of Job, in the biſhop of Glouceſter's "Divine Legation of Moſes," vol. ii. The biſhop is of opinion that this book is a dramatic poem written by Ezra, ſome time between the return of the Jews from the captivity of Babylon, and their thorough ſettlement in their own country, and adapted to the circumſtances of theſe times, by being made allegorical as well as dramatic: thus, Job, who is ſuppoſed to have been a real perſon, that lived a generation or two before Moſes, is deſigned to perſonate the Jewiſh people; his three friends the three great enemies of the Jews, Sanballat, Tobiah, and Geſhem, who upon their return from captivity, vexed and obſtructed them in rebuilding their city and temple; Job's wife was intended by the poet to repreſent the idolatrous wives which many of the Jews had taken, contrary to the law, and for which they are reproved by the prophet Nehemiah.

In order to prove the compoſition of this book to be dramatic, the learned biſhop alleges its ſtyle, which, excepting the introduction and concluſion, is in meaſure; its ſentiments, which are delivered not only in verſe but in a kind of poetry, animated by all the ſublimity of figures and floridneſs of deſcription, whence he concludes the whole to be a work of imagination; and the whole form of its compoſition. The biſhop's proof that the book of Job is no older than the time of Ezra, reſts chiefly upon theſe two points, *viz.* his notion of an equal providence under the Moſaic diſpenſation, and that of the book's being an allegorical dramatic poem. The former point, which he conceives to have been the grand queſtion diſcuſſed in this book, could be no queſtion, in his opinion, any where out of the land of Judea; nor there neither, in any period of the Jewiſh nation, either before or after that in which he places it. The queſtion he ſuppoſes to be this, whether God adminiſters his government over men here with an equal providence, ſo as that the good are always proſperous, and the bad unhappy; or whether, on the contrary, there be not ſuch apparent inequalities, as that proſperity and adverſity often happen indifferently to good and bad. Job, ſays our author, maintains the latter part of the queſtion, and his three friends the former. They argue theſe points through the whole diſpute, and each party firmly adheres to his firſt opinion. After giving ſome account of the diſtreſſed condition of the Jews upon their return from the captivity, he thus proceeds: "Could any thing be conceived more ſeaſonable and neceſſary at this time than ſuch a work as the book of Job? In which, on a traditional ſtory of great fame and reputation all over the Eaſt, a good man was repreſented as afflicted for the trial of his virtue, and rewarded for his afflictions; and in which their doubts about God's providence were piouſly reſolved into his almighty power. For to quiet all their anxieties, and to comfort them under their preſent diſtreſſes was, I ſuppoſe, the reaſon of one of their prophets compoſing the book of Job at this very period. But if ſuch was the end of writing this poetic ſtory, we cannot but ſuppoſe every thing in it would be fitted to the circumſtances of thoſe times. But this could not be done without making the poem *allegorical* as well as dramatic; that is, repreſenting the real perſons of that age under the perſons of the drama." That this poem is wholly allegorical the biſhop argues from the divers circumſtances that are added to each character, which can, by no means, belong to the perſons repreſenting; and therefore others were meant under thoſe characters, as the perſons repreſented. This ſtatement he endeavours to juſtify and confirm by examining each character, in its reference to the perſon repreſented, beginning with Job, who repreſents the Jewiſh people; and proceeding to ſhew how his wife pourtrayed the idolatrous wives of the Jews, and how his three friends repreſented the three capital enemies of the Jews, above-mentioned.

The next perſon in this allegorical drama is the devil himſelf, or Satan, the author and contriver of all the miſchief. This aſſault of Satan upon Job, ſays the biſhop, was that which, as the prophet Zachariah tells us, (chap. ii. ver. 13. chap. iii. ver. 1, &c.) he made, at this time, on the people; "The only difference is, that, in the prophecy, Joſhua the high prieſt ſtands for the people, and in this poem, Job; in all the reſt, the identity is ſo ſtrongly ſupported, that this ſingle circumſtance is alone ſufficient to confirm the truth of our whole repreſentation."—"The finding of Satan in the ſcene is a certain proof (ſays our author) that the work was compoſed in the age we aſſign to it. This evil being was little known to the people till about this time." The laſt perſon in this allegorical drama is Elihu; and Elihu, according to the biſhop's ſtatement, was Ezra, or the ſacred writer himſelf. Such are the general outlines of the learned biſhop's hypotheſis, in which, it muſt be allowed, he has manifeſted a conſiderable degree of ingenuity, and, as we conceive, no ſmall diſplay of fancy. This hypotheſis has been examined, and in our judgment, ſatisfactorily refuted in Mr. Peters' "Critical Diſſertation on the Book of Job."

Le Clerc ſuppoſes that the book of Job, which, in his opinion, was a hiſtory treated in a poetical manner, or a hiſtory treated in the form of a parable, was written after the Jews were carried into Babylon, and urges, in proof of this, the frequent chaldaiſms that occur in it.

The learned Grotius apprehends that this book contains a true hiſtory, treated in a poetical manner; and he was probably led to adopt this opinion from adverting to the ſupernatural and ſurpriſing incidents that occur in it; ſuch as that of the ſons of God preſenting themſelves before Jehovah, and the divine interpoſition at the concluſion. But as he ſuppoſed the book to be written at the diſtance of about a thouſand years from the date of the ſubject of which it treats, he could ſcarcely imagine that there was much of true hiſtory in it. Would not a conſiderable difficulty in ſettling the time, when this book was written, be obviated, by ſuppoſing that the introductory part in the two firſt chapters, in which Satan makes ſo conſpicuous a figure, (and perhaps the concluſion,) were written after the Babyloniſh captivity, by ſome writer, Ezra or another perſon; for, as biſhop Warburton allows, Satan became more known among the Jews after their return from Babylon? Grotius farther ſuppoſes, that the events recorded in this poetical hiſtory happened in Arabia, whilſt the Hebrews wandered in the deſert; and that the writer, who was a Hebrew, lived before the time of Ezekiel, as he infers from that paſſage in his prophecy, where Job is mentioned; but after David and Solomon, from whoſe writings, as he conceives, ſome ſentences and forms of ſpeech are transferred hither; and that it was written for the uſe of the Edomites, tranſported to Babylon, to confirm them in the worſhip of the true God, and to teach them patience in adverſity.

The learned writer whoſe ſentiments we are now detailing, acknowledges that there is no mention in this book of any law but ſuch as was traditional; nor of any point of hiſtory, beſides thoſe of the more ancient times, *viz.* before the giving of the Moſaic law; that the length of Job's life which extended to 200 years, agrees with thoſe times; and that though the writer is unknown, it appears credible from a paſſage in Ezekiel, that he lived before the time of that prophet. David and Solomon might have borrowed forms of ſpeech from the book of Job; which is no leſs probable than the ſuppoſition of Grotius already mentioned; and if the book was written before the time of Ezekiel, the author could not have borrowed from Daniel, Ezra, and the Chaldee paraphraſts, as Grotius ſeems to intimate.

Schultens aſcribes the poetical, or dialogue part of this book, the ſtyle of which, he ſays, has all the marks of the moſt venerable and remote antiquity, to Job himſelf; the reſt he ſuppoſes to be the work of ſome Hebrew collector. As for Le Clerc's chaldaiſms, ſuch as the termination *in* for *im*, in the plural, he ſays they are true Hebrew and Arabic, of the moſt ancient ſtamp. See alſo Grey's Job, p. 12. of the preface. Moſt of the Jewiſh doctors believe that Moſes was the writer of this book; and M. Huet, with whom profeſſor Michaelis concurs, ſuppoſes that it was written by Moſes in his exile in the land of Midian; where he reſided 40 years. Some have ſuppoſed that it was either written by him, or tranſlated by him from the original Syriac, or Arabic, and that it was deſigned to prepare the Iſraelites for their exodus from Egypt, and the hardſhips of their future peregrination. All thoſe learned men, who ſuppoſe this book to have been written by Moſes, or Elihu, as Lightfoot imagines, or ſome perſon near the time of Job, muſt of courſe be perſuaded that there is nothing in the ſtyle, which is not very conſiſtent with this remote antiquity; and that the phraſes which others take for imitations of paſſages in the Pſalms or Proverbs, Daniel or Ezra, are rather originals to theſe, and that theſe laſt are really the imitations. It is certain, whoever was the author of this book, that the ſtyle has a mixture of the Arabic. And thoſe who have made the happieſt conjectures for the ſolution of difficulties and the explication of particular paſſages, have been more indebted to the Arabic than to the Chaldee; ſo that the language in which it was written might have been ſpoken in Arabia in the days of Job. And this is the more probable, if the ſons of Abraham by Keturah (from whom Job himſelf is ſuppoſed to be deſcended) were thoſe who peopled this part of the world; for then, without doubt, they carried the language of Abraham along with them.

Mr. Peters concurs in opinion with thoſe who believe this book to be the oldeſt in the world; that it was written, probably, by Job himſelf; and that it contains, in the main, a true hiſtory.

The eminently learned and ingenious critic, biſhop Lowth, has devoted three lectures of his "Prælectiones, &c." to the examination of the book of Job. The ſcene of this book is laid in Idumæa; the hiſtory of an inhabitant of that country is the baſis of the narrative; the characters who ſpeak are Idumæans, or at leaſt Arabians of the adjacent country, all originally of the race of Abraham. The language is pure Hebrew, although the author appears to be an Idumæan; for it is not improbable that all the poſterity of Abraham, Iſraelites, Idumæans, and Arabians, whether of the family of Keturah or Iſhmael, ſpoke for a conſiderable time one common language. Our learned author, diſcarding the ſentiments of thoſe who aſcribe this book to Elihu, proceeds to examine the claims of Moſes, to whom it has been more generally aſcribed. This hypotheſis he repreſents as very futile, ſince it is impoſſible to trace, throughout the whole book, the ſlighteſt alluſion to the manners, cuſtoms, ceremonies, or hiſtory of the Iſraelites. The ſtyle of Job appears, alſo, to be materially different from the poetical ſtyle of Moſes; being much more compact, conciſe, or condenſed, more accurate in the poetical conformation of the ſentences. He therefore avows himſelf inclined to favour the opinion of thoſe, who ſuppoſe Job himſelf, or ſome contemporary, to be the author of this poem, which is the moſt ancient of all the ſacred books, as is manifeſt from the ſubject, the language, the general character, and even from the obſcurity of the work. The ſtyle of the poem favours ſo much of the antique, that in the judgment of the learned prelate, whoever would ſuppoſe it written after the Babyloniſh captivity would fall little ſhort of the error of Hardouin, who aſcribed the golden verſes of Virgil, Horace, &c. to the "iron age" of monkiſh pedantry and ignorance.

As to the time in which Job lived, the length of his life evinces that he was before Moſes, and probably contemporary with the patriarchs. That he lived at a period prior to the promulgation of the law is very probable, from the nature of the ſacrifice which he inſtitutes, conformably to the command of God, namely, ſeven oxen and ſeven rams; a reſpect being paid in theſe countries, and at that period, to that number, from the traditional accounts which were ſtill preſerved among them of the ſeven days of creation. The poem is founded in fact, as far as concerns the general ſubject of the narrative; though the whole dialogue, and probably ſome other parts, have partaken largely of the embelliſhments of poetry: but this has not by any means extended ſo far as to convert the whole into an allegory. The exordium and concluſion, indeed, are diſtinct from the poem itſelf, and ſtand in the place of an argument or illuſtration; but our author conceives, that they are coëval with the poetical part, and the work of the ſame author, becauſe they are indiſpenſibly neceſſary to the unravelling of the plot, which is not developed in the body of the poem. Michaelis, who conſiders the ſubject of the poem as altogether fabulous, and who apprehends that it is more inſtructive as a fable than it poſſibly could be if it were a true hiſtory, cannot but regard the exordium, in which Satan appears as the accuſer of Job, rather in the light of a fable than of a true narrative. It is ſurely incredible that ſuch a converſation ever took place between the Almighty and Satan, who is ſuppoſed to return with *news* from the terreſtrial regions. There are, it is true, ſays the learned prelate, phraſes extant in the exordium, in which ſome critics have pretended to diſcover the hand of a later writer; but he is not convinced by the arguments which they produce. The principal object held forth to our contemplation in this production is the example of a good man, eminent for his piety, and of approved integrity, ſuddenly precipitated from the very ſummit of proſperity into the loweſt depths of miſery and ruin: who having been firſt bereaved of his wealth, his poſſeſſions, and his children, is afterwards afflicted with the moſt excruciating anguiſh of a loathſome diſeaſe, which entirely covers his body. He ſuſtains all, however, with the mildeſt ſubmiſſion, and the moſt complete reſignation to the will of Providence. "In all this," ſays the hiſtorian, "Job ſinned not, nor charged God fooliſhly." And after the ſecond trial, "In all this did not Job ſin with his lips." The author of the hiſtory remarks upon this circumſtance a ſecond time, in order to excite the obſervation of the reader, and to render him more attentive to what follows, which properly conſtitutes the true ſubject of the poem: namely, the conduct of Job with reſpect to his reverence for the Almighty, and the changes which accumulating miſery might produce in his temper and behaviour. Accordingly we find that another ſtill more exquiſite trial of his patience yet awaits him, and which indeed, as the writer ſeems to intimate, he ſcarcely appears to have ſuſtained with equal firmneſs, namely, the unjuſt ſuſpicions, the bitter reproaches, and the violent altercations of his friends, who had viſited him on the pretence of affording conſolation. Here commences the plot or action of the poem: for when, after a long ſilence of all parties, the grief of Job breaks forth into paſſionate exclamations, and a vehement execration on the day of his birth; the minds of his friends are ſuddenly exaſperated, their intentions are changed, and their conſolation, if indeed they originally intended any, is converted into contumely and reproaches. The firſt of theſe three ſingular comforters reproves his impatience; calls in queſtion his integrity, by indirectly inſinuating that God does not inflict ſuch puniſhments upon the righteous; and finally admoniſhes him, that the chaſtiſement of God is not to be deſpiſed. The next of them, not leſs intemperate in his reproofs, takes it for granted, that the children of Job had only received the reward due to their offences; and with regard to himſelf, intimates, that if he be innocent, and will apply with proper humility to the divine mercy, he may be reſtored. The third upbraids him with arrogance, with vanity, and even with falſehood, becauſe he has preſumed to defend himſelf againſt the unjuſt accuſations of his companions; and exhorts him to a ſounder mode of reaſoning and a more holy life. They all, with a manifeſt, though indirect alluſion to Job, diſcourſe very copiouſly concerning the divine judgments which are always openly diſplayed againſt the wicked, and of the certain deſtruction of hypocritical pretenders to virtue and religion. In reply to this, Job enumerates his ſufferings, and complains bitterly of the inhumanity of his friends, and of the ſeverity which he has experienced from the hand of God; he calls to witneſs both God and man, that he is unjuſtly oppreſſed; he intimates, that he is weak in compariſon with God, that the contention is conſequently unequal, and that be his cauſe ever ſo righteous he cannot hope to prevail. He expoſtulates with God himſelf ſtill more vehemently, and with greater freedom, affirming, that he does not diſcriminate characters, but equally afflicts the juſt and the unjuſt. The expoſtulations of Job ſerve only to irritate ſtill more the reſentment of his pretended friends; they reproach him in ſeverer terms with pride, impiety, paſſion, and madneſs: they repeat the ſame arguments reſpecting the juſtice of God, the puniſhment of the wicked, and their certain deſtruction after a ſhort period of apparent proſperity. This ſentiment they confidently pronounce to be confirmed both by their experience and by that of their fathers; and they maliciouſly exaggerate the ungrateful topic, by the moſt ſplendid imagery and the moſt forcible language. On the part of Job, the general ſcope of the argument is much the ſame as before, but the expreſſion is conſiderably heightened; it conſiſts of appeals to the Almighty, aſſeverations of his own innocence, earneſt expoſtulations, complaints of the cruelty of his friends, melancholy reflections on the vanity of human life, and upon his own ſevere misfortunes, ending in grief and deſperation: he affirms, however, that he places his ultimate hope and confidence in God; and the more vehemently his adverſaries urge, that the wicked only are objects of the divine wrath, and obnoxious to puniſhment, ſo much the more reſolutely does Job aſſert their perpetual impunity, proſperity, and happineſs even to the end of their exiſtence. The firſt of his opponents, Eliphaz, incenſed by this aſſertion, deſcends directly to open crimination and contumely; he accuſes the moſt upright of men of the moſt atrocious crimes, of injuſtice, rapine, and oppreſſion; inveighs againſt him as an impious pretender to virtue and religion, and with a kind of ſarcaſtic benevolence exhorts him to penitence. Vehemently affected with this reproof, Job, in a ſtill more animated and confident ſtrain, appeals to the tribunal of All-ſeeing Juſtice; and wiſhes it were only permitted him to plead his cauſe in the preſence of God himſelf. He complains ſtill more intemperately of the unequal treatment of Providence; exults in his own integrity, and then more tenaciouſly maintains his former opinion concerning the impunity of the wicked. To this another of the triumvirate, Bildad, replies, by a maſterly, though conciſe, diſſertation on the majeſty and ſanctity of the Divine Being, indirectly rebuking the preſumption of Job, who has dared to queſtion his decrees. In reply to Bildad, Job demonſtrates himſelf no leſs expert at wielding the weapons of ſatire and ridicule, than thoſe of reaſon and argument; and reverting to a more ſerious tone, he diſplays the infinite power and wiſdom of God more copiouſly, and more poetically than the former ſpeaker. The third of the friends making no return, and the others remaining ſilent, Job at length opens the true ſentiments of his heart concerning the fate of the wicked; he allows that their proſperity is unſtable, and that they and their deſcendants ſhall at laſt experience on a ſudden, that God is the avenger of iniquity. In all this, however, he contends that the divine counſels do not admit of human inveſtigation; but that the chief wiſdom of man conſiſts in the fear of God. He beautifully deſcants upon his former proſperity; and exhibits a ſtriking contraſt between it and his preſent affliction and debaſement. Laſtly, in anſwer to the crimination of Eliphaz, and the implications of the others, he relates the principal tranſactions of his paſt life; he aſſerts his integrity as diſplayed in all the duties of life, and in the ſight of God and man; and again appeals to the juſtice and omniſcience of God in atteſtation of his veracity.

When Job's three friends have ceaſed to diſpute with Job, "becauſe he ſeemeth juſt in his own eyes," that is, becauſe he has uniformly contended, that there was no wickedneſs in himſelf which could call down the heavy vengeance of God; Elihu comes forward juſtly offended with both parties; with Job, becauſe "he juſtified himſelf in preference to God," that is, becauſe he defended ſo vehemently the juſtice of his own cauſe, that he ſeemed in ſome meaſure to arraign the juſtice of God; againſt the three friends, becauſe, "though they were unable to anſwer Job, they ceaſed not to condemn him," that is, they concluded in their own minds that Job was impious and wicked, while, nevertheleſs, they had nothing ſpecific to object againſt his aſſertions of his own innocence, or upon which they might ſafely ground their accuſation.

The conduct of Elihu evidently correſponds with this ſtate of the controverſy: he profeſſes, after a ſlight prefatory mention of himſelf, to reaſon with Job, unbiaſſed equally by favour or reſentment. He therefore reproves Job from his own mouth, becauſe he had attributed too much to himſelf; becauſe he had affirmed himſelf to be altogether free from guilt and depravity; becauſe he had preſumed to contend with God, and had not ſcrupled to inſinuate that the Deity was hoſtile to him. He aſſerts, that it is not neceſſary for God to explain and develope his counſels to men; that he nevertheleſs takes many occaſions of admoniſhing them, not only by viſions and revelations, but even by the viſitations of his Providence, by ſending calamities and diſeaſes upon them, to repreſs their arrogance and reform their obduracy. He next rebukes Job, becauſe he had pronounced himſelf upright, and affirmed that God had acted inimically, if not unjuſtly towards him, which he proves to be no leſs improper than indecent. In the third place, he objects to Job, that from the miſeries of the good, and the proſperity of the wicked, he has falſely and perverſely concluded that there was no advantage to be derived from the practice of virtue. On the contrary he affirms, that when the afflictions of the juſt continue, it is becauſe they do not place a proper confidence in God, aſk relief at his hands, patiently expect it, nor demean themſelves before him with becoming humility and ſubmiſſion. This obſervation alone, he adds very properly, is at once a ſufficient reproof of the contumacy of Job, and a full refutation of the unjuſt ſuſpicions of his friends. Laſtly, he explains the purpoſes of the Deity in chaſtening men, which are in general to prove and to amend them, to repreſs their arrogance, to afford him an opportunity of exemplifying his juſtice upon the obſtinate and rebellious, and of ſhewing favour to the humble and obedient. He ſuppoſes God to have acted in this manner towards Job; on that account he exhorts him to humble himſelf before his righteous Judge, to beware of appearing obſtinate or contumacious in his ſight, and of relapſing into a repetition of his ſin. He intreats him, from the contemplation of the divine power and majeſty, to endeavour to retain a proper reverence for the Almighty. To theſe frequently intermitted and often repeated admonitions of Elihu, Job makes no return.

The ſpeech of Elihu is followed by the addreſs of God himſelf: at the cloſe of which, Job humbly ſubmits to the will of Providence, acknowledges his own ignorance and imbecility, and "repents in duſt and aſhes."

On a due conſideration of all theſe circumſtances, the principal object of the poem ſeems to be this third and laſt trial of Job, from the injuſtice and unkindneſs of his accuſing friends. The conſequence of which is, in the firſt place, the anger, indignation, and contumacy of Job, and afterwards his compoſure, ſubmiſſion, and penitence. The deſign of the poem is, therefore, to teach men, that having a due reſpect to the corruption, infirmity, and ignorance of human nature, as well as to the infinite wiſdom and majeſty of God, they are to reject all confidence in their own ſtrength, in their own righteouſneſs, and to preſerve on all occaſions an unwavering and unſullied faith, and to ſubmit with becoming reverence to his decrees.

The whole hiſtory detailed in the book of Job, taken together, contains an example of patience, together with its reward.

Our author next proceeds to inquire whether the poem of Job be poſſeſſed of the peculiar properties of the Greek drama: and after conſidering a variety of circumſtances, he affirms without heſitation, that the poem of Job contains no plot or action whatever, not even of the moſt ſimple kind: it uniformly exhibits one conſtant ſtate of things, without the ſmalleſt change of feature from the beginning to the end; and contains nearly a repreſentation of thoſe manners, paſſions, and ſentiments, which might actually be expected in ſuch a ſituation. The very nature of the ſubject excludes even the poſſibility of a plot or action. Upon the whole, our author concludes, that the poem of Job cannot properly be brought into compariſon with any of the Greek tragedies. But though it has no claim to the merit of a perfect drama, our author does not wiſh to derogate from its merits. That cenſure will rather apply to thoſe who, by criticiſing it according to foreign and improper rules, would make that compoſition appear lame and imperfect, which, on the contrary, is in its kind moſt beautiful and perfect. If indeed the extreme antiquity of this poem, the obſcurity and the difficulty that neceſſarily enſue from that circumſtance be conſidered; and if allowance be made for the total want of plot and action, we ſhall have cauſe to wonder at the elegance and intereſt which we find in its form, conduct, and economy. The arrangement is perfectly regular, and every part is admirably adapted to its end and deſign. The antiquary or the critic, who has been at the pains to trace the hiſtory of the Grecian drama from its firſt weak and imperfect efforts, and has carefully obſerved its tardy progreſs to perfection, will ſcarcely, without aſtoniſhment, contemplate a poem produced ſo many ages before, ſo elegant in its deſign, ſo regular in its ſtructure, ſo animated, ſo affecting, ſo near to the true dramatic model: while, on the contrary, the united wiſdom of Greece, after ages of ſtudy, was not able to produce any thing approaching to perfection in this walk of poetry before the time of Æſchylus. But however this be—whatever rank may be aſſigned to Job, in a compariſon with the poets of Greece, to whom we muſt at leaſt allow the merit of art and method; amongſt the Hebrews, it muſt certainly be allowed, in this reſpect, to be unrivalled. It is of little conſequence whether it be eſteemed a didactic or an ethic, a pathetic or dramatic poem; only let it be aſſigned a diſtinct and conſpicuous ſtation in the higheſt rank of the Hebrew poetry.

The moſt ſplendid examples, ſays our author, of every beauty and elegance of ſentiment, of imagery, and of diction, meet the eye of the attentive reader in every part of the poem. Let it ſuffice to ſay, that the dignity of the ſtyle is anſwerable to that of the ſubject; its force and energy to the greatneſs of thoſe paſſions which it deſcribes: and as this production excels all the other remains of the Hebrew poetry in economy and arrangement, ſo it yields to none in ſublimity of ſtyle, and in every grace and excellence of compoſition. Among the principal of theſe may be accounted the accurate and perfectly poetical conformation of the ſentences, which is indeed generally moſt obſervable in the moſt ancient of the poetical compoſitions of the Hebrews. Here, however, as is natural and proper in a poem of ſo great length and ſublimity, the writer's ſkill is diſplayed in the proper adjuſtment of the period, and in the accurate diſtribution of the members, rather than in the antitheſis of words, or in any laboured adaptation of the paralleliſms.

"The poetry of the book of Job," ſays Dr. Blair, "is not only equal to that of any other of the ſacred writings, but is ſuperior to them all, except thoſe of Iſaiah alone. As Iſaiah is the moſt ſublime, David the moſt pleaſing and tender, ſo Job is the moſt deſcriptive of all the inſpired poets. A peculiar glow of fancy, and ſtrength of deſcription, characterize this author. No writer whatever abounds ſo much in metaphors. He may be ſaid, not to deſcribe, but to render viſible, whatever he treats of. Inſtances every where occur; particularly in the 18th and 20th chapters, in which he paints the condition of the wicked." Schultens and Le Clerc's Præf. ad Comment. in Job. Lowth de Sac. Poeſ. Prælectiones 32—34. Gregory's Tranſ. with Michaelis's Notes. Peter's Crit. Diſſert. Dupin. Heath, Scott, and Grey on Job. Blair's Lect. vol. iii. Dr. Stock, biſhop of Killala, in his tranſlation and notes, concurs with thoſe who refer this book to a late period; not earlier than the Babyloniſh captivity.

Job's *Tears*, in *Botany*. See Coix.

Job, *St.*, in *Geography*, a town of Hungary, near which are a celebrated abbey, and an old caſtle; 24 miles S.E. of Debreczin.

JOBAK, a town of Hindooſtan, in the Gurry Mundelah; 30 miles S. of Gurrah.

JOBBER, a perſon who undertakes jobs, or ſmall pieces of work.

In ſome ſtatutes, jobber is uſed for a perſon who buys and ſells cattle for others. See Broker.

JOBBING, Stock, denotes the practice of trafficking in the public funds, or of buying and ſelling ſtock, with a view to its riſe or fall. The term is commonly applied to the illegal practice of buying and ſelling ſtock for time, or of accounting for the differences in the riſe or fall of any particular ſtock for a ſtipulated time; whether the buyer or ſeller be poſſeſſed of any ſuch ſtock or not. See *Stock* Brokers.

Jobbing, in *Rural Economy*, a term uſed by farmers for a petty kind of buying and ſelling, or dealing in cattle, or any other ſort of farming-ſtock. Men of this kind are alſo frequently employed by the larger dealers. It has been obſerved, that "if a midland farmer goes to a fair, he is aſhamed to return without having 'done ſome buſineſs:' he muſt either buy or ſell, or he loſes his credit as a market man. Hence, probably, the quantity of buſineſs done at the midland fairs, compared with thoſe of other diſtricts, where one-third, or perhaps half, the ſtock is frequently unſold, is very conſiderable, while here, the whole fair may be ſaid to be generally transferred."

JOBENT Nails. See Nails.

JOBERT, Lewis, in *Biography*, a French Jeſuit, diſtinguiſhed as well by his antiquarian knowledge, as by his pulpit talents and eloquence, was born at Paris in the year 1637. He was a teacher of the ſeveral branches of polite literature, and performed the duties of his ſtation with diſtinguiſhed ability. He died in 1719, leaving behind him many works, but the moſt important was an elaborate treatiſe on "Medals," which was publiſhed in two volumes, 12mo., in the year 1692. This work poſſeſſes great merit, and met with a very favourable reception. It has gone through many editions at Paris, Amſterdam, Leipſic, and Nuremburg. The moſt correct is ſaid to be that of Paris in 1739, with additions by M. Joſeph Bimard de la Baſtie. Moreri.

JOBIE, in *Geography*, an iſland in the Pacific ocean, at the entrance of a great bay on the coaſt of New Guinea; 110 miles long from E. to W., and from 6 to 20 broad. S. lat. 1° 36′ to 2°. E. long. 135° 50′ to 137° 36′.

JOCALLA, a town of Peru, in the dioceſe of La Paz; 9 miles N. of Potoſi.

JOCHER, Christian Gottlieb, in *Biography*, doctor of theology, public profeſſor of hiſtory at Leipſic, and librarian to the academy, was born in that city in 1694. Having received the elements of an excellent education at different ſchools, he devoted himſelf to the ſtudy of theology, and obtained his degrees at Leipſic. He ſoon became a diſciple of Leibnitz and Wolf, and was the firſt perſon who gave lectures on the ſyſtem of Wolf. He ſoon attracted a numerous concourſe of pupils, and was moſt aſſiduous in his inſtructions. To render his lectures as uſeful as poſſible, he ſtudied inceſſantly, ſo as to injure his health. In 1720 his father died in diſtreſſed circumſtances, which obliged the ſon to exert all his powers for his ſupport: he became the editor of the German "Acta Eruditorum," which he conducted with great ſpirit till the year 1739. In 1730 he was appointed profeſſor of philoſophy, then of hiſtory, and in 1742 he obtained the office of librarian to the univerſity. He died in 1758, much eſteemed as a man of letters and a good teacher. He poſſeſſed an extenſive knowledge in the various branches of literature and ſcience, and was acquainted with the beſt writers on the ſeveral ſubjects. His principal work was "A Compendious Dictionary of learned Men," arranged alphabetically. This went through four editions in the author's life time, of which the laſt was extended to four volumes quarto. Two ſupplementary volumes, which go as far as I, have been ſince publiſhed by Adelung, entitled "A Continuation of, and Supplement to Jocher's General Dictionary of learned Men." Gen. Biog.

JOCKEY, in the management of horſes; the perſon who trims up, and rides about horſes for ſale.

JOCKGRIM, in *Geography*, a town of France, in the department of the Lower Rhine, ſituated on an eminence near the Rhine; 9 miles S.E. of Landau.

JOCKLET, or Yocklet, a term uſed in ſome parts of Kent for a little farm which requires but one yoke of oxen to till it.

JOCKMOCKI, in *Geography*, a town of Sweden, in the lapmark of Lulea; 90 miles N.N.W. of Lulea.

JOCKO, in *Zoology*. See Simia *Satyrus*.

JOCRONS, in *Geography*, a town of Hindooſtan, in Myſore; 20 miles N.N.E. of Chitteldroog.

JODELLE, Stephen, in *Biography*, an early French poet, was born at Paris in 1532, of a family of ſome rank. He was a man of various talents, ſkilled in the ancient languages, and converſant in the arts of painting, ſculpture, and architecture, as well as dextrous in the uſe of arms; but his chief excellence was in poetry. He is ſaid to have made five hundred Latin verſes in one night. He was the firſt perſon who introduced tragedy and comedy in the ancient form into French poetry. His Cleopatra is the earlieſt of French tragedies, and was acted with great applauſe before Henry II. and all the great men of France. It is ſimple in its plan, and provided with a perpetual chorus in imitation of the ancient ſtyle. The comedies of this writer are ſaid to be ſuperior to his tragedies; he was undoubtedly popular in his day, but was, notwithſtanding, ſuffered to fall into indigence, to which his careleſsneſs and love of pleaſure contributed. He died in 1573, at the age of 41, and upon his death-bed he dictated a ſonnet to Charles IX., containing ſevere reproaches for deſerting him in neceſſity. His works have been publiſhed collectively at Paris and Lyons.

JODO, in *Geography*, a town of Japan, in the iſland of Niphon; 5 miles S. of Meaco.

JODOIGNE, a town of France, in the department of Dyle, and chief place of a canton, in the diſtrict of Nevelles: the place contains 2012, and the canton 14,434, inhabitants, on a territory of 165 kiliometres, in 28 communes.

JOEL, or *the Prophecy of Joel*, a canonical book of the Old Teſtament. Joel was the ſon of Pethuel, and the ſecond of the twelve leſſer prophets. The ſtyle of this prophet is elegant, perſpicuous, copious, and fluent; he is alſo ſublime, animated, and energetic. In the 1ſt and 2d chapters he diſplays the full force of the prophetic poetry, and ſhews how naturally it inclines to the uſe of metaphors, allegories, and compariſons. Nor is the connection of the matter leſs clear and eminent than the complexion of the ſtyle. But after allowing him perſpicuity both in language and arrangement, it cannot be denied, that there is ſometimes great obſcurity in his ſubject, and particularly in the latter part of his prophecy. About the beginning of the laſt century, Herman Von der Handt, the Hardouin of Germany, attempted to reduce Joel's allegories, as he calls them, to Iambic verſe. Joel upbraids the Iſraelites for their idolatry, and foretels the calamities they ſhould ſuffer as the puniſhment of that ſin: but he endeavours to ſupport them with the comfort that their miſeries ſhould have an end upon their reformation and repentance. Some writers, inferring the order of time in which the minor prophets lived from the order in which they are placed in the Hebrew copies, conclude that Joel propheſied before Amos, who was contemporary with Uzziah, king of Judah. Archbiſhop Uſher makes this inference from Joel's foretelling that drought, chap. i. which Amos mentions as having happened, chap. iv. 7, 8, 9. If we conſider the main deſign of Joel's prophecy, we ſhall be apt to conclude, that it was uttered after the captivity of the ten tribes; for he directs his diſcourſe only to Judah, and ſpeaks diſtinctly of the ſacrifices and oblations that were daily made in the temple.

Biſhop Newcome, adopting the conjecture of Druſius, ſuppoſes that he lived under the long reign of Manaſſeh, and before his converſion; that is, ſome time from 697 to 660 B. C. Lowth's Com. Lowth's Præl. xxi. Newcome's Attempt towards an improved Verſion, &c. of the Twelve Minor Prophets.

JOGHIS, a ſect of heathen religious in the Eaſt Indies, who never marry, nor hold any thing in private property; but live on alms, and practiſe ſtrange ſeverities on themſelves.

They are ſubject to a general, who ſends them from one country to another to preach: they are, properly, a kind of penitent pilgrims; and are ſuppoſed to be a branch of the ancient Gymnoſophiſts.

They frequent, principally, ſuch places as are conſecrated by the devotion of the people, and pretend to live ſeveral days together without eating or drinking. After having gone through a courſe of diſcipline for a certain time, they look upon themſelves as impeccable, and privileged to do any thing; upon which they give a looſe to their paſſions, and run into all manner of debauchery.

JOGHY-COOPA, in *Geography*, a town of Aſſam; 90 miles N.W. of Gerghonge.

JOGUES, or Yoogs, certain ages, eras, or periods, of extraordinary length, in the chronology of the Hindoos. They are four in number; of which the following is an account, extracted from Halhed's Preface to the Code of Gentoo Laws, p. 36.

1. The *Suttee Jogue* (or age of purity), is ſaid to have laſted three million two hundred thouſand years; and they

hold that the life of man was extended in that age to one hundred thouſand years, and that his ſtature was twenty-one cubits.

2. The *Tirtah Jogue* (in which one-third of mankind was corrupted), they ſuppoſe to have conſiſted of two million four hundred thouſand years, and that men lived to the age of ten thouſand years.

3. The *Dwapaar Jogue* (in which half of the human race became depraved), endured one million ſix hundred thouſand years, and the life of man was then reduced to a thouſand years.

4. The *Collee Jogue* (in which all mankind are corrupted, or rather leſſened, for that is the true meaning of *Collee*), is the preſent era, which they ſuppoſed ordained to ſubſiſt four hundred thouſand years, of which near five thouſand are already paſt; and the life of man in that period is limited to one hundred years. See Hindoos.

We ſhall here ſubjoin Dr. Robertſon's obſervations on the above periods, from the Notes to his Hiſtorical Diſquiſition concerning India.

"If (ſays he, p. 360.) we ſuppoſe the computation of time in the Indian chronology to be made by ſolar, or even by lunar years, nothing can be more extravagant in itſelf, or more repugnant to our mode of calculating the duration of the world, founded on ſacred and infallible authority. From one circumſtance, however, which merits attention, we may conclude that the information which we have hitherto received concerning the chronology of the Hindoos is very incorrect. We have, as far as I know, only five original accounts of the different jogues, or eras of the Hindoos. The firſt is given by M. Rogers, who received it from the Brahmins on the Coromandel coaſt. According to it, the Suttee Jogue is a period of one million ſeven hundred and twenty-eight thouſand years; the Tirtah Jogue is one million two hundred and ninety-ſix thouſand years; the Dwapaar Jogue is eight hundred and ſixty-four thouſand. The duration of the Collee Jogue he does not ſpecify. (Porte Ouverte, p. 179.) The next is that of M. Bernier, who received it from the Brahmins of Benares. According to him the duration of the Suttee Jogue, was two million five hundred thouſand years; that of the Tirtah Jogue, one million two hundred thouſand years; that of the Dwapaar Jogue is eight hundred and ſixty-four thouſand years. Concerning the period of the Collee Jogue, he likewiſe is ſilent. (Voyages, tom. ii. p. 160.) The third is that of colonel Dow; according to which the Suttee Jogue is a period of fourteen million of years; the Tirtah Jogue one million eighty thouſand; the Dwapaar Jogue ſeventy-two thouſand; and the Collee Jogue thirty-ſix thouſand years. (Hiſt. of Hindoſt. vol. i. p. 2.) The fourth account is that of M. le Gentil, who received it from the Brahmins of the Coromandel coaſt; and as his information was acquired in the ſame part of India, and derived from the ſame ſource with that of M. Rogers, it agrees with his in every particular. (Mem. de l'Academ. des Sciences, pour 1772 tom. ii. part i. p. 176.) The fifth is the account of Mr. Halhed, which has been already given. From this diſcrepancy, not only of the total numbers, but of many of the articles in the different accounts, it is manifeſt that our information concerning Indian chronology is hitherto as uncertain as the whole ſyſtem of it is wild and fabulous. To me it appears highly probable, that when we underſtand more thoroughly the principles upon which the fictitious eras or jogues of the Hindoos have been formed, we may be more able to reconcile their chronology to the true mode of computing time, founded on the authority of the Old Teſtament; and may likewiſe find reaſon to conclude, that the account given by their aſtronomers of the ſituation of the heavenly bodies at the beginning of the Collee Jogue, is not eſtabliſhed by actual obſervation, but the reſult of a retroſpective calculation."

JOHADINGA, in *Geography*, a town of Bengal; 32 miles N.E. of Calcutta.

JOHAN, St., a town of France, in the department of the Sarre, on the Sarre, communicating by a bridge with Saarbruck.—Alſo, three towns in the duchy of Stiria.—Alſo, a town of the archbiſhopric of Salzburg; 30 miles S.S.E. of Salzburg.

JOHAN-GEORGEN-STADT, a town of Saxony, in the circle of Erzgeburg, founded in 1654 by the Proteſtant miners, who were driven from Platten in Bohemia, and ſo named after John George I. The corn, cultivated near the town, is inconſiderable, but the breed of cattle is good. The men are employed in mining, and the women in weaving lace. Ores of tin and ſilver have been formerly found near this place. Copper ore, cobalt, emery, and other minerals are now found; 24 miles S. of Chemnitz. N. lat. 50° 23′. E. long. 12° 40′.

JOHANNES, a ſmall iſland in the Pacific ocean, diſcovered in 1767. N. lat. 6° 50′. E. long. 132° 18′.

JOHANNESBERG, or Bichofsberg, a town of Germany, famous for its wine; 16 miles W. of Mentz.

JOHANNESBURG, a town of Pruſſia, in the province of Natangen, near the Spirding lake; 96 miles S.S.E. of Konigſberg. N. lat. 53° 22′. E. long. 22° 2′.

JOHANNS, St., a town of Auſtria; 11 miles S.S.E. of Glaggnitz.—Alſo, a town of Auſtria; 8 miles E. of Bavarian Waidhoven.

JOHANSTHAL, a town of Moravia, in the circle of Prerau, ſituated in Sileſia; 12 miles N.N.W. of Jagendorf.

JOHN *the* Baptist, in *Scripture Biography*, was the ſon of Zacharias, a prieſt of the courſe of Abia, and of Elizabeth, couſin to Mary, the mother of our Saviour. He was announced before his birth to Zacharias, who received inſtructions to call him John, and who was apprized of the high and honourable character which he was to ſuſtain, as the forerunner of the Meſſiah. See the account of his birth and office in the firſt chapter of St. Luke's Goſpel. Having withdrawn himſelf from ſociety, in order to prepare, by exerciſes of devotion, and ſtrictneſs of manners, for the duties of the office which was aſſigned him, he was called to commence his miniſtry when he was about thirty years of age; and, like the ancient prophets, he quitted his ſolitude in a garment of camel's hair, and diſtinguiſhed himſelf by abſtinence and ſelf-denial, and ſeverity of morals. His commiſſion was to proclaim the approaching advent and kingdom of the Meſſiah, and to qualify men, by repentance and reformation, for becoming partakers of the bleſſings which the great teacher and ſaviour was empowered to beſtow. The ſucceſs of his preaching was ſuch, that multitudes reſorted to hear him, and to be baptiſed by him in the waters of Jordan. His reputation was ſuch among the people, that many began to debate among themſelves, whether he was not the Meſſiah: and when the Jewiſh Sanhedrim, hearing of his fame, ſent ſcribes and phariſees from Jeruſalem to examine his pretenſions, John thought it ſufficient honour to be commiſſioned as the forerunner of the Meſſiah, and therefore explicitly declared that he was not the Meſſiah himſelf. At the appointed time Jeſus came to him from Nazareth, and after ſome heſitation, firſt from ignorance of his perſon and character, and afterwards, from humility and diffidence, John performed for him the religious rite of baptiſm, according to his requeſt. As ſoon as this ſervice was concluded, John had ample evidence preſented to him of the dignity and real character of Jeſus; for a lambent flame deſcended upon him with a kind of hovering dove-like motion, and a voice from heaven accompanied it, proclaiming "This is my beloved Son, in whom I am well pleaſed." John, being thoroughly ſatisfied that Jeſus was the promiſed and expected Meſſiah, eagerly embraced every opportunity that occurred of announcing him to the multitude, which attended his miniſtry, under this character. The diſciples of John became jealous of the increaſing fame of Jeſus; and fearful that the reputation and influence of their maſter would decline: but John corrected their miſapprehenſions, acknowledged his inferiority to Jeſus, and directed the people to transfer their views and regard from him, who was merely the forerunner of the Meſſiah and Saviour, to the perſon who really ſuſtained this high character, and to whom theſe honourable appellations belonged. In the courſe of John's miniſtry his fame commanded the attention of Herod, tetrarch of Galilee, and induced him to ſend for the preacher to his court; for ſome time his inſtruction and counſel ſeemed to impreſs the tetrarch's mind, and to give him pleaſure. But the fidelity of John would not permit Herod to form an inceſtuous connection with Herodias, his brother's wife, without ſeaſonable animadverſion and ſevere reproof. The tetrarch reſented the faithful reprehenſion of John, and committed him to priſon. During the interval of his confinement, Herodias was plotting his death: but Herod, for ſome time, partly from reverence for John, and partly from a dread of the people, who believed him to be a prophet, reſiſted the machinations of Herodias. An opportunity at length occurred, upon the birth-day of Herod, for the execution of the cruel purpoſe which this wicked woman had formed againſt John. Her daughter, by her former huſband, danced before the aſſembly that was convened in honour of his nativity, ſo much to the ſatisfaction of Herod, that he promiſed with an oath to grant her whatſoever ſhe requeſted, even though it ſhould be to the value of half his kingdom. The princeſs, inſtructed by her mother, requeſted that the head of John the Baptiſt ſhould be delivered to her in a charger, or large diſh. Herod was for ſome time reluctant; but upon her perſiſting in her requeſt, Herod complied, and ordered John to be beheaded in the priſon. The death of John the Baptiſt is mentioned by Joſephus in a paſſage, the genuineneſs of which is generally admitted by learned men. A diſpute had ariſen between Aretas, king of Petræa, the father of his firſt wife, whom he had put away for the ſake of Herodias, which was partly owing to this conduct, and partly to ſome difference that took place between them about the limits of their reſpective territories. In a conteſt between them Herod's whole army was defeated; and this defeat, ſays Joſephus, was conſidered by ſome of the Jews as a juſt puniſhment providentially inflicted on Herod, for the death of John, called the Baptiſt. For Herod, continues the Jewiſh writer, had killed him who was a juſt man, and had called upon the Jews to be baptiſed, and to practiſe virtue, exerciſing both juſtice towards men, and piety towards God: for ſo would baptiſm be acceptable to God, if they made uſe of it, not for the expiation of their ſins, but for the purity of the body; the mind being firſt purified by righteouſneſs. And many coming to him, for they were wonderfully taken with his diſcourſes, Herod was ſeized with apprehenſions, leſt, by his authority, they ſhould be led into ſedition againſt him, for they ſeemed capable of undertaking any thing by his direction, &c. (Antiq. l. xviii. c. 5. § 1, 2.) It has been ſaid by ſome perſons, that this paragraph contradicts our evangeliſts: for, acording to them, it was at the ſolicitation of Herodias and her daughter that John was beheaded. But here it is ſaid, that Herod put John to death becauſe he feared that he might be the cauſe of a ſedition. But the two accounts are by no means inconſiſtent: for Herod might have apprehenſions from John's popularity, and be diſpoſed, on that account, to take him off. See Lardner's Works, vol. vii. p. 117. The feſtival of the nativity of John the Baptiſt was appointed to be obſerved in the Chriſtian church on the 24th of June: the date of the firſt appointment is not known: but that it is to be placed before the end of the fourth century, appears from the ſermons of St. Auguſtine, adapted to the day.

JOHN *Baptiſt, Hermits of.* See HERMITS.

JOHN, *Saint*, an *apoſtle* and *evangeliſt*, was the ſon of Zebedee, a fiſherman, of the town of Bethſaida, on the ſea of Galilee, the younger brother of James the elder, (ſee JAMES,) and commonly reckoned the youngeſt of all Chriſt's diſciples. His mother's name was Salome. Zebedee, though a fiſherman, was not poor, and therefore we have no reaſon to imagine that his children were altogether illiterate, which ſome have imagined to have been the caſe, from a miſinterpretation of Acts, iv. 13, in which the terms *ἀγράμματοι* and *ἰδιῶται* denote perſons that were neither doctors nor magiſtrates, but men of private ſtations, who had not been educated in the ſchools of the Rabbies. (Grot. in loc.) See IDIOT. They were, without doubt, well acquainted with the ſcriptures of the Old Teſtament; having not only read them, but having heard them publicly read and explained in the ſynagogues. In common with other Jews, they entertained the expectation of the Meſſiah, and had heard John the Baptiſt preach, though they were not enliſted in the number of his diſciples. Before John was called to be an apoſtle, it cannot be queſtioned that he had ſeen and heard our bleſſed Lord, and had been witneſs of ſome of his miracles, particularly that at the wedding of Cana in Galilee. (See John, ii. 1 - 11.) His call to attend upon Jeſus ſtatedly is related Matt. iv. 21, 22. Mark, i. 19, 20. Luke, v. 1—10. From this time he and his brother James were the conſtant attendants on Chriſt; they heard his diſcourſes, and ſaw his miracles; and after previous inſtruction, both public and private, they were honoured with a ſelection and appointment to be of the number of the twelve apoſtles. What was his age at this time, his hiſtory does not preciſely aſcertain. Some have ſuppoſed that he was then 22 years old: others conjecture that he was about 25 or 26; and others again think, that he was about the ſame age with our Saviour. Dr. Lardner is of opinion, that none of the apoſtles of Chriſt were much under the age of 30, when they were appointed to this important office. However it be, John ſeems to have been the youngeſt of the twelve, and to have been diſtinguiſhed by a temper ſingularly mild, amiable, and affectionate. He was eminently the object of our Lord's regard and confidence, and admitted, on various occaſions, to free and intimate intercourſe with him; ſo that he was characterized as "the diſciple whom Jeſus loved." The evangelical hiſtory recites many inſtances which evince the intimacy that ſubſiſted between him and his maſter, and the high opinion which our bleſſed Lord entertained of his diſpoſition and character. His failings, however, did not eſcape notice; and he was reprehended for them by our Lord. Notwithſtanding his affectionate attachment to Chriſt, and the numerous inſtances of kind and condeſcending attention with which he had been honoured, he, in common with the other apoſtles, betrayed a culpable timidity in forſaking him during his laſt conflict; though he afterwards recovered his firmneſs, and attended the crucifixion: and, indeed, he ſeems to have been the only apoſtle who thus hazarded garded his own ſafety. On this occaſion he was diſtinguiſhed by the notice of his maſter, and by the recommendation of his mother to the future protection of this apoſtle. He was alſo a witneſs of the circumſtances that aſcertained our Lord's death and burial. After his reſurrection John was the firſt who entertained the belief that he was really riſen from the dead. On ſubſequent occaſions, when Jeſus manifeſted himſelf to his diſciples, and thus evinced the reality of his reſurrection, John was one of the number. In one of theſe interviews, when Peter, having received information of the manner of his own death, inquired with a reprehenſible curioſity concerning the fate of John, our Lord replied, "what if he tarry till I come," thus intimating either that he would ſurvive the deſtruction of Jeruſalem, or that his life would be prolonged till it was terminated in the courſe of nature. After the aſcenſion of Chriſt, and the effuſion of the Spirit on the day of pentecoſt, John became one of the chief apoſtles of the circumciſion, and exerciſed his miniſtry at and about Jeruſalem, in the manner and with the ſucceſs related in the book of Acts: he was preſent at the council of this city held in the year 49 or 50. (See Acts, xv.) Until this time he probably remained in the land of Iſrael, and had not travelled into any foreign countries. During his ſtay in Judea, it appears that he wrought many miracles. From the book of Revelation (chap. i. 9.) we learn, that St. John was for ſome time in the iſland of Patmos, where he was favoured with viſions and revelations. He is ſuppoſed to have been baniſhed thither in the 14th year of Domitian, and to have returned in the beginning of the reign of Nerva; ſo that his exile could not have laſted more than two years, or perhaps not above a year. From eccleſiaſtical hiſtory we learn that he lived to a great age, and that in the latter part of his life he reſided in Aſia, particularly at Epheſus, the chief city of that country. His ſettlement in Aſia ſeems, from ſeveral circumſtances, to have taken place about the time when the war broke out in Judea, in the year 66, or a ſhort time before, when probably St. Peter and Paul had been previouſly crowned with martyrdom. According to Irenæus, this apoſtle lived in Aſia till the time of Trajan, who ſucceeded Nerva, A.D. 98. From other accounts it appears that he died at Epheſus, and was buried near that city, about 68 years after our Lord's paſſion. Suppoſing our Lord to have been crucified in the year 32 of the vulgar era, which ſeems to have been Jerom's opinion; 68 years will extend to the year 100, or the third of Trajan; at which year of that emperor the death of St. John is placed by Jerom in his chronicle. At the time of his death it is not incredible, nor unlikely, that he was about 100 years of age. Some other particulars have been recorded concerning this apoſtle, which the moſt impartial critics have reckoned fabulous. It is related of him, that going to bathe at Epheſus, and perceiving that Cerinthus, or, as others ſay, Ebion, was in the bath, he came out haſtily without bathing, ſaying to thoſe that were with him, "Let us flee hence, leſt the bath ſhould fall while Cerinthus the enemy of the truth is within." It is alſo ſaid, that by order of the emperor Domitian, St. John was caſt into a cauldron of boiling oil at Rome, and came out again without being hurt. The following account, given by Jerom, of St. John's method of preaching when he was far advanced in years, and not able to make a long diſcourſe, is more worthy of credit. "The bleſſed apoſtle John, living at Epheſus to extreme old age, and being with difficulty carried to church in the arms of the diſciples, and being unable to make a long diſcourſe every time they aſſembled, was wont to ſay nothing but this; "Little children, love one another." At length the diſciples and brethren who attended, tired with hearing ſo often the ſame thing, ſaid, "Sir, why do you always ſay this?" who then made this anſwer, worthy of himſelf: "Becauſe," ſays he, "it is the Lord's command; and if that alone be done, it is ſufficient."

The writings which are generally aſcribed to St. John, and received as his, are a goſpel, three epiſtles, and the book of Revelation.

The goſpel of St. John has been univerſally received as genuine; and, as it is generally allowed that he had ſeen the other three goſpels, it may be conſidered as a kind of ſupplement to theſe, containing ſeveral things that occur in them, and many others which they have omitted. In the account of our Saviour's perſecution, death, and reſurrection, all four goſpels coincide in many particulars; though here St. John has various things peculiar to himſelf. In his goſpel many things recorded by the other evangeliſts are omitted. He has given us no account of our Saviour's nativity, nor of his baptiſm by John. He takes no notice of our Saviour's temptation in the wilderneſs; nor of the call, or names of the 12 apoſtles; nor of their miſſion in the time of our Saviour's life; nor of our Lord's parables, or other diſcourſes of his, recorded by them; nor of our Saviour's journies, of which they give an account; nor of any of thoſe predictions relating to the deſolations of Jeruſalem, which are found in the goſpels of Matthew, Mark, and Luke; nor has he repeated any miracles recorded by them, excepting only that of the multiplication of ſmall proviſion for feeding 5000, with the extraordinary circumſtances of the return to Capernaum from the country, where that miracle had been wrought. But he mentions ſeveral incidents which the other evangeliſts have not noticed. St. John gives an account of our Lord's cleanſing the temple, at his firſt paſſover, when he went to Jeruſalem; but all the other evangeliſts give a like account of his cleanſing the temple at the laſt paſſover. Theſe two acts are, however, different. He gives an account of the acts of Chriſt before the impriſonment of John the Baptiſt; of the wedding at Cana; of Nicodemus; of the woman of Samaria; of the cure of the man blind from his birth; of the reſurrection of Lazarus; of the indignation of Judas at the woman who anointed the Lord with ointment; of the Greeks that came to Jeſus; of Chriſt waſhing the feet of his diſciples; and of the conſolatory inſtructions, which he delivered to his apoſtles previouſly to his death, &c. St. John's goſpel contains alſo more plain and frequent aſſurances than thoſe that occur in the other goſpels, that Jeſus is not only a prophet and meſſenger of God, but the Chriſt, the Son of God, or that great prophet, that ſhould come into the world; referring, as many ſuppoſe, by peculiar expreſſions, to his pre-exiſtent dignity, though others think theſe expreſſions to be figurative.

Writers are not agreed as to the time when this goſpel was written. St. John, according to Mill, Fabricius, and Le Clerc, wrote his goſpel at Epheſus, after his return from the iſle of Patmos, A.D. 97, at the deſire of the Chriſtians of Aſia. Wetſtein thought that this goſpel might be written about the year 32 after our Lord's aſcenſion. Baſnage and Lampe ſuppoſed that it was written before the deſtruction of Jeruſalem: Dr. Lardner adopts this opinion, and aſſigns the date of it to the year of Chriſt 68. This period brings it nearer to that of the three other goſpels, which was about the year 64 or 65, and the goſpel itſelf, the leading deſign of which was to ſhew how inexcuſable the Jews were in not receiving Jeſus as the Chriſt, and to vindicate the providence of God in the calamities already befallen, or now coming upon them, was ſuitable to the circumſtances of the Jews at this period. It is obſerved by Dr. Lardner, as an evidence that it was one great deſign of St. John, in writing this goſpel, to ſhew the unreaſonableneſs and great guilt of the Jews in rejecting Jeſus, that in his goſpel are inſerted more inſtances of their attempts upon our Lord's life than in the other goſpels. Chryſoſtom was of opinion, that St. John did not write his goſpel till after the deſtruction of Jeruſalem. John, he ſays, writes not any of the things that occur in Matt. xxiv., leſt it ſhould be thought that he took an advantage from the event: for he was living a good while after the deſtruction of Jeruſalem. But the other evangeliſts, who died before the deſtruction of Jeruſalem, and ſaw none of theſe things, record theſe predictions. But John, if he wrote at the time above ſpecified, *viz.* when the event was near, might omit theſe predictions, as they were ſufficiently recorded already, and as it is not his manner to repeat what had been related before. He gives, however, ſeveral intimations of the miſeries that were coming upon the Jewiſh people. (Ch. iii. 36. iii. 18, 19. viii. 12. 21. 24. ix. 39—41. xii. 35, 36.) Mr. Whiſton, obſerving that St. John uſes the Roman or Julian beginning of the day in his goſpel, and reckons the hours from midnight and noon, urges this as an argument for the goſpel having been written after the deſtruction of Jeruſalem, and the period of the Jewiſh polity, at Epheſus, a place remote from Judea, and under the Roman government. To this it is replied, that St. John does not compute the hours of the day after the Roman, but rather after the Jewiſh manner; and, ſuppoſing St. John to have uſed the Roman method of computation, it does not follow that he wrote after the deſtruction of Jeruſalem, &c. As the goſpel was written at Epheſus, at a diſtance from Judea, he might, if he thought fit, have uſed the Roman way of reckoning, eſpecially when the period of the Jewiſh commonwealth was near, though not quite accompliſhed. The late date of the goſpel has been alſo argued, from what ſome have alleged, to have been the object or end of the writer. Accordingly, many ancient and ſome modern writers ſay, that this goſpel was written with a deſign to remove the errors of the Cerinthians, Ebionites, and other ſects, which cannot be ſuppoſed to have appeared before the deſtruction of Jeruſalem, and the overthrow of the Jewiſh people. But Mr. Lampe and Dr. Lardner have urged ſeveral reaſons to ſhew that St. John did not write againſt Cerinthus, or any other heretics in his goſpel; and that it was written before the riſe of thoſe hereſies, which are ſaid to be confuted by it. Lardner thinks that it would have been below an evangeliſt to write againſt heretics in the hiſtory of his Lord and maſter; and that none of the evangeliſts have entered into a particular account of things after our Lord's aſcenſion. Nothing of this kind, ſays this writer, occurs in the reſt of St. John's goſpel; and, therefore, why ſhould we imagine that there is any ſuch thing in the introduction; the deſign of which is to ſhew, that Jeſus came and acted by the authority of God, the Creator of the world, the God and ſupreme Lawgiver of the Jewiſh people. Some have thought, and particularly Grotius, that St. John concluded his goſpel with the words, which are at the end of the 20th chapter; and that which is in the 21ſt chapter was added after St. John's death by the church of Epheſus. But this opinion is contradicted by the general, or even univerſal, conſent of manuſcripts and verſions: to which it may be added, that none of the ancient Chriſtian writers ever made a queſtion, whether this chapter was compoſed by St. John or another. Moreover, the ſtyle is St. John's. Lardner's Suppl. to the Credibility, or Works, vol. vi. chap. 9.

Beſides the goſpel, St. John wrote three epiſtles, which are generally received in theſe parts of the world. The genuineneſs of the firſt epiſtle does not ſeem to have been ever queſtioned. It is referred to by Polycarp, and the martyrs of Lyons, and quoted by Papias. The firſt and ſecond epiſtles are cited by Irenæus, and received by Clement of Alexandria. Origen mentions three epiſtles, though he ſays that the ſecond and third were not allowed by all to be genuine. Dionyſius of Alexandria receives the firſt epiſtle, calling it the “Catholic epiſtle,” and he mentions the other two as aſcribed to St. John. The firſt epiſtle was received by Cyprian, and probably the other two. The ſecond epiſtle is quoted by Alexander, biſhop of Alexandria. Euſebius ſays, “that beſides the goſpel, his firſt epiſtle is univerſally acknowledged by thoſe of the preſent time, and by the ancients; but the other two are contradicted,” *i. e.* doubted of by ſome. All the three epiſtles were received by Athanaſius, by Cyril of Jeruſalem, by the council of Laodicea, and by Epiphanius. All three were received by Jerom: and the two laſt were doubted of by ſome in his time. All three were received by Rufinus, by the third council of Carthage, by Auguſtine, and by all thoſe authors who received the ſame canon of the New Teſtament with our's. All three are in the Alexandrian MS. and alſo in the catalogues of Gregory Nazianzen and of Amphilochius. The Syrian churches, however, received only one; nor were any more received by Chryſoſtom. Upon the whole we may obſerve, that one epiſtle was received by all as certainly genuine; and it is not of any importance to contend about the other two, as they are ſo very ſhort, and reſemble the firſt in ſentiment, phraſe, and manner of writing. The ſecond epiſtle conſiſts of only thirteen of our verſes; and of theſe eight may be found in the firſt, either in ſenſe or expreſſion. See CANON.

As to the time when theſe epiſtles were written, critics and commentators have entertained different opinions. Grotius, Hammond, and Whitby, ſuppoſe the firſt to have been written before the deſtruction of Jeruſalem, and the former thinks the place of writing it was Patmos. Dr. Benſon inclines to date it in the year of our Lord 68. Mill and Le Clerc refer it to the year 91 or 92; Baſnage to the year 98, and Baronius to 99. Beauſobre and Lenfant refer it to the end of the firſt century, when the apoſtle was far advanced in age. Whiſton thought that this, and the two other epiſtles of St. John, were written not long after each other, about the year of Chriſt 82 or 83. Lampe ſuppoſes the firſt epiſtle to have been written after the Jewiſh war, before St. John's exile in Patmos, and, probably, ſome conſiderable time before it: ſo that he nearly agrees about the time of the epiſtle with Whiſton. Dr. Lardner, conſidering that there are no expreſſions in the epiſtle declaring the time of it, or clearly referring to the calamities attending the downfal of the Jewiſh ſtate, thinks it probable, that it was not written till a good while after that event, about the year of Chriſt 80, or later. Some have thought that the firſt epiſtle was written to Jewiſh believers in Parthia; and others are of opinion, that it was addreſſed to the Jewiſh Chriſtians in Judea and Galilee. Others think it more probable, that it was directed to all believers, Gentiles as well as Jews; though Jewiſh believers are eſpecially regarded. The ſecond epiſtle is inſcribed “The elder to the elect lady, and her children.” By the “elect lady” ſome have underſtood the Chriſtian church in general, and others underſtand the appellation as deſigned to expreſs ſome particular church. Others again have ſuppoſed, that it was addreſſed to a female of the name of “Electa,” or “Eclecta;” and ſome have rendered the inſcription “to the elect Kyria.” Others again underſtand the inſcription agreeably to our own tranſlation; and this has been the common opinion, ſupported by the authorities of Beza, Mill, Wolfius, Wall, Le Clerc, and others.

The third epiſtle of St. John is inſcribed, "The elder to the beloved Gaius." There were two perſons of this name, mentioned in the Acts (xix. 29.), and in St. Paul's epiſtles (1 Cor. i. 14. Rom. xvi. 23.) He ſeems to have been an eminent Chriſtian, who lived in ſome city of Aſia, not far from Epheſus, where St. John chiefly reſided, after his leaving Judea. Concerning the caſe to which St. John refers in this epiſtle, there have been various ſentiments of learned men. Grotius ſuppoſed that the ſtrangers here ſpoken of were believing Jews, whom Diotrephes, a gentile, and biſhop of Pergamos, would not receive, becauſe they were Jews, or becauſe they were for blending the rites of the law with Chriſtianity. Others think, that Diotrephes was a Jew, and zealous for the law, and that he would not admit theſe ſtrangers, converts from among the Gentiles, becauſe they did not conſent to the obſervance of the rites and ceremonies of the law of Moſes. Learned men have lately been of opinion that St. John here ſpeaks of ſome, particularly Jews, who had gone out into the world, to propagate the Chriſtian religion, without receiving any pecuniary recompence from thoſe whom they had converted to the Chriſtian faith: and they think, that Caius or Gaius is commended by St. John for encouraging ſuch teachers, whilſt he blamed Diotrephes for not receiving and helping them. But this opinion is rejected by Lardner as unfounded, and he ſees nothing that ſhould lead us to think preachers here ſpoken of, but only ſtrangers in want. Some have ſuppoſed, that Diotrephes excommunicated, or caſt out of the church, the "brethren," members of it, who were for receiving theſe ſtrangers. Others ſuppoſe that the perſons, whom Diotrephes caſt out of the church were theſe ſtrangers, not members of the church. It is ſuppoſed, that Diotrephes had the diſpoſal of the revenues of the church; and that he oppoſed the diſtribution of the common ſtock to theſe ſtrangers, partly Jews and partly Gentiles, who needed relief, and diſcouraged ſuch as were willing to aſſiſt them out of their own property. Concerning the time of writing theſe two epiſtles, nothing can be ſaid with certainty. Mill places them about the ſame time with the firſt, in 91 or 92. Whiſton ſuppoſes, that all three were written about the year 82 or 83. Dr. Lardner conceives, that St. John was ſomewhat advanced in age, and that he had reſided a good while in Aſia, before he wrote any of theſe epiſtles. Hence he concludes, that theſe two were not written ſooner than the firſt; and if the firſt was written about the year 80, theſe two may be reckoned to have been written between the years 80 and 90. See EPISTLE. Lardner's Works, vol. vi. chap. 20.

The book of Revelation has been alſo aſcribed to St. John. See REVELATION.

JOHN, *St.*, *Chriſtians of.* See CHRISTIANS.

JOHN, ſurnamed *Mark.* See MARK.

JOHN I. emperor of the Eaſt, ſurnamed *Zimiſces*, was an Armenian noble, who ſerved with diſtinction in the armies of Romanus the younger. After the death of that emperor, he aſſiſted Nicephorus Phocas in his elevation to the empire and his marriage of the imperial widow, Theophano. Zimiſces became an object of ſuſpicion to Nicephorus, who deprived him of the poſt of general of the Eaſt, in which he had been generally victorious, and baniſhed him from court. The hero was reſolved to be revenged for the indignities inflicted on him, and having inſinuated himſelf into the good graces of the empreſs, he contrived a plot to take away her huſband's life. The plan ſucceeded, Nicephorus was ſlain, and John was immediately declared emperor, A.D. 969. Before the patriarch would conſecrate him he was told he muſt, by public penance, expiate the crime of which he had been guilty. John threw the blame of the deed on his companions, and readily agreed to ſeparate himſelf from them. Theophano parted in a paroxyſm of rage, and was immediately ſhut up in a monaſtery of Armenia. The reign of John was chiefly ſpent in military tranſactions, in which his valour and good fortune were equally conſpicuous. He obtained many victories over the Ruſſians, Bulgarians, and Saracens; and is ſuppoſed to have fallen a ſacrifice to the eunuch Baſil, whom he had offended, after a reign of ſix years. John Zimiſces, though arriving at the crown by an act of treaſon, wore it with glory, and ſeemed to merit it by his public and private virtues. His piety is extolled by writers of the time, and he is recorded as the firſt emperor who cauſed the effigy of Chriſt to be ſtamped upon the coin, with the legend, "Jeſus Chriſt, the King of Kings."

JOHN II. emperor of the Eaſt, was born in 1088, and ſucceeded his father Alexius in 1118. Soon after his acceſſion a conſpiracy was excited againſt him by his ſiſter, the celebrated Anna Comnena, to depoſe him in favour of her huſband Bryennius. The conſpiracy was diſcovered in time to prevent the evils that would otherwiſe have reſulted from it. This was the only domeſtic trouble by which his reign was diſturbed, and he had the happineſs of being able, during an adminiſtration of twenty-five years, to baniſh capital puniſhments from the whole empire, not excepting the caſe of thoſe perſons who had engaged with his ſiſter to take away his life. Againſt the public enemies of his country he was active and ſucceſsful, and he entertained the ambitious project of extending the eaſtern empire to its former limits, and recovering Antioch from the dominion of the Latins. He not only planned the enterprize but actually ſet out on the buſineſs, accompanied by his two ſons. Theſe were carried off by a premature death, and he himſelf died ſhortly after, in 1143, of a wound from one of his own poiſoned arrows. He was called the "Handſome," an appellation which has been thought to have been applied ironically: but whatever the qualities of his body were, his ſoul was formed in the mould of moral beauty, and few poſſeſſors of a throne have graced it with purer manners and more humane principles.

JOHN III., DUCAS, ſurnamed *Vataces*, emperor of the Eaſt, was born in 1193, and ſucceeded, by virtue of his marriage with the daughter of Theodore Laſcaris, to the throne at the death of that prince. Conſtantinople, the capital of the empire, was, at this period, in the hands of the Latins, as was likewiſe a conſiderable part of the empire. John, however, was a prince of great virtue, and recovered all the other places which had been taken by the Latins, and reduced under his dominion the European territories almoſt to the gates of Conſtantinople, and nearly the whole of Leſſer Aſia. He fought and gained many battles, defeating the Scythians, Tartars, and Bulgarians, and extended his empire on all ſides. While he was thus diſtinguiſhed in war, he was equally illuſtrious in the internal adminiſtration of his affairs, by which he reſtored proſperity to the haraſſed ſubjects of the eaſtern empire. He encouraged agriculture, and the uſeful arts, and promoted ſimplicity and regularity of manners. He died in 1258, after a glorious reign of 33 years.

JOHN IV., LASCARIS, ſon of Theodore the younger, whom he ſucceeded in 1259, at the age of ſix years, but ere he had ſat on the throne a ſingle year, he was deprived of his eyes, and impriſoned for life, by the deſpot Michael Palæologus.

John V., Cantacuzenus, emperor of the Eaſt, deſcended from the Paladins of France, was one of the principal confidants of the younger Andronicus, at the time of his revolt from his grandfather, and acted with great fidelity in the ſervice of the young prince, in whoſe reign he held the office of great domeſtic, by virtue of which he ruled both the emperor and the empire. At the death of Andronicus in 1341, Cantacuzenus was left guardian to the eldeſt of his ſons, then but nine years of age, and was made regent of the empire. His adminiſtration was diſturbed by the ambition of the great duke Apocaucus, who encouraged the empreſs dowager to aſſert a maternal right to the tutelage of her ſon, and by the patriarch John, who laid claim himſelf to the office of guardian. In ſelf-defence, therefore, Cantacuzenus cauſed himſelf to be made emperor in 1342, which produced a civil war, in which he was, at firſt, ſo far unſucceſsful, that he was obliged to quit his country and take refuge in Servia. After a ſeries of misfortunes he was at length, in 1347, received as a conqueror into Conſtantinople. He now aſſociated himſelf with his ward in the empire, but the union was ſoon interrupted by inteſtine diviſions, which, in 1355, he put an end to by a voluntary abdication, when he took the religious habit in a monaſtery of mount Athos. Here he employed himſelf in compoſing a hiſtory of the tranſactions to which he had been witneſs; and this work, compriſing a period of forty years, from the revolt of the younger Andronicus to his own abdication, is one of the moſt elegant productions of the modern Greeks. He likewiſe engaged in a religious controveſy, and compoſed four books againſt the Jews and Mahometans. This work was publiſhed at Baſil in 1543; and of his Hiſtory there is a Louvre edition in three volumes, fol. 1655. He is ſaid to have died in 1411: a letter to him from pope Gregory XI., in 1375, is ſtill extant. Theſe are the only emperors of the name of John that require any notice in this work. Gibbon. Univerſal Hiſtory.

John, king of France, ſucceeded his father, Philip of Valois, in 1350, being, at the time, forty years of age. One of his firſt acts was to put to death, without the form of trial, the conſtable, count d'Eu, who was ſuſpected of being in the intereſt of Edward III., king of England. This arbitrary act occaſioned much diſcontent among his nobles, whom he attempted to appeaſe by the inſtitution of the order of the ſtar, in imitation of Edward's order of the Garter, but being too laviſh of the new honour, it was brought into contempt. A war broke out between England and France, and John ſummoned the ſtates-general for the purpoſe of raiſing the neceſſary ſupplies. In the aſſembly of theſe ſtates it was agreed that no propoſition ſhould be admitted without the unanimous conſent of the three orders, which gave to the third eſtate an authority and independence which aſſimilated them to the commons of England. John made conſiderable conceſſions, and was enabled thereby to raiſe a powerful army. It was in this conteſt that the king of France was oppoſed to the Black Prince of England: at Maupertuis, near Poictiers, they met; the former with an army of ſixty thouſand men, the latter could ſcarcely enumerate twelve thouſand effective ſoldiers. Edward, feeling the diſadvantageous ground on which he ſtood, offered to reſign his priſoners, and the booty which he had already made, and to ſign a truce for ſeven years, provided he might be permitted to return to his own country in ſecurity, but John, confident of ſucceſs, required him to ſurrender himſelf a priſoner, with the principal officers of his army. This demand brought on the famous battle of Poictiers, on the 19th of September, 1356, in which John was made priſoner, and many of the French nobility loſt their lives. The captive monarch, though reſpectfully treated, was brought to England to grace the triumph of the conqueror; the peace, in 1360, put an end to his captivity, but to obtain his liberty he made over many of the moſt valuable provinces of his kingdom to the king of England, and agreed to pay a ranſom of three millions of gold crowns. The diſaſters to which he had already been ſubject, had ſo little effect in teaching him political wiſdom, that at the perſuaſion of pope Urban V. he took the croſs, and ſeriouſly reſolved upon an expedition into the Holy Land. The execution of this project was prevented by the diſhonourable eſcape of his ſon Lewis, count of Anjou, from England, where he was detained as a hoſtage. The king's ſenſe of juſtice and honour determined him inſtantly to return to England in the ſtead of his ſon. He landed in 1364, and was received by Edward with great magnificence; but he was ſhortly after attacked with a diſeaſe, of which he died at the palace at the Savoy in April, in the 56th year of his age, and the 14th of his reign. John was poſſeſſed of many noble qualities, but he was not gifted with very ſuperior talents: he was author of the maxim, "That if juſtice and good faith were baniſhed from the reſt of the world, they ought to find refuge in the hearts of princes." Univer. Hiſt. Hume.

John, king of England, born in 1166, was the youngeſt ſon of Henry II. by queen Eleanor of Guienne. He was his father's favourite, nevertheleſs he joined his brother Richard in thoſe projects againſt Henry, which induced the unhappy king, on his death-bed, to pronounce a curſe upon his children. He was left without any particular proviſion, which circumſtance gave him the name of "Lack-land." Richard, upon his acceſſion to the throne, behaved with the utmoſt liberality to John, but his generoſity could not attach him to his intereſt. During his abſence in the Holy Land, he formed ſecret intrigues with Richard's rival and inveterate foe, Philip king of France. Theſe broke out into open rebellion, but being unſucceſsful, he threw himſelf upon his brother's mercy. With a knowledge of his character, Richerd ſaid to his interceſſor, queen Eleanor, "I forgive him, and hope I ſhall as eaſily forget his ingratitude and injuries, as he will my pardon." John, who was utterly void of all ſenſe of honour and generoſity, proved the baſeneſs of his nature by the act with which he purchaſed forgiveneſs. He invited the officers of Philip's garriſon of Evreux to an entertainment, cauſed them to be all maſſacred, put the ſoldiers to the ſword, and delivered up the town to his brother. He aſcended the throne at the death of Richard in 1199, but he did not obtain an undiſputed ſucceſſion. War was excited in favour of Arthur of Britanny, in which the young prince fell into the hands of his uncle John: he was at firſt confined in the caſtle of Falaiſe, and his uncle in vain endeavoured to procure his aſſaſſination. At length he was conducted to the caſtle of Rouen, where John reſided, and he was never after heard of. The manner of his death was uncertain, but it is generally believed that the king ſtabbed him with his own hands. From this period John became the object of univerſal deteſtation, and all his foreign ſubjects prepared to throw off the yoke. The pope alſo excommunicated him, and abſolved his ſubjects from their allegiance. He for ſome time reſiſted the papal authority, but in 1213 he made his ſubmiſſion. The pope, now regarding England as his own, and jealous of the aggrandizement of Philip of France, ſent a meſſage to that prince, acquainting him with John's return to his duty towards the church, and requiring him to deſiſt from hoſtilities againſt a country now under the protection of the holy ſee. Philip had, however, made preparations for war, and was not to be put off from his plans by the mere order of the holy pontiff. A battle enſued, in which the fleet of England triumphed over that of France, and John even thought of regaining his former poſſeſſions; but the attempt was unſucceſsful, and he was obliged to return in diſgrace. His own barons, who had ſuffered by his controul, determined now to aſſert their privileges, and laid a ſtatement of their grievances before the king, which he attempted to elude. To ſecond their efforts they choſe a general, and immediately proceeded to warlike operations. They were received into London with open arms, which ſo intimidated the king, that he was obliged to ſubmit to ſuch articles of agreement as they thought fit to dictate. At Runnymede, John ſigned the famous Magna Charta, the baſis of Engliſh liberty, which not only protected the nobles againſt the crown, but ſecured many important rights and privileges to every order of freemen. It was ſtipulated that London ſhould remain in the hands of the barons, and the Tower in the cuſtody of the primate, till the articles of the charter were executed. The king made another attempt to retrieve his affairs by inliſting under his banners foreign troops, but moſt of his projects failed, and he died partly of diſeaſe, and partly of chagrin, at Newark, in October 1216. The character of this prince is tranſmitted to us in very black colours: perhaps his vices have been exaggerated. Ingratitude, perfidy, and cruelty were certainly the ruling principles of his conduct. His private life was ſtained with licentiouſneſs, and he ſeems to have paid no regard to the forms of religion. The beſt part of his conduct as a ſovereign, was the attention which he paid to commerce and maritime affairs. In his reign London received the gift of its popular conſtitution of the corporation. Hume. Henry.

John I., king of Portugal, natural ſon of Peter the Severe, was born about the year 1350, and raiſed to the throne in 1383, to the prejudice of John of Caſtile, who claimed in right of his wife Beatrix, daughter of Ferdinand. Soon after his acceſſion, the king of Caſtile invaded Portugal with a powerful army, but victory, which decided in favour of John, permanently fixed him on the throne. In 1387 he married Philippa, daughter of John of Gaunt, duke of Lancaſter. It was not till the year 1400, that a peace was finally ſettled between the two countries, which remained inviolate during the reſt of the reign. John employed the ſeaſon of public tranquillity in improving the police, and promoting the proſperity of his kingdom. Mindful of his former condition, he behaved with great condeſcenſion and familiarity to his ſubjects, and beſtowed his favours liberally. Though his bounty kept him poor, he moderated his impoſts, and found reſources in his frugality with reſpect to the ordinary amuſements of a court. He was accuſtomed to ſay that converſation was the cheapeſt of all pleaſures, as well as the moſt improving, and he promoted a taſte for letters among the nobility. He was, however, inflexible in the puniſhment of crimes, and by his ſeverity in this reſpect, he rooted out the bands of bravoes kept by the nobility to execute private revenge. In 1414, he fitted out a formidable expedition againſt the Moors, in which he was ſucceſsful, and he entruſted to his ſon Henry, duke of Viſeo, the chief management of affairs in Africa, which gave occaſion to that courſe of maritime diſcovery by which he became ſo much diſtinguiſhed. (See Henry.) The concluding cares of this ſovereign were occupied in the ſettlement of his family, in which he was very ſucceſsful. He died in 1433, after a long and proſperous reign, leaving behind him the character of one of the ableſt and beſt of the Portugueſe ſovereigns, under the title of "the father of his country." He is regarded as the founder of a new royal family.

John II., king of Portugal, ſon of Alphonſo V. was born in the year 1455. In 1476, he was appointed regent, and, in 1481, he aſſumed the whole power of king on the death of his father. Finding that the adminiſtration of juſtice was become exceedingly corrupt, he appointed a commiſſion to enquire into abuſes, and to reform whatever was wrong. He watched over the conduct of the judges, forewarning them of his diſpleaſure if they proved backward in the equitable diſcharge of their duties. "Take care," ſaid he, to one of them, "I hear you keep your hands open and your doors ſhut:" this timely warning ſufficed for his reformation. A conſpiracy was ſhortly formed againſt his life, at the head of which was the duke of Viſeo, a very young man and the queen's brother. The king, on being informed of it, ſent for the duke to court, and taking him aſide, charged him with his treaſonable purpoſe. What particularly paſſed on this occaſion is not known, but the reſult was, that the king drew his dagger, and laid the duke dead at his feet. Several of the other conſpirators were apprehended, ſome were executed, and others went into voluntary exile. John, willing to ſhew that he was not unneceſſarily ſevere, reſtored the forfeited eſtates of the duke of Viſeo to his brother, whom he likewiſe raiſed to high dignity in the ſtate. It is to the honour of this prince that he was the patron of commerce, particularly of that opened to the Portugueſe by their ſettlements on the coaſt of Guinea. Being told by Cano, the diſcoverer of Congo, that the natives concealed their gold-mines, "Never look for them," ſaid the king, "carry them what they want, and you will get their gold without digging for it." He did much towards the diſcovery of the paſſage by the Cape of Good Hope; but he had the mortification of reflecting, that by his refuſal of the propoſals of Columbus, he miſſed the opportunity of adding the weſtern world to his dominions. About the year 1490, he was grievouſly affected by the death of his only ſon, who was killed by a fall from his horſe at a race. He endeavoured, after this, to introduce his natural ſon George into the ſucceſſion, but the great oppoſition which he met with in this ſcheme induced him to lay aſide the project. He died in October 1495. The chief object of his reign ſeems to have been, to depreſs the nobility, to raiſe the inferior orders, and to promote the commercial proſperity of his kingdom.

John III., king of Portugal, was born in 1502, and ſucceeded to the crown in 1521. The events of this reign are in many reſpects important, and attach to them very ſerious conſequences. In the time of this prince the execrable inquiſition was introduced into Portugal, of which it was the curſe nearly three hundred years, and has only been aboliſhed within theſe few months, at the ſuggeſtion or demand of the Britiſh court. John ſent miſſionaries into the Eaſt Indies, of whom the celebrated Xavier was one. The new ſettlement of Brazil was brought into a flouriſhing ſtate in this reign, and particular attention was paid to the converſion of the natives. The king was attentive to what he believed would conduce to the happineſs of his ſubjects; he was economical with regard to himſelf, and unwilling to burden his ſubjects with new taxes. From his own reſources he founded hoſpitals, conſtructed fortifications, highways, and aqueducts, reſtored the univerſity of Coimbra, and executed other projects of utility and ſplendour. John died of an apoplexy in 1557, at the age of fifty-five, after a reign of thirty-five years. He was ſucceeded by his grandſon Sebaſtian, a minor.

JOHN IV., king of Portugal, born in March 1604, was ſon of Theodoſius, duke of Braganza, of the royal line. He ſucceeded his father in that dukedom in 1630, for, at that time, the Spaniards had taken poſſeſſion of the Portugueſe government, and annexed the country to the crown of Spain. It was become, in the reign of Philip IV., a domain of Caſtile, intended for the enriching of favourites. The oppreſſions and indignities ſuffered by the Portugueſe had inflamed their diſcontents to the higheſt pitch, and they were only waiting for a leader, to break forth into a general revolt which they meditated. They fixed on the duke of Braganza, and offered him the crown of Portugal, if he would ſtand forth in their cauſe, and merit the high honour by his proweſs. The Spaniſh court, aware of their intentions, practiſed a variety of arts to get the duke into its power. The higheſt honours were offered him, in hopes of alienating him from the Portugueſe cauſe; when theſe proved ineffectual, he was invited, or rather ordered, to come to Madrid to confer on ſtate affairs, and the impoſſibility of excuſing himſelf from this ſtep, haſtened his final determination. The leaders of the conſpiracy preſſed him again to accept of the crown; he heſitated, but on conſulting the ducheſs, ſhe confirmed him, with this heroic addreſs, "My lord, a violent death awaits you with certainty at Madrid, perhaps at Liſbon; at the former place you muſt die as a wretched priſoner; here, covered with glory, and a king. Let us confide in the love of the people, your juſt claim, and the protection of heaven." He accordingly acquieſced, a revolution was effected in his favour in December 1640, and he was inſtantly proclaimed John IV. The new ſovereign was acknowledged by all the powers of Europe, not immediately under the influence of the houſe of Auſtria, a conſpiracy was however formed againſt his life and throne, but it was diſcovered and ſuppreſſed, and a treaty with France and the United Provinces aſſiſted Portugal in foiling the attempts of Spain to recover its ſovereignty. The reign, neverthelefs, was paſſed in perpetual hoſtilities, though carried on with little vigour on either ſide. John died in 1656, leaving behind him two ſons and two daughters. His reign, though far from brilliant, was uſeful; he was ever deſirous of promoting the good of his people, and very unwillingly impoſed any burthens on them. He recovered from the Dutch, and ſecured the valuable ſettlement of the Brazils, but loſt the iſland of Ceylon.

JOHN V., king of Portugal, born in 1689, ſucceeded his father Peter II., in December 1706. The nation was at this time engaged in the Spaniſh ſucceſſion war, as one of the allies againſt the houſe of Bourbon; the new king was faithful to the cauſe, but little either of ſucceſs or honour attended his arms. The peace of Utrecht was favourable to Portugal, and from that time the king's attention was occupied in rendering his country flouriſhing. His government was wiſe and moderate, his character generous and patriotic. He died in 1750. For farther particulars relating to the kings of Portugal, the reader is referred to the Modern Univerſal Hiſtory.

JOHN, king of Denmark, born in 1455, ſucceeded his father Chriſtiern I. in 1481. He had been acknowledged king of Denmark and Norway in his father's life-time. He expected to have been choſen king of Sweden, but was diſappointed by the intrigues of the adminiſtrator of that kingdom, and it was not till 1497 that he was crowned the king. At the coronation-feaſt, one of the king's German officers hinting that it would be a politic act to cut off the heads of thoſe who had been leaders in the oppoſition to him, John replied with a manly indignation, that he would rather ſee all his evil counſellors on a gibbet than incur the ſhame and infamy of ſo ſavage a deed. "God forbid," ſaid the virtuous monarch, "that I ſhould ever deny to any free people the right of chuſing their own governors." For ſome time he acted conformably to this ſentiment, and exhibited a mind intent upon the public good, which produced a general ſatisfaction with his government. John, however, did not always act upon the principle of equity, which the maxim above quoted ſhould have inculcated. The people of Dithmarſh accordingly vindicated, at the point of the ſword, their independence; and their ſucceſs was the forerunner of an open revolt in Sweden, where diſcontents had been gradually accumulating againſt the king's adminiſtration, owing to the facility with which he had conferred offices and grants on his favourites, to the prejudice of the natives. The former regent headed the malcontents, and renounced his allegiance to John. The queen, Chriſtina, who was left at Stockholm, was obliged to capitulate; and a revolution was effected in 1502. After this many changes in the government took place, ſeveral of which led John to hope for a reſtoration to the crown; and a treaty for that purpoſe was concluded a ſhort time before his death, which happened in February 1513, in conſequence of a fall from his horſe. He poſſeſſed many eſtimable qualities, and would have been a really good king, but that he ſuffered himſelf to be ſwayed too much by his favourites.

JOHN III. king of Sweden, born in 1537, was ſecond ſon of Guſtavus Vaſa, who ſettled upon him the dukedom of Finland. In 1560 he was ſent to the court of England to forward the propoſed union between his elder brother Eric and queen Elizabeth. Not long after this Eric ſucceeded to the crown, and John became the object of his ſuſpicion. He was arreſted, brought to trial, and condemned; but his life was ſpared, and the ſentence exchanged for perpetual impriſonment. Several times it was determined to deſtroy him, but the tyrant as often relented, till at length, finding it neceſſary to ſtrengthen his government, he liberated John in 1567, to the great joy of the Swediſh nation. In the following year he took up arms againſt Eric, whom he depoſed, and aſcended the throne in his ſtead. He found the nation involved in a war with Denmark and Ruſſia, and almoſt ſtruggling for its exiſtence. He concluded peace with the former power, but hoſtilities continued with the latter till they were ſuſpended by a truce in 1573. By the influence of the queen, John abjured the Proteſtant religion, and embraced that of the church of Rome. In conſequence of this dereliction of principle he made many enemies; and although numbers of the clergy were gained over by views of ambition and emolument, yet a formidable party, attached to the reformation, with the king's brother, Charles, duke of Sudermania, at their head, made ſuch an oppoſition as nearly to involve the kingdom in a civil war. By the death of the queen, John found it expedient to leſſen his zeal with regard to the eſtabliſhment of the Roman religion, though he retained the deſire of making it the religion of the ſtate. He accordingly publiſhed a liturgy conformable to it, the uſe of which he enjoined to the clergy under the ſevereſt penalties. The flame of religious diſcord was hereby re-kindled; and the duke Charles again ſtood forth as the defender of the Proteſtant church. In 1590 John married Chriſtina, daughter of the duke of Holſtein. The war with Ruſſia was renewed, and Sweden loſt ſeveral fortreſſes. In this ſtate of affairs John died in 1592, after a reign of 24 years. Mod. Univ. Hiſt.

JOHN SOBIESKY, king of Poland, born in 1624, was ſon of a brave and able ſtateſman of the ſame name. He received a very liberal education, and viſited the politeſt courts in Europe. He aſcended, through the ſeveral gradations, to the higheſt poſt in the army, and ſignalized himſelf in many important actions. In the battle of Choczim, in 1673, after three days fighting, he gave the Turks a total and bloody defeat. In the following year, after many difficulties, and ſtruggling through much oppoſition, he ſucceeded to the crown of Poland, and immediately applied his reſources in the proſecution of the Turkiſh war, and by a ſeries of brilliant ſucceſſes ſoon induced the Porte to agree to a treaty, which completely revoked the diſhonourable terms of a former one. His coronation followed the reſtoration of peace, and he employed the interval of tranquillity in the re-eſtabliſhment of the finances of the kingdom, and in preparations for a future war, which his own martial diſpoſition rendered no diſtant event. In 1683, he made an alliance, offenſive and defenſive, with the court of Vienna, and without heſitation expended the treaſures which he had accumulated in levying troops, and putting his army into the beſt poſſible ſtate. The Turks having laid ſiege to Vienna, and reduced it to great ſtraits, he marched to its relief. Forming a junction with the imperial general, the duke of Lorraine, they attacked the Turkiſh camp on September 11th, 1683, entirely routed the Grand Viſir, took poſſeſſion of all his cannon, warlike-ſtores, &c. and broke up the ſiege. The people of Vienna regarded John as their ſaviour, and all Europe has rendered him the homage due to his heroiſm on this important occaſion; but the pride of the emperor Leopold produced from him a cold and ungracious acknowledgment of the ſervice. Between this and the year 1686 he performed many other noble deeds of valour; but from that period he paſſed life without glory, in projects for the advancement of his family by alliances, and eſpecially for ſecuring the crown to his ſon, by which he was involved in many domeſtic inquietudes, and civil diſſentions. He died in 1696, leſs regretted than might have been expected; but he had been accuſed, in his latter years, of conſulting the intereſts of his own power and ambition, rather than thoſe of his country. It was, however, univerſally admitted that he was not only a brave warrior and conſummate commander, but poſſeſſed all the accompliſhments that are fitted to adorn a throne. As a literary man, he was eloquent and well informed on moſt ſubjects. He was a good Latin ſcholar, converſant in ſeveral modern languages, and acquainted with ſcience beyond moſt of his countrymen. Mod. Univ. Hiſt.

John *of Gaunt*, or *Ghent*, duke of Lancaſter, was the third ſon of Edward III. king of England, and born at Ghent in 1340. He married Conſtance, a natural daughter of Peter the Cruel, king of Caſtile and Leon; and on the death of that monarch he laid claim to the throne in right of his wife, in oppoſition to Henry of Tranſtamare, but without ſucceſs. He ſerved with conſiderable glory in France with his brother the Black Prince, and on his death the management of public affairs was committed to the care of John during the life of his father. On the acceſſion of Richard II. he retired; but the envy of the courtiers, particularly the eccleſiaſtics, who hated him for protecting Wickliffe, followed him with falſe accuſations of a deſign to uſurp the throne, from which, however, he ſatisfactorily vindicated himſelf. In 1386 his only daughter was married to the heir apparent of the king of Caſtile, and John renounced his claim to that crown in conſideration of a very large ſum of money and penſion. John took for his third wife Catherine Swinford, ſiſter to the wife of his friend Chaucer the poet. He died in 1399, leaving a high character for valour, prudence, and generoſity. His ſon afterwards became king, under the title of Henry IV. See Hume's Hiſt. and Godwin's Life of Chaucer.

John *of Auſtria, Don*, the natural ſon of the emperor Charles V. was born at Ratiſbon in 1547. He firſt appeared as a public character in 1569, during the revolt of the Moors of Granada, when he was appointed captain-general of the Spaniſh galleys, and was ſent to Carthagena to take the command. He aſſiſted in the operations of the war, which was brought to a happy termination the following year. The holy league againſt the Turks for the protection of the Venetians, being formed between the king of Spain, the pope, and the Italian ſtates, don John was nominated, in 1571, general in chief, and aſſembled the united fleet at Corfu. In October he engaged with the Turkiſh fleet in the gulph of Lepanto, and obtained that victory which ſtands conſpicuous in the ſeries of actions between the Chriſtian and Mahometan powers. Don John, in perſon, fought with and took the Turkiſh admiral's galley, and the battle terminated in the loſs, on the part of the Turks, of 130 galleys taken, 55 deſtroyed, 25,000 men killed, and 10,000 made priſoners, beſides achieving the liberty of 15,000 Chriſtian ſlaves. Diviſions aroſe as to the future operations of the war: the advice of John was over-ruled, and the advantages obtained by this ſplendid victory by no means equalled the public expectation. In 1576 he was appointed governor of the Low Countries. The Catholic provinces had united with Holland and Zealand againſt the Spaniards, and don John was directed openly to concur in this convention, and cauſe the Spaniſh troops to leave the country. Shortly after this don John took poſſeſſion of Namur, Charlemont, and Marienburg, contrary to the intereſts of the ſtates, who, in 1577, reſumed their arms, depoſed don John, and declared the archduke Matthias their governor. A war commenced, and John gave the army of the Netherlands a very ſignal defeat, and made himſelf maſter of many ſtrong places. He was proceeding in his military career, when, in October 1578, he was taken off, after a ſhort illneſs, in his camp at Namur, in the 32d year of his age. He reſembled his father in perſon, whom he equalled in activity and enterpriſe, and whom he greatly ſurpaſſed in generoſity and humanity.

John I. pope, was a native of Tuſcany, and aſcended the papal chair on the death of Hormiſdas, in the year 523. His pontificate was ſhort and wretched, owing to the intemperate zeal of the emperor Juſtin for the extirpation of all the ſects who would not conform to the Catholic faith: he even attempted to extirpate the Arians, of which party Theodoric, king of the Goths, avowed himſelf a defender. This prince wrote to the emperor moſt preſſing letters in favour of his perſecuted ſubjects, and when he found that no regard was paid to theſe, knowing the influence which the pope had at the imperial court, he ordered John to attend him at Ravenna: from thence he went in quality of ambaſſador to Conſtantinople, where he was very honourably received, but the main object of his embaſſy was conducted in a way which gave his employer very little ſatisfaction; and on his return Theodoric cauſed him to be conducted from the palace to a priſon. He died in confinement in the year 526, after a pontificate of little more than two years and a half.

John II. was elevated to the papal throne in 533, upon the death of pope Boniface II. In the following year the diſpute, "whether one of the perſons of the Trinity ſuffered in the fleſh," was carried on with great bitterneſs. In this diſpute the emperor Juſtinian took a part; he not only maintained the affirmative ſide of the queſtion, but declared all thoſe who diſſented from him to be heretics. He alſo wrote to John, ſending him his own creed, aſſuring him that it was the faith of the whole eaſtern church, and intreated him to pronounce a judgment in its favour. The emperor's letter was accompanied with rich preſents, and the pope, without much heſitation, decided in favour of Juſtinian's confeſſion. He died in 535, after a pontificate of two years and five months. Six letters bear his name in the Collect. Concil. of which the firſt is generally rejected as ſpurious.

John III. pope, ſurnamed *Cataline*, a native of Rome, was ſon of Anaſtaſius, a perſon of conſiderable diſtinction. He was elevated to the popedom on the death of Pelagius in 560, and after holding it about thirteen years he died.

John IV. pope, ſurnamed *Scholaſticus*, was elected to the pontifical dignity upon the death of pope Severinus, in the year 640. He engaged deeply in the controverſy of the MONOTHELITES (which ſee), and involved himſelf in ſome difficulties on that account. He employed the wealth of the church in humanely redeeming vaſt numbers of Chriſtians, whom the Sclavi had carried off captives in their irruptions into the empire during the reign of Heraclius. The reign of this pontiff did not extend to a ſingle year. Three of his letters are inſerted in the fifth volume of the Collect. Concil.

John V. pope, a native of Antioch in Syria, was, while only a deacon in the church, appointed by pope Agatho one of three legates, whom he choſe to be his repreſentatives at the ſixth general council, and it was by him that the Greek copy of the letters of Honorius to Sergius, produced and read in the council, was compared, and found entirely to agree with the Latin original, depoſited in the library of the patriarch. In 685, upon the death of Benedict II., John was elected his ſucceſſor, an honour which he retained ſomething more than a year. He died, after a long and tedious illneſs, in the year 686.

John VI. pope, was elected to the papal throne in the year 702: the reigning emperor, Tiberius Apſimarus, objected to the election, and ordered him to be driven from the apoſtolic ſee: but the ſoldiers took part with John, and eſtabliſhed him on his throne. He diſplayed great generoſity by redeeming many captives, whom the duke of Benevento had taken in an irruption into the territories of the empire of Italy, and at length prevailed upon that prince to put an end to his hoſtilities againſt the ſubjects of the empire. He held a council at Rome, in which Wilfrid, who had been driven from the ſee of York, and baniſhed England, was declared innocent of the crimes laid to his charge. John died in 705, after a reign of little more than three years.

John VII. pope, was raiſed to the pontifical dignity on the death of John VI. Immediately on his elevation to the throne, the emperor Juſtinian demanded of him his opinion with regard to certain canons; but John was too wary to be thus drawn into a trap, and declined giving any judgment, leſt, by ſo doing, he might incur the emperor's diſpleaſure. He died after a pontificate of two years and ſeven months, in the year 707. A ſingle letter of this pope is to be found in the ſixth volume of the Collect. Concil.

John VIII. pope, was, on the death of Adrian II., elected to fill the papal ſee. This was in the year 872; and in the following year the emperor Lewis II. came to Rome, where he held an aſſembly of the ſtates of Italy ſubject to his empire, at which the pope aſſiſted. In that aſſembly the pope abſolved Lewis from an oath which he had taken not to interfere with the government of the dukedom of Benevento, under the pretence that it had been extorted by force, and alſo that it was inconſiſtent with the welfare of the empire. In 875 he crowned the emperor Charles the Bald, and three years after went to France, where he held a council at Troyes. In his pontificate Italy was greatly ravaged by the Saracens, who obliged the pope to pay tribute. He correſponded with Photius, patriarch of Conſtantinople, who had driven Ignatius from his ſeat, and uſurped for himſelf the dignity. At firſt the pope refuſed to acknowledge him; but Photius, by rich preſents, rendered his holineſs propitious, who not only conſented to abſolve him from the excommunications which had been repeatedly thundered out againſt him, but readily received him as his brother and colleague. In a council held at Conſtantinople, in the year 879, at which the papal legates and Photius conjointly preſided, the latter was declared lawful patriarch of the imperial city, and the legates, won over by his preſents, ventured ſo far to depart from their inſtructions, that they pronounced an anathema againſt all who ſhould receive any of the councils which had condemned him. Upon their return to Rome, conſcious of having gone beyond their inſtructions, they endeavoured to conceal this circumſtance from the pope; but he was ſoon appriſed of it, and exaſperated, as well at their treachery, as at the diſingenuity of Photius, declared all their proceedings null and void, and aſſembled another council in 881, at which he cauſed the patriarch to be a ſecond time condemned. After this he made an offer of the imperial crown to Charles the Groſs, and urged him by all means to come to Rome to receive it. As ſoon as the ſtate of his affairs would permit him, Charles proceeded to that city, and was crowned by the pope in St. Peter's church. John, however, could not prevail with the new emperor to lend him any aſſiſtance againſt the Saracens; he, therefore, endeavoured to gain over ſuch of the Italian princes as had entered into an alliance with them. He even went to Naples, to try whether he could perſuade Athanaſius to turn his arms againſt them. That prelate promiſed to ſupport the pope, and was ſupplied with money to enable him to levy the requiſite forces, but with the cooleſt treachery he turned thoſe forces againſt the pope himſelf. John inſtantly excommunicated him, and refuſed him abſolution but upon ſuch conditions as he could not comply with. This pope died in the year 882, after a pontificate of little more than ten years. More than three hundred of his letters are to be found in the ninth volume of the Collect. Concil. ſome of which are ſaid to throw conſiderable light on the eccleſiaſtical and civil affairs of the time in which he flouriſhed. He left alſo a ſermon pronounced in council on the confirmation of the election of Charles the Bald.

John IX. pope, a native and deacon of Tivoli, was raiſed to the papal dignity on the death of Theodore II. in 898. At this period Italy was divided by the factions of different pretenders to the empire: John at firſt refuſed to take any part in theſe conteſts; but owing to the violence of Berenger, king of Lombardy, he was induced, apparently, to eſpouſe his cauſe, and to crown him emperor. He had, however, no ſooner left the city, than the pope aſſembled a council, in which he declared the coronation of Berenger null and void, as having been extorted by force, and acknowledged Lambert, who had alſo been crowned king of Italy, as the only lawful emperor. In the ſame year John convened a council to meet at Ravenna, which confirmed the acts of the council of Rome, and approved of the coronation of Lambert, who was preſent in perſon. This pope died in the year 900, after having filled the papal chair about two years. Four of his letters are extant in the ninth volume of the Collect. Concil.

John X. pope, roſe in the church by degrees, from the rank of deacon to that of archbiſhop of Ravenna. He was indebted, for this laſt promotion, to a celebrated proſtitute Theodora, with whom he had long been intimate notwithſtanding his elevated ſtation in the church. In 914, Theodora, by her intrigues and intereſt, got her favourite and friend preferred to the pontifical chair. Under this pope, Rome and Italy were indebted for deliverance from the barbarous and oppreſſive Saracens In 916 he crowned anew Berenger, who readily aſſiſted him in his ambitious projects. The pope reſolved to take the field himſelf as generaliſſimo of all the forces, and under him the Saracen power was completely annihilated, which, during the ſpace of forty years, had been the terror of the whole of Italy. In the following year the pope began to feel ſome compunctions of conſcience on account of his former conduct, and accordingly ſent a legate, as his proxy, on a pilgrimage to the tomb of St. James, of Compoſtella, in the kingdom of Leon, hoping, at leaſt wiſhing, others to believe, that he ſhould atone for his vices by offering rich preſents at the ſhrine of a departed ſaint. In the year 925 John ſhewed how little regard he paid to the canons of the church by confirming the nomination of Hugh, a child only five years old, and ſon of count Herbert, in the archbiſhopric of Rheims. As John was indebted for his rank and elevation in the church to the intrigues of one infamous woman, ſo he loſt his dignity and life through thoſe of another. This was Marozia, the daughter of his former miſtreſs Theodora. Marozia, exaſperated that ſhe did not ſucceed her mother in the confidence of the pope, reſolved to deſtroy him and his brother Peter, who at this time was in habits of the ſtricteſt intimacy with him. She communicated the bloody deſign to her huſband, and prevailed on him not only to approve, but to be the inſtrument of carrying it into execution. Accordingly this wretch, on a certain day, when the pope and his brother were together in the Lateran palace, broke into it at the head of a band of ruffians, killed Peter before his brother's face, and then, ſeizing the pope, dragged him to priſon, where he ſoon afterwards died. This tragical event happened in the year 928, after John had been ſeated on the papal throne more than fourteen years. Three of the letters of this pope are to be found in the ninth volume of the Collect. Concil.

John XI. pope, was ſuppoſed to be the natural ſon of pope Sergius III. by the infamous Marozia, but according to others he was the ſon of Alberic, duke of Spoletta. It is certain he attained the dignity of pope through the influence of Marozia, and her huſband Guy, marquis of Tuſcany, in the year 931, upon the death of Stephen VII. Guy did not long ſurvive the promotion of John, and immediately upon his death, Marozia ſent word to his brother Hugh, king of Lombardy, that ſhe would make him maſter of Rome, upon the condition of marrying her. To this the prince readily acceded, and took poſſeſſion of his bride, and the caſtle of St. Angelo at the ſame time. Hugh rendered himſelf hateful to the Romans, and excited the reſentment of Alberic, a ſon of Marozia by her firſt huſband, who put himſelf at the head of the diſcontented, attacked the caſtle of St. Angelo, and made himſelf maſter of the fortreſs. In the confuſion Hugh made his eſcape, but Marozia and pope John fell into Alberic's hands, who kept them both in cloſe confinement during the remainder of their lives. John died in 936, after a pontificate of nearly five years.

John XII. pope, whoſe original name was Octavian, was ſon of the Alberic referred to in the laſt article. On the death of his father in 954, Octavian ſucceeded to his dignities, and not ſatisfied with his temporal power, he aſpired to the papal throne when it became vacant in the year 956, and ſecured the poſſeſſion of it to himſelf. On this occaſion he aſſumed the name of John XII. and thus introduced the cuſtom which was afterwards adopted by his ſucceſſors of changing their uſual names for others, upon their acceſſion to the pontificate. At this time Berenger tyrannized over Italy, and the pope implored the aſſiſtance of Otho I., who delivered the country. John crowned Otho at Rome, and promiſed him fidelity, which however was of very ſhort duration, for he united with the ſon of Berenger againſt his deliverer. Otho returned to Rome in 963, and called a council, in which the pope was accuſed of adultery, ſacrilege, and other crimes, which were ſatisfactorily proved againſt him, and he was depoſed. When the ſentence of his depoſition had been pronounced, the council, clergy, nobility, and people, unanimouſly elected Leo VIII. to fill his place. After this, John ſeveral times conſpired againſt the life of the new pope, and was as frequently pardoned, till at length he contrived to ſet himſelf again on the papal throne. John inſtantly aſſembled a council of prelates and cardinals, who condemned the council that had depoſed him, and paſſed different ſentences of condemnation on all thoſe who had been acceſſary to the elevation of his rival. John did not long ſurvive the holding of this council, for having engaged in a criminal connection with a married woman, the injured huſband who caught him in the act put an end to his holineſs's life and debaucheries by ſome violent blows which he gave him on his temples. His death is ſuppoſed to have taken place in 964, after he had filled the papal throne about eight years. A ſingle letter of his is inſerted in the ninth vol. of the Collect. Concil.

John XIII. pope, was one of the principal accuſers of the pope whoſe hiſtory has been juſt given. By the part which he took on this occaſion, he recommended himſelf to the favour of the emperor Otho, who, after the death of John, returned with his army to Rome, and held a council there, in which a decree was paſſed, conferring on the emperor and his ſucceſſors for ever the power of nominating the pope, and of granting inveſtiture to biſhops. After the death of Leo VIII., in the year 965, John was recommended by the emperor as his ſucceſſor to the holy ſee, which was decidedly contrary to the inclination of the Roman people, who conſpired againſt him and drove him from his throne. The emperor determined to take ample revenge for this inſult, and marching his army, he reſtored the pope, and ſeverely puniſhed thoſe who had taken part againſt him. He next went to Ravenna, accompanied by the pope, where he held a council in the year 967. Upon the breaking up of the council the pope returned to Rome, where he ſpent the remainder of his life in the unmoleſted poſſeſſion of his high dignity. In 968 he crowned, in St. Peter's church, the young Otho, king of Germany, whom his father had taken for his partner in the empire, and in the year 971 he crowned as empreſs Theophania, daughter of the late eaſtern emperor Romanus, who was married to Otho the younger. John died at Rome in 972, after having preſided in the Roman ſee nearly ſeven years. In his pontificate the Poles were firſt converted to the Chriſtian religion, and he is ſaid by ſome writers to have been the perſon who introduced the practice of bleſſing or conſecrating church bells. Four letters of this pope may be found in the ninth vol. of the Collect. Concil.

John XIV. pope, ſucceeded to the papal chair on the death of Benedict VII. in the year 985, an honour which he enjoyed but eight months. Boniface VII. who is claſſed among the anti-popes, undertook the expulſion of John. He prevailed, ſeized his rival, confined him in the caſtle of St. Angelo, and there either ſtarved him to death, or more humanely diſpatched him with poiſon. Boniface himſelf did not long ſurvive the victim of his cruelty, being carried off in the ſame year by a ſudden death. Upon this event, John, a native of Rome, and the ſon of one Robert, was elected pope, and governed the church during the ſpace of about four months, but for ſome cauſe or other, not ſufficiently explained, he is not reckoned among the popes.

JOHN XV. was elected to the papal dignity in the year 985, on the death of John, the ſon of Robert, who has been juſt mentioned. Soon after the commencement of his pontificate, Creſcentius, a man of great power at Rome, aſpired at the ſovereignty of the city, ſeized the caſtle of St. Angelo, and aſſumed the title of conſul. The pope, conceiving that he was in danger, implored the aſſiſtance of the emperor Otho III., who promiſed him, that, if neceſſary, he would come with his whole army, and ſupport the apoſtolic ſee with the ſame zeal which his father and grandfather had diſplayed. John informed Creſcentius of the imperial determination; he ſubmitted, and ſent ſome of the chiefs of his party to invite his holineſs back to Rome, with the ſtrongeſt aſſurances of ſafety, and of that reſpect which was due to the ſucceſſor of St. Peter. John complied, and was permitted to live unmoleſted till towards the cloſe of his pontificate. In the year 993, at a council held at the Lateran palace, the pope, after hearing read an account of the life and ſuppoſed miracles of Ulderic, biſhop of Auguſta, declared, with the approbation of his biſhops, that from thenceforth Ulderic might be worſhipped and invoked as a ſaint in heaven reigning with Chriſt. This is the firſt inſtance on record of the ſolemn canonization of a pretendedly meritorious character, a practice which ſoon contributed to crowd the Roman calendar with ſaints, and loaded the church with wealth, by the rich offerings with which the ſuperſtitious multitude was encouraged to propitiate the favour of thoſe new mediators between God and man. About this period the pope became engaged in a quarrel with the French clergy, over whom he obtained a complete victory; he had, however, more trouble with Creſcentius who began to reſume his ambitious projects at Rome. John applied again for aſſiſtance to Otho, who marched an army to his aſſiſtance, but in the midſt of theſe warlike preparations the pope died in the year 996, and in the eleventh year of his pontificate. Three of his letters are extant in the ninth vol. of the Collect. Concil.

JOHN XVI. pope, was a native of Roſſano, in Calabria, of mean extraction, but a perſon of conſiderable abilities and addreſs. He was employed by the emperors Otho II. and III. in affairs of conſiderable moment; from the latter he obtained poſſeſſion of the ſee of Placentia, and held it till he heard that Gregory V. was driven from Rome by Creſcentius in the year 997, when he bargained for, and purchaſed the popedom of that uſurper, and then aſſumed the title of John XVI. He was excommunicated by ſeveral councils held in Italy, France, and Germany, and at length the emperor Otho brought againſt him a powerful army. The pope, or, as he is ſometimes called, the antipope, endeavoured to make his eſcape from the city, but falling into the hands of ſome of Gregory's friends, they barbarouſly deprived him of his ſight, and cut off his noſe and ears. To complete the climax of their cruelty, they mounted the unhappy wretch on an aſs, led him through the ſtreets of the city, and forced him to exclaim "Whoever ſhall dare to diſpoſſeſs a pope, let him be ſerved like me."

JOHN XVII. pope, was elected to the holy office on the death of Silveſter II. in the year 1003, in which year he alſo died, after he had preſided over the church about five months. It has been aſſerted, that from this time, the people were deprived of voting at elections of the ſovereign pontiffs, which was afterwards confined to the clergy. He was ſucceeded by

JOHN XVIII. pope, who held the office to which he was elected in 1003, between five and ſix years, but few of his acts have come down to us, except his ſending St. Bruno to preach Chriſtianity to the Ruſſians, and his putting an end to the ſchiſm which exiſted between the eaſtern and weſtern churches.

JOHN XIX. pope, was ſon of Gregory, count of Tuſculum, and brother of Benedict VIII. Upon the death of the latter in the year 1024, the influence and wealth of Gregory procured the election of his other ſon, who was then a layman. It was at this moment that he thought it adviſable to aſſume the name of John XIX. Early in this pontificate an attempt was made, by the emperor Baſilius, to allow the patriarch of Conſtantinople the title of Univerſal biſhop of the Eaſt, but John ſent back the ambaſſadors with a refuſal, telling them that the title of univerſal biſhop became none but the ſucceſſors of St. Peter in the apoſtolic ſee. In the year 1026, Conrad, king of Germany, having entered Italy with an army, and having reduced all the towns which had ſhaken off the imperial yoke, went to Rome, where the pope crowned him emperor, and his queen empreſs, with the uſual ſolemnities. On this occaſion, Rudolph, king of Burgundy, and Canute, king of England, who were on a pilgrimage to Rome, were preſent. John died in 1033. Three of his letters are inſerted in the ninth volume of the Collect. Concil.

JOHN XX. or XXI. pope, a Portugueſe, ſon of one Julian, a phyſician, became eminent for his acquaintance with the ſciences, particularly with that of medicine, the practice of which he followed for ſome time with great reputation. He afterwards devoted himſelf to the church, and advanced by degrees to high preferment. He was made cardinal by Gregory X., and on the death of Adrian V., in 1276, he was elected to the pontifical dignity, when he took the name of John XX. or XXI. The firſt act of his pontificate was to revoke the famous conſtitution of Gregory X. which ordered that the cardinals ſhould be ſhut up in the conclave during the vacancy of the papal ſee. He did all in his power to aſſiſt the Chriſtians in the Eaſt. He was ignorant of the world, and became attached to the pretended principles of judicial aſtrology; from theſe he thought he had many years to live, and began to deviſe ſchemes for the future. He was, however, carried off in eight months after his elevation to the holy ſee. He was author of ſeveral tracts on logic, one on phyſiognomy, and ſome medical treatiſes. One of his letters to Edward I. king of England, is in the tenth volume of the Collect. Concil. and ſome others in the ſecond volume of Widdingus' "Annal. Minor."

JOHN XXI. or XXII. pope, a Frenchman by nation, and by deſcent, according to different writers, the ſon of a noble, a tavern-keeper, or a cobler. In early life he was appointed to ſome conſiderable offices in the ſtate, the duties of which he performed with ſo much credit to himſelf, as to manifeſt very ſuperior talents for public buſineſs. On the death of Clement V., in 1314, the moſt violent diſputes occurred in the election of a ſucceſſor to the holy ſee. Theſe were carried on for two years, after which the cardinals unanimouſly elected James de Oſſa, the ſubject of this article, who aſſumed the name of John XXI. or XXII. During his pontificate he founded ſeveral abbeys and biſhoprics; but he was not only the witneſs to, but the perpetrator of, many cruelties with reſpect to the Franciſcans; ſome of whom were, by his order, actually flayed alive, as preparatory to their being bound to the ſtake for burning, which ſavage ſentence was carried into execution without mercy. The cruelty of John was condemned by his warmeſt adherents, who did not ſcruple to declare that by it he had rendered himſelf utterly unworthy of the papal dignity, and that his deeds proved him to be the predicted anti-chriſt. They even revered theſe victims as martyrs to the truth, paying religious veneration to their bones and aſhes. He was next involved in the diſpute whether Chriſt and his apoſtles ever poſſeſſed any property or dominion, either in common or perſonally. The diſcuſſions on this queſtion were violent and bitter, and thoſe who maintained the negative ſide of the queſtion paid for their temerity by the moſt excruciating ſufferings inflicted on them. John was now engaged in a diſpute with Lewis of Bavaria, who, as the reward of his victory over Frederic of Auſtria, claimed the Imperial crown as his right. John, alarmed at his aſſurance, inſtantly excommunicated him, and forbade all the ſubjects of the empire, on penalty of the ſame ſentence, to acknowledge him for king, or obey him as ſuch. From this ſentence the monarch appealed to a general council, and publiſhed a manifeſto againſt his holineſs, deſcribing him as one who trampled on all laws, human and divine, to gratify his ambition or avarice; as a ravenous wolf, fleecing and devouring the flock committed to his care; and, as an avowed heretic, in condemning as hereſy the doctrine concerning the poverty of Chriſt. John died after a moſt turbulent pontificate, in the year 1334, at the great age of ninety years. Notwithſtanding his various acts, which have been but merely referred to, he found biographers to praiſe his good deeds, forgetting thoſe which were of a contrary deſcription. They ſaid he was a man of learning, and an encourager of the learned. The hiſtorian has held him up as ambitious, arrogant, cruel, and avaricious. He is ſuppoſed to have been the perſon who invented the "Annates," obliging every clergyman, preferred to a benefice, to pay into the apoſtolic chamber one year's income before he took poſſeſſion of it. He died immenſely rich, and was known in the literary world as author of ſeveral treatiſes: one "On the Contempt of the World:" one "On the Tranſmutation of Metals," and twenty-two Conſtitutions which he ordered to be called "Extravagantes." Many of his bulls and letters are likewiſe extant. He is ſaid alſo to have been author of ſeveral treatiſes on medicine, which led ſome of his biographers to ſay he was better fitted for a phyſician than a pope. He is ſaid by Walther to have written, among other things, a treatiſe on muſic, Eine Muſicam; but no ſuch treatiſe is enumerated in the liſt of his works by Baronius or Fabricius. This pontiff, however, ſeems to have intereſted himſelf very much about eccleſiaſtical muſic. The attempts at diſcant, or extemporaneous counterpoint, were thought ſo licentious in his time, that he prohibited the uſe of it in the church by a bull in 1322. There is, however, at the end of it this favourable clauſe: "It is not our intention wholly to prevent the uſe of concords in the ſacred ſervice, particularly on great feſtivals, provided the eccleſiaſtical chant or plain-ſong be carefully preſerved. The Abbé Lebœuf obſerves, that thoſe who drew up this bull, which is inſerted in the body of canon laws, erroneouſly confined diſcant to fourths, fifths, and eighths, from the peruſal of ancient authors on the ſubject of muſic, particularly Caſſiodorus, where they had found the following definition: "Symphonia eſt temperamentum ſonitus gravis ad acutum, vel acuti ad gravem, modulamen efficiens, ſive in voce, ſive in percuſſione, ſive in flatu. Symphoniæ ſunt ſex: prima, diateſſaron: ſecunda, diapente: tertia, diapaſon. Quarta, diapaſon et diateſſeron: quinta, diapaſon et diapente: ſexta, diapaſon et diapaſon."—"Symphony, or muſic in conſonance, is the mixing grave ſounds with acute, or acute with grave, either in ſinging or playing upon ſtringed or wind inſtruments. Symphonic concords are ſix: the fourth, fifth, and eighth, with their octaves. It is hardly poſſible to read this paſſage, and not give up the conteſt concerning ancient counterpoint, or at leaſt reduce it to the meagre kind of which Padre Martini has framed an example in his Storia Muſica.

John XXII. or XXIII. pope, formerly known by the name of Balthaſar-Coſſa, was a native of Naples, and being deſcended from a noble and wealthy family, he enjoyed the advantages of an excellent education at Bologna, where he took his degrees, and from thence he ſet out to Rome, anticipating the honours that ſeemed to be reſerved for him, for on being aſked by ſome of his friends whither he was going, he replied "to the popedom." Scarcely had he arrived at this great city, when he was made chamberlain to pope Boniface IX. who, in 1402, promoted him to the purple. He took an active part in the depoſition of Gregory XII. and exerted all his talents, influence, and property to ſecure the election of Alexander V. Soon after that pontiff's election the plague obliged him to quit Piſa, and he was prevailed upon by cardinal Coſſa to pay a viſit to Bologna. Here he found means to detain the pope, under various pretences, till his holineſs fell dangerouſly ill, and his complaints proved fatal to him. The ſubject of our preſent article has lain under the heavy charge of cauſing him to be poiſoned by his phyſicians: he was, however, elected his ſucceſſor, and from the title of cardinal Coſſa he aſſumed the name of John XXIII. On the very day that he was raiſed to this high dignity in the church, he wrote to all Chriſtian princes, acquainting them of his promotion, and exhorting them to ſupport his claims againſt the pretenſions of thoſe who had been condemned and depoſed by the church univerſal. One of the earlieſt objects of John's adminiſtration was to raiſe a fund to ſupport the claims of his friend Lewis of Anjou, in oppoſition to thoſe of his inveterate enemy, Ladiſlaus, to the poſſeſſion of the kingdom of Naples. In his progreſs he ſolemnly excommunicated Ladiſlaus, and then ordered a cruſade to be preached againſt him all over Chriſtendom. By the bull iſſued on this occaſion, all were exhorted to take the croſs and engage in this holy war; and to all who ſhould embark in it, the ſame indulgences were granted as to thoſe who went to the conqueſt of the Holy Land. In a ſhort time peace was reſtored; this was effected by John's taking off the excommunication from Ladiſlaus, who, in return, agreed to abandon the cauſe of Gregory, whom he had hitherto vindicated as the true pope. After the reſtoration of tranquillity, John made a promotion of fourteen cardinals, and ſummoned all the prelates of the church to attend a general council at Rome. At this council few biſhops were preſent, its proceedings were, probably, unimportant, except in this, that it condemned the doctrine of Wickliff, and ordered his works to be committed to the flames. Ladiſlaus took the firſt opportunity of attacking pope John: the pontiff appealed to all Chriſtian princes, exhorting them to appoint a general council to put a ſtop to the reigning evils, and to unite the whole church under one head. The choice of the place was left to the emperor, who fixed on Conſtance. Here the council was opened on the 1ſt of November 1414. After many ſeſſions a liſt of accuſations againſt the pope was read, containing ſeventy articles, ſome of which, however, were too ſcandalous even to be gone into: the others related to the pope's ſimony and tyranny; and to the means which he took of amaſſing immenſe riches. After theſe articles, and the depoſitions in ſupport of them, were read and examined, the council declared them to be fully proved, and then unanimouſly paſſed a ſentence of ſuſpenſion againſt the pope. This ſentence was communicated to him by a deputation from the council. After this, *viz.* on the 29th of May 1415, the council proceeded a ſtep farther, and unanimouſly paſſed the definitive ſentence of John's depoſition, and ordered his ſeals to be broken. He was then committed to the care of Lewis, duke of Bavaria, and count palatine of the Rhine, who kept him priſoner, but treated him with civility and reſpect. At the expiration of about four years he obtained his liberty, and made ſuch conceſſions to the exiſting pope Martin V. that he created him cardinal biſhop of Tuſculum, and dean of the ſacred college: he alſo ordained that he ſhould always ſit next to the pope, and that his ſeat ſhould be elevated a little above thoſe of the other cardinals. He did not live many months to enjoy theſe honours. His character has already been deſcribed: he was unqueſtionably vicious and deſtitute of good principles, and merited that fall which he experienced. He was author of a poem "De Varietate Fortunæ," which is ſaid to be diſtinguiſhed by genius and taſte. His bull for aſſembling the council of Conſtance; the form of his reſignation, and ſome of his letters, are ſtill extant. For farther particulars relating to the popes John, the reader is referred to Bower's Hiſtory.

JOHN *of Bayeux*, known alſo by the name of John of Avranches, an illuſtrious Gallican prelate in the eleventh century, the firſt of all the biſhops of Avranches, and afterwards promoted to the archiepiſcopal ſee of Rouen. He held a provincial council in the year 1074, at which ſeveral ſtatutes were paſſed for the regulation of eccleſiaſtical diſcipline, which provoked the reſentment of the lax and diſſipated clergy, who obliged him to ſeek for ſafety in flight. Other perſecutions obliged him to reſign his preferment, and retire to his country houſe: here he was attacked by the monks of the abbey of St. Owen, who killed him on the ſpot. He was author of a work "On the Duties of Eccleſiaſtics," which was firſt publiſhed with notes, by John le Prevot, canon of Rouen. Moreri.

JOHN DAMASCENUS, or St. John of Damaſcus, who lived in the eighth century, is celebrated by the writers of his life, and by eccleſiaſtical hiſtorians, as the compiler and reformer of chants in the Greek church, in the ſame manner as St. Gregory in the Roman. And Leo Allatius, under the title of *Octoëchus*, tells us they were compoſed by John Damaſcenus. Zarlino goes ſtill farther, and informs us that in the firſt ages of Chriſtianity the ancient Greek notation by letters having been thrown aſide, John Damaſcenus invented new characters, which he accommodated to the Greek eccleſiaſtical tones; and that theſe characters did not, like our's, merely expreſs ſingle ſounds, but all the intervals uſed in melody: as a ſemitone, tone, third minor, third major, &c. aſcending and deſcending with their different duration.

This reſembles, in many particulars, the notation in ancient Romiſh miſſals, before the time-table and characters in preſent uſe were invented, or even the Gregorian notes generally received.

JOHN DE MURIS. See MURIS.

JOHN *of Saliſbury*, a learned Engliſhman of the 12th century, was elected biſhop of Chartres in France in the year 1177, an office which he held about four years when he died. He wrote the life of Thomas á Becket and ſeveral other works. This learned prelate ſeems to have been much offended and ſcandalized at the licentiouſneſs of the ſingers in performing the ſacred rites. We ſhould ſuppoſe, by his cenſures, that the choral band was outrageouſly addicted to flouriſhing, and that many of them ſung in falſit. What the complaints of the good biſhop of Chartres were, the following paſſage from his Policraticus will ſhew.

"Muſica cultum religionis inceſtat, quod ante conſpectum Domini, in ipſis penetralibus ſanctuarii, laſcivientis vocis luxu, quadam oſtentatione ſui, muliebribus modis notularum articulorumque cæſuris, ſtupentes animulas emollire nituntur. Cum præcinentium, et ſuccinentium, canentium, et decinentium, intercinentium, et occinentium, præmelles modulationes audieris, Sirenarum concentus credas eſſe, non hominum, et de vocum facilitate miraberis, quibus philomela vel pſittacus, aut ſi quid ſonorius eſt, modos ſuos nequeunt coæquare. Ea ſiquidem eſt aſcendendi deſcendendique facilitas; ea ſectio vel geminatio notularum, ea replicatio articulorum, ſingulorumque conſolidatio; ſic acuta vel acutiſſima, gravibus et ſubgravibus temperantur, ut auribus ſui indicii fere ſubtrahatur autoritas." Policraticus, ſive de Nugis Curialium, lib. i. c. 6.

"The rites of religion," ſays he, "are now profaned by muſic: and it ſeems as if no other uſe were made of it than to corrupt the mind by wanton modulations, effeminate inflections, and frittered notes and periods, even in the *Penetralia*, or awful ſanctuary itſelf. The ſtupid crowd, delighted with all theſe vagaries, imagine they hear a concert of ſirens, in which the performers ſtrive to imitate the notes of nightingales and parrots, not thoſe of men; ſometimes deſcending to the bottom of the ſcale, ſometimes mounting to the ſummit; now ſoftening and now enforcing the tones, repeating paſſages, mixing in ſuch a manner the grave ſounds with the more grave, and the acute with the moſt acute, that the aſtoniſhed and bewildered ear is unable to diſtinguiſh one voice from another."

JOHN *of Raguſa*, a learned Catholic prelate, who flouriſhed in the fifteenth century, was born in the city whence he derived his ſurname. While young he entered himſelf among the preaching friars, and applied with ſuch diligence to his ſtudies, that he became one of the moſt learned men of his time. He was particularly celebrated for his deep acquaintance with the Oriental languages. In 1426 he was appointed attorney-general of his order at the court of Rome, and was nominated by pope Martin V. one of his divines at the council of Baſil. At this aſſembly he was the principal diſputant againſt the doctrines promulgated by John Huſs. After this he was ſent on different legations to Conſtantinople, with a deſign of bringing about an union between the eaſtern and weſtern churches, but his exertions were not attended with ſucceſs. On his return to Italy he was nominated to the ſee of Argos in the Peloponneſus. It has been aſſerted by ſome authors that he was made a cardinal. His works are "A Diſcourſe againſt the Huſſites:" Acts of his Legation to Conſtantinople:" and "An Account of his Travels in the Eaſt." Moreri.

JOHN, *Preſter*. See PRESTER.

St. JOHN's *Bread*, in *Botany*. See CERATONIA.

JOHN's *Sweet*. See PINK.

St. JOHN's *Wort*. See HYPERICUM.

St. JOHN's *Wort*, *Hypericum perforatum*, in the *Materia Medica*, a ſpecies of hypericum which grows, commonly to the height of a foot and a half, in woods and uncultivated grounds, and flowers in July. This plant has a bitteriſh, ſub-aſtringent taſte, and a ſweetiſh ſmell. Among the ancients it was in great repute; and they preſcribed it in hyſteria, hypochondriaſis, and mania: they alſo imagined that it had the peculiar power of curing demoniacs, and it thence obtained the name of "fuga dæmonum." It was alſo recommended internally for wounds, bruiſes, ulcers, hæmoptyſis, mictus cruentus, gravel, dyſentery, agues, worms; and outwardly as an anodyne, and as a diſcutient and detergent.

tergent. However, it is now very rarely uſed. The flowers only are directed for uſe, as containing the greateſt proportion of the reſinous oily matter, in which the medical efficacy of the plant is ſuppoſed to reſide. The dark puncta of the petals and the capſules afford this eſſential oil, which is contained in minute veſicles, or glands, and gives a red colour to rectified ſpirit, and to expreſſed oils: the latter has been long known in the ſhops by the name of "oleum hyperici." The colouring matter is ſaid to give a good dye to wool. Woodville's Med. Bot.

John's, *St.*, *College*, in America. See College.

John *de Frontera, St.*, in *Geography*. See Juan *de la Frontera*.

John's *Haven*, a ſmall ſea-port town in the pariſh of Benholme, and ſhire of Kincardine, Scotland, was formerly one of the moſt conſiderable fiſhing towns on the ſouthern coaſt of Scotland. At preſent, however, it is much reduced, its trade declined, and population diminiſhed. A company of ſail-cloth manufacturers have eſtabliſhed works here, and thus given employment to the inhabitants. The population of the pariſh, in the year 1793, was calculated at 1019. This place is 9 miles north of Montroſe.

John's *Iſlands*, iſlands of America, near the coaſt of South Carolina, S.W. of Charleſtown harbour, divided from James's iſland by the river Stono, which forms a convenient and ſafe port.

John's *Iſland*, an iſland in the bay of Quinta, Upper Canada, oppoſite the Mohawk ſettlement, weſt of Richmond.

John, *St.*, a town of the iſland of May, one of the cape Verd iſlands.—Alſo, one of the Virgin iſlands, in the Weſt Indies; 12 leagues E. of Porto Rico; about five miles long, and one broad; ſaid to be the beſt watered of all the Virgin iſles, though it has little good land, and its exportations are trifling. Its harbour, called "Crawl bay," is reckoned better than that of St. Thomas, and is accounted the beſt to the leeward of Antigua. N. lat. 18° 7'. W. long. 64° 32'.—Alſo, a ſea-port town well built, on the weſt coaſt of the iſland of Antigua. It is ſituated in a pariſh of the ſame name, on Loblolly bay. It is the capital of the iſland, and a port of entry. Its harbour is excellent and well fortified. This town is the reſidence of the governor-general of the leeward Charaibe iſlands; here the aſſembly is held; and its port carries on a great trade. This town was nearly deſtroyed by fire in Auguſt 1769; upwards of 260 houſes being conſumed, beſides wharfs, cranes, &c. N. lat. 17° 4'. W. long. 62° 4'.—Alſo, an iſland, called alſo *Prince* Edward's *Iſland* (which ſee), in the gulf of St. Lawrence, ſituated at a ſmall diſtance to the weſt of the iſland of Cape Breton, and to the north of Nova Scotia, to which it is attached. Its coaſts on the north and ſouth are much interſected with bays; it is well watered by rivers, and its ſoil is for the moſt part rich and fertile. It formerly belonged to the French, who improved it to ſuch advantage, that it was deemed the granary of Canada, which it ſupplied with plenty of corn, as well as beef and pork. On the conqueſt of Cape Breton in 1745, the inhabitants quietly ſubmitted to the Britiſh arms. Its capital is Charlotte's town, which is the reſidence of the lieutenant-governor, who is the chief officer in the iſland: its other towns are George town, Prince's town, Hillſborough town, Pownal town, Maryborough town, &c. Its length from N.E. to S.W. is reckoned about 100 (Pinkerton ſays 60) miles, and its mean breadth is 30 miles. The whole iſland is divided into three counties, *viz.* King's, Queen's, and Prince's counties, which are ſubdivided into 14 pariſhes, conſiſting of 27 townſhips, and comprehending in all 1,363,400 acres. The number of inhabitants is eſtimated at about 5000. N. lat. 46° 20'. W. long. 63°.—Alſo, a ſmall iſland in the Pacific ocean, eaſt of New Ireland, ſo called by Schouten, and by Bougainville Bournand. S. lat. 4°. E. long. 153° 50'.—Alſo, a ſmall iſland in the Red ſea.—Alſo, a ſmall iſland in the Weſt Indies, north of St. Croix, and ſouth of Tortola; noted for its fine harbour, which, it is ſaid, is ſufficient to contain the whole Britiſh navy.—Alſo, a bay and iſland on the weſt coaſt of Newfoundland, in the gulf of St. Lawrence, at the S.W. end of the ſtraits of Belleiſle.—Alſo, a town on the eaſt coaſt of Newfoundland. N. lat. 47° 35'. W. long. 52° 20'.—Alſo, a town of America, being the north-weſternmoſt in Suſſex county, Delaware, ſituated at the head of Nanticoke river, about 22 miles S.W. of Dover. N. lat. 38° 48'. W. long. 75° 40'.—Alſo, a town and fort in Lower Canada, on the weſt bank of Sorel river, at the north end of lake Champlain, 28 miles ſouth of Montreal. This town has been eſtabliſhed as the ſole port of entry and clearance for all goods imported from the interior of the United States into Canada, by the executive council of Lower Canada, in July 1796. N. lat. 45° 9'. W. long. 72° 18'.—Alſo, a ſea-port on the S.E. coaſt of the iſland of Tinos. N. lat. 37° 32'. E. long. 25° 15'.—Alſo, a river of America, in Eaſt Florida, which riſes in a ſwamp in the interior of the province, and purſues a northern courſe, in a broad navigable ſtream, ſpreading frequently into ſpacious bays or lakes, of which lake George is the chief. At its mouth is a ſhifting bar; 10½ leagues north of St. Auguſtine.—Alſo, a river, called Little St. John's, which riſes in a ſwamp called Ouaquephenogaw, and after a winding courſe of about 200 miles, falls into Apalache bay, about 10 miles eaſt of Apalache river. It is ſaid to be the pureſt and cleareſt of any in America, receiving, as the Indians ſay, no tributary ſtreams, but being fed by ſprings which guſh through its banks, and is about 200 yards broad, and about 15 or 20 feet deep at the town of Talahaſochete.—Alſo, a river which is the largeſt in the Britiſh province of New Brunſwick. From its mouth on the north ſide of the bay of Funchal to its main ſource it is computed to be 350 miles; the tide flows 80 or 90 miles up this river; and it is navigable for ſloops of 50 tons 60 miles, and for boats 200. Its general courſe from its origin is E.S.E. It is the common route to Quebec. It furniſhes the greateſt plenty of ſalmon, baſs, and ſturgeon. This river is fed by many tributary ſtreams, and in its various branches it waters and enriches a large tract of excellent country, which is ſettled and under improvement. The uplands are, in general, covered with fine timber, ſuch as pine and ſpruce, hemlock and hard wood, principally beech, birch, maple, and aſh. The pines on this river are the largeſt in Britiſh America, and afford a conſiderable ſupply of maſts for the Britiſh navy.—Alſo, a river of Africa, which runs into the Indian ſea, S. lat. 31° 20'; and another of Africa, which runs into the Atlantic, N. lat. 19° 20'.—Alſo, a lake in Lower Canada, which receives rivers almoſt in every direction, and diſcharges its waters through Saguenai river into the St. Lawrence, at Tadouſac. It is about 25 miles in diameter.

JOHNNY Groat's House, the moſt northerly dwelling of Scotland, in the county of Caithneſs; one mile W. of Duncanſby Head.

JOHNSBURY, a townſhip of America, in Caledonia county, Vermont, bounded S.W. by Danville; containing 663 inhabitants.

JOHNSON, John, in *Biography*, a learned divine of the church of England, was born at Friendſbury, near Rocheſter, in Kent, in the year 1662. He received the elements of a good education at King's ſchool, Canterbury, and from thence he was ſent, when he was about 15 years of age, to Magdalen college, Cambridge. Here he took his degrees and entered into deacon's orders, and ſhortly after obtained a curacy near Canterbury. In 1686, he was ordained prieſt, and collated by archbiſhop Sancroft to the vicarages of Bocton and Hearne-Hill. After the revolution he complied with the new order of things, and became an able advocate in its defence, which gained him the friendſhip and patronage of archbiſhop Tenniſon, from whom he received ſeveral inſtances of church preferment, and in 1707, was collated to the vicarage of Cranbrook. Here he ſeems to have completely abandoned his friends and his principles, and to have advanced from ſtep to ſtep till he even denied the king's ſupremacy, and refuſed to read the prayers enjoined on the acceſſion of George I. Notwithſtanding this dereliction of principle, he was twice choſen proctor in convocation for the dioceſe of Canterbury. He died in 1725, having been ſeveral times under proſecution, from the effects of which he was releaſed by ſubmiſſion to the higher powers: had his fortitude been equal to his zeal, he would have ſuffered in defence of the moſt arbitrary and indefenſible opinions, that can well be broached by a man of ſenſe. Johnſon was unqueſtionably a man of ſound learning; his morals were exemplary and his piety unaffected. He was diligent in the diſcharge of the ſeveral duties belonging to the paſtoral office, but his temper was bad, and during the latter years of his life, he ſhewed ſo much bigotry and intolerance againſt thoſe who thought as he himſelf had formerly thought, as detracted from the value of his good qualities. His principal works are "The Clergyman's Vade Mecum;" "A Collection of Eccleſiaſtical Laws, Canons, &c.;" "The unbloody Sacrifice and Altar unveiled and ſupported;" and "A Paraphraſe on the Pſalms in the Liturgy." After his death his ſurviving daughter publiſhed two volumes of his poſthumous ſermons and diſcourſes. Biog. Brit.

JOHNSON, SAMUEL, an Engliſh divine, was born in the year 1649, in the county of Stafford, though others have named Warwickſhire as his birth-place. He was educated at St. Paul's ſchool, London, whence he was removed to Trinity college, Cambridge. After he had taken orders, he was preſented to the rectory of Corringham, in the hundreds of Eſſex, but the place not agreeing with his health, he removed to London, and took an active part in the political diſcuſſions of the times. He was introduced to lord Ruſſell, who immediately made him his domeſtic chaplain. He now became a formidable writer in the cauſe of liberty, and was called on during the reign of Charles II. to bear his teſtimony to the truth by ſevere impriſonment. But his ſufferings were brought to the acme by a paper which he drew up in the year 1686, when the army was encamped upon Hounſlow Heath, entitled, "An humble and hearty Addreſs to all Engliſh Proteſtants in the preſent Army." For this he was brought to trial, and condemned to ſtand in the pillory at three places, to pay a fine of 500 marks, and to be publicly whipped from Newgate to Tyburn. Before they executed this ſavage ſentence they intended to degrade and deprive him of his orders, but fortunately for the ſufferer, the prelates Crew, Sprat, and White, too eager, probably, to perform the commands of the tyrant, forgot to ſtrip off his caſſock. This informality was fatal to their plans, and they found it impoſſible to take away his living. Notwithſtanding the laceration of his body, his heart was unbroken, and he continued to employ his pen in the ſame cauſe, till the revolution changed his ſituation. Parliament now declared that the proceedings againſt him were illegal, and the houſe of lords addreſſed king William to confer upon him ſome preferment. Johnſon was ambitious of a biſhopric, but he was offered a deanery; this he did not accept, but received a penſion of 300*l.* *per annum* during his own and his ſon's life, a preſent of 1000*l.*, and a place of 100*l.* *per annum* for his ſon. A tract, which he afterwards publiſhed, was the cauſe of ſo much perſonal violence as nearly to have coſt him his life: the piece was entitled "An Argument proving that the Abrogation of King James by the People of England from the Royal Throne, and the Promotion of the Prince of Orange in his ſtead, was according to the Conſtitution of the Engliſh Government, and preſcribed by it." It was, unqueſtionably, on account of this pamphlet that ſeven ruffians broke into his houſe early in the morning, aſſembled round his bed, gave him a wound on the head with a ſword, and otherwiſe ill-treated him. They threatened to take his life, but ſhrinking from ſo foul a deed, they left him wounded, and did no injury to his houſe or effects. Notwithſtanding his general attachment to the new government, he did not ſpare its defects; he complained grievouſly of the duration of parliaments, which he maintained ought to be continued for one year each only. On ſome occaſions his oppoſition was carried ſo far as to lead his beſt friends to ſuſpect he was about to abandon his original principles. He died in 1703, and his works were collected and printed in one volume folio. Biog. Brit.

JOHNSON, SAMUEL, a celebrated Engliſh writer, was born at Litchfield, in the year 1709, in which city his father carried on the bookſelling buſineſs on a very ſmall ſcale. He was educated partly at the free-ſchool of his native city, and partly at Stourbridge, in Worceſterſhire. He was probably intended for trade, but having acquired a reputation for learning, his father very willingly complied with the propoſal of Mr. Corbet, of maintaining Samuel at Oxford, as companion to his ſon. He accordingly was entered a commoner of Pembroke college, in the year 1728, when he was in the nineteenth year of his age. Johnſon was careleſs of his character with reſpect to the diſcipline and the ſtudies of the place, yet he obtained credit by ſome of his compoſitions, of which the moſt diſtinguiſhed was a tranſlation into Latin of Pope's Meſſiah, written with great ſpirit and vigour. He remained at Oxford but three years, during a part of which he had to ſtruggle with the griping hand of penury. Soon after his return home, his father died in very narrow circumſtances, and about this time it appears, from his own account, that he was firſt led to think in earneſt of religion, by the peruſal of Law's "Serious Call to the Unconverted." He engaged himſelf as uſher to the grammar ſchool of Market Boſworth, Leiceſterſhire, but the treatment which he met with at this place ill accorded with his feelings, and he quitted the ſchool, and paſſed ſome time with a friend at Birmingham. Here he wrote ſome literary eſſays, and tranſlated and abridged from the French the account of the voyage to Abyſſinia, by father Lobo. This was publiſhed without the tranſlator's name, at London, in 1735. Returning to Litchfield, he iſſued propoſals for publiſhing by ſubſcription, the Latin poem of Politian, but they did not meet with encouragement, and the deſign was abandoned. He now made a bold effort to improve his ſituation, married the widow of Mr. Porter, a mercer of Birmingham, and opened a ſchool. He had received 800*l.* with his lady, and depending on his own learning and powers, he took a large houſe, and advertiſed for ſcholars to be boarded and inſtructed in the Greek and Latin languages. His plan did not ſucceed; not more than three ſcholars offered, among theſe was the celebrated David Garrick. After a year's trial he abandoned his ſchool, and reſolved to become a literary adventurer in the metropolis. He accordingly ſet out, taking his ſcholar

Garrick as his companion, being furniſhed with recommendatory letters by Mr. Gilbert Walmſley, a gentleman who had been before the friend and benefactor of Johnſon. Johnſon and his friend arrived in London in March 1737; his firſt and principal engagement was with Cave, the proprietor of the Gentleman's Magazine, and at the deſire of this gentleman he undertook a tranſlation of Father Paul's Hiſtory of the Council of Trent, which was partly printed and then the ſcheme was given up. At this period Johnſon became acquainted with Savage, in whoſe misfortunes he ſympathized, and in whoſe company he was a ſpectator of the vices and diſorders of the metropolis, and probably a ſharer in the hardſhips which he endured, and in the irregularities which he committed, but whatever ſtain the morals of Johnſon might receive from this connection, it was obliterated by the permanent influence of the principles of piety and virtue. The literary piece which brought him into public notice, was entitled "London, a Poem;" written in imitation of Juvenal's Third Satire. For this he received of Dodſley the ſum of 10*l.* It was printed without any name, but it was ſaid by Pope, then in the height of his popularity, that the author of ſo good a ſatire could not remain long concealed. Johnſon, at this period, wanted ſomething more ſubſtantial than mere praiſe, and offered himſelf as a candidate for the maſterſhip of a free-ſchool in the country. This he was unable to attain, becauſe it was neceſſary that the maſter ſhould have taken his degree of M. A. This he had neglected to do while he was at Oxford, and now he had applied for the honour to the univerſity of Dublin, through the medium of lord Gower, who, in writing to his friend on the ſubject, ſays, "he is not afraid of the ſtricteſt examination, though he is of ſo long a journey; and yet he will venture it, if the dean (Swift) thinks it neceſſary, chooſing rather to die on the road, than to be ſtarved to death in tranſlating for the bookſellers, which has been his only ſubſiſtence for ſome time paſt." This application produced no effect, and he was obliged to content himſelf with the patronage of the London bookſellers, particularly with the employment which he obtained in the Gentleman's Magazine. In this work were given the parliamentary debates, under the fiction of "Debates in the Senate of Liliput," and the ſpeakers were diſguiſed under feigned names. Guthrie, for a time, compoſed theſe ſpeeches from ſuch hints as he could bring away in his memory. Johnſon firſt aſſiſted in this department, and then entirely filled it, and the public was highly gratified with the eloquence diſplayed in theſe compoſitions. In 1739 he publiſhed a humorous pamphlet, entitled "Marmor Norfolcienſe," conſiſting of a ſuppoſed ancient prophecy in Latin monkiſh rhymes, with an explanation. He compoſed, about the ſame period, ſeveral biographical articles for the Gentleman's Magazine, of which the principal was the life of Savage, which was afterwards publiſhed ſeparately, and has been univerſally admired both as a moſt intereſting and curious portrait, and as containing many admirable reflections on life and manners. In the year 1747 he publiſhed the plan of his Engliſh Dictionary, addreſſed to the earl of Cheſterfield, whom he would gladly have recognized as his patron in this arduous taſk. But his lordſhip concerned himſelf very little about the author or his work. No two men could be more oppoſite in their manners than Johnſon and lord Cheſterfield, and a very ſlight intercourſe on this occaſion terminated in their mutual averſion, ſo that the author in his preface informed the public, that "the *Engliſh Dictionary* was written with little aſſiſtance of the learned, and without any patronage of the great; not in the ſoft obſcurities of retirement, or under the ſhelter of academic bowers, but amidſt inconvenience and diſtraction, in ſickneſs and in ſorrow." From the bookſellers, Johnſon received fifteen hundred guineas for his labour, which was not completed till the year 1755. The intervals of this compilation were ſufficient to allow of various literary avocations. In 1747 he wrote a prologue on the opening of Drury-lane theatre. In 1749 he produced another imitation of Juvenal, entitled "The Vanity of Human Wiſhes;" and his tragedy of "Irene." He next commenced his periodical work, entitled "The Rambler," which came out in papers at the rate of two in a week, from the month of March 1750, till the ſame month in 1752. He was the author of the whole of this work, with the exception of about ten papers only, and in it he appears the warm and ſtedfaſt friend of religion and morality. The ſerious ſtyle of the Rambler prevented it at firſt from attaining a very extenſive circulation, but after it was collected into volumes, it roſe in the public eſtimation, and the author ſaw the publication of the tenth edition. Soon after the cloſe of this paper he had the misfortune to loſe his wife, a circumſtance which he never ceaſed to deplore. Not long afterwards he took into his houſe, as an inmate, Mrs. Anne Williams, the daughter of a phyſician in South Wales, who had conſumed his time and fortune in purſuit of the longitude. Her deſtitute condition, aggravated by blindneſs, with her talents for writing and converſation, recommended her to the benevolence of Mr. Johnſon. In the "Adventurer," conducted by Dr. Hawkſworth, he intereſted himſelf, ſupplied it with ſeveral papers of his own, and obtained for it the contributions of Mr. Warton. Previouſly to the publication of his dictionary, the degree of M. A. was conferred on him by the univerſity of Oxford, and about the ſame time the earl of Cheſterfield wrote two letters in its favour in "The World" This civility was regarded, by Johnſon, as an advance from that nobleman for the purpoſe of obtaining from him a dedication as patron of the work, but he now rejected the patronage which he would before have gladly accepted, and wrote a letter to the noble lord, in which he employed all the force of pointed ſarcaſm and manly diſdain to make him aſhamed of his former conduct. The dictionary was received by the public with general applauſe, and its author was immediately ranked among the greateſt benefactors of his native tongue. The publication of this great work did not relieve him from his embarraſſments, for the price of the labour had been conſumed in the progreſs of its compilation. He was ſtill entirely dependent upon the exertions of the day for its ſupport, and ſo low was he reduced, though now regarded as an honour to his country, that in the following year he was put under an arreſt for the trifling ſum of five or ſix pounds. In 1758 he began "The Idler," a periodical paper, which was publiſhed in a weekly newſpaper. On the death of his mother in 1759, he wrote the romance of "Raſſelas," to defray the expences of her funeral, and to pay her debts. This, though written in a very haſty manner, is reckoned one of his moſt ſplendid performances: it is elegant in language, rich in imagery, and weighty in ſentiment. It has been tranſlated into ſeveral modern languages. Such, however, was the depreſſed ſtate of his finances, that he was obliged to break up houſe-keeping and retire to chambers. From this ſituation he was reſcued by the grant of a penſion of 300*l.* *per annum*, in 1762, without any ſtipulation with reſpect to his literary exertions. In 1765 he had the honour of an interview with his majeſty in the royal library, when the ſovereign aſked if he intended to publiſh any more works? To this he replied, that he thought he had written enough, on which the king ſaid, "I ſhould have thought ſo too, if you had not written ſo well." In this year he publiſhed his edition of Shakſpeare's Works, which was ſent into the world with a preface, written with all the powers of his maſterly pen, and which is reckoned among the moſt valuable of his critical diſquiſitions. About this period he inſtituted a literary club, conſiſting of ſeveral of the moſt celebrated men of the age, among whom were ſome who occupied very elevated ſituations in ſociety. In 1770 he appeared an advocate for the meaſures of government, and publiſhed, firſt, "The Falſe Alarm," occaſioned by the expulſion of Mr. Wilkes from the houſe of commons. This was followed by "Thoughts on the late Tranſactions reſpecting Falkland's Iſland," deſigned to ſhew the unreaſonableneſs of going to war on account of the conduct of Spain relative to that barren poſſeſſion. His next publication on political ſubjects was entitled "The Patriot," which was compoſed on the eve of a general election in order to indiſpoſe the people againſt the meaſures of the oppoſition. In 1775 he publiſhed, "Taxation no Tyranny," which was written in defence of the right of the mother country taxing the colonies at pleaſure. Theſe pamphlets, which were probably written on principle, did but little ſervice to the cauſe which he vindicated. In 1773 he went on a tour with Mr. Boſwell to the weſtern iſlands of Scotland, of which journey he publiſhed an account under the title of "A Journey to the Weſtern Iſlands of Scotland." In this he gave a moſt deciſive opinion againſt the authenticity of the poems aſcribed to Oſſian, which occaſioned a difference between him and the tranſlator, Mr. Macpherſon. In 1775, the univerſity of Oxford conferred on him, through the intereſt of the miniſter, the degree of doctor of laws, which he highly valued. The ſome honour had been given him ſome years before by the univerſity of Dublin, of which he had made no uſe. When the unhappy Dr. Dodd lay under ſentence of death, in Newgate, Johnſon, moved either by compaſſion for the man, or by a deſire of reſcuing the cloth from public diſgrace, wrote two petitions to his majeſty in his name, and ſupplied him with a ſpeech at the bar, and a ſermon to be preached to his fellow convicts. (See Dodd.) In the year 1779, Dr. Johnſon began his laſt literary undertaking, "The Lives of the Engliſh Poets," which, notwithſtanding the ſtrong prejudices of the author, may be regarded as a moſt valuable treaſure of ſound criticiſm, and a model of literary biography. This work was completed in 1781: it is not only attached to his edition of the Engliſh poets, but has been re-printed a great many times in a ſeparate form. The concluding portion of Dr. Johnſon's life was clouded over by the loſs of ſeveral highly reſpected friends, by a progreſſive decline of health, and by the proſpect of approaching diſſolution, which neither his religion nor his philoſophy taught him to bear with even decent compoſure. At laſt, however, his mind became calm, compoſed, and truly reſigned: he died December 13th, 1785, in the 75th year of his age. His remains, attended by a reſpectable concourſe of friends, were interred in Weſtminſter abbey; and a monumental ſtatue has been erected to his memory in St. Paul's cathedral. His works, with a life of the author, were publiſhed collectively in 11 volumes, 8vo. by ſir John Hawkins, in 1787; and in 1792, a new edition of them in 12 volumes, with a life by Mr. Murphy, was given to the public. Mr. Boſwell and Mrs. Piozzi have likewiſe given ample accounts of their friend: perhaps there is no inſtance of a private man of letters, in this country, whoſe deceaſe was marked by the appearance of ſo many laudatory and biographical tributes to his public reputation. As a writer, Dr. Johnſon did much ſervice to his country, by fixing its language and regulating its morality. In his perſon he was large, robuſt, and unwieldy; in his dreſs he was ſingular and ſlovenly; in converſation he was poſitive, and impatient of all contradiction. But with theſe deductions, he was an excellent character; he had a heart full of tenderneſs and compaſſion, and all his actions were the reſult of principle. He was a zealous advocate for what he regarded as the truth. He was high in his religious and political principles, and at one period of his life he was friendly to the views of the houſe of Stuart. He had a noble independence of mind, and would never ſtoop to any man however exalted, nor diſguiſe his ſentiments to flatter another. His judgment was uncommonly acute, his imagination quick, his memory tenacious, and his converſation, though very dictatorial, was often brilliant, and always inſtructive. For farther particulars, the reader is referred to the works above mentioned.

Johnson, in *Geography*, a county of America, in North Carolina and Newbern diſtrict, containing 6201 inhabitants, of whom 1763 are ſlaves. It is 30 miles ſquare, and watered by ſeveral ſtreams. The greateſt part of the county is level, and its principal produce is corn. Its chief town is Smithfield.

JOHNSONIA, in *Botany*, ſo named by Mr. R. Brown in memory of Dr. Thomas Johnſon, author of ſome little botanical works, publiſhed in the form of travels between 1629 and 1641, and editor of the ſecond edition of Gerarde's Herbal in 1633. Wood ſays he was killed, while fighting in the royal cauſe, in September 1644. Brown. Prodr. Nov. Holl. v. 1. 287. Claſs and order, *Triandria Monogynia*. Nat. Ord. *Aſphodeli*, Juſſ.

Eſſ. Ch. Perianth (rather corolla) in ſix deep equal ſegments, withering, deciduous. Filaments dilated and united at their baſe, inſerted into the baſe of the inner ſegments of the corolla. Style thread-ſhaped. Stigma obtuſe. Capſule ſuperior, of three cells and three valves, with partitions from the middle of the valves. Seeds two in each cell, inſerted into the central column, one of them pendulous. Scar creſted.

1. J. *lupulina*. Native of the ſouth coaſt of New Holland. *Root* fibrous, perennial. *Leaves* two-ranked, twiſted, linear, dilated, and half ſheathing at the baſe. *Stalk* radical, ſimple, bearing near its top a ſolitary, oblong, hop-like ſpike of ſmall ſeſſile *flowers*, with coloured imbricated *bracteas*, the lowermoſt of which are ſmall and barren.

JOHNSTON, John, in *Biography*, an eminent naturaliſt, was born at Sambter, in Great Poland, in the year 1603: he received the greater part of his education in his own country; but in 1622, he came to England, and from thence he went to Scotland, where he ſtudied with great diligence in the univerſity of St. Andrews till the year 1625. He afterwards ſtudied at Leyden and Cambridge. He undertook the education of the two ſons of the count de Kurtzbach, and accompanied them to Holland. While he reſided with his pupils at Leyden, he took his degree as doctor of phyſic; and when he went a third time to England, the ſame honour was conferred on him by the univerſity of Cambridge. He died in June 1675, in the 72d year of his age. He is known in the literary world by a number of works in the different departments of natural hiſtory. Gen. Biog.

Johnston, in *Geography*, a townſhip of America, in Providence county, Rhode iſland, weſt of the town of Providence; containing 1364 inhabitants.—Alſo, a townſhip in Franklin county, Vermont; having 135 inhabitants.

JOHNSTONE, George, in *Biography*, a naval commander, ſon of a Scotch baronet, devoted himſelf to the ſea ſervice at an early period of life. After paſſing through the ſubordinate

ſubordinate ſtations, he was, in the year 1760, made maſter and commander; and in two years after, he was raiſed to the rank of poſt captain. At the peace, he was appointed governor of Weſt Florida; and on his return to England, he took an active part in the affairs of the Eaſt India company, particularly in oppoſition to lord Clive. In 1771 he wrote a work, entitled, "Thoughts on our Acquiſitions in the Eaſt Indies, particularly reſpecting Bengal." He ſat twice in parliament, firſt for Cockermouth, and afterwards for Appleby. He had a duel with lord George Germaine, on account of ſome reflections which fell from him in the houſe reſpecting his lordſhip. He was one of the commiſſioners ſent to treat with the Americans. He died in 1787.

Johnstone's *Straits*, in *Geography*, a channel of the Pacific ocean, between the iſland of Quadre and Vancouver, and the weſt coaſt of North America. This channel branches off from the northern part of the gulf of Georgia, from point Chatham to the weſt, bearing a little north for about 60 miles in length, the breadth being from two to four. N. lat. 50° 20′ to 50° 35′. E. long. 233° to 234° 46′.

JOHNSTOWN, a poſt-town of America, and capital of Montgomery county, in the ſtate of New York, ſituated on the north bank of Mohawk river, 24 miles weſt of Schenactady. The town contains about 70 houſes, a Preſbyterian and an Epiſcopal church, a court-houſe, and a gaol. In the townſhip are 3932 inhabitants.—Alſo, a town in the townſhip of Edwardſburgh, Upper Canada, ſituated upon the river St. Lawrence, above the uppermoſt rapids, in aſcending to lake Ontario. From this town veſſels may be navigated with ſafety to Queenſtown, and at the ports of lake Ontario.

Johnstown, *New*, a town in the townſhip of Cornwall, Upper Canada, ſituated upon the river St Lawrence, below the long Saalt, to the northward of Grand Iſle St. Regis; and is now called Cornwall.

Johnstown, the name of ſeveral villages in Ireland. One of theſe, in the county of Kilkenny, has been lately made a poſt-town. It contains a number of neat houſes, built for the accommodation of thoſe who frequent the neighbouring chalybeate Spa of Ballyſpellan. It is on the mail-coach road from Dublin to Cork, through Caſhel, and is 60 miles S.W. from Dublin.—Another Johnſtown, in the county of Kildare, is about 13 miles from Dublin, on the Great Southern road; and in conſequence of a good inn, is frequently made a ſtage by thoſe who travel poſt.—Two others, called St. Johnſtown, were formerly boroughs repreſented in parliament: one of them in the county of Donegal, on the river Foyle, which is here of conſiderable breadth, 87 miles N. by W. from Strabane, and 108½ N. by W. from Dublin; the other in the county of Longford, 6 miles W. from Granard.—There is alſo a ſmall town called Johnſtown Bridge, in the county of Kildare, on the borders of Meath, ſituated on the river Blackwater, 21 miles from Dublin.

JOHOR, a town of the peninſula of Malacca, near the ſouth coaſt, and capital of a kingdom of the ſame name. N. lat. 1° 40′. E. long. 103° 54′.

JOIGNY, a town of France, and principal place of a diſtrict, in the department of the Yonne, near the river Yonne. The place contains 5219, and the canton 13,137 inhabitants, on a territory of 307½ kiliometres, in 17 communes; 14 miles N.W. of Auxerre. N. lat. 47° 59′. E. long. 3° 29′.

JOINAGUR. See Jyenagur.

JOINDER, or Joynder, is the coupling, or joining, two perſons in one action, or ſuit, againſt another. See Demurrer.

JOINERY is a branch in *Civil Architecture*, and conſiſts of the art of framing or joining wood together, for internal and external finiſhings of houſes; as the coverings and linings of rough walls, or the coverings of rough timbers, and of the conſtruction of doors, windows, and ſtairs.

Hence joinery requires much more accurate and nice workmanſhip than carpentry, which conſiſts only of rough timbers, uſed in ſupporting the various parts of an edifice: joinery is therefore uſed by way of decoration only, and being always near to the eye, and conſequently liable to inſpection, requires that the joints ſhould be fitted together with the utmoſt care, and the ſurfaces made ſmooth.

The wood uſed is called ſtuff, and is previouſly formed by the pit-ſaw into rectangular priſms, which are denominated boards, battens, or planks, according to their breadth. Battens run from two to ſeven inches wide, boards from ſeven to nine inches wide, and planks from nine inches to any greater breadth that can be cut out of a piece of wood.

The operations of joinery conſiſt of forming ſurfaces of various kinds, alſo of grooving, rebating, and moulding, and of mortiſing and tenoning, and laſtly, of joining two or ſeveral pieces together, ſo as to form a frame or ſolid maſs.

Surfaces, in joinery, are either plane or curved, but moſt frequently plane.

All kinds of ſurfaces are firſt formed in the rough, and finally brought to exact forms by means of tools adapted thereto.

Grooving conſiſts in taking away a part of a rectangular ſection from a piece of wood, ſo as to form a channel of equal breadth throughout, with three ſurfaces, one being parallel, and the other two perpendicular to the ſurface of the wood from which the channel is receſſed: the channel thus formed is called a groove.

Rebating conſiſts in taking away a part from a piece of wood of a rectangular ſection, ſo as to leave only two ſides, each of a parallel breadth, the one ſide being perpendicular to the ſurface of the wood, and the other parallel thereto: the cavity thus formed is called a rebate. From this definition it is manifeſt, that a rebate can only be formed by reducing the piece of wood to be rebated at the angle itſelf, and may therefore be looked upon as a half groove.

A mortiſe is a cavity receſſed within the ſurface of a piece of wood, with four ſides perpendicular to that ſurface, and likewiſe to each other: the act of making a mortiſe is called mortiſing.

A tenon is a projection formed on the end of a piece of wood with four plane ſides, at right angles to each other, and to a plane, from which it projects; and this plane is called the ſhoulder of the tenon.

In the following, all pieces of wood whatever are ſuppoſed to be rectangular priſms, and the length in a direction of the fibres; two of the ſides of every mortiſe to be perpendicular, and the other two ſides parallel to the fibres; the four ſides of every tenon in the direction of the fibres, unleſs otherwiſe aſſerted: likewiſe, if two of the ſurfaces of a piece of wood be of greater breadth than the other two, theſe are called the edges and thoſe the ſides, and each line of concourſe, formed by two adjacent ſides, is called an arris.

Moulding conſiſts in forming the ſurface of a piece by curve or plane ſurfaces, or by both, in ſuch a manner, that all parallel ſections will be ſimilar figures, that is, their boundaries may be made all to coincide.

The firſt thing to be done in joinery is to ſelect the ſtuff or boards, which ought to be well ſeaſoned for every purpoſe in joinery, and then line it out; and if the ſtuff is not already at the ſize, as is moſt frequently the caſe, it muſt be ripped out with the ripping ſaw, or croſs cut with the hand ſaw, or both, as may be wanted. The next thing is the planing of the ſtuff firſt upon a ſide, then the edge ſquared, and then gaged to a breadth and thickneſs, ſhould either or both be found neceſſary.

Two or more pieces of ſtuff may be faſtened together in various ways by pins of wood or by nails, but in work prepared by the joiner for the uſe of building, pieces are more frequently joined together by making their ſurfaces coincide, and then plaſtering them over with a hot tenacious liquid called glue, then rubbing the ſurfaces until the glue has been almoſt rubbed out, and the one piece brought to its ſituation with reſpect to the other. The beſt work is always joined by this method.

When boards are required of a greater breadth than common, ſeveral common boards muſt be faſtened together edge to edge, either by nailing them to pieces extending acroſs the breadth, or gluing them edge to edge, or by joining pieces tranſverſely together with ſmall boards, tongued and grooved into the interſtices.

Two pieces of ſtuff are joined together at right or oblique angles by mortiſe and tenon adapted to each other, and faſtened together with glue. When a frame, conſiſting of ſeveral pieces, is required, the mortiſes and tenons are fitted together, and the joints glued all at one time, then entered to their places, and forced together by means of an inſtrument called a cramp.

The operation of forming a given ſurface, by taking away the ſuperfluous wood, is called planing, and the tools themſelves planes.

The firſt tools uſed by joiners are bench planes, which generally conſiſt of a jack plane, for taking away the rough of the ſaw and the ſuperfluous wood, only leaving ſo much as is ſufficient to ſmooth the ſurface; the trying plane to ſmooth or reduce the ridges left by the jack plane, and to ſtraighten or regulate the ſurface, whether it be plane or convex; the long plane when the ſurface is required to be very ſtraight; and the ſmoothing plane in ſmoothing, as its name implies, and giving the laſt finiſh to the work.

Beſides the bench planes there are others for forming any kind of priſmatic ſurfaces whatever, as rebating planes, grooving planes, and moulding planes: but for a more particular deſcription of theſe and the bench planes, we ſhall refer to the article PLANE.

The tools employed in boring cylindric holes are a ſtock with bits of various deſcriptions and ſizes, gimblets and brad awls of ſeveral diameters.

The tools uſed in paring the wood obliquely, or acroſs the fibres, and for cutting rectangular priſmatic cavities, are in general denominated chiſſels: thoſe for paring the wood acroſs the fibres are called firmers, or paring chiſſels, and thoſe for cutting rectangular priſmatic cavities, are called mortiſe chiſſels, the rectangular cavities themſelves being called mortiſes when made to receive a projection of the ſame form and ſize, and by this means to faſten two pieces of wood together at any angle. The ſides of all chiſſels, in a direction of their length, are ſtraight, and the ſide of a chiſſel which contains the cutting edge at the end is ſteel. The beſt paring chiſſels are made entirely of caſt ſteel. Chiſſels for paring concave ſurfaces are denominated gouges.

Dividing wood, by cutting away a very thin portion of the material of equal thickneſs throughout, to any required extent, by means of a thin plate of ſteel with a toothed edge, is called ſawing, and the inſtruments themſelves are called ſaws, which are of ſeveral kinds, as the ripping ſaw, for dividing boards into ſeparate pieces in a direction of the fibres; the hand ſaw, for croſs cutting and ſawing thin pieces in a direction of the grain; the pannel ſaw, either for croſs cutting or cutting very thin boards longitudinally; the tenon ſaw, with a thick iron back, for making an inciſion of any depth below the ſurface of the wood, and for cutting pieces entirely through, not exceeding the breadth of that part of the plate without the iron back; likewiſe a ſaſh ſaw and a dovetail ſaw, uſed much in the ſame way as the tenon ſaw. From the thinneſs of the plates of theſe three laſt ſaws, it is neceſſary to ſtiffen them by a ſtrong piece of metal called the back, which is grooved to receive the upper edge of the plate that is fixed to the back, and which is thereby ſecured and prevented from buckling. When it is required to divide boards into curved pieces, a very narrow ſaw without a back, called a compaſs ſaw, is uſed, and in cutting a very ſmall hole a ſaw of a ſimilar deſcription, called a key-hole ſaw, is employed. All theſe ſaws have their plates longer and thinner, and their teeth finer, as they ſucceed each other in the order here mentioned, excepting the two laſt, which have thicker plates and coarſer teeth than either the ſaſh or dovetail ſaw. The external and internal angles of the teeth of all ſaws are generally formed at an angle of 60 degrees, and the front edge teeth ſlope backward in a ſmall degree, but incline or recline from the ſtraight line drawn from the interior angle perpendicular to the edge in the plane of the plate, as the ſaw may be employed in ripping or in croſs cutting, or cutting perpendicular to the fibres. The teeth of all ſaws, except turning and key-hole ſaws, are bent on contrary ſides of the plate, each two teeth ſucceeding each other, being alike bent on the different ſides of the plate; *viz.* the one as much to the one ſide as the other is to the other ſide, and conſequently all the teeth on the ſame ſide alike bent throughout the length of the plate for the purpoſe of clearing the ſides of the cut which it makes in the wood.

Of all cutting tools whatever, the ſaw is the moſt uſeful to the joiner, as the timber or wood which he employs can be divided into ſlips or bars of any ſize, with no more waſte of ſtuff than a ſlice, the breadth of which is equal to the depth of the piece to be cut through, and the thickneſs equal to the diſtance of the teeth between their extreme points on the alternate ſides of the ſaw meaſured on a line perpendicular to the ſaid ſides: whereas, without the uſe of the ſaw, cylindrical trees could only be reduced to the intended ſize by means of the axe; in the uſe of which there would not only be an immenſe conſumption of ſtuff, but alſo much greater labour would be required to ſtraighten it.

Joiners uſe a ſmall axe, called a hatchet, for cutting off the ſuperfluous wood from the edge of a piece of a board, when the waſte is not of ſufficient conſequence to be ſawn.

All the above are what are commonly denominated edge tools, but there are others required to regulate the forms. All angles whatever are formed by other reverſed angles of the ſame number of degrees as an exterior angle by an interior one, and the contrary. The inſtrument for trying right angles is called a ſquare, and thoſe for trying oblique angles are called bevels. The two ſides which form the edge of a ſquare are always ſtationary, but thoſe of bevels are generally moveable one leg upon the other round a joint, In ſome caſes, where a great number of pieces are required to be wrought to the ſame angle, a ſtationary bevel, called a joint hook, is uſed.

When it is required to reduce a piece of ſtuff to a parallel breadth, an inſtrument called a gage is uſed for the purpoſe. The gage conſiſts generally of a ſquare piece with a ſquare mortiſe, through which a bar at right angles thereto is fitted and made to ſlide. The bar, which is called the ſtem, has a ſharp point, cutter, or tooth at one extremity, projecting a little from the ſurface, ſo that when the ſide of the gage, next to the end which has the point, is applied upon the vertical ſurface of the wood, with the flat ſide of the ſtem which has the tooth upon the horizontal ſurface, and puſhed and drawn alternately by the workman from and towards him, the cutter will make an inciſion from the ſurface into the wood, at a parallel diſtance from the upper edge of the vertical ſide on the right hand. This line, ſo drawn, will mark out with preciſion, and ſhew the ſuperfluous ſtuff to be taken away.

When a mortiſe is required to be cut in a piece of wood, a gage with two teeth is uſed. The conſtruction of this inſtrument is the ſame as the common gage; but in addition thereto, the ſtem has a longitudinal ſlider with a tooth projecting from the end of the ſlider, ſo that the two teeth may be brought nearer, or to any remote diſtance from each other, at pleaſure; and alſo to any diſtance, from the face of the head or guide within the reach of the ſtem.

When wood has been planed, and required to be ſawn acroſs the fibres, and as it is neceſſary to be kept ſtationary while ſawing, in order to prevent the ſides or the edges from being bruiſed, joiners uſe a flat piece of wood with two projecting knobs on the oppoſite ſides, one at each end, called a ſide hook. The vertical ſide of the interior angle of one of the knobs is placed cloſe to the vertical ſide, and the under ſide upon the top of the bench; then the wood is preſſed againſt the knob which projects from the upper ſurface while it is cutting with the ſaw; but the uſe of two ſide hooks is better, as they keep the piece of wood to be ſawn more ſteady.

When it is required to cut a piece of wood to a mitre with one ſide; that is, to half a right angle, joiners uſe a trunk of wood with three ſides, like a box without ends, or a top, the ſides and bottom being parallel pieces, and the ſides of equal heights: through each of the oppoſite ſides is cut a kerf in a plane, perpendicular to the bottom, at oblique angles of 45 and 135 degrees, with the planes of the ſides; and another kerf is made in the ſame manner, ſo as to have its plane at right angles to the former. The trunk thus conſtructed is called a mitre-box. When the wood is to be cut, the mitre-box is fixed ſteady againſt two ſide hooks, and the piece, which is always leſs than the interior breadth of the mitre-box, is laid within, and preſſed againſt the farther interior angle of the mitre-box with the ſide downwards, to which the ſaw-kerf is intended to be perpendicular, and in this poſition it is to be cut. The two kerfs in the ſides of the mitre-box are requiſite, in order to form the acute angle on the right or left-hand ſide of the piece, as may be required.

When it is required to make a piece of wood ſtraight in one direction, joiners uſe a ſlip of wood ſtraightened on one edge, from which the ſlip of wood itſelf is called a ſtraight edge. Its uſe is obvious; by its application it will be ſeen whether there is a coincidence between the ſtraight edge and the ſurface.

When it is required to know whether the ſurface of a piece of wood is in the ſame plane, joiners uſe two ſlips of wood ſtraightened each on one edge with the oppoſite edge parallel, and both pieces of the ſame breadth between the parallel edges: each piece has therefore two ſtraight edges. Suppoſe it were required to know whether a board is twiſted or its ſurface in a plane, the workman lays one of the ſlips acroſs the one end, and the other acroſs the other end of the board, with one of the ſtraight edges of each upon the ſurface; then he looks in the longitudinal direction of the board, over the upper edges of the two ſlips, until his eye and the two upper edges of the ſlips are in one plane; or otherwiſe, the interſection of the plane, paſſing through the eye and the upper edge of the neareſt ſlip, interſect the upper edge of the farther ſlip. If it happen as in the former caſe, the ends of the wood under the ſlips are in the ſame plane; but ſhould it happen as in the latter, they are not. In this laſt caſe the ſurface is ſaid to wind; and when the ſurface is ſo reduced that every two lines are in one plane, it is ſaid to be out of winding, which implies its being an entire plane: from the uſe of theſe ſlips they are denominated winding ſticks.

Before we can proceed to the method of bringing a rough ſurface to a plane, it will firſt be neceſſary to ſhew how to make a ſtraight edge or ruller.

Here the joiner muſt not loſe ſight of the definition of a ſtraight line, *viz.* a ſtraight line is that which will always coincide with another ſtraight line, however applied together.

The operation of making the edge of a board ſtraight is called by joiners ſhooting, and the edge ſo made is ſaid to be ſhot.

Straight edges may be thus formed; plane the edges of two boards and apply them together, ſo that the ſuperficies or faces of the boards be in the ſame plane, and if there be no cavity between the joint the edges will be ſtraight; but if not, the faces muſt be applied to each other, the edges brought together, and planed and tried as before, until they are found to coincide.

Another mode is by having a plane ſurface given: plane the edges of a board as ſtraight as the eye will admit of, and apply the face of it to that of the plane, and by the edge of the board draw a line, turn the board over with the other ſide upon the plane, and bring the planed edge to the line drawn before, and the extremities of the edges to their former places, and draw another line; then if all the parts of this line coincide with the former line, the edge is already ſtraight, but if not, repeat the operation as often as may be found neceſſary.

Another mode is to plane the edge of a board as ſtraight as the eye will admit of; then plane the edge of another board until it is made to coincide with the former; take a third board and plane the edge of this in like manner, by making it coincide with the edge of the firſt board; apply the edges of the two laſt boards together, then if they coincide the operation is at an end, but if not, repeat it as often as may be found neceſſary.

By any of the methods now ſhewn, the ſuperficies of the boards, to be ſhot, are ſuppoſed to be parallel planes not very diſtant from each other; for if the faces be not parallel, or if the thickneſs be conſiderable, the operation will be the more liable to error.

To reduce the rough ſurface of a body to a plane.—This will not be very difficult, when it is known that a plane is that which will every where coincide with a ſtraight line.

The moſt practical methods are the following: Let the workman provide two winding ſticks, and apply them as before directed, making the ends out of winding if they are not found to be ſo; then if all the parts of the ſurface are ſtraight on which the edges of the winding ſticks were placed, it is evident that the whole ſurface muſt be plane. If the ſurface is hollow between the ſaid lines, one of the ends or both muſt be planed lower, until the ſurface acquires a ſmall convexity in the length, and then, if ſtraightened between the ſtraight lines at the ends, it will be a perfect plane.

Another mode of forming a plane of the ſurface is of a quadrilateral form: apply a ruler along the diagonals, then if they are ſtraight they are in a plane, but if they are both hollow, or both round, the ſurface to be reduced is either concave or convex, and muſt be ſtraightened in theſe directions accordingly; and, laſtly, if by trying acroſs the diagonals with the ſtraight edge it be found that the one be hollow and the other round, the ſurface of the board winds. In this caſe bring down the protuberant part of the convex diagonal, ſo as to be ſtraight with the two extremities; then ſtraighten the concave diagonal, by planing either of the two ends or both of them, according as the thickneſs of the board will require. Both diagonals being now ſtraight, traverſe the wood, that is, plane it acroſs the fibres, until all the protuberant parts between the diagonals are removed; then the workman may proceed to ſmooth it by working it in the direction of the fibres.

To join any number of planks together, ſo as to form a board of a determinate breadth, the fibres of each running longitudinal to thoſe of any other.—Shoot the two edges that are to be joined; turn the ſides of the boards towards each other, ſo that the edges that are ſhot may be both uppermoſt; ſpread theſe edges over with ſtrong glue of a proper conſiſtence, made very hot; one of the boards being fixed, turn the other upon it, ſo that the two edges may coincide, and that the faces may be both in the ſame plane; rub the upper one to and fro in the direction of the fibres till the glue is almoſt out of the joint; let theſe dry for a few hours; then proceed to make another joint; continue to join as many boards or planks in the ſame manner, till the whole intended breadth be made out. If the boards or planks of which the board is to be compoſed are very long, the edges that are to be united would require to be warmed before a fire; and, for rubbing and keeping the joints fair to each other, three men would be found neceſſary, one at each extremity, and one at the middle. Boards, glued together with this kind of cement, will ſtand as long as the ſubſtance of the deals or planks compoſing them, if not expoſed to rain or intenſe heat, provided that the wood has been well ſeaſoned beforehand, and that the grain be free and ſtraight, uninterrupted with few or no knots. When a board which is to be expoſed to the weather is to be made of ſeveral boards or planks, the cement to be uſed for uniting them ſhould not be of ſkin glue, but of white lead ground up with linſeed-oil, ſo thin that the colour may be ſenſibly changed into a whitiſh caſt: this kind of glue will require a much greater time to dry than ſkin glue. Boards to be expoſed to the weather, when their thickneſs will admit, are frequently tongued together; that is, the edges of both boards are grooved to an equal diſtance from the faces, and to an equal depth; and a ſlip of wood is made to fit the cavity made in both: this ſlip ſhould be made to fill the grooves, but ought not to be ſo tight as to prevent the joint from being rubbed with proper cement.

To glue any two boards together forming a given angle.—This may either be accompliſhed by ſhooting the edge of the one board to the whole of the given angle, and the face of the other ſtraight; then, by applying theſe two ſurfaces together, and rubbing as before, they will form the angle required; or, if the two edges are ſhot to half the given angle, and the edges applied together and rubbed and ſet as before, the faces of the boards will form the angle required. In both theſe methods, when only one ſide of the board is to be expoſed to ſight, which is moſt commonly the caſe, pieces of wood called blocks are fitted to the angle, and the ſides glued acroſs the joint or legs of the angle, being previouſly planed for that purpoſe.

To form wooden architraves for apertures by gluing longitudinal pieces together.—Architraves may be formed out of the ſolid pieces; but as their formation in this way is attended with a waſte of both ſtuff and time, the moſt eligible method is to glue the parts longitudinally together, as is beſt adapted to the nature of the mouldings. Architraves of the Grecian form, for doors and windows, generally conſiſt of one or two faces in parallel planes, the one of which recedes only in a ſmall degree from the other, while the outer edge is terminated with one or ſeveral mouldings which have a very prominent projection. In this caſe make a board of ſufficient thickneſs, and in breadth equal to the breadth of the architrave: prepare a ſlip of wood of a ſufficient thickneſs and breadth for the mouldings on the outer termination of the architrave; glue this ſlip upon the face cloſe to the edge of the board, with the outer edge fluſh therewith. In the operation two men will be at leaſt required to rub the ſlip to a joint with the board; and as it often happens that the ſide of the ſlip, which is to comply with the ſurface of the board, is conſiderably bent, the ſlip is nailed down to the board; but, previouſly, ſmall ſquare pieces of wood, called buttons, are bored with holes, one in each, and a nail is put through the hole to the head; then the ſlip is alſo bored with a brad-awl; and the nails, with the pieces thus deſcribed, are entered and driven home as far as the buttons will permit. The buttons may be about three quarters of an inch thick, and the other two dimenſions each equal to, or ſomething more than, the breadth of the ſlip. The ſlip is ſometimes grooved; and the edge of the board is tongued, glued, and inſerted in the groove, inſtead of the above method. Sometimes, alſo, the two faces are made of different boards tongued together at their joining; then the whole is afterwards ſtuck into mouldings.

To form the ſurface of a cylinder with wood, whoſe fibres are in planes perpendicular to the axis of the cylinder, ſuch as may be uſed in circular dado, or the ſoffits of windows.

Method 1.—When the dimenſion of the cylindric ſurface, parallel to the axis, is not broader than a plank or board: this may be done by bending and gluing ſeveral veneers together; and the firſt upon a mould or brackets, the edges of which are in the ſurface of the propoſed cylinder parallel to its axis.

This may be accompliſhed by means of two ſets of brackets fixed upon a board with hollow cylindric ſpace between them, of ſufficient thickneſs for taking in the veneers, and double wedges for confining them. If this operation is carefully done, and the glue properly dried, the wedges may be ſlackened, and the cylindric part ſo glued up will be found to ſtand very well; but it muſt be obſerved, that, as the wood has a natural tendency to unbend itſelf, the curve ſurface, upon which it is glued, ſhould be ſomewhat quicker than that intended to be made.

Some workmen take another method by forming a hollow cradle, and bending the veneers into it, and confining their ends with wedges, which compreſs them together; and by a very ſmall degree of rubbing, with a hammer made for this purpoſe, the glue will be forced out of the joint.

Another method is to form a cradle or templet to the intended ſurface, and lay a veneer upon it; then glue blocks of wood upon the back of it, cloſely fitted to its ſurface, and the other joints to each other, the fibres of the blocks correſponding with thoſe of the veneer.

A third method is to make a cradle and place the veneers upon it, confining one end of them ſpread in the glue between the veneers with a bruſh, and fix a bridle acroſs, confining the ends of this bridle either by nails or by ſcrews; open the veeners again, and put in glue a ſecond time between each two, and fix another bridle acroſs them: proceed in this manner to the other extremity.

A fourth method is to run a number of equi-diſtant grooves acroſs the back of the board at right angles to its edges, leaving only a ſmall thickneſs towards the face, let this be bent round a craddle or templet made on purpoſe; and let the grooves be filled with ſlips of wood, which, after the glue is quite dry, are to be planed down to the ſurface of the cylindric board, which may be ſtiffened with canvas glued acroſs the back.

Inſtead of uſing a grooving plane, workmen frequently make kerfs with the ſaw; but this is not ſo ſtrong when finiſhed, as it is very difficult to inſert the ſlips, and very uncertain as to the depth of each of the kerfs, which will occaſion a very unequal bending of the board, if not to a regular depth.

To bend a board, ſo as to form the fruſtum of a cone, or any ſegmental portion of the fruſtum of a cone, ſuch as the ſoffit of the head of an aperture.—Find the form of the covering according to the geometrical principles of carpentry; cut out a board to this form, and run a number of equidiſtant grooves acroſs it tending to the centre: this being fixed to a templet made to the ſurface of a cone, proceed and finiſh it in the ſame manner as in the laſt method ſhewn for a cylinder.

To bend boards ſo as to form a ſpheric ſurface.—Make a mould to the covering of a given portion of the ſphere in plano, according to the geometrical principles of carpentry; complete the number of ſtaves by this mould; make a templet or mould to a great circle of the ſphere; groove each of the ſtaves acroſs at right angles to a line paſſing through the middle, and bend it round the templet; put ſlips in the grooves; laſtly, ſhoot the edges of the ſtaves, ſo as to be in planes tending to the centre of the ſphere: theſe ſtaves being glued together will form a ſpheric ſurface.

To glue up the ſhaft of a column.—Deſcribe two circles of diameters, equal to thoſe of the ſuperior and inferior ends of the ſhaft.

Circumſcribe theſe by polygons, conſiſting of the ſame number of regular ſides as the column is to conſiſt of ſtaves.

From the angles draw lines to the centre, which will give the bevels for working the edges of the ſtaves. In this proceſs, after two pieces are glued together, and dried, proceed to glue a third piece in the ſame manner and ſo on to the laſt but one. The laſt, previous to being glued, the blocks ſhould be fixed upon it, and then the whole may be cloſed in. N. B. The number of ſtaves ſhould be eight or twelve, otherwiſe the joint will fall in the middle of the flutes, which ſhould not be in the caſe. It is a very good method to diminiſh the ſtaves, previous to their being glued together, as otherwiſe the waſte of ſtuff would be very great.

To glue up the baſe of a column in ſeveral horizontal courſes, or rings, in order to be turned in a lathe.—Conſider the number of horizontal or bevel joints, which are beſt made at the internal angles of mouldings; prepare a board, ſo as to have a plain ſurface; let a circle be deſcribed on the plane of a diameter, equal to the diameter of the greateſt circle in the height of the courſe, and circumſcribe an equilateral polygon about the circle, with as many ſides as there are to be pieces in a courſe, and from the angles draw lines towards the centre: then any radial line, and one of the adjoining ſides of the polygon, will form the angle by which the ends of every two pieces that are to form the courſe will meet, ſo as to make their planes coincide. The geometrical part being thus finiſhed, prepare the pieces each in length equal to the ſide of the polygon, with an acute angle at each end from the outer ſide, equal to the aforeſaid angle on the board, ſo that each piece will thus have a longer and a ſhorter ſide: apply the longer ſide of each piece to the polygon, the ſhorter ſide being next to the centre, ſo that one of the ends may coincide with a radial; then the other end will alſo coincide, and thus the whole will meet together, if the work be true. But as this is difficult, it is common to allow the pieces to be a ſmall matter longer, in order to plane them, ſo as to make cloſe work: for though the methods be true, the workman, though ever ſo careful, cannot work to geometrical exactneſs; even the thickneſs of ſhaving, or the ſmalleſt degree of twiſt in the board, will ſpoil the work. Suppoſe the courſe completely jointed, take the whole to pieces, and glue the ſurfaces which are to meet each other, and rub each two adjacent pieces to a joint, until the whole ring or courſe is firmly cloſed. When the glue is dry, plane the upper ſide truly; take the radius of the greateſt projecting member in the next courſe, and deſcribe a circle upon the top of the courſe, on the ſame axis with the centre of the lower circle; and with the centre of this circle, in the plane of the top of the courſe, biſect any one of the arcs comprehended between two adjacent joints; and from the point of biſection, divide the circumference into as many equal parts as there are pieces in the under courſe, and draw radiating lines towards the centre: join every two neareſt points in the circumference, and thus an inſcribed polygon will be formed; draw lines to touch the circumference parallel to the ſides of the inſcribed polygon, and thus a polygon will be made to circumſcribe the circle: produce the radiating lines, until they meet the angles of the circumſcribing polygon; then the ſides of the circumſcribing polygon will be the ſituations of the bottom edge of the vertical outer ſides of the ſecond courſe, and the radiations the ſituations of the joints. Proceed, as in the firſt courſe, to adapt the pieces to their reſpective ſituations, making cloſe work: glue each piece to its place on the lower courſe, and likewiſe the joints; and when the glue of this courſe is dry, its upper ſide may be planed true. Proceed with the uppermoſt courſe in the like manner, making the joints fall in the middle of the lengths of the pieces of the lower courſe; and when finiſhed, the work may be ſent to the turner.

To glue up the Ionic and Corinthian capitals for carving.—The abacus muſt be glued in parts, ſuch that their joints may be in vertical planes. The leaves and caulicoles of the Corinthian capital may be firſt made of rectangular blocks, and fixed to the vans.

To make a cornice round a cylindric body out of the leaſt quantity of wood, when the body is greater than a half cylinder, and concave, and when the members will nearly touch a right line applied tranſverſely.—Draw a ſection of the cylinder through its axis, and let the ſection of the cornice be repreſented upon the cylindric ſection. Draw a tranſverſe line touching the two extreme members of the cornice: parallel to this line draw another line within, at ſuch a diſtance from the former as may be found neceſſary for thickneſs of ſtuff; produce this laſt line, until it meet the line repreſenting the axis of the cylinder. The junction will either be above or below, according as the cornice is applied to the convex or concave ſides of the cylinder. This meeting is the centre of two concentric circles, whoſe radii are the diſtances between the neareſt and fartheſt extremes of the ſection of the cornice. This is evidently an application of the method of finding the covering of a cone. When mouldings are got out in this manner, *viz.* by a piece which does not occupy the ſpace, when ſet to the place repreſented by the height and breadth, they are ſaid to be ſprung.

When a cornice is to have much projection, the corona or middle part is got out of a ſolid piece, and the parts above and below, or one of them, as may be found neceſſary, only ſet to the ſpring, and ſupported by brackets.

To deſcribe the various kinds of joinings in the practice of joinery.—*Fig.* 1. *Plate* XXII. is a ſection ſhewing the moſt ſimple method of joining boards, or any kind of framed work together at the angles; this kind of joining is much uſed in coarſe work; it is called lap-joining.

Fig. 2. the method of joining troughs together.

Fig. 3. the method of joining dado together at an internal angle.

Fig. 4. the manner of fixing two pieces of framing together at the angle of their meeting with a returned bead, in order that the joint ſhould be concealed. This is only uſed in common finiſhings; in good finiſhings a bead of $\frac{3}{8}$ths of an inch broad is generally run cloſe to the joint, and the angle is left entire.

Fig. 5. ſhews the common method of mitring. This form is always uſed in mouldings at an external angle, and ſometimes alſo in internal angles: but for internal angles, ſcribing is to be preferred, when it can be applied, which may always be the caſe, when there are no quirked mouldings; that is, when mouldings are ſuch that a perpendicular line to the plane of the wall may fall upon any part of them without going through the ſolid of the moulding.

Fig. 6. is another method of mitring. This may be uſed in all plane ſurfaces, at an external angle, but is not applicable to mouldings. This manner of mitring is much more preferable in point of ſtrength to that of *fig.* 5, in caſes where the two can be applied.

Dove-tailing is another mode of joining two plane ſurfaces together at an angle, by cutting pins of a priſmatic form and trapezoidal ſection on the end of one piece, and notching the end of the other in the ſame manner, ſo that the exterior parts of the one is adapted to the indentations of the other, without leaving any cavity when the two ſides are brought home to their places. This is the ſtrongeſt method of joining plane boards; it ſhould always be uſed in work which may be required to be moved from place to place. There are three ſorts of dove-tailing. One kind, called common dove-tailing, ſhews the ends of the joints: another kind, called lap-dove-tailing, conceals the joints of the dove-tails, but ſhews a ſtraight joint, not at the angle, but at a ſmall diſtance parallel to it. The third ſort is called mitre dove-tailing, which ſhews no joint but in the angle. This method is very neat, it is ſtronger than the ſtraight joint ſhewn by the ſection *fig.* 6, and where both ſtrength and beauty is required it muſt be preferred to any other. *Fig.* 7, N° 1, is a ſection of common dove-tailing; N° 2, the ſide of one of the pieces ſhewing the pins; N° 3, ſhews the ends of the pins; N° 4. the ſide of the other piece, ſhewing the indentations for receiving the pins.

Fig. 8. N° 1, 2, 3, 4, and 5, different parts of mitre dove-tailing.

To join two pieces of wood together, the fibres of the one running tranſverſely to the fibres of the other by mortiſe and tenon or dove-tailing.—One method is by cutting a mortiſe to a very ſmall depth in the one piece, and a tenon of the ſame length in the other, and by bolting them together with one or two bolts: where the breadth of the piece having the tenon is conſiderable, the nuts are to be let in from that ſide of the tenoned piece which is not expoſed to ſight; the heads of the bolts upon the mortiſed piece may be ſunk into the wood entirely below the ſurface, and the cavity may be filled up with a piece of the ſame kind of wood, neatly fitted in.

Definitions.—1. A frame, in joinery, is the connection of ſeveral pieces of timber of an equal thickneſs, joined tranſverſely to each other, made faſt by means of mortiſes and tenons, leaving rectangular ſpaces between for other pieces of timber, called pannels, each of which is inſerted into each edge of the former by means of a groove.

2. Thoſe parts of the frame which terminate the two vertical extremes are called ſtyles.

3. The horizontal parts, which are mortiſed into the ſtyles, are called rails.

4. If there be any intermediate pieces mortiſed into the rails, parallel to the ſtyles, ſuch pieces are called muntons.

In framed-work, rails have ſeveral epithets, according to their ſituations; that bordering the framing at the lower extremity is called the bottom rail, that bordering the framing, at the other extremity, is called the top rail. The names of intermediate rails vary according to their number and ſituation. In doors, that in which the lock is inſerted is called the middle, or lock rail; the intermediate rail next to the top rail, is called the frieze rail.

Doors.—A door, in joinery, is a framed piece of timber-work, or boards nailed together, for the purpoſe of ſhutting up at pleaſure any aperture in a wall or partition, in order to give or prevent paſſage from one apartment to another.

Plate XXIII. *fig.* 1, is a four equal-pannelled door: the form is only uſed in very common work, and is frequently without mouldings.

Fig. 2. is a nine-pannelled door, with ſquare pannels at the top. This form is frequently uſed in ſtreet-doors, of which the back is often lined with boards, in the manner of *fig.* 3, fluſh with the ſtyles and top rail; the other rails and muntons muſt therefore be receſſed upon one ſide to receive the boarding.

Fig. 4. is a ſix equal-pannelled pair of folding-doors, having two pannels in the breadth.

Fig. 5. is a double margin, or a pair of folding-doors, with four pannels in height, and two in breadth, having lying pannels below the top-rail, and above the lock-rail.

Fig. 6. is a ten-pannelled pair of folding-doors, five in height, and two in breadth, having lying pannels at the top, bottom, and in the middle, with long pannels between them. Of this form is the ancient door of the Pantheon at Rome.

Fig. 7. a ſaſh-door: this form, if not ſhut with another ſeparate door, ſhould have ſhifting-ſhutters, to cover the glaſs parts, fixed with bolts and nuts. For this purpoſe, it ſhould at leaſt be one inch and a quarter thicker than a pannelled door in the ſame place: this gives room for the outſide of the ſhutter to be fluſh with the ſtyles of the door; but if otherwiſe, an ugly frame muſt be patched round the glazed parts, in order to contain the ſhutter.

Fig. 8. an ancient door, of which form are the windows and door of the temple of Veſta at Rome, and alſo thoſe of the temple of Eretheus at Athens.

Figs. 9 and 10. are doors of communication, or ſuch as, when open, will not encumber the floor, as other kinds of receſſed doors, by jetting into the room, but may either be concealed entirely within the partition, or folded cloſe to it: they are uſed for the purpoſe of making a free communication between one room and another, at great meetings or balls, when any one of the rooms would be inſufficient though large enough for common uſe.

Fig. 9. the elevation of a door to be folded cloſe to the partition, by means of a hanging ſtyle, or pilaſter, on each ſide which is firſt hung to the jamb, then a folding door to each pilaſter.

Fig. 10. is a door conſiſting of four parts: each middle part is hinged to each extreme part; each two parts, on each ſide, in time of company, may be removed entirely out of the way into hollows on each ſide of the partition, and guided by grooves at the top and bottom, and made to ſlide freely upon rollers.

Fig. 11. is a jib-door, that is, ſuch a door as, when ſhut, may be as much concealed as poſſible from having the appearance of a door. Jib-doors are uſed, when only one aperture at the end of the ſide of a room is neceſſary; and when it is required to keep the ſymmetry of that ſide, without having the appearance of a door; the baſe, ſurbaſe, and paper are, therefore, continued over it as in the other parts of the room, the joint being only ſeen at the top, and upon the edge oppoſite the hinge.

JOINING *of* ISSUE. See ISSUE.

JOINT, the juncture, articulation, or aſſemblage, of two or more things. See ARTICULATION.

JOINT, in *Anatomy*, the connection of two or more bones to each other: theſe parts are generally ſo organized as to admit of motion, but in ſome inſtances this is not the caſe.

The joints or articulations are generally referred to three claſſes: the immoveable, or *ſynarthroſis;* the half moveable, or *amphiarthroſis;* and the completely moveable, or *diarthroſis.*

The firſt of theſe includes the various kinds of ſuture; for the deſcription of which, ſee CRANIUM.

The amphiarthroſis, or joint admitting of ſlight motion, is made up either of cartilaginous ligaments (*ſymphyſis*), or of true cartilage (*ſynchondroſis*). The union of the bodies of the vertebræ to each other, and the articulations of the pelvis, are examples of the former: the connection of the firſt pair of ribs to the ſternum, and of the different bones of the ſternum to each other, exemplify the latter.

For the account of the third ſpecies, or moveable articulation, ſee DIARTHROSIS.

A general deſcription of the compoſition of a joint will be found under the article EXTREMITIES, near the beginning; and in the ſame article the particular joints of the limbs are deſcribed. The account of the articulation of the lower jaw is given under DEGLUTITION; that of the connection of the head to the vertebral column under HEAD. The articulations of the vertebræ are conſidered in the article SPINE; thoſe of the ribs, in RIBS; and of the pelvis, in PELVIS.

JOINTS, *Diſeaſes of.* Under this head we intend to notice a few caſes which belong to the department of *Surgery*, and are not elſewhere treated of in this publication.

Inflammation of Joints.—Idiopathic caſes of this kind are not common. The complaint ordinarily originates in conſequence of a contuſion, ſprain, wound, or other kind of injury done to the part affected. Phlegmonous inflammation, whereſoever ſituated, is uniformly attended with certain local ſymptoms, by which both its preſence and degree may be aſcertained. Preternatural redneſs, increaſed heat, a throbbing pain, and a tenſe ſwelling, affecting the ſeat of its attack, are the common marks which denote its exiſtence in all ſituations. When a joint is inflamed, the ſame local phenomena are preſent, and the conſtitution is diſturbed by the uſual ſymptoms of inflammatory fever; but in theſe caſes they are apt to be exceedingly ſevere. The inflammation attacks the capſular ligaments, and not remaining confined to any particular portion of them, it very quickly diffuſes itſelf univerſally over their whole extent, as is commonly the caſe in all inflammations of ſmooth membranes. That there is this peculiarity in inflammation of membranes, is often ſtrikingly proved in the inſtance of peritonitis, ariſing after the operation of lithotomy. Here, we know, that the inflammation commences in the bladder, is communicated to the portion of the peritoneum which covers the fundus and poſterior ſurface of this viſcus, and thence rapidly ſpreads over the whole extent of the abdomen.

The capſules of the joints are naturally endued with little ſenſibility; but, like the gums, and ſeveral other parts in a ſimilar ſtate, they become acutely painful when inflamed. The complaint is accompanied by an increaſed ſecretion of the ſynovia, which becomes of a more aqueous, and of a leſs albuminous quality than it is in a healthy ſtate. Hence this fluid is not ſo well calculated for lubricating the articular ſurfaces and preventing the effects of friction, as it is in the natural condition of the joint. This circumſtance may explain why a grating ſenſation is often perceived on moving the patella when the knee is inflamed.

The capſules of the joints may, as well as other membranes, be thickened by inflammation. At other times an exudation of coagulating lymph may take place upon their internal ſurfaces; and as, by a general law of the animal economy, the contiguous veſſels are always prone to ſhoot into lymph thus effuſed upon an inflamed ſurface, the conſequence frequently is, that organized ſubſtances, ſuch as pieces of cartilage and bone, are produced in the interior of the joint. The inconveniences of theſe extraneous bodies, and the mode of relief, will be a ſubject which we ſhall preſently have to conſider.

When the inflammation is more vehement, ſuppuration may happen within the capſular ligament. Unfortunately, this is by no means an unfrequent occurrence. At length the capſular ligament ulcerates, and purulent matter is effuſed beneath the integuments. The ſkin may next ulcerate, ſo that the abſceſs is diſcharged, and the caſe ſeems to be ſomewhat benefited. The openings through which ſuch collections of matter are diſcharged, will be found, upon examination with a probe, to be the terminations of ſinuſes leading into the cavity of the joint.

A large joint ſeldom falls into a ſtate of ſuppuration, in conſequence of acute inflammation, without the conſtitution being at the ſame time ſo diſturbed, that life itſelf is greatly endangered. In the moſt violent ſtate of the inflammation, or that which is the immediate forerunner of ſuppuration, the pulſe is exceedingly frequent; but not quite ſo full and ſtrong as it would be if the part affected were of a ſtructure better adapted to reſiſt the ravages of diſeaſe. The patient's ſkin is dry and hot; he is reſtleſs and vigilant; and, in very bad caſes, delirium and coma may enſue, and end fatally.

But the rapidity with which the common inflammatory fever aſſumes in ſuch caſes the hectic type is a circumſtance which muſt not be paſſed over in ſilence. When an abſceſs has formed in a large joint, in conſequence of a ſevere attack of common inflammation, the patient immediately begins to be affected with hectic ſymptoms, and the ſtrong action attendant on the inflammatory fever ſuddenly ceaſes.

Local conſequences, even worſe than thoſe above deſcribed, may follow inflammation of a joint. As the layer of the capſular ligament reflected over the cartilages of the articulation is often inflamed, the cartilages themſelves are very liable to have the inflammation communicated to them. Parts partaking of a cartilaginous ſtructure being very incapable of bearing the irritation of diſeaſe, are often abſorbed, ſo that, in the inſtance before us, a portion, or the whole of the articular ſurface of the bones, may be left completely denuded of its natural covering. At length the heads of the bones entering into the formation of the affected joint inflame, and become carious.

Sometimes only ſuch parts as are exterior to the capſular ligament of the joint are inflamed, and in this caſe the ſymptoms are never ſo ſevere, nor ſo obſtinate, as when the complaint is more deeply ſituated. Even when ſuppuration takes place on the outſide of the capſule, the caſe is not dangerous, provided the cavity of the joint be not involved in the inflammatory attacks. Every inflammation of a large joint may generally be conſidered as a caſe of conſiderable importance; yet certainly there are inſtances where the inflammation being mild in degree, and ſimple in its nature, the danger is not urgent. However, every ſurgeon ought to be well impreſſed with the fact, that though the inflammation be originally of a healthy ſort, it is always very likely to be converted into one of a ſpecific nature, whenever there is a tendency in the conſtitution to ſcrofulous diſeaſe. A perſon, whoſe habit is ſcrofulous, may ſometimes continue, during life, exempt from any local diſeaſes of this ſpecific nature, provided he be fortunate enough to avoid all irritation of parts on which ſcrofula is moſt particularly diſpoſed to make its attack. Among ſuch parts we muſt claſs the joints, eſpecially the knee, hip, elbow, and ankle. Hence, when a joint is inflamed, how mild ſoever the affections may be, we ought never to forget, that when there is a tendency to ſcrofula in the ſyſtem, the original caſe of ſimple inflammation is very apt to be the exciting cauſe of the white ſwelling, one of the moſt ſevere and intractable diſeaſes which increaſe the catalogue of human miſeries. Hence the prudence of adopting with exactneſs whatever method of treatment may be indicated. In the following obſervations, we ſhall ſuppoſe the caſe to be that of an inflamed knee. The means beſt calculated for the relief of an inflamed joint are, generally ſpeaking, thoſe which are called antiphlogiſtic. There are few caſes in which general and topical bleeding is more neceſſary and uſeful. The violence of the inflammation, and the ſtrength, age, and pulſe of the patient, muſt determine with what freedom the lancet ſhould be employed. Leeches, however, may always be applied, and their application be repeated ſeveral times with advantage. When the leeches have fallen off, the bleeding is to be promoted by fomenting the part. The ſurgeon ſhould daily perſiſt in this method, until the acute ſtage of the inflammation has entirely ſubſided. In conjunction with this treatment, he ſhould take care to keep the joint continually ſurrounded with linen wet with the ſaturnine lotion. In no caſe of inflammation are the application of cold lotions, and the maintenance of a conſtant evaporation from the ſurface of the part affected, more ſtrikingly advantageous.

Fomentations and emollient poultices, however, ſometimes afford moſt eaſe to the patient, in which circumſtance they ought to have the preference.

Together with the foregoing means, laxative and febrifuge medicines are to be exhibited, and in a caſe of ſevere pain and loſs of ſleep, opiates.

When the acute ſtage of the inflammation has abated, the plan of treatment may be a little altered. The grand object is now to remove the effects which have been left by the preceding affection. Theſe are a thickened ſtate of the capſular ligament, and parts ſurrounding the articulation; a ſtiffneſs of the joint, and pain when it is moved; a collection of fluid in the capſule, &c. This ſtate of the complaint, when neglected, and there is a tendency to ſcrofula, may prove exceedingly obſtinate, and even terminate in an irremediable ſpecific diſtemper of the joint. When, therefore, the local redneſs, tenſion, and throbbing, and the ſymptoms of inflammatory fever ſubſide, the activity of the practitioner ought not to be relaxed. The application of a bliſter to the joint will now be found particularly efficacious, and the diſcharge ſhould be kept up for a few days with the ſavin cerate. Very large collections of fluid in the capſular ligament of the knee, great thickening about the joint, and other remaining effects of inflammation, may often, under ſuch treatment, be quite got rid of in a week or ten days.

In other caſes, in which the inflammation and its effects are ſlighter, lotions compoſed of ſpirit of wine, vinegar, and ſal ammoniac, ſuffice for the removal of any chronic complaints which may continue after the acute inflammation is at an end.

When the inflammation of a large joint like the knee is induced by a wound, the ſtomach is often much affected, and the ſymptoms may be very violent and even fatal.

Of Preternatural Cartilaginous Subſtances in Joints.—The ancients have either neglected to notice this diſeaſe in their writings, or they have not been at all acquainted with it. Ambroſe Paré is the firſt author who mentions it: he had made an inciſion, in order to diſcharge ſome fluid from the cavity of the knee-joint, when a hard, poliſhed, white body, about as large as an almond, was diſcharged from the wound. (Livre 25. chap. 15.) Since the time of Paré, the complaint has been deſcribed by numerous ſurgical authors; but the moſt valuable information on the ſubject may be found in the works of Reimarus, Morgagni, Bromfield, Ford, Deſault, Home, Hey, and Abernethy.

The external part of the extraneous ſubſtances, to which alluſion has been made, is in general of a cartilaginous conſiſtence, while their central part is frequently oſſeous. Their figure is ſubject to great variety; but they uſually have one concave ſide, and another which is convex. They are, for the moſt part, formed in the knee, and have been ſuppoſed by Reimarus, and a few other writers, to be met with in no other articulation. Morgagni, however, has ſeen oſſified bodies of this kind in the ankle-joint. Haller, alſo, diſcovered a great number of cartilaginous bodies in the articulation of the jaw, where the natural cartilages had been deſtroyed. Mr. Hey, of Leeds, mentions a caſe, in which there were two bodies of this deſcription in the elbow-joint. The largeſt preternatural cartilage perhaps ever met with is mentioned by Mr. Home, as being nearly equal in ſize to the knee-pan itſelf, and ſituated in the knee-joint of a ſoldier, belonging to the 56th regiment. The greateſt number ever known to be contained in one articulation is twenty-five. In moſt inſtances, we only find one.

Theſe preternatural cartilaginous ſubſtances are either attached to ſome part of the inſide of the joint, or they are quite unconnected, looſe, and moveable. It is only when they become ſo ſituated, as to interpoſe themſelves between two articular ſurfaces, which glide over each other in the motion of a limb, that much inconvenience commonly reſults from their preſence. While they continue by the ſide of the patella they cauſe but little trouble; but when they ſlip under the ligament of that bone, or between the ſame bone and the condyles of the femur, or between the latter bone and the head of the tibia, then they impede progreſſion, cauſe conſiderable pain, and often excite inflammation.

Much light was thrown upon the formation of looſe cartilaginous tumours in the joints, by the penetrating genius of the late Mr. Hunter. It was his belief, that a coagulum of extravaſated blood might, under certain circumſtances, be converted into an organized vaſcular ſubſtance, by the veſſels growing into it from the neighbouring living ſurface. No one doubts that the coagulating lymph has conſtantly a tendency to become vaſcular, when effuſed on the ſurface of an inflamed membrane. Now, if we take the trouble of peruſing the caſes which are related by different authors, we ſhall find, that the formation of looſe cartilaginous ſubſtances in the joints, has generally been preceded by violence done to the part, and by ſymptoms of inflammation. Of this deſcription are the examples publiſhed by Mr. Ford, M. Brochier in Default's Journal, Mr. Abernethy, and Mr. Hey. Latta mentions four inſtances which were preceded by rheumatiſm. In this ſtate, we conceive that the capſular ligament, or its delicate layer, reflected over the articular cartilages, effuſes coagulating lymph upon a part of its ſurface; that ſuch lymph ſoon becomes vaſcular and organized; and that it gradually aſſumes a ſtructure more or leſs like that of cartilage.

Looſe preternatural cartilages are moſtly attached to ſome part of the articular cavity, which does not ſuffer attrition when the joint is moved. Dr. Alexander Monro, in diſſecting the knee of a malefactor, found in the joint an oſſeous tumour, which was connected by a ligamentous pedicle with the exterior edge of the cartilage covering the external cavity of the tibia. (Edin. Eſſays, vol. iv. p. 245.) Perfect quietude is eſſential to the growth of new veſſels into coagulating lymph, and in the caſe juſt now quoted, if the exudation had taken place, where it would ſoon have been diſturbed in the motion of the limb, its organization could ſcarcely have happened. Alſo, if ſuch cartilaginous bodies were to be commonly formed on a part of the articular cavity, neceſſarily expoſed to friction in walking, &c. then patients would experience pain from the firſt. But, as they do not feel inconvenience till the tumour has become very moveable by the gradual elongation, or ſudden rupture of its pedicle, and only then when the tumour glides into a ſituation where it is pinched between the articular ſurfaces, we have a right to conclude, that moſt cartilaginous bodies of this kind grow originally in a ſituation, where they are not particularly expoſed to diſturbance in the motion of the joint. In moſt inſtances, the communication of vaſcularity muſt alſo happen, during the tenderneſs of the joint, at which period the patient naturally keeps his limb in a quiet ſtate, in order to avoid pain. After all inflammation has ſubſided, the limb is again moved with freedom; the organized coagulum is gradually looſened by the motion, and at length it only remains connected with the joint to which it was originally attached, by means of a long ſlender pedicle, through which its nutrient veſſels proceed. At laſt the pedicle breaks, and the cartilaginous ſubſtance is left quite looſe, like an extraneous body, in the cavity of the joint.

The irritation of looſe cartilages in the knee often occaſions an increaſed quantity of fluid in the capſular ligament, but this is not invariably the caſe. When the irritation is ſuch as to induce a degree of heat and tenderneſs in the joint, there is uſually a preternatural quantity of the ſynovia ſecreted: when pain and inconvenience have not lately been felt, this fluid is generally not more abundant, than in the natural ſtate of the joint.

With reſpect to the treatment of theſe caſes, we are not acquainted with any certain means of freeing the patient from the inconveniences of the diſeaſe, if we except making an inciſion into the joint, for the purpoſe of extracting the cartilaginous ſubſtance. To this plan, the danger attendant on all wounds of ſo large an articulation as the knee is a very ſerious objection. Hence, Middleton and Gooch tried another method, which was to conduct the extraneous body into a ſituation where it produced no pain, and to retain it in that poſition a long time, by means of bandages, under the idea, that the cartilaginous ſubſtance would adhere to the contiguous parts, and occaſion no future trouble. Theſe ſurgeons appear at leaſt to have thus afforded temporary relief.

Mr. Hey, impreſſed with a juſt ſenſe of the dangerous ſymptoms, which have occaſionally reſulted from the moſt ſimple wounds penetrating the knee-joint, tried the efficacy of a laced knee-cap, and the caſes which he has adduced clearly demonſtrate, that the benefit thus obtained is not tranſient, at leaſt as long as the patient continues to wear the bandage. In one caſe, the method had been tried, for ten years, with all the ſucceſs which the patient could deſire.

All things conſidered, it is our decided opinion, that the effect of a knee-cap, or of a compreſs and roller, ought generally to be tried before having recourſe to the knife, ſuppoſing the cartilaginous ſubſtance can be placed in a ſituation where it gives no pain, and admits of being compreſſed. But doubtleſs there are inſtances, in which it is the duty of the ſurgeon to operate. If a man be deprived of his livelihood by not being able to uſe his knee; if he cannot, or will not, take the trouble of wearing a bandage; if he be urgently deſirous of running the riſk of the operation, after circumſtances have been impartially explained to him; if a bandage fail in affording ſufficient relief; and laſtly, if exceſſive pain, ſevere inflammation of the joint, and lameneſs, be frequently brought on by the diſeaſe; the employment of the knife ſeems juſtifiable and proper. It is very certain, that ſucceſs has generally attended the operation; but ſmall as the hazard may be of loſing the limb, and even life, in the attempt to get rid of the complaint; yet, ſince the inconveniences of the diſeaſe are in moſt caſes very bearable, and are alſo capable of palliation by means of a bandage, endangering the limb and life in any degree muſt appear to many perſons contrary to the dictates of prudence.

We have no inſtance recorded, where there was a neceſſity for removing a cartilaginous tumour from any joint but the knee.

The diſeaſe being often attended with a degree of heat and tenderneſs about the joint, there can exiſt no doubt of the propriety of keeping the patient in bed a day or two before he ſubmits to the operation, the danger of which is in a great meaſure proportioned to the ſubſequent inflammation. When the attempt to heal the wound by the firſt intention ſucceeds, much of the hazard is alſo paſt. Therefore, the joint ſhould be brought into as quiet a ſtate as poſſible before the inciſion is practiſed, and beſides a little confinement, the ſurgeon ſhould direct leeches and cold ſaturnine lotions to be applied to the knee, and an opening draught or two to be taken.

As the looſe piece of cartilage may, in general, be moved round the joint, the ſurgeon frequently has it in his power to chooſe the place where he will make the inciſion. Ford, Latta, and others have made the wound on the outſide of the joint. Deſault uſed to bring the looſe cartilage to the inner ſide of the articulation, againſt the attachment of the capſular ligament, and then make the cut in that ſituation. Mr. Abernethy has recommended bringing the extraneous ſubſtance to the outſide of the internal condyle of the os femoris, and dividing the capſular ligament at that part. Mr. Ruſſell adviſes us to puſh the moveable body upwards, on the inſide of the thigh, in order that the inciſion may be as diſtant as poſſible from the moving ſurface of the joint. Mr. Hunter alſo preferred removing theſe looſe bodies at the upper part of the joint, becauſe there the bag, which contains the ſynovia, has leſs of the nature of a capſular ligament.

But whatever place may be choſen for the inciſion, it is of great conſequence that an aſſiſtant prevent the looſe cartilage from ſlipping away, leſt it ſhould not eaſily be found again, and the purpoſe of the operation be fruſtrated. It is clear, that if the capſular ligament were wounded when an accident of this kind occurred, the patient would be expoſed to all the danger of the operation, without any chance of being benefited by it.

All operators have followed the plan of drawing the integuments to one ſide before making the inciſion, ſo that as ſoon as the exciſion of the cartilage is accompliſhed, the wound in the capſular ligament may become immediately covered with ſkin. Thus the bad effects of the cavity of the joint being expoſed, are materially prevented. The piece of cartilage, when brought into view, is to be directly extracted by means of a tenaculum.

The ſkin is then to be brought over the opening in the capſular ligament; the external wound is to be cloſed with ſticking plaſter; cold lotions are to be applied to the knee; and every antiphlogiſtic meaſure adopted, which may ſeem prudent and neceſſary.

Experience has further proved, that the patient is not completely out of danger as ſoon as the wound is united; and that he ought, for ſome time longer, to keep the limb at reſt. See Bromfield's Chirurgical Caſes and Obſervations, vol. i. p. 335, 336.

Of Hydrops Articuli, or Dropſy of the Joints.—This diſeaſe conſiſts of an accumulation of water in the capſular ligament of a joint, and is very analogous to the hydrocele, or collection of an aqueous fluid in the tunica vaginalis teſtis. Both theſe complaints, indeed, are alike, in not ariſing from a general dropſical affection of the conſtitution, the patient being frequently in other reſpects quite ſound. There are, it is true, a few exceptions to the latter part of this obſervation. The knee is, of all joints, the moſt liable to the diſeaſe, perhaps on account of the largeneſs and looſeneſs of its capſular ligament.

The preciſe cauſes of hydrops articuli are often beyond the reach of inveſtigation. The diſorder, however, is frequently preceded by ſevere rheumatic affections, fevers, and local violence. In moſt caſes a fluctuation is very diſtinguiſhable, unleſs the joint be uncommonly diſtended. When the limb, alſo, is extended, ſo as to relax the extenſor muſcles of the leg, the knee-pan may be made to riſe up, by preſſing the tumour, and a fulneſs may then be diſcerned on each ſide of that bone. The complaint is in general unattended with ſerious pain, though ſome uneaſineſs, and a ſenſe of ſtiffneſs are experienced.

In conſidering the treatment of this, as well as of moſt other diſeaſes, it behoves us to pay eſpecial attention to the cauſes where they are diſcoverable, the mere removal of them being often of itſelf capable of effecting a cure. Thus, when hydrops articuli occurs during the debility conſequent to typhoid and other fevers, the complaint can hardly be expected to get well till the ſtrength of the conſtitution is, in ſome degree reſtored. The connection between the local and conſtitutional diſorder is well illuſtrated in a caſe which Mr. Ruſſell has related, and in which every local remedy was tried without avail: the diſeaſe, which would not yield as long as the debility conſequent to a typhus fever laſted, got well ſpontaneouſly immediately when the patient regained his ſtrength. On Morbid Affections of the Knee, p. 192.

In ordinary examples hydrops articuli is quite a local malady, unconnected with any diſorder of the conſtitution, and may be diſperſed by topical treatment. One of the moſt effectual means for this purpoſe, is the application of a bliſter, which ſhould be kept open with the ſavin cerate. The operation of the bliſter may alſo be very materially promoted by the preſſure of a bandage. In ſome inſtances the action of the abſorbents may be ſufficiently excited by moderate exerciſe, and frictions with flannel impregnated with the ſteam of vinegar, or by electricity, and rubbing the joint with camphorated mercurial ointment. The patient ſhould likewiſe be purged with calomel, or kali acetatum, unleſs any particular reaſons forbid.

Surgical writers inform us of caſes, which reſiſt common treatment, are attended with immoderate diſtention, and even with ſuch irritation upon a weak conſtitution, as ſeriouſly impairs the health. Here, the ſurgeon would be juſtified in making a ſmall puncture into the joint, in order to diſcharge the fluid. Care ſhould be taken to make the opening no larger than neceſſary, and to draw the integuments to one ſide, before introducing the lancet, or trocar, ſo that the wound in the capſular ligament, as ſoon as the operation is finiſhed, may become covered with ſkin.

Exciſion of Diſeaſed Joints.—In the year 1782, Mr. Park, a ſurgeon at Liverpool, made the propoſal of totally extirpating many diſeaſed joints, ſo as to do away the neceſſity of cutting off limbs, which might ſtill be of more uſe to the patients than any artificial contrivance. It was his plan to effect an entire removal of the heads of ſuch bones as compoſed the diſeaſed articulation, and then to make the ſawn extremities of the bones grow together, like the ends of a fracture.

After undertaking ſome experiments upon the dead ſubject, Mr. Park, in 1781, performed the operation of extirpating the diſeaſed knee of a ſtrong robuſt ſailor, aged 33. The method purſued was much like that which had been previouſly tried upon the dead ſubject, and which was as follows: An inciſion began about two inches above the upper end of the patella, and extended about as far below its lower part. Another one was made acroſs this at right angles, immediately over the patella, down to the bone, and nearly half round the limb, the leg being in an extended ſtate. The lower angles, formed by theſe inciſions, were raiſed, ſo as to lay bare the capſular ligament; the patella was then taken out; the upper angles were raiſed, ſo as fairly to denude the head of the femur, and to allow a ſmall catling to be paſſed acroſs the poſterior flat part of the bone, immediately above the condyles, care being taken to keep one of the flat ſides of the point of the inſtrument quite cloſe to the bone all the way. The catling being withdrawn, an elaſtic ſpatula was introduced into its place, for the purpoſe of protecting the ſoft parts during the ſawing of the thigh-bone. The head of the bone, thus ſeparated, was carefully diſſected out; the head of the tibia was then eaſily turned out and ſawn off, and as much as poſſible of the capſular ligament diſſected away. The quantity of bone removed in the operation was a very little more than two inches of the thigh-bone, and rather more than one inch of the tibia. The only large artery divided was one on the front of the knee, and it ceaſed to bleed before the operation was concluded; but the ends of the bones bled very freely. To keep the redundant integuments from falling inwards, and the edges of the wounds in tolerable contact, a few ſutures were uſed. The dreſſings were light and ſuperficial, and the limb was put in a tin caſe, which was long enough to receive the whole member, from the ankle to the trochanter major.

We learn from Mr. Park, that afterwards many troubleſome circumſtances occurred, ariſing chiefly from the difficulty of keeping the limb in a fixed poſition, the great depth of the wound, and the abſceſſes and ſinuſes which were formed in the part. The firſt ſymptoms, however, were not at all dangerous. But the patient was obliged to keep his bed nine or ten weeks, and it was many months before the cure was complete. The man afterwards went to ſea, and ſo uſeful was his limb, that he was able to do his duty extremely well.

Mr. Park made another attempt to extirpate a diſeaſed knee, but it was leſs favourable, as the patient lingered a few months after the operation, and died.

About the ſame time that Mr. Park made his propoſal, a ſimilar plan was ſuggeſted by P. F. Moreau, a French ſurgeon, and tried in ſeveral inſtances, upon the knee, elbow, &c. by himſelf and his ſon.

The exciſion of diſeaſed joints ſeems, at preſent, to have no advocates among ſurgeons of judgment and experience. A full relation of all that is known on the ſubject has been lately publiſhed by Dr. Jeffrays, in a work entitled "Caſes of the Exciſion of Carious Joints." In this book may be found a deſcription of a very ingenious ſaw for facilitating the operation. The inſtrument is conſtructed with joints, like a watch chain, ſo as to allow itſelf to be drawn behind a bone with a crooked needle, and be calculated for cutting the bone from behind forwards, without injuring the ſoft parts. It was made by Mr. Richards, who was aſſiſted by his nephew, the preſent Mr. Richards, of Brick Lane, London. In placing the ſaw under the bone, its cutting edge is to be turned away from the fleſh. Handles are afterwards hooked on the inſtrument.

The reaſons which keep the practice of cutting out diſeaſed joints from being imitated, are, in our opinion, of the moſt invincible kind. We believe that it is only right to amputate a limb, on account of a diſeaſed joint, when the patient's health is ſo reduced, that it cannot any longer bear the irritation of the local diſeaſe, and that as long as the ſtrength holds out, the propriety of endeavouring to cure the diſeaſe, and preſerve the limb, is dictated by every principle of good ſurgery, as well as humanity. If it be only in hopeleſs circumſtances, and in a reduced ſtate of the patient, that we are to turn our minds to the uſe of the knife, it ſeems improbable that a patient, after being greatly reduced by hectic ſymptoms, would in general recover from ſo bold and terrible an operation, as that of diſſecting away the whole of the knee-joint. If ſome few ſhould eſcape with life and limb preſerved, would the bulk of perſons treated in this manner have the ſame good fortune?

The extirpation of ſo large an articulation as the knee cannot be compared with the operation of amputation, in point of ſimplicity and ſafety. The chief objections are founded, however, not upon the pain, nor difficulty of the operation, but upon the great length of time which the healing of the wound requires, and which, in the firſt caſe recorded by Mr. Park, was no leſs than eight months. His ſecond example, as we have already mentioned, ended fatally. Moreau's patient, though much debilitated, eſcaped the firſt dangers conſequent to the operation; and "after three months confinement, the patient was in ſuch a ſtate, that Moreau expected he would be able to walk upon crutches in another month or ſix weeks!" In the mean time the young man died of a dyſentery. Allowing the exciſion of the knee to be followed by all poſſible ſucceſs, few men of judgment will alſo acknowledge, that the advantage of having a mutilated, ſhortened, ſtiff limb, inſtead of a wooden leg, is an adequate compenſation for the more painful operation that has been endured, and the greater riſk that has been run.

Many of the foregoing obſervations were originally publiſhed in a Treatiſe on the Diſeaſes of the Joints by S. Cooper, 1807.

Joints, in *Mining*, are applied to the vertical fiſſures, or cutters, by which moſt of the ſtrata are divided nearly vertically, into ſeparate blocks and pieces. In the limeſtone quarries in Derbyſhire, two very diſtinct kinds of joints are noticed in the rock, ſome that are peculiar to the particular beds of ſtone, (the fiſſures of W. Martin,) and rarely ſink through more than two or three beds; and others, that break through all the beds of limeſtone, and form a perfectly ſtraight wall often to the face of their quarries; theſe laſt ſeem perfectly allied to mineral veins, though often not more than the eighth, or a quarter of an inch wide, and have their ſides ſkirted with fluor, or calcareous ſpar, or barytes, and are poliſhed, or ſhew thicker ſides in ſome inſtances, and often theſe joints contain ſmall ſpecks of lead ore; while it is very rare for the other, or partial joints, to contain ſpar or ore; theſe kinds of joints, when cloſe filled with ſpar, ſo as to cement the parts of the rock firmly together again, ſeem to anſwer to the cotemporaneous veins of Werner; and the ſpar-joints of other writers; Mr. William Martin calls them rifts, Outlines, p. 171. Quarrymen ſometimes apply the term *joint* to the partings or thin way-boards which ſeparate the different thin ſtrata or beds of ſtone in a rock; but properly, theſe are called bed-joints, or ſtrata-ſeams. The definition which M. Werner gives of ſtrata, *viz.* "thoſe parts of a rock which lie between *parallel rents and fiſſures*," (Tranſl. of New Theory of Veins, p. 2.), is much too general, as it may include both the kinds of joints above-mentioned, and the impropriety alſo is ſtriking, of applying the term *rent* to the bed-joints of a rock, or ſemi-ſtrata of Martin; with ſuch vague ideas as theſe, it is no wonder that many obſervers have miſtaken the cutters or joints of thick ſtrata, that happen to range parallel, for bed-joints or ſtrata-ſeams, and deſcribed ſtrata as vertical, which are in reality horizontal, or near it.

Joints, in *Architecture*, denote the ſeparations between the ſtones; which are filled with mortar, plaſter, or cement.

Joint, in *Carpentry*, &c. is applied to ſeveral manners of aſſembling, or fitting, pieces of wood together. Thus we ſay, a dove-tail joint, &c. See Joinery, Mortise, Dove-tail, &c.

Joint, *Univerſal*, in *Mechanics*, an excellent invention of Dr. Hook, adapted to all kinds of motions and flexures; of which he has given a large account in his Cutlerian Lectures, printed in 1678. This ſeems to have given occaſion to the gimbols uſed in ſuſpending the ſea-compaſs, the mechaniſm of which is the ſame with that of Deſaguliers's rolling lamp.

Joint, in *Ship Building*, a term ſignifying the juncture of the frame-timbers, which is repreſented by a line, whereby the ſhape of the veſſel is determined at the ſtations of the frames, to which the moulds are made for forming the various timbers, and although the frame is compoſed of a double ſet of timbers, yet they are generally cloſe enough that the mould, made at the joint or middle, gives the ſhape of the foreſide of the one, and the aftſide of the other.

Joint *Action*, in *Law*. In perſonal actions ſeveral wrongs may be joined in one writ; but actions founded upon a tort, and on a contract, cannot be joined; for they require different pleas and different proceſs.

Joint-*battery*. See Battery.

Joint-*executors*, in *Law*, are two or more perſons appointed ſuch by will: in which caſe they are accounted but as one ſingle perſon, ſo that the actions done by one of them are taken to be the acts of all, becauſe they all repreſent the perſon of the teſtator; thus, where two joint-executors are poſſeſſed of a leaſe for years, in right of their teſtator, one of them may ſell the term without the other's joining; and in like manner, where one joint-executor gives a releaſe, the others are bound by it, each having an authority over the whole eſtate; but a joint-executor is not charged with the acts of his companion, any farther than he is actually poſſeſſed of the goods of the teſtator: however, if joint-executors enter into an agreement, that each ſhall intermeddle with particular parts of the teſtator's eſtate, in that caſe each becomes chargeable for the whole by agreement. It has been held, that two joint-executors cannot urge ſeparate pleas, becauſe their teſtator, if living, on an action brought againſt him, could have been allowed but one plea; and that, if all the executors are not named in any action brought by joint-executors, the action will abate. As to legatees, the receipt of one executor charges not the other. See EXECUTOR.

JOINT-*lives*, denote lives that continue during the ſame time, or that exiſt together. See LIFE-*annuities*.

JOINT-*rule*. See *Carpenters' joint* RULE.

JOINT-TENANCY, in *Law*, ſee the next article.

JOINTENANTS, or JOINT-TENANTS, in *Law*, thoſe who come to, and hold, lands and tenements by one title *pro indiviſo*, or without partition.

Theſe are diſtinguiſhed from *ſole*, or ſeveral-tenants, from *parceners* and from *tenants in common*. Anciently they were called *participes*, and not *hæredes*. See SEVERALTY.

An eſtate in joint-tenancy is where lands or tenements are granted to two or more perſons to hold in fee-ſimple, fee-tail, for life, for years, or at will. This is ſometimes called an eſtate in "jointure," which word, as well as the other, ſignifies an union or conjunction of intereſt. The "creation" of an eſtate of this kind depends upon the wording of the deed or deviſe by which the tenants claim title; for this eſtate can only ariſe by purchaſe or grant, that is, by the act of the parties, and never by the mere act of the law. Now, if an eſtate be given to a plurality of perſons, without adding any reſtrictive, excluſive, or explanatory words, as if an eſtate be granted to A and B and their heirs, this makes them immediately joint-tenants in fee of the lands. For the law interprets the grant ſo as to make all parts of it take effect, which can only be done by creating an eſtate in them both. As, therefore, the grantor has thus united their names, the law gives them a thorough union in all other reſpects. The "properties" of a joint eſtate are derived from its unity; and this unity is fourfold; *viz.* the unity of intereſt, the unity of title, the unity of time, and the unity of poſſeſſion; or in other words, joint-tenants have one and the ſame intereſt, accruing by one and the ſame conveyance, commencing at one and the ſame time, and held by one and the ſame undivided poſſeſſion. With regard to unity of *intereſt*, it may be obſerved, that one joint-tenant cannot be entitled to one period of duration, or quantity of intereſt in lands, and the other to a different; one cannot be tenant for life, and the other for years; one cannot be tenant in fee, and the other in tail. (Co. Litt. 188.) But if land be limited to A and B for their lives, this makes them joint-tenants of the freehold; if to A and B and their heirs, it makes them joint-tenants of the inheritance. (Litt. § 277.) If land be granted to A and B for their lives, and to the heirs of A; here A and B are joint-tenants of the freehold during their reſpective lives, and A has the remainder of the fee in ſeveralty; or, if land be given to A and B, and the heirs of the body of A; here both have a joint eſtate for life, and A hath a ſeveral remainder in tail. (Litt. § 285.) Joint-tenants muſt alſo have an unity of *title*; their eſtate muſt be created by one and the ſame act, whether legal or illegal; as by one and the ſame grant, or by one and the ſame diſſeiſin. (Litt. § 278.) Joint-tenancy cannot ariſe by deſcent or act of law; but merely by purchaſe, or acquiſition by the act of the party; and, unleſs that act be one and the ſame, the two tenants would have different titles; and if they had different titles, one might prove good, and the other bad, which would abſolutely deſtroy the jointure. There muſt alſo be an unity of *time*; their eſtates muſt be veſted at one and the ſame period, as well as by one and the ſame title. As in caſe of a preſent eſtate made to A and B; or a remainder in fee to A and B after a particular eſtate; in either caſe A and B are joint-tenants of this preſent eſtate, or this veſted remainder. But if, after a leaſe for life, the remainder be limited to the heirs of A and B; and during the continuance of the particular eſtate A dies, which veſts the remainder of one moiety in his heir; and then B dies, whereby the other moiety becomes veſted in the heir of B; now A's heir and B's heir are not joint-tenants of this remainder, but tenants in common; for one moiety veſted at one time, and the other moiety veſted at another. (Co. Litt. 188.) Moreover, in joint-tenancy there muſt be an unity of *poſſeſſion*. Joint-tenants are ſaid to be ſeiſed "per my et per tout," by the half or moiety, and by all; that is, they each of them have the entire poſſeſſion, as well of every *parcel* as of the *whole*. (Litt § 288. 5 Rep. 10.) And therefore, if an eſtate in fee be given to a man and his wife, they are neither properly joint-tenants, nor tenants in common: for huſband and wife being conſidered as one perſon in law, they cannot take the eſtate by moieties, but both are ſeiſed of the entirety, "per tout et non per my;" the conſequence of which is, that neither the huſband nor the wife can diſpoſe of any part without the aſſent of the other, but the whole muſt remain to the ſurvivor. (Litt. § 665. Co. Litt. 187. 2 Vern. 120. 2 Lev. 39.) From theſe principles we may deduce other incidents pertaining to the joint-tenant's eſtate. If two joint-tenants let a verbal leaſe of their land, reſerving rent to be paid to one of them, it ſhall enure to both, in reſpect of the joint-reverſion. (Co. Litt. 214.) If their leſſee ſurrenders his leaſe to one of them, it ſhall alſo enure to both, becauſe of the privity or relation of their eſtate. (Co. Litt. 192.) For the ſame reaſon, livery of ſeiſin, made to one joint-tenant, ſhall enure to both of them (Co. Litt. 49.); and the entry, or re-entry, of one joint-tenant, is as effectual in law as if it were the act of both. (Co. Litt. 319. 364.) In all actions, alſo, relating to their joint-eſtate, one joint-tenant cannot ſue or be ſued without joining the other. (Co. Litt. 195.) But if two or more joint-tenants be ſeiſed of an advowſon, and they preſent different clerks, the biſhop may refuſe to admit either: becauſe neither joint-tenant hath a ſeveral right of patronage, but each is ſeiſed of the whole; and if they do not both agree within ſix months, the right of preſentation ſhall lapſe. But the ordinary may, if he pleaſes, admit a clerk preſented by either, that divine ſervice may be regularly performed; and if the clerk of one joint-tenant be ſo admitted, this ſhall keep up the title in both of them. (Co. Litt. 185.) It is held alſo, that one joint-tenant cannot have an action againſt another for treſpaſs, in reſpect of his land (3 Leon. 262.); for each has an equal right to enter on any part of it. But one joint-tenant is not capable by himſelf of doing any act which may tend to defeat or injure the eſtate of the other, as to let leaſes, or grant copy-holds (1 Leon. 234.); and if any waſte be done, which tends to the deſtruction of the inheritance, one joint-tenant may have an action of waſte againſt the other, by conſtruction of the ſtatute Weſtm. 2. c. 22. (2 Inſt. 403.) So likewiſe, though at common law no action of account lay for one tenant againſt another, unleſs he had conſtituted him his bailiff or receiver (Co. Litt. 200.); yet now by the ſtatute 4 Anne, c. 16. joint-tenants may have actions of account againſt each other, for receiving more than their due ſhare of the profits of the tenements held in joint-tenancy. From the ſame principle alſo ariſes the remaining grand incident of joint eſtates; *viz.* the doctrine of *ſurvivorſhip*; which ſee.

An eſtate in joint-tenancy may be *ſevered* and *deſtroyed*, by deſtroying any of its conſtituent unities. The firſt, indeed, cannot be effected by any ſubſequent tranſaction. But the joint-tenant's eſtate may be deſtroyed without any alienation, by merely diſuniting their *poſſeſſion*. Hence, if two joint-tenants agree to part their lands, and hold them in ſeveralty, they are no longer joint-tenants, and the right of ſurvivorſhip is by ſuch ſeparation deſtroyed. (Co. Litt. 188. 193.) By common law all the joint-tenants might agree to make partition of the lands; but one of them could not compel the other ſo to do (Litt. § 290.); but now by the ſtatutes 31 Hen. VIII. c. 1. and 32 Hen. VIII. c. 32. joint-tenants, either of inheritance or other leſs eſtates, are compellable by writ of partition to divide their lands. Again, the jointure may be deſtroyed by deſtroying the unity of *title*. As if one joint-tenant alienes and conveys his eſtate to a third perſon, the joint-tenancy is ſevered, and turned into tenancy in common. (Litt. § 292.) But a deviſe of one's ſhare by will is no ſeverance of the jointure; for no teſtament takes effect till after the death of the teſtator, and by ſuch death the right of the ſurvivor, which accrued at the original creation of the eſtate, and has therefore a priority to the other, is already veſted. (Litt. § 287.) It may be alſo deſtroyed by deſtroying the unity of *intereſt*. And therefore, if there be two joint-tenants for life, and the inheritance is purchaſed by or deſcends upon another, it is a ſeverance of the jointure. (Cro. Eliz. 470.) In like manner, if a joint tenant in fee makes a leaſe for life of his ſhare, this defeats the jointure, for it deſtroys the unity both of title and intereſt. (Litt. § 302, 303.) And whenever, or by whatever means the jointure ceaſes or is ſevered, the right of ſurvivorſhip the ſame inſtant ceaſes with it. (Co. Litt. 108.) Yet, if one of theſe joint-tenants alienes his ſhare, the two remaining tenants ſtill hold their parts by joint-tenancy and ſurvivorſhip (Litt. § 294.); and if one of three of theſe joint-tenants releaſes his ſhare to one of his companions, though the joint-tenancy is deſtroyed with regard to that part, yet the two remaining parts are ſtill held in jointure (Litt. § 304.); for they ſtill preſerve their original conſtituent unities.

Things perſonal may belong to their owners, not only in ſeveralty, but alſo in joint-tenancy, and in common as well as real eſtates. Thus if a houſe, or other perſonal chattel, be given to two or more abſolutely, they are joint-tenants of it; and, unleſs the jointure be ſevered, the ſame doctrine of ſurvivorſhip ſhall take place as in eſtates of lands and tenements. (Litt. § 282. 1 Vern. 482.) The king cannot have a joint property with any perſon in one entire chattel, or ſuch a one as is not capable of diviſion or ſeparation; but where the titles of a king and a ſubject concur, the king ſhall have the whole. Blackſt. Com. b. ii.

JOINT-*water*, a term uſed by our farriers, for what the old writers in medicine have called hydarthros; a running of a clear ichor from the joints, when they are either wounded or ulcerated: it is common in diſeaſes of horſes.

JOINTEE, in the *Manege*. See HANDFUL.

JOINTRESS, or JOINTERESS, ſhe that hath an eſtate ſettled upon her by her huſband, to hold during her life, if ſhe ſurvives him.

JOINTURE, in *Law*, a covenant whereby the huſband, or ſome friend in his behalf, makes over to his wife, on condition of marriage, certain lands and tenements for the term of her life, or otherwiſe, in lieu of dower.

Others define jointure a bargain and contract of livelihood, adjoined to the contract of marriage, being a competent proviſion of freehold lands or tenements, &c. for the wife, during her life at leaſt, to take effect in profit or poſſeſſion, after the death of her huſband, if ſhe herſelf is not the cauſe of the extermination or forfeiture of it.

And to make a perfect jointure within the ſtatute of 27 Hen. VIII. c. 10. to bar dower, ſeveral things are to be obſerved. 1. It muſt be made to take effect for the life of the wife in poſſeſſion or profit, preſently after the deceaſe of her huſband. 2. It muſt be for the term of her own life, or a greater eſtate; but it may be limited to continue no longer than ſhe remains a widow, &c. 3. It muſt be made for herſelf, and to none other in truſt for her. 4. It is to be expreſſed to be in ſatisfaction of her whole dower, and not a part of it. 5. It may be made before or after marriage: if it be made before, the wife cannot waive it, and claim her dower at common law (4 Rep. 1, 2.); but if it be made after marriage, ſhe has her election, after the huſband's death, and may either accept it, or refuſe it, and betake herſelf to her dower at common law; for ſhe was not capable of conſenting to it during coverture, unleſs the jointure be made by act of parliament. After the death of her huſband, the wife may enter into her jointure, and is not driven to a real action, as ſhe is to recover dower by the common law; and upon a lawful eviction of her jointure, ſhe ſhall be endowed according to the rate of her huſband's lands, whereof ſhe was dowable at common law.

A wife's jointure ſhall not be forfeited by the treaſon of the huſband (Co. Litt. 37.); but feme-coverts, committing treaſon or felony, may forfeit their jointures, and being convict of recuſancy, they ſhall forfeit two parts in three of their jointures and dower, by 3 Jac. I. c. 4.

JOINVILLLE, JOHN SIRE DE, in *Biography*, a French hiſtorian, born in the early part of the thirteenth century, made a conſiderable figure in the court of Lewis IX. This prince he followed in all his military expeditions, and aſſiſted him alſo in the adminiſtration of juſtice. One of the duties which he had to perform, was to hear the pleas of applicants at the palace gate, and to report them to his majeſty, and alſo to inveſtigate the truth of the allegations. When Lewis took the croſs, and made his expedition into Egypt in 1249, Joinville, inſtigated by the martial ſpirit and devotion of the age, attended him with a train of followers ſuited to his rank, and his narrative of this enterprize in his life of Lewis, is one of the moſt curious and valuable records of that age. The hiſtorian ſhared his ſovereign's captivity, as well as the dangers which they all incurred from the common enemy. He returned in ſafety, and was ſo much impreſſed with the danger and impolicy of theſe expeditions, that he made no ſcruple of condemning thoſe who adviſed Lewis to undertake his ſecond cruſade, and excuſed himſelf from accompanying the king, on the pretext of having been ruined by the firſt. Joinville's hiſtory was completed in the year 1309, when the author, according to Gibbon, muſt have been more than ninety years of age: it is a faithful detail of the facts which occurred under his own obſervation. "A monkiſh hiſtorian ſhould have been content to applaud the moſt deſpicable part of his (the king's) character; but the noble and gallant Joinville, who ſhared the friendſhips and captivity of Lewis, has traced with the pencil of nature the free portrait of his virtues as well of his failings." The moſt valuable edition of this work is that of Du Cange in 1688; but the text of the Paris edition in 1761 is reckoned the moſt pure and authentic. It has been lately tranſlated into the Engliſh, and publiſhed by Mr. Johnes of Hafod. Moreri, Gibbon.

Joinville, in *Geography*, a town of France, in the department of the Upper Marne, and chief place of a canton, in the diſtrict of Waſſy, ſituated on the Marne; 15 miles S.E. of St. Dizier. The place contains 3086, and the canton 7476 inhabitants, on a territory of 145 kiliometres, in 15 communes. N. lat. 48° 27′. E. long. 5° 13′.

JOIRE, St., a town of France, in the department of Mont Blanc; 4 miles S.E. of Chambery.—Alſo, a town in the ſame department; 15 miles S.E. of Geneva.

JOISTS, or Joysts, in *Architecture*, thoſe pieces of timber framed into the girders and ſummers on which the boards of floors are laid.

Joiſts are from ſix to eight inches ſquare, and ought ſeldom to lie at a greater diſtance from each other than ten or twelve inches; nor ought they ever to bear at a greater length than ten feet; or to lie leſs into the wall than eight inches. See Chimney.

Sometimes the carpenters furr their joiſts, as they call it; that is, they lay two rows of joiſts, one over the other.

JOKALAY, in *Geography*, a town of Sweden, in the government of Abo; 22 miles N.W. of Abo.

JOKES. See Jesting.

JOKI, in *Geography*, a town of Japan, in the iſland of Niphon; 50 miles N. of Meaco.

JOKIOS, a town of Sweden, in the province of Tavaſtland; 28 miles W.S.W. of Tavaſthus.

JOKKAS, a town of Sweden, in the province of Tavaſtland; 107 miles N.E. of Tavaſthus.

JOKKATO, a town of Africa, in the kingdom of Barra.

JOKO, a town of Africa, in Kaarta. N. lat. 14° 30′. W. long. 8°.

JOKOMI, a town of Japan, in the iſland of Niphon; 25 miles N. of Jedo.

JOLCOS, or, as Homer calls it, *Jaolcos*, in *Ancient Geography*, a town of Theſſaly, in Magneſia, at the lower extremity of the Pelaſgic gulf, ſeven ſtadia from Demetrias and the ſea. It was anciently conſiderable, and had a famous port. Pliny ſays that Adraſte at this place invented the funeral games; and Strabo reckons it in the number of thoſe towns which were deſtroyed in order to people the town of Demetrias. Jaſon, the ſon of Eſon, was king of Jolcos, and from hence the Argonauts took their departure; and it is ſaid that on their return they found the town in the poſſeſſion of Pelias, brother of Jaſon, who had him put to death.

JOLIAN, in *Geography*, a town of Hindooſtan, in Guzerat; 20 miles N. of Gogo.

JOLIBA, denoting, in the language of the Negroes, "great water," is a name which they give to the river Niger, called by the Moors "Nil il Abud," or the river of Slaves. When Mr. Park, in his intereſting Tour, firſt diſcovered this river, it appeared to him as broad as the Thames at Weſtminſter, and flowing majeſtically, but ſlowly, from weſt to eaſt, through the middle of a very extenſive town, called Sego. This enterpriſing and ingenious traveller purſued the courſe of the Joliba from W. long. 5° 30′ to Silla, long. 1° 30′, the utmoſt extent of his expedition. See Guin and Niger.

JOLITHUS, in *Botany*, from ιον, *a violet*, and λιϑος, *a ſtone*, a cryptogamic plant, referred by Linnæus to the genus *Byſſus*, by ſome others to that of *Lichen*. It is found in the form of broad crimſon patches, when moiſt, ſmelling ſtrongly of violets, or rather of Orris root, clothing the ſurface of ſtones in clear ſprings, as at Holywell in Flintſhire, Tunbridge, and other places. Nothing is known concerning the fructification.

JOLLONE Key, in *Geography*, a ſmall iſland among the Bahamas. N. lat. 26° 12′. W. long. 77° 2′.

JOLO, or Soere Carta, a town of Java, and capital of the kingdom of Soeſoehoenam.

JOLUCAR, a town of Spain, in the province of Granada; 7 miles N.E. of Motril.

JOLUT, an iſland near the weſt coaſt of Eaſt Greenland. N. lat. 60° 56′. W. long. 46° 50′.

JOLY, Claude, in *Biography*, a French writer, was born at Paris in 1607. He was precentor of the cathedral of Paris, and died in that city in the year 1700. He was author of a book entitled "Maxims for the Education of a Prince," which was condemned by the judicature of Paris, and was burnt by the hands of the common hangman in 1665. He likewiſe wrote ſeveral other pieces, chiefly theological.

Joly, Guy, a French writer of memoirs, was counſellor to the king, and ſyndic of the renters of the hotel de ville, in Paris. He was attached to the cardinal de Retz, whom he followed, for a conſiderable time, in all his various fortunes. After the return of that miniſter from Rome, Joly quitted him on account of want of mutual confidence. He drew up "Memoirs from 1648 to 1665," in two volumes 12mo. which are chiefly an abridged account of what the cardinal himſelf has recorded in his own memoirs: but they are written in a more exact ſtyle than thoſe of the cardinal, and contain many additional curious facts. Joly was engaged to defend the rights of the queen, and drew up "Remarks on Two Treatiſes written by Peter Stockmans in oppoſition to her Claims on Brabant and the Low Countries." He was author of another work, entitled "Intrigues of Peace, or Negociations at Court by the Friends of M. le Prince, after his retreat in Guienne." Moreri.

Joly, in *Geography*, a port on the S. coaſt of Nova Scotia.

JOMELLI, Nicolo, in *Biography*, one of the moſt intelligent, learned, and affecting dramatic compoſers of modern times, was born at Avellino, a town about twenty-five miles from Naples, in which city he had his muſical education under Leo and Durante. The firſt opera to which we find his name, is "Riccimero Rè de' Goti," compoſed for the Argentina theatre at Rome, 1740: and between that period and 1758, he compoſed for that city fourteen operas, beſides others for Venice and different Italian theatres.

From 1758 to about 1768, he reſided in Germany, being engaged in the ſervice of the duke of Wurtemburg, at Stuttgardt, or rather at Ludwigſburg, his new capital, where Jomelli's works were performed. Here he produced a great number of operas and other compoſitions, by which he acquired great reputation, and totally changed the taſte of vocal muſic in Germany. On his return to Italy, he left all theſe productions behind him, upon a ſuppoſition that he ſhould again reſume his ſtation at Ludwigſburg, after viſiting his native country. But as he never returned thither to claim theſe compoſitions, they fell into the hands of his patron, the duke of Wurtemburg, who preſerved them as precious relics of this great maſter.

Propoſals were publiſhed at Stuttgardt, in 1783, and in Cramer's Mag. der. Mus. for September of the ſame year, for printing by ſubſcription the entire dramatic works of Jomelli in ſcore, which he compoſed during his reſidence at the court of the duke of Wurtemburg, conſiſting of fifteen ſerious operas, five paſtoral dramas, and three burlettas; but whether this undertaking was ever accompliſhed, we have not been able to learn.

The ſerious operas which Jomelli compoſed for Stuttgardt, are the following: "L'Olimpiade, La Clemenza di Tito, Nitteti, Pelope, Enea nel Lazio, Catone in Utica, Il Re Paſtore, Aleſſandro nell' Indie, Ezio, Didone, Demofoonte, Semiramide, Vologeſo, Artaſerſe, and Fetonte." Paſtoral dramas: "Imeneo in Atene, Il Paſtore Illuſtre, and L'Iſola Diſabitata." Comic operas: "Il Matrimonio per Concorſo, La Schiava Liberata, and Il Cacciatore Deluſo."

Very few entire operas of Jomelli were ever performed in England: the firſt was "Attilio Regolo," in 1753, without any captivating ſinger. Serafini, firſt man, with little voice, though a good actor; and the Viſconti, firſt woman, but now *paſſée*, were little able to render the muſic captivating, or even to do it juſtice. Yet an extraordinary circumſtance happened during the whole run of this opera, which no other, perhaps, could ever boaſt. This drama was terminated by a piece of recitative without a ſubſequent air, in ſpeaking which, Serafini was conſtantly encored. A circumſtance the more extraordinary, as the Engliſh in general, who are ignorant of the Italian language, hate recitative, and would never go a ſecond time to an opera, if not attracted by the airs and fine ſinging.

In 1755, Jomelli's opera of "Andromaca" was performed in London; in which the firſt air, "Si ſoffre un cor trianno," has conſiderable merit; but the cloſe of the allegro is now old faſhioned. A great part of this opera was compoſed by Jomelli in his firſt manner; but originality and the hand of a maſter always appear. The air, "Eccoti il figlio," as ſung and acted by Mingotti, was truly dramatic and affecting. The whole is very ſuperior to almoſt all contemporary productions.

In 1759, a duet by Jomelli, in the paſticcio opera of "Vologeſo," was extremely pleaſing, and the firſt which we remarked on the preſent dramatic model, chiefly in dialogue, with only burſts of paſſion, in two parts. And Eliſi, while he was in England, ſung ſeveral grand airs by Jomelli, compoſed on purpoſe to diſplay that ſinger's dexterity in hitting wide intervals.

In 1768, Guarducci, inſtead of an opera for his benefit, had the oratorio of "Betulia Liberata," written by Metaſtaſio, and ſet by Jomelli, in which, among many admirable compoſitions, an air of ſupplication by the high prieſt, through which were heard the murmurs of the people in a diſtant chorus, crying for peace and bread in tones ſo ſubdued as ſcarcely to be heard, was juſtly admired for its fine and new effect.

After he quitted Germany, Jomelli compoſed a great number of operas expreſsly for the king of Portugal, who tried every expedient to tempt him to go to Liſbon; which honour, though he declined, on account of the delicate ſtate of his wife's health, yet he annually furniſhed that prince with new productions, as well as with whatever he compoſed for other purpoſes.

He compoſed, after his return to Naples, three operas for that city: "Armida," in 1769; "Demofoonte," 1770; "Iſigenia in Aulide," 1771. And in 1772, "Achille in Sciro," for Rome, which was his laſt.

Some of the muſic which he compoſed for the dances of his operas has been much celebrated, particularly his "Chaconne," which is well known in England, and has ſerved as a model for that ſpecies of dance throughout Europe, ever ſince it was compoſed.

The operas of Jomelli will be always valuable to profeſſors and curious collectors, for the excellence of the compoſition; though it has been thought neceſſary, in compliance with the general rage for novelty, to lay them aſide and to have the ſame dramas new ſet for the ſtage, in order to diſplay the talents, or hide the defects, of new ſingers.

As Jomelli was a great harmoniſt, and naturally grave and majeſtic in his ſtyle, he ſeems to have manifeſted abilities in writing for the church, ſuperior even to thoſe for the ſtage.

Of the many oratorios he compoſed, we are only acquainted with three: "Iſacco Figura del Redentore;" "Betulia Liberata;" and "La Paſſione;" all written by Metaſtaſio, and all admirably ſet. In the firſt accompanied recitative and air of "Iſacco," at the opening of the ſecond part, beginning, "Chi per pietà mi dice, il mio figlio che fa?" in which are painted, with an uncommon degree of agitation and paſſion, the anxiety and terror of Sarah, during the abſence of Abraham, whom ſhe ſuppoſes is in the act of ſacrificing her ſon Iſaac, have been juſtly much admired.

We are in poſſeſſion of a Te Deum and a Requiem of his compoſition, which manifeſt him to have been a great maſter of the church ſtyle; though he had acquired great fame as a dramatic compoſer before he began to exerciſe himſelf in this ſpecies of writing, concerning which he had never beſtowed a thought ſince he left the muſic-ſchool, or conſervatorio, till about the year 1751, when it having been determined at Rome that the muſic for paſſion-week ſhould be as excellent as poſſible, Durante, Jomelli, and Perez, were employed to ſet the leſſons from the Lamentations of Jeremiah, for the three moſt ſolemn days of that holy time. Jomelli's compoſition was performed on Wedneſday, Perez's on Thurſdays, and Durante's on Good Friday. The firſt is entitled "Lettione Primo per li mercoledì ſanto, con Violini, Oboè, Viola, Flauti e Corni da Caccia." The ſecond "Lettione Prima del Giovedì ſanto, a Soprano ſolo, con Violini, Viola, Oboè, e Corni da Caccia." And the third "Lettione Terza del Venerdì ſanto, a 4 Voci, con Violini, Viola, e Corni da Caccia." Having procured a ſcore of theſe compoſitions at Rome, and lately examined them, we can venture to ſay that they all appear admirable: and as the compoſers were all men of great abilities, who exerted themſelves on this honourable occaſion, it is difficult to determine, in their ſeveral ſtyles, which is the beſt. The productions of Jomelli and Perez are in an elevated, elegant, dignified, ſupplicating, and expreſſive oratorio ſtyle; and that of Durante more in the ancient ſtyle of church muſic: more learned in modulation, more abounding in fugue, and more elaborate in the texture of the parts, as might be expected from his maturer age, and the ſolemnity of the day on which his muſic was to be performed.

But though Jomelli acquired conſiderable fame by this compoſition for the church, yet he was ſo far from being intoxicated by it, that in a viſit to Padre Martini, at Bologna, ſoon after, he told this learned contrapuntiſt that he had a ſcholar to introduce to him. Padre Martini aſſured him, that he ſhould be glad to inſtruct any one ſo well recommended. And a few days after, the good father aſking who and where was the diſciple he had talked of? Jomelli anſwered, *Padre ſon io*; and pulling a *ſtudio* of paper out of his pocket, on which he had been trying his ſtrength in modulation and fugue upon *canto fermo*, begged of him to examine and point out his errors.

From this period he produced many admirable compoſitions for the church, in which he united elegance with learning, and grace with bold deſign. Among other productions of this kind, the two following merit commemoration. An "Offertorio," or motet, for five voices without inſtruments, followed by an Alleluja of four parts in chorus; and a "Miſſa pro defunctis," or burial ſervice, which he compoſed at Stuttgardt for the obſequies of a lady of high rank and favour at the court of his patron, the duke of Wurtemburg. Theſe compoſitions, which are learned without pedantry, and grave without dulneſs, will be laſting monuments of his abilities as a contrapuntiſt.

But the moſt elaborate of all his compoſitions, is the "Miſerere," or fifty-firſt pſalm, tranſlated into Italian verſe, by his friend Saverio Mattei, which he ſet for two voices, accompanied with inſtruments, in 1773, the year before his deceaſe. In this production, which breathes a pious gravity, and compunction of heart ſuited to the contrite ſentiments of the pſalmiſt, there is a manifeſt ſtruggle at extraneous modulation and new effects, perhaps too much at the expence of facility and grace. Though all the movements of this compoſition are ſlow, yet the execution is ſo difficult, both to the voices and inſtruments, that when it was performed in London at Marchetti's benefit, it was the opinion of the late Mr. Bach, that Jomelli had purpoſely written what he could not execute himſelf, in order to perplex the performers. This, however, muſt have been ſaid in pleaſantry, for Jomelli had no malevolence in his diſpoſition; perhaps in ſtriving at excellence with too great ſolicitude, he ſometimes had recourſe to art and ſtudy, inſtead of giving way to his own feelings. There are, however, admirable ſtrokes of paſſion as well as ſcience in the muſic that he has ſet to this pſalm, which, though above the comprehenſion of common hearers, will afford great pleaſure to thoſe that are able to read the ſcore, or to follow the performers through the labyrinths of art.

This admirable compoſer had, in general, ſuch a facility in writing, that he ſeldom courted the Muſe at an inſtrument; and ſo tenacious a memory, that Sacchini aſſured us he frequently compoſed an air on opening a book of lyric poetry, while, like a peripatetic, he has been walking about a room, which he remembered a year after, and then committed it to paper, as faſt as he could write a letter.

As Raphael had three manners of painting, Jomelli had three ſtyles of compoſition. Before he went to Germany, the eaſy and graceful flow of Vinci and Pergoleſi pervaded all his productions; but when he was in the ſervice of the duke of Wurtemburg, finding the Germans were fond of learning and complication, he changed his ſtyle in compliance with the taſte and expectations of his audience; and on his return to Italy, he tried to thin and ſimplify his dramatic Muſe, which, however, was ſtill ſo much too operoſe for Italian ears, that in 1770, upon a Neapolitan being aſked how he liked Jomelli's new opera of "Demofoonte," he cried out with vehemence, *è ſcelerata, Signore!*

Climate ſeems to operate ſo much on muſic, however its influence may be diſputed in manners and government, that what is admired in one country is deteſted in another. In cold climates *labour* is neceſſary to circulation; in hot, *eaſe* is the grand deſideratum. This principle is carried to ſuch exceſs in Italy, that whatever gives the hearer of muſic the leaſt trouble to diſentangle, is Gothic, pedantic, and *ſcelerata*. As to difficulties of *execution*, in a *ſingle part*, the compoſers and performers may ſpin their brains, and burſt their blood-veſſels, and welcome, provided the texture of the parts is clear and ſimple.

The Gothic inventions, as they call them, of fugues, canons, and laboured counterpoint of the ſixteenth century, they are willing to reſign to the Flemings, who firſt brought them into Italy; but of which all the natives, except a few obſtinate pedants, ſtruggled to diveſt their muſic, particularly that for the ſtage, during the laſt two centuries.

It is the *exceſs* only of learning and facility that is truly reprehenſible by good taſte and ſound judgment; and *difficult* and *eaſy* are relative terms, which they only can define. To lovers of muſic who have heard much in various ſtyles, little is new; as to others who have heard but little, all is new. The former want reſearch and new effects, which, to the latter, old muſic can furniſh. Palates accuſtomed to plain food find *ragoûts* and *morceaux friands* too highly ſeaſoned; while to thoſe who have long been pampered with dainties, ſimplicity is inſipid. How then is a compoſer or performer to pleaſe a mixed audience, but by avoiding too much complacence to the excluſive taſte of either the learned, or the ignorant, the ſupercilious, or the ſimple?

The health of Jomelli began to decline in 1770, ſoon after we had ſeen him in perfect health at Naples. He was then corpulent, and reminded us of the figure of Handel. In 1771, he had a ſtroke of the palſy, which, however, did not impair his intellects, as he compoſed "Achille in Sciro" for the Roman theatre, and a cantata for the ſafe delivery of the queen of Naples, in 1772; and in 1773, his Italian "Miſerere," the moſt elaborate and ſtudied of all his works.

His learned friend, Signor Saverio Mattei, the tranſlator of the pſalms into Italian verſe, from whoſe admirable verſion Jomelli had taken the "Miſerere," or fifty-firſt pſalm, drew up a very intereſting account of the works and public funeral of the great muſician, and printed it in his "Saggio di Poeſia Latine et Italiane," publiſhed at Naples immediately after his deceaſe.

The reverence and regard with which we have been long impreſſed for the works and character of this gifted man, have already rendered the article too long to admit of further extenſion, or we ſhould have wiſhed to inſert Signor Mattei's whole account; but having given it elſewhere, we ſhall here only cite the introduction, which does equal honour to the author and his friend.

Naples, September, 1774. "Yeſterday all the muſicians of this city united in celebrating the funeral of the great Jomelli. The church was very finely ornamented; and a great number of wax tapers were placed about the pompous bier. Two orcheſtras of three rows each could ſcarcely contain the vocal and inſtrumental performers who aſſiſted in executing the muſic that was expreſsly compoſed on the occaſion by the worthy Sabitini, who beat the time himſelf, as maeſtro di capella. It was the celebrated Genaro Manna, compoſer of the archiepiſcopal church, who firſt ſuggeſted this plan of a public funeral, in which all theſe muſicians had an opportunity of manifeſting their regard for Jomelli, and of furniſhing an example to poſterity of the gratitude due to great talents, which may likewiſe ſtimulate young artiſts to merit equal honours. At the deſire of Signor Manna, not only every muſician attended the funeral and performed gratis, but contributed likewiſe towards the expences of this ſolemnity.

"Jomelli was my friend; he lived two years in my neighbourhood, and I had frequent opportunities of converſing with him, and of admiring his captivating manners, particularly his modeſty in ſpeaking of rival artiſts, whoſe compoſitions

poſitions he readily praiſed, though their authors were not equally candid in ſpeaking of him.

"Jomelli had acquired conſiderable knowledge in other arts than muſic: his poetry was full of taſte, and there is a fine ode of his writing, in the collection publiſhed at Rome, on the ſubject of the reconciliation between the pope and king of Portugal.

"He was ambitious of diſtinguiſhing himſelf from other compoſers in a way peculiar to himſelf. His invention was always fertile, his ſtyle lyrical and Pindaric; and juſt as Pindar darted from one ſubject to another, Jomelli changed his tones and themes in a way wholly new, and learnedly irregular."

This account is terminated with many excellent reflections on the ſtyle of Jomelli, and the cabals and frivolous taſte of the Neapolitans at the time of his death. All we ſhall add is, that the latter works of Jomelli will be ever regarded with reverence by real judges of compoſition, as there is no mixture of trivial or fantaſtical movements or paſſages in his truly claſſical, and often ſublime works.

JON, in *Natural Hiſtory*, the name of a gem deſcribed by Pliny, and ſaid to be brought from the Eaſt Indies; he deſcribes it as being of a purple or violet colour, but rarely very deep in the tinge. It ſeems to have been a ſpecies of amethyſt.

Jon *of Chios*, in *Biography*, a tragic and lyric poet and philoſopher, who firſt recited his poems in the 82d Olympiad, 452 years B.C., mentions in ſome verſes quoted by Euclid, the ten-ſtringed lyre, Δεκαχορδω λυρα; a proof that the conjoint tetrachord was added to the ſcale in his time, which was about fifty years after Pythagoras is ſuppoſed to have conſtructed the octachord. Jon died, according to Fabricius, vol. i. p. 681, 419 B. C., and 78 years after Pythagoras. Beſides tragedies and dithyrambics, Jon compoſed odes, pæans, hymns, and ſcolia, or convivial ſongs.

IONA, I, Hii, or *I-Colum-kill*, in *Geography*, one of the weſtern iſlands of Scotland, in the Atlantic ocean, is ſeparated from the weſtern point of Mull by a narrow channel, called the ſound of I. It meaſures about three miles in length, by three quarters of a mile in breadth. It is a place of much note in the early annals of the country, as the retreat of learning, during the age of barbariſm and illiteracy which pervaded Europe after the overthrow of the Roman empire. Dr. Johnſon calls this place "the luminary of the Caledonian regions, whence ſavage clans and roving barbarians derived the benefits of knowledge, and the bleſſings of religion." The monkiſh writers called this iſland Iona, which ſignifies the iſland of waves; Bede calls it Hii; but the proper name is I, (founded like the Engliſh *ee*,) which in the Gaelic ſignifies iſland, this being called ſo by way of eminence. In more modern times, this inſular diſtrict obtained the name of I-Colum-kill, that is, the iſland of Columb's-cell. The name Iona is now diſuſed, and the iſland is generally called I, except when the ſpeaker would wiſh to mark it with peculiar emphaſis, and then it is expreſſed I-Colum-kill. The Druids were undoubtedly in poſſeſſion of this iſland prior to the introduction of Chriſtianity: a green eminence, cloſe to the ſound of I, is to this day called the Druid's burial place; and here are ſtill extant the remains of a ſmall Druidical temple, or circular row of upright ſtones, in a farm called Roſſal, where, as the name imports, the courts of juſtice were held. The iſland ſeems to have been early the ſeat of a religious ſociety of Chriſtians, or order of monks, named Culdees, who ſettled here about the beginning of the ſixth century. The foundation of a circular building or houſe, called the Culdees cell, ſtill remains. The hiſtory of the Druids in this iſland is wholly unknown; but that of the Culdees has been amply and learnedly narrated by Dr. Jamieſon, in a quarto volume, publiſhed in 1811. It was reſerved for Columba to raiſe the fame of the iſland to the great height it attained to in his own and after ages. This eminent man left his native country, Ireland, in the year 563, to preach the goſpel to the Northern Picts; and having converted the Pictiſh monarch, obtained from him the grant of this ſequeſtered iſle, where he founded an abbey for canons regular. Having ſucceſsfully preſided here upwards of thirty years, he died June 9th, 597; leaving his abbey firmly ſettled, a people converted by his labours from Paganiſm to Chriſtianity, and a name renowned for ſanctity, piety, and "good works." The abbey acquired very extenſive juriſdictions; held, for many ages, the chief ſway among the Scottiſh and Pictiſh monaſteries; and was liberally endowed by the piety and munificence of the kings and great men of Scotland. The Danes diſlodged the monks in 807, and the abbey remained for ſeveral years depopulated; but on the retreat of the invaders, it received a new order of inhabitants, the Cluniacs, who continued to occupy it till the diſſolution of monaſtic inſtitutions, when the revenues were united to the ſee of Argyle; and, on the abolition of epiſcopacy, became the property of the duke of Argyle. The remains of the abbey, and its appendages, though much dilapidated, are, by the care and attention of the Argyle family, kept in better preſervation than moſt ruins of the kind in Scotland. The late dukes built a wall round the whole abbey, to prevent further depredations; and prohibited their tenants from removing any fallen ſtones. Time has levelled ſome of the buildings with the ground; but the greater part is ſtill ſtanding. The cathedral, or St. Mary's church, is almoſt entire: it is built in the form of a croſs, 115 feet in length, and 23 in width; the length of the tranſept 70 feet. In the church-yard is a croſs of a ſingle piece of red granite, 14 feet high, 22 broad, and 10 inches thick. St. Oran's chapel, ſaid to be the firſt building begun by Columba, is ſtill ſtanding, but in a ruinous condition. The Virgin's chapel was entire till within a few years, when part of it fell. Moſt of the cloiſters and the biſhop's houſe are alſo ſtanding. There is ſtill remaining of the abbey, ſufficient to give a tolerable idea of what it was. Of the nunnery, an eſtabliſhment nearly coëval with the abbey, there are fewer remains: the church belonging to it is deprived of the roof. Here alſo ſtands what was called the pariſh church, yet entire, but verging to decay. Near the chapel of St. Oran is a large encloſure, called the "burying-place of Oran," in which are depoſited the remains of forty-eight Scottiſh kings, four kings of Ireland, eight Norwegian monarchs, and one king of France, who were ambitious of repoſing in this hallowed ground. In the ſame ſanctuary, at a reſpectful diſtance, lie moſt of the lords of the iſles.

The iſland of I is included in the united pariſhes of Kilfinchen and Kilviceuen. It abounds with many valuable minerals. Here is but one ſmall village, containing about 60 houſes and 350 inhabitants. The pariſh miniſter of Kilviceuen viſits this iſland every quarter of a year, which is the only opportunity of public worſhip and religious inſtruction which the people now enjoy. Strange reverſe! that divine ſervice ſhould be performed but four times in the year, in a place where it was formerly celebrated as many times in a day. Sinclair's Statiſtical Account of Scotland, vol. xiv. Pennant's Tour in Scotland. Johnſon's Journey to the Weſtern Iſlands. Chalmers's Caledonia. Jamieſon's Hiſtorical Account of the ancient Culdees, &c. 4to. 1811.

Iona, a town of Hindooſtan, in the country of Delhi; 25 miles S. of Delhi.

JONÆ Piscis, the *Jonas-fiſh*, a name given by many authors to the common ſhark, the *canis carcharias* of authors.

It has this name from an opinion that it was the fiſh which ſwallowed up the prophet of that name. But there are many objections to ſuch an opinion.

JONAH, or *the Prophecy of Jonah*, who was the ſon of Amittai, and a native of Gathhepher, a town belonging to the tribe of Zebulon, in Lower Galilee, a canonical book of the Old Teſtament, in which it is related, that Jonah was ordered to go and propheſy the deſtruction of the Ninevites; but that diſobediently attempting a voyage another way, he was diſcovered by the riſing of a ſudden tempeſt, and caſt into the ſea, where he was ſwallowed up by a large fiſh. Having lodged three days and three nights in the belly of the fiſh, he was diſgorged upon the ſhore: whereupon, being ſenſible of his paſt danger, and ſurpriſing deliverance, he betook himſelf to the journey and embaſſy to which he was appointed. Arriving at Nineveh, the metropolis of Aſſyria, he, according to his commiſſion, boldly laid open to the inhabitants their ſins and miſcarriages, and proclaimed their ſudden overthrow; upon which the whole city, by prayer and faſting, and a ſpeedy repentance, happily averted the divine vengeance, and eſcaped the threatened ruin. Jonah, inſtead of admiring the divine clemency, was indignant under the apprehenſion that his veracity would be ſuſpected, and that he would be deemed by the people to be a falſe prophet. Having retired from the city, he prepared for himſelf a booth, over which a plant ſprang up miraculouſly in one night, which, by its ſpreading foliage, ſheltered him from the burning heat of the ſun. But the plant ſuddenly withering away, ſo that he was expoſed to a ſuffocating wind and the ſun's ſcorching beams, he again expreſſed his impatience, and his wiſh to die rather than to live in ſuch circumſtances of diſtreſs. At length, having been reproved for his impatient, querulous temper, and the conduct of Providence in ſparing the Ninevites having been juſtified to his full conviction, his complaints were ſilenced. Of his further hiſtory we have no authentic account. Jonah was the moſt ancient of all the prophets whoſe writings are preſerved in the Scripture canon. Some have ſuppoſed that he propheſied in the latter end of Jehu's, or the beginning of Jehoahaz's reign, at which time the kingdom of Iſrael was brought very low by the oppreſſions of Hazael king of Syria. (2 Kings, xiii. 22.) Others refer his predictions to the reign of Jeroboam II. king of Iſrael, or between the years 823 and 783 B.C. 2 Kings, xiv. 25. Newcome's Verſion and Notes.

JONDAL, in *Geography*, a town of Norway, in the the dioceſe of Bergen; 30 miles E. of Bergen.

JONDISABUR, a town of Perſia, in the province of Chuſiſtan; 185 miles E.S.E. of Bagdad.

JONEIKISCHKEN, a town of Pruſſian Lithuania; 36 miles W. of Tilſit.

JONES, in *Biography*, a Welſhman who was blind, and the beſt performer on the harp of his time. The old ducheſs of Marlborough would have retained him in her ſervice, with a penſion, as an inmate; but he could not endure confinement, and was engaged by Evans, the landlord of a well-accuſtomed home-brewed ale-houſe, at the Hercules' Pillars, oppoſite Clifford's Inn paſſage in Fleet-ſtreet, where he performed in a great room up ſtairs during the winter ſeaſon. He played extempore voluntaries, the fugues in the ſonatas and concertos of Corelli, and moſt of his ſolos, with many of Handel's opera ſongs, with uncommon neatneſs, which were thought great feats, at a time when ſcarcely any thing but Welſh tunes with variations was ever attempted on that inſtrument in the hands of other harpers. He alſo played on the violin, and accurately imitated on that inſtrument, to the great delight of the home-brewed ale-drinkers, the ſobs, ſighs, and groans of a Quaker's ſermon.

Evans dying, his widow took Cuper's Gardens in Surrey, oppoſite to Somerſet-houſe; erected an orcheſtra there, which was reckoned the beſt for muſic in the kingdom; furniſhed it with an organ, which was played by little Harry Burgeſs, the harpſichord-player at Drury-lane, with his uſual unmeaning neatneſs; and eſtabliſhed the Gardens as an evening place of entertainment for the ſummer ſeaſon, like Vauxhall, with the addition of fire-works. But it was too much in the vicinity of Drury-lane and Covent-garden for order and decorum to be long preſerved inviolate; ſo that after four or five ſummers, it was ſuppreſſed by the magiſtrates; and poor Jones, who had been admitted as a performer in the orcheſtra by mother Evans, (as ſhe was uſually called,) loſing both his ſalary and importance, died about the year 1748. He was buried in Lambeth church-yard, and his funeral proceſſion, attended by a great number of muſical people, was ſolemnized by the performance of a dead march by a voluntary band of innumerable inſtruments.

Jones, John, late organiſt of St. Paul's, the Charter-houſe, and joint organiſt of the Temple with Stanley. The father of this muſician, a worthy man of profeſſional merit and good conduct, having lived many years at lady Vanbrugh's, Whitehall, as a domeſtic muſician, prevailed on her ladyſhip to patronize his ſon; which ſhe did ſo effectually, that though his abilities as a performer or compoſer were not above mediocrity, nor were his perſon or manners very captivating, yet, by the zeal and influence of his father's patroneſs, he obtained three places, which are regarded by muſicians as the poſts of honour in London, and more deſirable, if the king's chapel be excepted, than any at which an organiſt can aſpire.

Jones, John, a phyſician of the 16th century, and author of ſeveral works, but of whoſe hiſtory little more is known than that he was born in Wales, or was of Welſh extraction; that he ſtudied at both our univerſities, and took a medical degree at Cambridge; and that he became eminent in the practice of his profeſſion at Bath, and in Nottinghamſhire and Derbyſhire. He mentions curing a perſon at Louth in 1562; and the date of his laſt publication is 1579. He wrote only in the Engliſh language, and left the following works: 1. "The Dial of Agues," Lond. 1556; 2. "The Benefit of the ancient Bathes of Buckſtone, which cureth moſt grievous Sickneſſes," ibid. 1572. This work contains very little concerning either the nature or hiſtory of theſe baths; but chiefly general directions, compiled from ancient authors, relative to the diet and regimen proper to be uſed with a courſe of bathing; 3. "The Bathes of Bath's ayde, wonderful and moſt excellent againſt very many Sickneſſes," ibid. 1572.; 4. "A brief, excellent, and profitable Diſcourſe of the natural Beginning of all growing and living Things, Heat, Generation, &c." Lond. 1574; 5. "A Tranſlation, from Latin into Engliſh, of Galen's four Books of Elements," ib. 1574. Dr. Aikin puts the following *quære*, after mentioning this work: "Is not this the ſame with the preceding piece?" 6. "The Art and Science of preſerving Body and Soul in Health, Wiſdom, and Catholic Religion," 1579, 4to. See Aikin, Biog. Mem. of Med.

Another phyſician, of the name of John Jones, is mentioned by bibliographers, who was born at Landaff, and was admitted a member of the Royal College of Phyſicians, in London, near the end of the 17th century, and was author of the following publications: 1. “Novarum Diſſertationum de morbis abſtruſioribus Tractatus primus, de Febribus intermittentibus. In quo obiter de Febris continuæ natura explicatur,” Lond. 1683; 2. “De morbis Hibernorum et de Dyſenteria Hibernicâ,” ib. 1698.; “The Myſteries of Opium revealed,” ib. 1701. Eloy. Dict. Hiſt.

Jones, Inigo, an eminent architect, was born in London about the year 1572. He was probably intended for a mechanical employment, but his talent for the fine arts attracted the notice of ſome conſiderable perſons about the court, among whom were the earls of Arundel and Pembroke. To the latter of theſe noblemen he was indebted for that degree of patronage which enabled him to viſit Italy for the purpoſe of perfecting himſelf in landſcape-painting, to which his genius ſeemed firſt to point. He took up his reſidence chiefly at Venice, where it is ſaid the works of Palladio gave him a turn to the ſtudy of architecture, which branch of art he made his profeſſion. He was invited by Chriſtian IV. king of Denmark, to undertake the office of his firſt architect. Having been ſome years in the ſervice of that ſovereign, he accompanied him, in 1606, on a viſit to his brother-in-law, king James; and, expreſſing a deſire of remaining in his native country, he was appointed architect to the queen. He ſerved prince Henry in the ſame capacity, and obtained a grant, in reverſion, of the place of ſurveyor-general of the works. After the death of the prince, Mr. Jones viſited Italy again, and ſpent ſome years there in improving himſelf in his art. On his return he undertook the duties of the office of ſurveyor-general, and finding the Board of Works much in debt, he relinquiſhed his own dues, and prevailed upon the other principal officers to do the ſame, till all arrears were cleared. In 1620 the king ſent him to inveſtigate the nature and purpoſe of that remarkable antiquity, Stonehenge; and he wrote a treatiſe to prove that it was the work of the Romans, but he made no converts to this opinion. He was now employed in building the banquetting-houſe at Whitehall, which remains a model of the pure and elegant taſte of the architect. He was likewiſe appointed a commiſſioner for repairing the cathedral of St. Paul's, which office, as well as his other poſts, was continued to him under the reign of Charles I. The repairs of St. Paul's did not commence till 1633; and he is accuſed of having committed, in that undertaking, ſome capital faults by mixing the Roman and Grecian ſtyle with the Gothic. He had much employment both from the court and nobility, and realized a handſome fortune, which was diminiſhed by his ſufferings during the troubles which ſucceeded. He was obnoxious as a favourite of his royal maſter, and as a Roman Catholic. He was firſt attacked in 1640, when he was called before the houſe of lords, on a complaint of the pariſhioners of St. Gregory's, for demoliſhing part of their church, in order to make room for his additions to St. Paul's. He was fined, in 1646, 545*l.* as a malignant. He was much afflicted by the king's death, and died, worn down by grief and misfortune, in July 1651. He was the greateſt Engliſh architect previouſly to ſir Chriſtopher Wren. A collection of his deſigns was engraved and publiſhed by Mr. Kent, in two volumes folio, 1727. Others were publiſhed in 1743 and 1744. A copy of Palladio's architecture, with manuſcript notes by Mr. Jones, is in the library of Worceſter college, Oxford. Biog. Brit.

Jones, William, father of ſir William, the ſubject of the next article, was born in the year 1680, in the iſland of Angleſey, North Wales. His parents were yeomen, or little farmers, in that iſland, and gave to their ſon the beſt education which their circumſtances would allow; but he owed his future fame and fortune to the diligent cultivation of the intellectual powers by which he was eminently diſtinguiſhed. Addicted from early life to the ſtudy of mathematics, he commenced his career of advancement in the humble office of a teacher of theſe ſciences on board a man of war. In this ſituation he attracted the notice, and obtained the friendſhip of lord Anſon. He appeared as an author in his 22d year; when his treatiſe on the art of navigation was much approved. We may judge of his predominant taſte for literature and ſcience by a trivial circumſtance which occurred at the capture of Vigo, in 1702. Having joined his comrades in pillaging the town, he ſelected a bookſeller's ſhop, in hope of obtaining ſome valuable plunder; but, diſappointed in his expectations, he took up a pair of ſciſſors, which was his only booty, and which he afterwards exhibited to his friends as a trophy of his military ſucceſs. On his return to England, he eſtabliſhed himſelf as a teacher of mathematics in London; and here, at the age of 26 years, he publiſhed his “Synopſis Palmariorum Matheſeos;” a work which has ever ſince been held in the higheſt eſtimation as a compendious but comprehenſive ſummary of mathematical ſcience. Mr. Jones was no leſs eſteemed and reſpected on account of his private character and pleaſing manners, than for his natural talents and ſcientific attainments; ſo that he reckoned among his friends the moſt eminent perſons of the period in which he lived. Lord Hardwicke ſelected him as a companion on the circuit, when he was chief juſtice; and when he afterwards held the great ſeal, conferred upon him the office of ſecretary for the peace, as a teſtimony of his friendſhip and regard. He was alſo in habits of intimate acquaintance with lord Parker, preſident of the Royal Society, ſir Iſaac Newton, Halley, Mead, and Samuel Johnſon. So highly was his merit appretiated by ſir Iſaac Newton, that he prepared, with his permiſſion, and very much to his ſatisfaction, a very elegant edition of ſmall tracts in the higher mathematics. Upon the retirement of lord Macclesfield to Sherborne caſtle, Mr. Jones reſided in his family, and inſtructed his lordſhip in the ſciences. Whilſt he occupied this ſituation he had the misfortune, by the failure of a banker, to loſe the greateſt part of that property which he had accumulated by the moſt laudable induſtry and economy; but the loſs was in a great meaſure repaired to him by the kind attention of his lordſhip, who procured for him a ſinecure place of conſiderable emolument. He was afterwards offered, by the ſame nobleman, a more lucrative ſituation; which, however, he declined, that he might be more at leiſure to devote himſelf to his favourite ſcientific purſuits. In this retreat he formed an acquaintance with Miſs Mary Nix, the daughter of a cabinet-maker, who had become eminent in his profeſſion, and whoſe talents and manners had recommended him to an intimacy with lord Macclesfield. This acquaintance terminated in marriage; and the connection proved a ſource of perſonal ſatisfaction to Mr. Jones himſelf, and of permanent honour to his name and family. By this lady Mr. Jones had three children; two ſons and a daughter. One ſon died in infancy; the other will be the ſubject of the next article; and the daughter, who was married to Mr. Rainsford, an opulent merchant retired from buſineſs, periſhed miſerably, in the year 1802, in conſequence of her clothes accidentally taking fire. The death of Mr. Jones was occaſioned by a polypus in the heart, which, notwithſtanding the medical attention and aſſiſtance of Dr. Mead, proved incurable. Of the ſingular ſelf-poſſeſſion and promptitude of Mrs. Jones, the following anecdote is related. A friend, who knew her huſband's dangerous ſituation, addreſſed him with a letter of condolence, recommending acquieſcence and reſignation from a due conſideration of the brevity of life. Mrs. Jones, perceiving its purport, and probably dreading its effects on the ſpirits of her huſband, when ſhe was deſired by him to read it, compoſed in the moment another letter ſo clearly and ſo rapidly, that he had no ſuſpicion of the deception; and this ſhe executed in a ſtyle ſo chearful and entertaining, that, inſtead of being depreſſed, he was greatly exhilarated by it. His diſorder at length terminated in his death, which happened ſoon after the incident we have related, in July 1749. The property of which he died poſſeſſed was moderate; but his reputation was univerſally acknowledged. After his death, the widow was favoured with many offers of ſervice by thoſe who reſpected her deceaſed huſband; and ſhe was under peculiar obligations to Mr. Baker, author of a treatiſe on the microſcope, &c. for aſſiſtance in arranging the collection of ſhells, foſſils, and other curioſities left by Mr. Jones, and diſpoſing of them to the greateſt advantage. His library was bequeathed to lord Macclesfield. It has been ſaid by the compilers of the Biographical Dictionary, that Mr. Jones had completed a very important mathematical work, and had actually ſent the firſt ſheet to the preſs, but that the progreſs of his diſorder obliged him to diſcontinue the impreſſion. It is moreover ſaid, that the MS. fairly tranſcribed, was entruſted, a few days before his demiſe, to the care of lord Macclesfield, who promiſed to publiſh it for the honour of the author, and the benefit of his family. If this account be true, and a work, which was to have been entitled, "The Introduction to the Mathematics," had been actually prepared, the MS. muſt have been loſt, as it could not be found among the books and papers of lord Macclesfield, who ſurvived his friend many years. Among the memoranda of ſir William Jones there is no document that ſerves to confirm or diſprove this account. The mathematical works of Mr. Jones, that have been publiſhed, are much admired for neatneſs, brevity, and accuracy; and they afford ample evidence, teſtified alſo by his correſpondence with Mr. Cotes of Cambridge, that he was a very eminent mathematician. We have already mentioned his "New Compendium of the whole Art of Navigation," 8vo. 1702; and his "Synopſis Palmariorum Matheſeos; or, a new Introduction to the Mathematics, containing the Principles of Arithmetic and Geometry, demonſtrated in a ſhort and eaſy Method," 8vo. 1706. In the Philoſophical Tranſactions, we have ſeveral papers on logarithms, on the properties of conic ſections, on the diſpoſition of equations for exhibiting the relations of geometrical lines, &c. communicated to the Royal Society, of which he was a member. He was alſo the editor of ſome mathematical works of ſir Iſaac Newton, under the title of "Analyſis per quantitatum ſeries, fluxiones, ac differentias; cum enumeratione linearum tertii ordinis." Memoirs of the Life, Writings, and Correſpondence of ſir William Jones, by lord Teignmouth.

Jones, *Sir* William, the ſon of the ſubject of the preceding article, was deſcended, by the maternal ſide, from ſome of the ancient princes and chieftains of North Wales; but he is entitled to notice in this place on account of much more important and valuable diſtinctions; thoſe of talents, acquirements, and character, which raiſed him to a rank of pre-eminence, that has been attained by few either in ancient or modern times. From the materials ſupplied by lord Teignmouth, in his ample and excellent "Memoirs of the Life, Writings, and Correſpondence of ſir William Jones," in addition to thoſe which our own recollection will furniſh, we ſhall be able to give an account of this diſtinguiſhed perſon, which, however imperfect it may be, and however inadequate to our ſentiments of perſonal reſpect, and feelings of lively gratitude, cannot fail of being intereſting to our readers; nor will they need any apology if we exceed our uſual limits on this occaſion.

Sir William Jones was born in London on the eve of the feſtival of St. Michael, in the year 1746; but having loſt his father when he was three years old, the care of his education devolved upon his mother, who appears to have been eminently qualified to direct and ſuperintend it, more particularly in his infant years. Her character has been delineated by her huſband in the following terms: "She was virtuous without blemiſh, generous without extravagance, frugal but not niggard, cheerful but not giddy, cloſe but not ſullen, ingenious but not conceited, of ſpirit but not paſſionate, of her company cautious, in her friendſhip truſty, to her parents dutiful, and to her huſband ever faithful, loving and obedient." Mrs. Jones took great pains, by the ſtudy of algebra, trigonometry, and navigation, to qualify herſelf for being the preceptreſs of her ſiſter's ſon; and to theſe ſciences, rather remote from a lady's province, ſhe paid particular attention, becauſe he was deſtined to a maritime profeſſion. Her ſolicitude for the improvement of her own ſon induced her to decline accepting the kind invitation of the counteſs of Macclesfield to remain at Sherborne caſtle, after her huſband's death; and her diſcriminating judgment led her, in her plan for his inſtruction, to reject the ſeverity of diſcipline, and to conduct his mind inſenſibly to knowledge and exertion, by exciting his curioſity and directing it to uſeful objects. In conſequence of her attention, he was, in his fourth year, able to read diſtinctly and rapidly any Engliſh book; and with a view to the cultivation of his memory, ſhe cauſed him to learn and repeat ſome of the moſt popular ſpeeches in Shakſpeare, and the beſt of Gay's fables. His propenſity to reading was ſignally manifeſted in his fifth year; and in his ſixth he was initiated by the aſſiſtance of a friend in the rudiments of the Latin grammar. At Michaelmas 1753, in the cloſe of his ſeventh year, he was placed at Harrow ſchool, of which Dr. Thackeray was the head maſter. During the two firſt years of his reſidence in this ſeminary, he was diſtinguiſhed more by diligence than by ſuperiority of talents; but his faculties gained ſtrength by exerciſe, and the proſpect of the eminence to which he afterwards attained gradually brightened. His mother, who anxiouſly watched over his progreſs, improved the opportunities which his vacations, and the abſence of 12 months from ſchool, in conſequence of the fracture of his thigh-bone, afforded, of increaſing his acquaintance with his native tongue, and with Engliſh authors, and of teaching him alſo the rudiments of drawing, in which ſhe herſelf excelled. During this interval, the progreſs of his claſſical ſtudies was interrupted. However, on his return to ſchool, he was placed in the claſs to which he would have attained, if no interruption had occurred. This error of judgment, on the part of his maſter, though it ſubjected him to corporal puniſhment and degradation for non-performance of exerciſes which ſhould not have been required, and though it produced in his mind an invincible abhorrence of his maſter's conduct, ſerved to rouſe his emulation, and to call forth the exertion of his native powers; ſo that in a little while he was advanced to the head of his claſs, and might, if he had been ſo diſpoſed, have retorted on his claſs-fellows their former reproaches of his indolence or dulneſs. In his 12th year, he was removed to the upper ſchool. At this time a circumſtance occurred, which afforded ſignal evidence of the ſtrength and tenaciouſneſs of his memory. His ſchool-fellows propoſed to amuſe themſelves with the repreſentation of a play; and at his recommendation the Tempeſt was ſelected; but not being able to procure a copy, he furniſhed them with it from his memory; and in the exhibition he performed the part of Proſpero. As he advanced in the ſchool, his diligence increaſed; and he commenced the ſtudy of the Greek language. At this time he tranſlated into Engliſh verſe ſeveral of the epiſtles of Ovid, and all the paſtorals of Virgil; and he compoſed a dramatic piece on the ſtory of Meleager, which he denominated a tragedy, and which, during the vacation, was acted by ſome of his moſt intimate ſchool-fellows; the part of the hero being performed by himſelf. His acquaintance with proſody was very diſtinguiſhed; ſo that he was able to ſcan the trochaic and iambic verſes of Terence, before his companions ſuſpected that they were any thing but mere proſe. At ſchool he wrote the exerciſes of many boys in the two ſuperior claſſes, and thoſe in his own claſs were happy to become his pupils. During the holidays he learned the rudiments of French and arithmetic; and in this early age he was highly gratified by being honoured with an admiſſion to the ſociety of learned and ingenious men at the houſe of Mr. Baker and his friend Mr. Pond. At the requeſt of his mother he read the "Spectacle de la Nature;" but derived greater amuſement, as he acknowledged, from the Arabian tales, and from Shakſpeare, whoſe poems and plays he repeatedly peruſed with increaſed delight. At Harrow he invented a political play, in which Dr. Bennet, biſhop of Cloyne, and the celebrated Dr. Parr, were his principal aſſociates. "They divided the fields in the neighbourhood of Harrow, according to a map of Greece, into ſtates and kingdoms; each fixed upon one as his dominion, and aſſumed an ancient name. Some of their ſchool-fellows conſented to be ſtyled barbarians, who were to invade their territories and attack their hillocks, which were denominated fortreſſes. The chiefs vigorouſly defended their reſpective domains againſt the incurſions of the enemy; and in theſe imitative wars the young ſtateſmen held councils, made vehement harangues, and compoſed memorials, all doubtleſs very boyiſh, but calculated to fill their minds with ideas of legiſlation and civil government. In theſe unuſual amuſements Jones was ever the leader." In his 15th year Dr. Thackeray was ſucceeded by Dr. Sumner, who ſoon diſcovered the talents and acquirements of his pupil; and who afforded him every advantage in the proſecution of his ſtudies which he had it in his power to grant him. Indeed this excellent inſtructor of youth, with an excuſable partiality and an amiable modeſty, was heard to declare, "that Jones knew more Greek than himſelf, and was a greater proficient in the idiom of that language." During the two years which he ſpent with Dr. Sumner, he employed his time in reading and imitating the beſt ancient authors of Greece and Rome; and, devoting the night as well as the day to ſtudy, he acquired the knowledge of the Arabic characters, and a ſufficient acquaintance with the Hebrew language to enable him to read ſome of the Pſalms in the original. His reputation was at this early period of his life ſo extenſive, "that he was often flattered by the inquiries of ſtrangers, under the title of the great ſcholar." Some of his juvenile compoſitions, both in proſe and verſe, may be found in the fragment of a work which he began at ſchool, and entitled "Limon," in imitation of Cicero, and may be found in the complete edition of his works. His inceſſant application occaſioned a weakneſs in his ſight, which rendered it neceſſary for Dr. Sumner to interdict it during the laſt months of his reſidence at Harrow. The intervals of interrupted ſtudy, which he reluctantly allowed himſelf, were employed in learning cheſs, by practiſing the games of Philidor. As he was intended for the profeſſion of the law, for which, however, he does not ſeem to have had any great predilection, ſome of his friends recommended his being placed, at the age of 16, in the office of a ſpecial pleader; others, however, wiſhed him to be removed from Harrow to one of the univerſities. The choice of an univerſity was for ſome time the ſubject of deliberation; but at length Oxford was preferred in conſequence of the recommendation of Dr. Glaſſe, and the inclination of his mother, who determined to reſide with him at the univerſity. In the ſpring of 1764 he was matriculated and admitted into Univerſity college; and in the following term, after having ſpent a few months at Harrow, in order to finiſh a courſe of lectures in which he was much intereſted, he fixed himſelf at Oxford. Upon his firſt ſettlement in the univerſity he was rather diſguſted than pleaſed with the plan of education. "Inſtead of pure principles on the ſubjects of taſte, on rhetoric, poetry, and practical morals, he *complained* that he was required to attend dull comments on artificial ethics, and logic detailed in ſuch barbarous Latin, that he profeſſed to know as little of it as he then knew of Arabic." The only logic then in faſhion was that of the ſchools: and in a memorandum written by himſelf, which," ſays his biographer, lord Teignmouth, "is my authority for theſe remarks, I find an anecdote related of one of the fellows, who was reading Locke with his own pupils, that he carefully paſſed over every paſſage in which that great metaphyſician derides the old ſyſtem." After a reſidence of a few months at the univerſity, on the 31ſt of October, 1764, Mr. Jones was unanimouſly elected one of the four ſcholars on the foundation of ſir Simon Bennett, for which aſſiſtance he was grateful; more eſpecially as the proſpect of a fellowſhip was remote. Addicted to oriental literature for ſeveral years, he now indulged his inclination by the ſtudy of Arabic under the example and encouragement of a fellow ſtudent, and with the aſſiſtance of a native of Aleppo. His ſituation at the univerſity became gradually more pleaſant to him than it was at firſt; for his college tutors, perceiving that his whole time was devoted to improvement, diſpenſed with his attendance on their lectures, and even allowed him to purſue his ſtudies in a manner agreeable to his taſte and inclination. To the peruſal of the principal Greek poets and hiſtorians, and of the entire works of Plato and Lucian, he added the ſtudy of the Arabic and alſo of the modern Perſic languages. During his vacations, which he ſpent in London, he attended the ſchools of Angelo, in order to acquire the elegant accompliſhments of riding and fencing; and at home he directed his attention to the modern languages; reading the beſt authors in Italian, Spaniſh, and Portugueſe. The poſſeſſion of a fellowſhip, which he was anxious of obtaining, partly for relieving his mother from the burden of his education, and partly for ſecuring ſome kind of independence, however inconſiderable, to himſelf, was ſtill at a diſtance; and he almoſt deſpaired of obtaining it. Having been recommended to the family of earl Spencer by Dr. Shipley, to whom he was not perſonally known, but who was not unacquainted with his compoſitions at Harrow, an offer was made to him by Mr. Arden, related, by marriage, to his friend Sumner, of being private tutor to lord Althorp, now earl Spencer. The propoſal was cheerfully accepted, and upon an interview with his pupil, then ſeven years old, he was ſo pleaſed, that he determined to give up all thoughts of a profeſſion, and to devote himſelf to the faithful diſcharge of the duties of education now devolved upon him. In the ſummer of 1765, he wholly left the univerſity, and entered on his new office. At Wimbledon, where he reſided till the approach of winter, he found leiſure to compoſe many of his Engliſh poems, and to read the greateſt part of the Old Teſtament in Hebrew, particularly the book of Job, and the Prophets, which he ſtudied with great attention. In the following ſummer a fellowſhip became vacant, and he was elected to it Aug. 7, 1766. At this time he was offered by the duke of Grafton, then at the head of the treaſury, the place of interpreter for Eaſtern languages, which he politely declined, apprehending that it would be inconſiſtent with his other engagements and purſuits. In the courſe of this ſummer he formed an acquaintance with a young lady, Anna Maria, the eldeſt daughter of Dr. Shipley, then dean of Wincheſter, who was viſiting at Wimbledon, to which he owed the happineſs of his future life. But ſuch were his views of an honourable independence, and his reſolution never to owe his fortune to a wife, or her kindred, that, notwithſtanding the impreſſions made upon his heart by the perſon and converſation of this lady, he could not then admit any idea of a matrimonial connection. In the following winter he attended the two ſchools of Angelo, and by a ſecret arrangement with Gallini, acquired the accompliſhment of dancing. Having occaſion to accompany lord Spencer's family to Spa in the ſummer of 1767, he improved himſelf, during the ſhort period of three weeks' reſidence in this place, in the art of dancing, by the leſſons of Janſon of Aix-la-Chapelle, and acquired a very conſiderable knowledge of the German language. In the year 1768 application was made to Mr. Jones by the ſecretary of ſtate, on behalf of the king of Denmark, then in England, requeſting him to give a literal tranſlation of the life of Nadir Shah in the French language. Having for ſome time declined the propoſal, he at length accepted it; and the tranſlation was publiſhed, after ſome delay, in the year 1770. To the hiſtory of Nadir Shah, he added a treatiſe on Oriental Poetry, which treatiſe, executed by a young man in his 23d year, has been juſtly conſidered as an extraordinary performance; "inſtructive and elegant, intereſting from its novelty, entertaining from its ſubject and variety, and exhibiting the combined powers of taſte and erudition." Being at Tunbridge in 1768, he then began to learn muſic, and afterwards received leſſons from Evans on the Welſh harp. We may here mention his attendance on a courſe of anatomical lectures by the celebrated Hunter, and his ſtudy of the mathematics, which he ſo well underſtood, as to be able to read and underſtand Newton's Principia.

In the beginning of this year he had commenced an acquaintance with Reviczki, afterwards the imperial miniſter at Warſaw, and ambaſſador at the court of England, with the title of count. This accompliſhed nobleman being captivated by the charms of oriental literature, cultivated an intimacy with Mr. Jones, which was continued by a correſpondence, that was carried on for many years. Many of the letters that paſſed between them on their favourite ſubject are publiſhed in the life by lord Teignmouth. In the ſummer of 1769, Mr. Jones attended his pupil to Harrow; and it was with peculiar ſatisfaction that he renewed that intercourſe with Dr. Sumner, which had been for ſome time interrupted, though not altogether diſcontinued. Here he tranſcribed a Perſian grammar, which three years before he had compoſed for a ſchool-fellow, who was deſtined for India; he alſo began a dictionary of the Perſian language.

Of the religious principles of Mr. Jones ſome account may be reaſonably expected. Whilſt he was at Harrow, in his 24th year, we have reaſon to believe that his faith in Chriſtianity was not unblended with doubts. Indeed no particular attention ſeems to have been paid to this part of his education; a circumſtance which, we confeſs, appears to us ſurpriſing, and for which we are unable to account. His mind, however, was ſo upright and ſo well diſpoſed, that he expreſſed his doubts, not in the too faſhionable mode of conceited cavilling, but with a ſincere deſire of obtaining a ſolution of them. Finding himſelf diſappointed, he determined to examine the ſubject for himſelf, and to peruſe the whole ſcripture in the original, that he might be enabled to form a correct judgment of the connection between the two parts, and of their evidence both internal and external. The reſult was a firm belief in the authenticity and inſpiration of the ſacred writings. About this time he drew up a ſeries of propoſitions, which have been found in his own hand-writing in a Hebrew copy of the book of Hoſea, and which contain the ſketch of a demonſtration of the divine authority of the Chriſtian religion. To theſe propoſitions, tranſcribed by his biographer, the following note is ſubjoined: "what muſt be the importance of a book," of which it may be truly ſaid, "if this book be not true, the religion which we profeſs is falſe?"

Towards the end of the year 1769, Mr. Jones accompanied lord Spencer's family to the continent. Soon after his return he adopted the reſolution of altering his plan of life. The courſe which he was purſuing, however agreeable it was rendered to him by the family with which he was connected, did not exactly correſpond to that idea and ſpirit of independence which marked his character. "He united the laudable deſire of acquiring public diſtinction and of making his fortune by his own efforts: above all, he was animated with the noble ambition of being uſeful to his country;" accordingly he determined to devote himſelf to the ſtudy and practice of the law; and with this view he was admitted into the Temple on the 19th of September 1770. His attachment to Oriental literature and to general ſcience, however, continued unabated, notwithſtanding the time and attention which he devoted to his new profeſſion. In 1772 he publiſhed a ſmall volume of poems, conſiſting chiefly of tranſlations from the Aſiatic languages, with two proſe diſſertations annexed: and though he does not appear to have communicated any paper for the Philoſophical Tranſactions, he was, on the 30th of April 1772, elected a fellow of the Royal Society. On occaſion of taking his Maſter's degree in the univerſity in 1773, he compoſed an oration, intending to have ſpoken it in the theatre. The ſpeech was publiſhed 10 years after, and the topics that characterize it are, "an ardent love of liberty, an enthuſiaſtic veneration for the univerſity, a warm and diſcriminate eulogium on learned men, who devoted their talents and labours to the cauſe of religion, ſcience, and freedom." In the commencement of 1774, he publiſhed his commentaries on Aſiatic poetry, a work begun in 1766, and finiſhed in 1769, when he was in his 23d year, which "was received with admiration and applauſe by the oriental ſcholars of Europe in general, as well as by the learned of his own country." To theſe commentaries is annexed an elegant addreſs to the Muſe, in which Mr. Jones declares his purpoſe of renouncing polite literature, and devoting himſelf altogether to the ſtudy of the law. In January 1774 he was called to the bar; and for ſome years he ſeems to have inflexibly adhered to the above-mentioned reſolutions. For ſome time he declined practice, and ſedulouſly applied himſelf to his legal ſtudies. In 1775, for the firſt time, he attended the ſpring circuit and ſeſſions at Oxford; perhaps more as a ſpectator than an actor; and in the following year he was regular in his attendance at Weſtminſter-hall. In 1778 he publiſhed a tranſlation of the ſpeeches of Iſæus, in cauſes concerning the law of ſucceſſion to property at Athens, with a prefatory diſcourſe, notes critical and hiſtorical, and a commentary. The year

1784

1784 forms an intereſting era in the memoirs of Mr. Jones. His profeſſional practice had increaſed, and afforded a proſpect of farther enlargement with augmented profit; but as his views were particularly directed to the vacant ſeat on the bench of Fort William in Bengal, and as lord North had encouraged his expectation of occupying it, he was leſs anxious about the augmentation of buſineſs in his legal profeſſion. In this ſtate of ſuſpence, the political events of the times engaged his attention. To the American war, in its commencement and further progreſs, he was decidedly adverſe. At this time the reflections which he indulged dictated a very animated and claſſical ode to liberty, which he compoſed in Latin, and publiſhed under the title of "Julii Meleſigoni ad Libertatem," the aſſumed name being formed by a tranſpoſition of the letters of Gulielmus Joneſius. This ode ſtrongly diſplays his genius, erudition, feelings, and political principles. The vacancy of a ſeat in parliament for the univerſity of Oxford being likely to occur, Mr. Jones was encouraged by his friends to offer himſelf as a candidate; but though he was ambitious of this honour, the diſappointment gave him no great concern. Although this conteſted election occupied a conſiderable portion of his thoughts and time, he found leiſure to publiſh a ſmall pamphlet, entitled "An Inquiry into the legal Mode of ſuppreſſing Riots, with a conſtitutional Plan of future Defence." In a ſpeech, eminently characteriſtic of his principles and feelings, which he intended to have delivered at a meeting of the freeholders of Middleſex, aſſembled Sept. 9th of this year, for nominating two repreſentatives in the new parliament, he reprobated the American war and the conduct of the late parliament in ſupporting it: he expreſſed his ſentiments without reſerve on the African ſlave trade, and avowed the conduct which he would have purſued, if he had been placed in the houſe of commons. In the courſe of this year, the death of his mother, to whom he was attached by every poſſible tie of nature, affection, and gratitude, involved him in the deepeſt affliction. In this and the following year he was diligently employed in his profeſſional ſtudies and practice, whilſt literature and politics alſo engaged a degree of his attention; but the principal object of his ambition and hopes was the vacant ſeat on the bench in India. Whatever was connected with this object intereſted his thoughts; and hence he was led to undertake the tranſlation of an Arabian poem on the Mohammedan law of ſucceſſion to the property of inteſtates. In the year 1782 the public attention was much occupied with attempts to procure, by conſtitutional means, a reformation of parliament. This was a buſineſs congenial to Mr. Jones's ſentiments and feelings; and he concurred in the public efforts for this purpoſe, both by ſpeaking and writing. About this time he publiſhed his "Eſſay on the Law of Bailments;" and in the ſame year, 1782, he became a member of the Society for Conſtitutional Information. In his letter of acknowledgment for being elected into this ſociety, he profeſſes his attachment to the excellent conſtitution of his country; and then adds, "on the people depend the welfare, the ſecurity, and the permanence of every legal government; in the people muſt reſide all ſubſtantial power; and to the people muſt all thoſe, in whoſe ability and knowledge we ſometimes wiſely, often imprudently, confide, be always accountable for the due exerciſe of that power with which they are for a time entruſted." Whilſt he was at Paris, in the year 1782, he wrote a little "jeu d'eſprit," as he calls it; and of which he ſays, in a letter to lord Althorp, "it was printed here by a ſociety, who, if they will ſteer clear of party, will do more good to Britain, than all the philoſophers and antiquaries of Somerſet houſe. But to ſpeak the truth, I greatly doubt, whether they, or any other man in this country, can do it ſubſtantial good. The nation, as Demoſthenes ſays, will be fed like a conſumptive patient, with chicken broth and panada, which will neither ſuffer him to expire, nor keep him wholly alive." This "jeu d'eſprit" was a "Dialogue between a Farmer and Country Gentleman on the Principles of Government." After a bill of indictment had been found againſt the dean of St. Aſaph, for the publication of the edition, which was printed in Wales, ſir William Jones ſent a letter to lord Kenyon, then chief-juſtice of Cheſter, in which he avowed himſelf to be the author of the dialogue, and maintained that every poſition in it was ſtrictly conformable to the laws and conſtitution of England. In the beginning of 1783, Mr. Jones publiſhed his tranſlation of the ſeven Arabian poems, which he had finiſhed in 1781. The moſt intereſting period of Mr. Jones's life was now approaching; for in March 1783, by the active friendſhip of lord Aſhburton, and under the adminiſtration of lord Shelburne, he was appointed a judge of the ſupreme court of judicature at Fort William in Bengal, on which occaſion he received the honour of knighthood; and in the April following, he married Anna Maria Shipley, the eldeſt daughter of the biſhop of St. Aſaph, a lady to whom he had been long attached, who deſerved his moſt affectionate eſteem, who contributed in a very high degree to his domeſtic happineſs, and who lamented his death with a moſt pungent and permanent grief. To the publications of ſir William Jones, which we have already noticed, we ſhall here add an abridged hiſtory of the life of Nadir Shah, in Engliſh, and a hiſtory of the Perſian language, intended to be prefixed to the firſt edition of his Perſian grammar.

Sir William Jones embarked for India in the Crocodile frigate, and in April 1783 left his native country. He was now in his 37th year, with his faculties in full vigour, in poſſeſſion of the appointment to which his views had been long directed, indulging the expectation of acquiring an ample independence, and having no reaſon to apprehend that the climate of India would be hoſtile to his conſtitution. He could not be ſorry to abandon the political diſcuſſions, that divided his friends and alienated them from one another; and which muſt have produced mutual ſhyneſs and reſerve between him and thoſe to whom he was in other reſpects attached; and which ſerved to agitate the whole country. He had with him a companion and friend, from whoſe ſociety he could not but derive the greateſt ſatisfaction and comfort, which kindred minds and united hearts are capable of receiving and communicating. In ſuch ſociety, and with ample reſources in his own mind, a kind of temporary baniſhment from his country would be tolerable, the long voyage would not be tedious and unintereſting, and a ſettlement for important and beneficial purpoſes in a foreign land would be regarded without anxiety and averſion. In September 1783 he landed ſafely at Calcutta, and was received with cordial congratulations by thoſe who were chiefly intereſted in his arrival. In the following December he entered upon his judicial functions, and at the opening of the ſeſſions, delivered to the grand jury his firſt charge, which was conciſe, elegant, appropriate, and conciliatory. Scientific objects, during the intervals of profeſſional duties, engaged his attention; and in order to combine the efforts of many in uſeful purſuits, he deviſed the inſtitution of a ſociety in Calcutta, ſimilar in its plan and objects to thoſe that have been eſtabliſhed in the principal cities of Europe. See SOCIETY.

In the year ſucceeding that of his arrival, ſir William Jones was attacked with a diſorder which exhauſted his ſtrength, and threatened his valuable life. As ſoon, however, as he was able to undertake it, he projected a journey to Benares, principally with a view of opening ſources of uſeful information. He proceeded by way of Moorſhedabad, Jungepore, Bhagilpoor, and Patna, to Benares. In the courſe of this journey his diſorder once and again returned upon him, and ſeemed to excite in his mind an apprehenſion of its fatal termination. That this was the caſe we infer from a prayer which he compoſed on this occaſion, and which is as follows :

" O thou beſtower of all good ! if it pleaſe thee to continue my eaſy taſks in this life, grant me ſtrength to perform them as a faithful ſervant ; but if thy wiſdom hath willed to end them by this thy viſitation, admit me, not weighing my unworthineſs, but through thy mercy declared in Chriſt, into thy heavenly manſions, that I may continually advance in happineſs, by advancing in true knowledge and awful love of thee, thy will be done !"

After a ſhort reſidence at Benares, he returned by the Ganges to Bhagilpoor ; and in his journey from hence to Calcutta, he viſited Gour, once the reſidence of the ſovereigns of Bengal. In a letter written to a friend after his return, he ſays, " As we approached Calcutta we perceived the difference of climate, and thought of Bhagilpoor with pleaſure and regret." " I am juſt returned," ſays he, in another letter, " as it were from the brink of another world, having been abſent near ſeven months ; and reduced to a ſkeleton by fevers of every denomination, with an obſtinate bilious flux at their heels. My health is tolerably reſtored by a long ramble through South Bahar, and the diſtrict of Benares." During this tour he wrote two tracts ; one a little tale in verſe, under the title of " The Enchanted Maid," or " Hindu Wife ;" and the other, " A Treatiſe on the Gods of Greece, Italy, and India," afterwards preſented to the Society, and publiſhed in the Aſiatic Reſearches. The deſign of this work is to evince a reſemblance, too ſtrong to have been accidental, between the popular worſhip of the old Greeks and Italians, and that of the Hindus, and between their ſtrange religion and that of Egypt, China, Perſia, Phrygia, Phœnicia, and Syria, and even remoter nations. This reſemblance, if it were eſtabliſhed, would authoriſe, as ſir William Jones conceives, an inference of a general union and affinity between the moſt diſtinguiſhed inhabitants of the primitive world, at the time when they deviated, as they did too early deviate, from the rational adoration of the only true God. Sir William Jones, with his reſtored health, reſumed his functions in the ſupreme court of judicature, and renewed the meetings of the ſociety, interrupted by his abſence. The ſociety of ſir William Jones was ſo much valued and ſought for, and he was ſubject to ſo many intruſions, that, for the ſake of enjoying the benefit of air and exerciſe, and of purſuing his literary purſuits without interruption, he made choice of a reſidence at Criſhnagur, where the ſoil was dry, and the air pure. To the Aſiatic Miſcellany, a periodical work undertaken at Calcutta in 1785, but altogether unconnected with the Aſiatic ſociety, ſir W. Jones contributed occaſional compoſitions. Sir William, having long propoſed making an excurſion to Chatigan, the eaſtern limit of the Britiſh dominions in Bengal, executed his deſign after the receſs of the court in the beginning of 1786, and repaired thither by ſea. During his ſhort reſidence at Chatigan, he found leiſure, amidſt other occupations, to peruſe twice the heroic poem of Ferdoſi, the Homer of Perſia, ſuppoſed to contain 60,000 couplets. But the work to which his principal attention and labour were directed, was a tranſlation of the Hindu and Mohammedan laws. Accordingly, in one of his letters, he ſays, " Sanſcrit and Arabic will enable me to do this country more eſſential ſervice, than the introduction of arts, (even if I ſhould be able to introduce them,) by procuring an accurate digeſt of Hindu and Mohammedan laws, which the natives hold ſacred, and by which both juſtice and policy require that they ſhould be governed." Accordingly, he addreſſed a letter to the governor-general, lord Cornwallis, on this ſubject. The marquis Cornwallis conſidered the accompliſhment of the propoſed plan, as calculated to reflect the higheſt honour on his adminiſtration. With this ſanction ſir W. Jones entered on the execution of the work ; and having carefully ſelected, from the moſt learned Hindus and Mohammedans, a ſufficient number of perſons duly qualified for the taſk of compilation, he traced the plan of the digeſt, preſcribed its arrangement, and pointed out the MSS. from which it was to be formed. Although it is much to be regretted that ſir W. Jones did not live to tranſlate the digeſt of Hindu law, to the compilation of which he had devoted ſo much attention and labour ; yet it is ſatisfactory to know, that his benevolent intentions have not been diſappointed, and that Mr. H. T. Colebrooke, in the civil ſervice of the Eaſt India company at Bengal, from motives of public ſpirit, and a laudable hope of diſtinction, has completed a tranſlation of it with an ability which does him the higheſt credit. Sir W. Jones ſuggeſted an improvement in the police at Calcutta, ſo as to render it more efficient, and more conformable to the Britiſh conſtitution. His ſuggeſtions were adopted in an application to parliament, and confirmed by its ſanction. The application of ſir W. was inceſſant ; and after what he calls his " ſeaſoning," the ſtate of his health allowed his devoting ſeven hours a day for four or five months in the year to profeſſional engagements, and unremitted attention, during the vacations, to a complete knowledge of India, which was to be obtained only in the country itſelf, where it was his intention not to prolong his ſtay beyond the laſt year of the eighteenth century. Among other literary occupations which engaged his attention, he undertook the charge of editing the elegant poem of Hatefi, on the unfortunate loves of Laili and Majnon, an Arabian youth and princeſs. He publiſhed the book at his own expence, and appropriated the profits of the ſale to the relief of inſolvent debtors in the gaol at Calcutta. The buſineſs that was devolved upon him as preſident of the ſociety at Calcutta, and in conſequence of preparing the various excellent papers which he contributed to it, will be more particularly noticed in our account of that *Society*. In the year 1789, ſir William preſented to the public a tranſlation of an ancient Indian drama, entitled " Sacontala," or the " Fatal Ring," exhibiting a very pleaſing and authentic picture of old Hindu manners, and one of the greateſt curioſities that the literature of Aſia had yet brought to light. Calidas, the author of it, called by ſir W. the Shakſpeare of India, lived in the firſt century B. C., and wrote ſeveral other dramas and poetical pieces. The principal ſources of amuſement of which ſir W. availed himſelf, was the converſation of the Pundits, with whom he talked freely, in the language of the gods (Sanſcrit), and botany, in which latter ſtudy, if it may be ſo called, he was much aſſiſted by lady Jones. Their evenings were generally paſſed together, and devoted to the peruſal of the beſt modern authors in the different languages of Europe. We find, however, from ſeveral of his letters, that he felt great anxiety concerning the debilitated ſtate of her health, and that, painful as muſt be their mutual ſeparation, he had engaged her promiſe to take her paſſage for Europe in January 1793. Such was her affectionate attachment to her huſband, that ſhe remained in India in oppoſition to the advice of her phyſicians, though ſhe could entertain no reaſonable expectation of recovering her health in the climate of that country. It was finally ſettled, however, that ſhe ſhould return to England ; and it was his determination to follow her in the enſuing ſeaſon, hoping at that period to have diſcharged his engagements with the government of India, and intending to purſue his reſearches through Perſia or China by a circuitous route, to his native country. Lady Jones embarked in December 1793. Soon after her departure, *viz.* in the beginning of 1794, ſir William Jones publiſhed a tranſlation of the Ordinances of Menu, compriſing the Indian ſyſtem of duties, religious and civil. In this work he had been long engaged from motives ſimilar to thoſe which had induced him to undertake the compilation of the digeſt; *viz.* to aid the benevolent intentions of the legiſlature of Great Britain, in ſecuring to the natives of India the adminiſtration of juſtice, to a certain extent, by their own laws.

To thoſe who entertain a juſt ſenſe of the importance of the principles and the utility of the duties of religion, the following prayer, compoſed by ſir W. Jones on the firſt day of the year 1782, about fifteen months before his embarkation for India, and more than twelve years before his death, will not be unacceptable:——"Eternal and incomprehenſible *Mind*, who, by thy boundleſs *power*, before time began, createdſt innumerable *worlds*, for thy *glory*, and innumerable orders of *beings* for their *happineſs*, which thy infinite *goodneſs* prompted thee to deſire, and thy infinite *wiſdom* enabled thee to know! We, thy *creatures*, vaniſh into nothing before thy ſupreme majeſty; we hourly feel our *weakneſs;* we daily bewail our *vices;* we continually acknowledge our *folly;* thee only we *adore* with awful veneration; thee we thank with the moſt fervent zeal; thee we *praiſe* with aſtoniſhment and rapture; to thy *power* we humbly ſubmit; of thy *goodneſs* we devoutly implore protection; on thy *wiſdom* we firmly and cheerfully rely. We do but open our *eyes*, and inſtantly we perceive thy divine exiſtence; we do but exert our *reaſon*, and in a moment we diſcover thy divine *attributes;* but our eyes could not behold thy *ſplendour*, nor could our *minds* comprehend thy divine *eſſence;* we *ſee* thee *only* through thy ſtupendous and all-perfect *works;* we *know* thee *only* by that ray of ſacred light which it has pleaſed thee to reveal. Nevertheleſs, if creatures too *ignorant* to *conceive*, and too *depraved* to *purſue*, the means of their own happineſs, may, without preſumption, expreſs their wants to their CREATOR, let us humbly ſupplicate thee to remove from us that *evil*, which thou haſt permitted for a *time* to exiſt, that the *ultimate good* of all may be complete, and to ſecure us from that *vice*, which thou ſuffereſt to ſpread ſnares around us, that the triumph of virtue may be more conſpicuous. Irradiate our minds with all *uſeful truth;* inſtil into our hearts a ſpirit of *general benevolence;* give *underſtanding* to the fooliſh; *meekneſs* to the proud; *temperance* to the diſſolute; *fortitude* to the feeble-hearted; *hope* to the deſponding; *faith* to the unbelieving; *diligence* to the ſlothful; *patience* to thoſe who are in *pain;* and thy celeſtial aid to thoſe who are in *danger:* comfort the *afflicted;* relieve the *diſtreſſed;* ſupply the *hungry* with ſalutary food; and the *thirſty* with a plentiful ſtream. Impute not our *doubts* to indifference, nor our *ſlowneſs of belief* to *hardneſs of heart;* but be indulgent to our *imperfect nature*, and ſupply our *imperfections* by thy *heavenly favour*. 'Suffer not, we anxiouſly pray, ſuffer not *oppreſſion* to prevail over *innocence*, nor the *might* of the *avenger* over the *weakneſs* of the *juſt.*' Whenever we addreſs thee in our retirement from the vanities of the world, if our prayers are *fooliſh*, *pity* us; if *preſumptuous*, *pardon* us; if *acceptable* to thee, grant them, all-powerful God, grant them; and, as with our *living* voice, and with our *dying* lips, we will expreſs our ſubmiſſion to thy *decrees*, adore thy *providence*, and bleſs thy *diſpenſations;* ſo in all *future* ſtates, to which we reverently hope thy *goodneſs* will raiſe us, grant that we may continue *praiſing, admiring, venerating, worſhipping* thee more and more, through *worlds* without *number*, and *ages* without *end!*" This prayer is undoubtedly the effuſion of a truly pious mind, impreſſed with juſt ſentiments of the Deity and of human nature; and though it does not expreſs any explicit faith in the doctrines of Chriſtianity, theſe ſentiments are ſuch as reaſon and experience ſuggeſt, and ſuch as revelation expreſsly teaches us. It ſhould alſo be recollected, that long before this prayer was written, ſir W. Jones had demonſtrated, as we have already obſerved, to his own ſatisfaction, that Jeſus was the Meſſiah predicted by the prophets. We have alſo farther evidence, which no incredulity can conteſt, of his firm belief in the divine authority of the ſcriptures and divine miſſion of Jeſus Chriſt. Of the ſacred writings, he ſays, in a paſſage tranſcribed from his own MS. in his bible: "I have carefully and regularly peruſed theſe holy ſcriptures, and am of opinion, that the volume, independently of its divine origin, contains more ſublimity, purer morality, more important hiſtory, and finer ſtrains of eloquence, than can be collected from all other books, in whatever language they may have been written." It would indeed be endleſs to cite paſſages from his writings, which demonſtrate his ſentiments on the ſubject of revelation, and at the ſame time his earneſt ſolicitude to impreſs his own belief on others. In this connection we cannot forbear tranſcribing a paſſage from the Memoirs of his biographer, which do honour to his judgment and his heart.

"In matters of eternal concern," ſays lord Teignmouth, "the authority of the higheſt human opinions has no claim to be admitted, as a ground of belief; but it may, with the ſtricteſt propriety, be oppoſed to that of men of inferior learning and penetration; and, whilſt the pious derive ſatisfaction from the peruſal of ſentiments according with their own, thoſe who doubt or diſbelieve, ſhould be induced to weigh, with candour and impartiality, arguments which have produced conviction in the minds of the beſt, the wiſeſt, and the moſt learned of mankind."

After the departure of lady Jones, "whoſe ſociety had ſweetened the toil of application, and cheered his hours of relaxation," ſir William mixed more in promiſcuous ſociety; "but his affections were tranſported with her to his native country," and, without doubt, led him to anticipate, with an anxiety blended with delight, the period which he had fixed in his own mind for leaving India, and renewing his intercourſe with her, and with other friends. But Providence had otherwiſe determined. On the evening of the 20th of April, or nearly about that date, in 1794, he prolonged his walk to a late hour; in conſequence of which he complained of aguiſh ſymptoms; but feeling no alarm he jocularly repeated an old adage; "An ague in the ſpring is medicine for a king." But his complaint, of which he had no apprehenſion, was that which is common in Bengal, *viz.* an inflammation in the liver. The medicines preſcribed by the phyſician who attended him, and who ſoon diſcovered the nature of his diſorder, were adminiſtered without effect. The progreſs of the diſeaſe was uncommonly rapid, and terminated fatally on the 27th of April 1794. His biographer found him, on the morning of that day, "lying on his bed in a poſture of meditation; and the only ſymptom of remaining life was a ſmall degree of motion in the heart, which after a few ſeconds ceaſed, and he expired without a pang or groan. His bodily ſuffering, from the complacency of his features and the eaſe of his attitude, could not have been ſevere; and his mind muſt have derived conſolation from thoſe ſources where he had been in the habit of ſeeking it, and where alone, in our laſt moments, it can ever be found."

found." On the following day the funeral ceremony was performed, "with the honours due to his public ſtation; and the numerous attendance of the moſt reſpectable Britiſh inhabitants of Calcutta evinced their ſorrow for his loſs, and their reſpect for his memory."

The following epitaph, evidently intended for himſelf, was written by ſir William Jones, not long before his demiſe. It diſplays ſome ſtriking features of his character, reſignation to the will of his Creator, love and good-will to mankind; but it is modeſtly ſilent upon his intellectual attainments.

Here was depoſited
the mortal part of a man,
who feared God, but not Death;
and maintained independence,
but ſought not riches;
who thought
none below him, but the baſe and unjuſt,
none above him, but the wiſe and virtuous;
who loved
his parents, kindred, friends, and country,
with an ardour
which was the chief ſource of
all his pleaſures and all his pains;
and who, having devoted
his life to their ſervice,
and to
the improvement of his mind,
reſigned it calmly,
giving glory to his Creator,
wiſhing peace on earth,
and with
good will to all creatures,
on the [*Twenty-ſeventh*] day of [*April*]
in the year of our bleſſed Redeemer
One thouſand ſeven hundred [*and ninety-four.*]

By an unanimous vote of the Court of Directors of the Eaſt India Company, it was reſolved, that a monument to his memory ſhould be ordered, for the purpoſe of being erected in St. Paul's cathedral, with a ſuitable inſcription; and that a ſtatue of ſir William Jones ſhould be prepared at the expence of the company, and ſent to Bengal, with directions for its being placed in a proper ſituation there. A ſociety of gentlemen in Bengal, who had received their education at Oxford, ſubſcribed a ſum to be given, as a prize, for the beſt diſſertation on his character and merits, by any of the ſtudents of that univerſity; and the premium was adjudged to Mr. Henry Philpotts, A. M. Fellow of Magdalen college. Lady Jones teſtified her affection for ſir William, and her deſire to perpetuate his fame, by an elegant monument erected, at her expence, in the anti-chamber of Univerſity college, Oxford, and by the publication of his works in an elegant edition of ſix 4to. volumes; thus ſtrictly conforming to his opinion, that "the beſt monument that can be erected to a man of literary talents, is a good edition of his works."

"In the ſhort ſpace of 47 years," ſays his biographer, "by the exertion of rare intellectual talents, he acquired a knowledge of arts, ſciences, and languages, which has ſeldom been equalled, and ſcarcely, if ever, ſurpaſſed." Without conſidering him as a competitor in Grecian literature with a Porſon or a Parr, he deſerves to be ranked high among claſſical ſcholars; and "as a philologiſt, he could boaſt an univerſality in which he had no rival. His ſkill in the idioms of India, Perſia, and Arabia, has perhaps never been equalled by any European; and his compoſitions on oriental ſubjects diſplay a taſte, which we ſeldom find in the writings of thoſe who had preceded him in theſe tracts of literature. The language of Conſtantinople was alſo familiar to him; and of the Chineſe characters and tongue, he had learned enough to enable him to tranſlate an ode of Confucius. In the modern dialects of Europe, French, Italian, Spaniſh, Portugueſe, and German, he was thoroughly converſant, and had peruſed the moſt admired writers in thoſe languages." The following tranſcript of a paper written by himſelf, will inform us, how far his knowledge of languages extended;

LANGUAGES:

Eight languages ſtudied critically;
English, Latin, French, Italian,
Greek, Arabic, Perſian, Sanſcrit.

Eight ſtudied leſs perfectly, but all intelligible with a dictionary;

Spaniſh, Portugueſe, German, Runick,
Hebrew, Bengali, Hindi, Turkiſh.

Twelve ſtudied leſs perfectly, but all attainable;

Tibetian, Pâli, Phalavi, Deri,
Ruſſian, Syriac, Ethiopic, Coptic,
Welſh, Swediſh, Dutch, Chineſe.

Twenty-eight languages.

In another memorandum, he mentions having read a grammar of the Ruſſian and Welſh. The knowledge of languages, however, was, in ſir W. Jones's eſtimation, inferior and ſubordinate to other objects. They were, in his poſſeſſion, the keys of univerſal literature and ſcience, and ſerved, according to the uſe which he made of them, to unlock ſtorehouſes of ancient and modern treaſures, for the amuſement, inſtruction, and general benefit of mankind. The eleven diſcourſes which he addreſſed to the Aſiatic ſociety, and to which we ſhall have occaſion to refer under future articles, are ſpecimens of the uſes to which he applied them.

"A mere catalogue of the writings of ſir William Jones," ſays his biographer, "would ſhew the extent and variety of his erudition; a peruſal of them will prove, that it was no leſs deep than miſcellaneous. Whatever topic he diſcuſſes, his ideas flow with eaſe and perſpicuity, his ſtyle is always clear and poliſhed; animated and forcible, when his ſubject requires it. His philological, botanical, philoſophical, and chronological diſquiſitions, his hiſtorical reſearches, and even his Perſian grammar, whilſt they fix the curioſity and attention of the reader, by the novelty, depth, or importance of the knowledge diſplayed in them, always delight by elegance of diction. His compoſitions are never dry, tedious, nor diſguſting; and literature and ſcience come from his hands, adorned with all their grace and beauty. No writer, perhaps, ever diſplayed ſo much learning, with ſo little affectation of it." With regard to his law publications, it is ſaid, that his "Eſſay on Bailements" was ſanctioned by the approbation of lord Mansfield; and all his writings in this department ſhew, that he had thoroughly ſtudied the principles of law as a ſcience. As to his opinion of the Britiſh conſtitution, it appears from repeated declarations that occur in his letters, and particularly in his 10th diſcourſe, delivered to the Aſiatic ſociety in 1793, that he conſidered it as the nobleſt and moſt perfect that ever was formed. With regard to his political principles, he was an enlightened and decided friend to civil and religious liberty. Like many others of the ſame principles, he entertained a favourable opinion of the French revolution at its commencement,

ment, and wiſhed ſucceſs to the exertions of that nation for the eſtabliſhment of a free conſtitution: but ſubſequent events muſt have given him new views, not ſo much of the principles on which the revolution was founded, as of the meaſures which have been adopted by ſome of its zealous partizans. To liberty, indeed, his attachment was enthuſiaſtic, and he never ſpeaks of tyranny or oppreſſion, but in the language of deteſtation. He dreaded, and wiſhed to reſtrain every encroachment on liberty; and though he never enliſted under the banners of any party, he always concurred in judgment and exertion with thoſe who wiſhed to render pure and permanent the conſtitution of his country. With this view he was a zealous advocate for a reformation in the repreſentation of the country, as the only means of reſtoring the balance of the conſtitution, and in one of his letters to lord Althorp, he expreſsly declares, that "on the popular part of every government depend its real force, the obligation of its laws, its welfare, its ſecurity, its permanence." The laſt political publication of ſir W. Jones is prior to the year 1783.

As a judge in India, his conduct was ſtrictly conformable to the profeſſions which he made in his firſt charge to the grand jury at Calcutta. "On the bench he was laborious, patient, and diſcriminating; his charges to the grand jury, which do not exceed ſix, exhibit a veneration for the laws of his country; a juſt and ſpirited encomium on the trial by jury, as the greateſt and moſt invaluable right derived from them to the ſubject; a deteſtation of crimes, combined with mercy to the offender; occaſional elucidations of the law; and the ſtrongeſt feelings of humanity and benevolence. His knowledge of the Sanſcrit and Arabic eminently qualified him for the adminiſtration of juſtice in the ſupreme court, by enabling him to detect miſrepreſentations of the Hindu or Mohammedan laws, and to correct impoſitions in the form of adminiſtering oaths to the followers of Brahma and Mohammed. The inflexible integrity with which he diſcharged the ſolemn duty of this ſtation will long be remembered in Calcutta, both by Europeans and natives.

Having through life directed his attention to various branches of literature and ſcience, in all which he had made conſiderable proficiency, his laſt and favourite purſuit was the ſtudy of botany; and this conſtituted the principal amuſement of his leiſure hours.

It might naturally be inquired by what arts or method he was enabled to attain that extraordinary degree of knowledge for which he was diſtinguiſhed. His faculties were naturally vigorous and ſtrengthened by exerciſe; his memory, as we have before obſerved, was, from early life, ſingularly retentive; his emulation was ardent and unbounded; and his perſeverance invincible. In India his ſtudies began with the dawn; and, with the intermiſſion of profeſſional duties, were continued throughout the day. Another circumſtance, which has been exemplified in ſome other inſtances that might be mentioned, and which gave him peculiar advantage in the exerciſe of his talents, was "the regular allotment of his time to particular occupations, and a ſcrupulous adherence to the diſtribution which he had fixed;" ſo that "all his ſtudies were purſued without interruption or confuſion." With ſir W. Jones it was a favourite opinion, "that all men are born with an equal capacity for improvement." Accordingly ſir I. Newton modeſtly declared, "that if he had done the world any ſervice, it was due to nothing but induſtry and patient thought." Sir W. Jones having maintained the above-mentioned opinion in converſation with a friend, Thomas Law, eſq. received the following unpremeditated reply:

"Sir William, you attempt, in vain,
By depth of reaſon to maintain,
That all men's talents are the ſame,
And they, not nature, are to blame.
Whate'er you ſay, whate'er you write,
Proves your opponents in the right.
Leſt genius ſhould be ill-defin'd
I term it *your ſuperior mind*,
Hence to your friends 'tis plainly ſhewn,
You're ignorant of yourſelf alone."

Sir William Jones's Anſwer.

"Ah! but too well, dear friend, I know
My fancy weak, my reaſon ſlow,
My memory by art improv'd,
My mind by baſeleſs trifles mov'd.
Give me (thus high my pride I raiſe)
The ploughman's or the gardener's praiſe,
With patient and unceaſing toil,
To meliorate a ſtubborn ſoil,
And ſay, (no higher meed I aſk,)
With zeal haſt thou perform'd thy taſk.
Praiſe, of which virtuous minds may boaſt,
They beſt confer, who merit moſt."

Beſides the finiſhed productions of ſir William Jones's ſkill and labour, he had contemplated many more than he had executed: and for this reaſon, as well as many others, we cannot forbear regretting his premature death.

It is needleſs to add any thing in commendation of his private and ſocial virtues. The independence of his integrity, his probity and humanity, and alſo his univerſal philanthropy and benevolence, are acknowledged by all who knew him. The compiler of this article joins with many others in a grateful and reſpectful remembrance of his diſpoſition to perform acts of kindneſs; and he has reaſons, peculiar to himſelf, for regretting his premature death. In every domeſtic relation, as a ſon, a brother, and a huſband, he was attentive to every dictate of love, and to every obligation of duty. In his intercourſe with the Indian natives, he was condeſcending and conciliatory; liberally rewarding thoſe who aſſiſted him, and treating his dependents as friends. His biographer records the following anecdote of a circumſtance that occurred after his demiſe: "the Pundits who were in the habit of attending him, when I ſaw them at a public *durbar*, a few days after that melancholy event, could neither reſtrain their tears for his loſs, nor find terms to expreſs their admiration at the wonderful progreſs which he had made, in the ſciences which they profeſſed." Upon the whole, we may join with Dr. Parr, who knew his talents and character, in applying to ſir William Jones his own words: "It is happy for us that this man was born."

Having attained, by the aſſiduous exertion of his abilities, and in a courſe of uſeful ſervice to his country and mankind, a high degree of reputation; and by economy that did not encroach upon his beneficence, a liberal competence, he was prepared, one would have thought, at the age of 47 years, to enjoy dignity with independence. His plans, and the objects of his purſuit, in the proſpect of future life, were various and extenſive; and he would naturally indulge many pleaſing ideas in the view of returning, at a fixed period, to his native country, and to beloved friends, who would anxiouſly wiſh for his arrival. Few perſons ſeemed to be more capable of improving and enjoying prolonged life than ſir William Jones; and few perſons ſeemed to be better prepared for a more exalted ſtate of progreſſive improvement, and of permanent felicity, than that to which the moſt diſtinguiſhed and proſperous can attain within the regions of mortality.

We ſhall cloſe this article with obſerving that lady Jones, ſince the demiſe of ſir William, has preſented to the Royal Society a collection of MSS. Sanſcrit and Arabic, which he reckoned ineſtimable, and alſo another large collection of Eaſtern MSS.; of which a catalogue, compiled by Mr. Wilkins, is inſerted in the 13th volume of ſir William Jones's Works, 8vo. ed.

JONES, *Sir* THOMAS, lord chief juſtice of the Common Pleas in the reigns of Charles II. and James II., is celebrated for his reply to the latter, who conſulted him on his diſpenſing power, and ſaid he could ſoon have twelve judges of his opinion: ſir Thomas anſwered, "Twelve judges you may poſſibly find, ſir, but not twelve lawyers." He was author of Reports. Granger.

JONES, JEREMIAH, a learned Engliſh non-conformiſt divine in the eighteenth century, is ſuppoſed to have been born about the year 1693. It is not known where he received his grammar learning, but he was, at an early age, diſtinguiſhed for his proficiency in uſeful knowledge. He purſued his academical ſtudies under the tuition of his uncle, the Rev. Samuel Jones of Tewkſbury, in Glouceſterſhire, from whoſe ſeminary many pupils were ſent into the world, who became diſtinguiſhed for their literature or rank in life. Among theſe were Butler, afterwards biſhop of Durham; Secker, afterwards archbiſhop of Canterbury; and Samuel Chandler, miniſter of the Old Jewry meeting-houſe. When Mr. Jones had finiſhed his courſe of academical learning, he ſettled with a congregation of Proteſtant Diſſenters at Avening, in Glouceſterſhire. He obtained a high character for ſound and very extenſive learning; and he was popular as a preacher. Though a hard ſtudent and a profound ſcholar his manners were not ſevere or forbidding: he would even relax from his ſtudies and join a party in his neighbourhood in the exerciſe of bowls. He died in 1724, when he was only in his thirty-firſt year. During his life he publiſhed "A Vindication of the former Part of St. Matthew's Goſpel, &c." But his moſt valuable and important work, which he had prepared for the preſs before his death, but which was not publiſhed till the year 1726, was his "New and full Method of ſettling the Canonical Authority of the New Teſtament." The works of Mr. Jones remain as monuments of his learning, ingenuity, and indefatigable induſtry, and would have done credit to the aſſiduity and ability of a literary man of ſixty. They were become exceedingly ſcarce, and bore a very high price, when, about ten years ſince, the conductors of the Clarendon preſs republiſhed them. "Mr. Jones," obſerves Dr. Maltby, "has brought together, with uncommon diligence and judgment, the external evidence for the authenticity of the canonical books; and he has, with equal ability and fairneſs, ſtated his reaſons for deciding againſt the apocryphal." Had his life been ſpared, Mr. Jones would have drawn up another and diſtinct volume on the apoſtolical fathers. Monthly Magazine.

JONES, WILLIAM, a worthy clergyman of the church of England, was born at Lowick, in Northamptonſhire, in the year 1726. He laid a good foundation of grammar learning in the country, and when he was of a proper age he was admitted a ſcholar at the Charter-Houſe in London, where he made a rapid progreſs in the Latin and Greek languages, and at the ſame time ſhewed a turn for philoſophical purſuits. When he was about eighteen years of age, he was entered of Univerſity college, Oxford, and in this ſeminary he purſued the uſual courſe of ſtudies with unremitted diligence. Here he adopted the Hutchinſonian opinions in theology and natural philoſophy. Mr. Jones was admitted to the degree of B. A. in the year 1749, and was, in the ſame year, admitted to deacon's orders. In 1751, he was ordained prieſt, and in 1753, he publiſhed his "Full Anſwer to Biſhop Clayton's Eſſay on Spirit," in which he endeavoured to ſupport the cauſe of orthodoxy by an appeal to the religion and learning of heathen antiquity. His next work was entitled the "Catholic Doctrine of the Trinity," which was favourably received by the orthodox party. He now engaged in a courſe of experiments with the view of elucidating and eſtabliſhing his favourite theory. In this he was liberally ſupported by friends who ſubſcribed among themſelves very large ſums to enable him to purchaſe ſuch an apparatus as he ſtood in need of. The reſult of his labours was "An Eſſay on the firſt Principles of Natural Philoſophy," publiſhed in 1762. In the year 1764, he was preſented by archbiſhop Secker with the vicarage of Betherſden, in Kent. Here, to increaſe his income, he undertook the tuition of a few pupils, an office for which he was admirably qualified. In 1765, the archbiſhop preſented him to the rectory of Pluckley, where he continued his plan of education, and at the ſame time diſcharged the paſtoral duties with exemplary zeal and diligence. In the year 1769, he publiſhed "A Letter to a Young Gentleman at Oxford, intended for Holy Orders, containing ſome ſeaſonable Cautions againſt Errors in Doctrine." From this time, to the year 1781, he publiſhed ſeveral other pieces, chiefly theological, and in the latter year he gave the world his "Phyſiological Diſquiſitions, or Diſcourſes concerning the Natural Philoſophy of the Elements." This work contains much inſtructive, and much fanciful matter, ingeniouſly applied in an attempt to inveſtigate the cauſes of things, and to conſtruct a theory of nature on the principles of the author's favourite ſyſtem. His next publication was theological; it conſiſted of lectures on the figurative language of the Holy Scriptures, and the interpretation of it from the Scripture itſelf. This was publiſhed in 1788, and, in 1790, he gave the public two volumes of ſermons on moral and religious ſubjects, which include diſcourſes on natural hiſtory, delivered at an annual lecture at Shoreditch church, of which the preacher is appointed by the Royal Society. In the year 1792 he employed his pen in the ſervice of politics, and printed a two-penny pamphlet, entitled "A Letter from Thomas Bull to his Brother John," which was moſt induſtriouſly circulated throughout the kingdom by the friends of adminiſtration. Mr. Jones attempted to form a ſociety "for the reformation of principles," but it did not ſucceed: he was the founder of the periodical publication entitled the "Britiſh Critic," and he edited a collection of tracts in two volumes, which had been originally publiſhed by Mr. Law, Mr. Norris, Dr. Horne, and others. This work was entitled "The Scholar armed againſt the Errors of the Time, or a Collection of Tracts on the Principles and Evidences of Chriſtianity, the Conſtitution of the Church, and Authority of civil Government." In 1795 he publiſhed "Memoirs of the Life, Studies, and Writings of the Right Reverend George Horne, D.D. late lord biſhop of Norwich," to the ſecond edition of which he prefixed a conciſe expoſition of Mr. Hutchinſon's leading theological and philoſophical opinions. His laſt publication was "A Diſcourſe on the Uſe and Intention of ſome remarkable Paſſages of Scripture, &c." Shortly after this, he ſuffered moſt ſeverely from a paralytic ſeizure, which at length, in February 1800, 1800, put an end to his life in the ſeventy-fourth year of his age. Mr. Jones's learning was very reſpectable, his attachment to truth was zealous and ardent, and his moral conduct highly exemplary. He delighted in doing good, and was a vigilant and affectionate paſtor. He was, in addition to his other learning, a proficient in muſic, and compoſed ten church-pieces for the organ, and four anthems, which have been much admired. His works have been publiſhed in 12 vols, 8vo. See Gentleman's Magazine for 1800.

Jones, Paul, a naval adventurer, was a native of Selkirk, in Scotland, but ſettling in America, he obtained, in 1775, the command of a ſhip under commodore Hopkins, and diſtinguiſhed himſelf in ſeveral engagements, on which account he received a captain's commiſſion. He then ſailed to France, and being well acquainted with the coaſt of Ireland, and the northern part of England, he conceived the deſign of effecting a deſcent. He accordingly landed at Whitehaven, and did conſiderable miſchief there. He afterwards ſailed for Scotland, where he landed on the eſtate of the earl of Selkirk, and plundered his lordſhip's houſe of all the plate: he next took the Drake ſloop of war, with which he went to Breſt. After this he ſailed round Ireland to the North ſea, with three ſhips, *viz.* the Richard, Pallas, and Vengeance. Having committed great miſchief on that coaſt, he fell in with the Baltic fleet, convoyed by the Serapis frigate, and another armed veſſel, both of which he captured off Flamborough-head. For theſe ſervices the king of France conferred on him the order of merit, and gave him a gold-hilted ſword. We hear no more of his exploits after the concluſion of the American war. He died at Paris in 1792. Monthly Mag.

Jones, in *Geography*, a county of North Carolina, in Newbern diſtrict, bounded N. by Craven, and well watered by the river Trent and its tributary ſtreams. It contains 4241 free inhabitants, and 1899 ſlaves. Its chief town is Trenton.

Jones, *St.*, a town of America, in Kent county, Delaware, containing 1586 inhabitants.

Jones's *Creek*, a river of Pennſylvania, which runs into the Delaware. N. lat. 40° 58′. W. long. 75° 15′.

Jones's *Iſland*, an iſland in Hudſon's bay. N. lat. 61° 52′. W. long. 63°.

Jones's *Key*, a ſmall iſland in the Spaniſh Main, near the Moſquito ſhore, ſurrounded with rocks. N. lat. 15° 35′. W. long. 82° 27′.

Jones's *Town*, in Pennſylvania. See Williamsburg.

JONESBOROUGH, a poſt-town of America, and chief town of Waſhington diſtrict, in Teneſſee, and alſo the ſeat of the diſtrict and county courts, 26 miles from Greenville and 40 from Abingdon, in Virginia.—Alſo, the chief and poſt-town of Camden county, Edenton diſtrict, North Carolina; containing a court-houſe and a few dwelling houſes.

JONESIA, in *Botany*, is a genus dedicated by Dr. Roxburgh to the memory of the celebrated ſir William Jones, who, amongſt the varied and unrivalled accompliſhments he attained in almoſt every department of ſcience, was by no means unſkilled in botanical reſearches. Roxb. Aſiat. Reſearches, v. 4. 355. Willd. Sp. Pl. v. 2. 287. (Aſjogam; Hort. Malabar. v. 5. 117. t. 59.) Claſs and order, *Heptandria Monogynia.* Nat. Ord. . . . . ?

Eſſ. Ch. Calyx of two leaves. Corolla funnel-ſhaped, with a cloſed, fleſhy tube; limb four-cleft. Nectary a little ring bearing the ſtamens, inſerted into the throat of the tube of the corolla. Germen pedicellated. Pod-ſhaped like a ſcymitar, turgid, containing from four to eight ſeeds.

1. J. *pinnata.* Willd. (J. Aſoca; Roxb. Aſiat. Reſearches, v. 4. 355.) A native of the Eaſt Indies.—This *tree* riſes to the height of about 15 feet. *Root* whitiſh, covered with a blackiſh *bark*, inodorous, firmly fixed in the ground and ſpreading by means of numerous fibres. *Leaves* alternate, unequally pinnate, conſiſting of from four to ſix pair of oblong-lanceolate, ſmooth, ſhining, ſtrong leaflets. *Flowers* making a denſe cyme, odorous, of a fine yellow colour. *Stamens* long and ſlender, of a beautiful ſhining red, with dark purple tops. *Style* greeniſh-white, with a round tip.

We have ſeen a beautiful ſpecimen of this plant which was gathered and preſerved by lord Valentia in his Travels through India; and this authorizes us to ſay that the *Aſjogam* of the *Hortus Malabaricus* is a moſt correct delineation of our *Joneſia.* It is found in gardens about Calcutta, where it grows to be a very handſome tree. The plants and ſeeds were originally brought from the interior of the country, where it is indigenous.

JONGLEURS, muſicians, players on inſtruments, in the infancy of French poetry, who attached themſelves to the troubadours or provincial poets.

The hiſtory of the French theatre informs us that a kind of merry-andrews were thus called that accompanied the troubadours, who began to flouriſh about the beginning of the eleventh century. The term jongleur ſeems to be a corruption of the Latin word *joculator*, in French *joueur*, and in Engliſh player on an inſtrument. Mention is made of the jongleurs from the time of the emperor Henry II., who died in 1056. As they played upon different inſtruments, they aſſociated with the troubadours and ſingers, to execute the works of the firſt, and thus, in their company they gained admiſſion into the palaces of kings and princes, and drew from them magnificent preſents. Some time after the death of Joan I. queen of Naples and Sicily, and counteſs of Provence, which happened 1382, all thoſe of the profeſſion of troubadours and jongleurs, ſeparated into two different claſſes of actors. Some, under the ancient name of *troubadours*, joined ſinging to inſtruments, or the recitation of voices; others ſimply took the name of players, or *joculators*, as they were named in their certificates.

About the year 1330, the minſtrels of Paris, including the jongleurs, formed themſelves into a company, and obtained a charter. The police frequently repreſſed their licentiouſneſs, and regulated their conduct: Philip Auguſtus baniſhed them the firſt year of his reign; but they were recalled by his ſucceſſors, and united under the general name of *meneſtraudie*, minſtrelſy; having a chief appointed over them, who was called *king of the minſtrels*. Lewis IX. exempted them from a tariff or toll at the entrance into Paris, on condition that they would ſing a ſong and make their monkies dance to the tollman, perhaps to prove their title to ſuch indulgence; and hence aroſe the well-known proverb: *Payer en gambades et en monnoïe de ſinge.*

The aſſociated minſtrels inhabited a particular ſtreet, to which they gave the name, which it ſtill retains, of *St. Julien des Meneſtriers.* It was here that the public was provided with muſicians for weddings and parties of pleaſure; but as a greater number of them uſually attended on ſuch occaſions than were ordered, and all expected to be paid the ſame price, William de Germont, provoſt of Paris, in 1331 prohibited the jongleurs and jonglereſſes from going to thoſe who required their performance in greater numbers than had been ſtipulated, upon a ſevere penalty. In 1395 their libertiniſm and immoralities again incurred the cenſure of government, by which it was ſtrictly enjoined that they ſhould henceforth, neither in public nor private, ſpeak, act, or ſing any thing that was indecorous or unfit for modeſt eyes and ears, upon pain of two months impriſonment, and living on bread and water.

Though the word *minſtrel*, in Engliſh, is confined to ſtrolling muſicians, players on inſtruments; yet the term jongleur, in old French, included buffoons, fortune-tellers, ſlight of hand, tumblers, &c. beſides *violars*, or performers on the violle or viol; *juglars*, or flute players; *muſars*, or players on other inſtruments; *comiques*, or comedians.

All theſe, at laſt, aſſumed the name of *jongleurs*, as the moſt ancient, and the women who followed this profeſſion were denominated jongleureſſes. They ſettled at Paris in one particular ſtreet, which thence was called "la rue des jongleurs," and which is ſtill called the ſtreet of "St. Julien des Menétriers." In that ſtreet people uſed to apply for performers on feſtivals, and for parties of pleaſure.

By an ordonnance of William of Clermont, provoſt of Paris, 14th Sept. 1395, the jongleurs were forbidden to utter, repreſent, or ſing in public places, or elſewhere, any thing that would occaſion ſcandal, on pain of fine and two months impriſonment. Since that time we hear no more of them, except their dancing and performing tricks with ſwords and other weapons. Theſe were called *batalores*, in Fr. *bateleurs*, merry-andrews; and, at length, tumblers and rope-dancers. See MINSTREL.

IONIA, in *Ancient Geography*, ſo called from the Ionians, who inhabited this part of Aſia Minor, was bounded on the N. by Æolia; on the W. by the Ægean and Icarian ſeas; on the S. by Caria; and on the E. by Lydia and part of Caria. It lies between the 37th and 40th degrees of north latitude, but its extent in longitude, which has not been accurately determined, was inconſiderable. The moſt remarkable cities of Ionia were Phocæa, Smyrna, Clazomenæ, Erythræ, Teos, Lebadus, Colophon, Epheſus, Priene, and Miletus. The iſlands of Chios and Samos were likewiſe inhabited by the Ionians, and belonged to their confederacy. See the next article.

IONIANS, conſtitute a claſs of people among thoſe who were the moſt celebrated of the Greeks. They derived their origin from the Hellenes, who were ſo called from Hellen, the ſon of Deucalion, and who formed a ſmall tribe in Theſſaly: and from Dorus, Æolus, and Ion, his more remote deſcendants, the Hellenes were diſcriminated by the names of Dorians, Æolians, and Ionians. The name of the latter was gradually loſt in the more illuſtrious appellation of Athenians, ſettled in the leſs barren parts of Attica. (See ATTICA and ATHENS.) When the Heraclidæ took poſſeſſion of the Peloponneſus, 80 years after the taking of Troy, B.C. 1104, a ſignal revolution took place in ſeveral ſtates of Greece; and thoſe tribes, which occupied the iſlands and coaſts of Aſia Minor, were either expelled by their conquerors, or migrated to ſeek new ſettlements. The Æolians were the firſt of theſe emigrants, they croſſed the Helleſpont 88 years after the taking of Troy, B.C. 1096, and eſtabliſhed themſelves in the country, afterwards called Æolis or Æolia. According to Blair's tables their migration took place before the return of the Heraclidæ, in the year B.C. 1124. (See ÆOLIS.) Upon the death of Codrus, B.C. 1070, the monarchical form of government was aboliſhed in Athens, and ſucceeded by the adminiſtration of Archons. Diſſatisfied probably with this change, Neleus and Androclus, younger ſons of Codrus, determined to leave their country. Accordingly being joined by many refugees, and Athenian citizens, who complained that Attica was too narrow and barren for maintaining the increaſing number of its inhabitants, ſailed to Aſia Minor, and, expelling the ancient inhabitants, ſeized the central and moſt beautiful portion of the Aſiatic coaſt. Their colonies were gradually diffuſed from the banks of the Hermus to the promontory of Poſideion. They afterwards took poſſeſſion of Chios and Samos; and all theſe countries were united by the common name of Ionia, to denote that the Ionians compoſed the moſt numerous diviſion of the colony. The Ionic migration is fixed in Blair's tables at the year B.C. 1044, 60 years after the return of the Heraclidæ; but others refer it to the year B.C. 1055. The laſt tribe which emigrated was that of the Dorians, who, in the year B. C. 944, ſailed to the iſlands of Rhodes and Crete, already peopled by Doric tribes; while others tranſported themſelves to the peninſula of Caria, which, in honour of their mother country, received the name of Doris. (See DORIS.) In conſequence of this eſtabliſhment, which was formed 240 years after the Trojan war, the weſtern coaſt of Aſia Minor was planted by the Æolians in the north, the Ionians in the middle, and the Dorians in the ſouth. The Ionians, in particular, ſettled in a country of great extent and fertility, enjoying the moſt delicious climate, and peculiarly adapted to a commercial intercourſe with the moſt improved nations of antiquity. Thus favoured, they ſilently flouriſhed in peace and proſperity, till their growing numbers and wealth excited the avarice or jealouſy of the powers of Aſia. They were ſucceſſively conquered by the Lydians and Perſians, but never thoroughly ſubdued. "Having imbibed," ſays Dr. Gillies (Hiſt. of Anc. Greece, vol. 1. chap. 3.) "the principles of European liberty, they ſpurned the yoke of Aſiatic bondage. In their glorious ſtruggles to reaſſume the character of freemen, they ſolicited and obtained the aſſiſtance of their Athenian anceſtors, and occaſioned that memorable rivalſhip between the Greeks and Perſians, which having laſted two centuries, ended in the deſtruction of the Perſian empire. In this illuſtrious conteſt, the firſt ſucceſſes of the Greeks againſt enemies far more powerful, and incomparably more numerous than themſelves, inſpired them with an enthuſiaſm of valour. Their exploits merited not only praiſe but wonder; and ſeemed fit ſubjects for that hiſtorical romance, which, in the progreſs of literature, naturally ſucceeds to epic poetry." In proceſs of time the Ionians, poſſeſſing the delightful country above-mentioned, together with the mouths of great rivers, having before them convenient and capacious harbours, and behind, the wealthy and populous nations of Aſia, whoſe commerce they enjoyed and engroſſed, attained ſuch early and rapid proficiency in the arts of navigation and traffic, as raiſed the cities of Miletus, Colophon, and Phocæa, to an extraordinary pitch of opulence and grandeur. Their population increaſing with their proſperity, they diffuſed new colonies every where around them. Having obtained footing in Egypt, in the eighth century before Chriſt, they acquired, and thenceforth preſerved, the excluſive commerce of that ancient and powerful kingdom. Their territories, though in their greateſt breadth compreſſed between the ſea and the dominions of Lydia to the extent of ſcarcely forty miles, became not only flouriſhing in peace, but formidable in war. With the utmoſt induſtry and perſeverance they improved and ennobled the uſeful or elegant arts, which they found already practiſed among the Phrygians and Lydians. They incorporated the muſic of thoſe nations with their own. Their poetry far excelled whatever Pagan antiquity could boaſt moſt precious. They rivalled the ſkill of their neighbours in moulding clay and caſting braſs. They appear to have been the firſt people who made ſtatues of marble. The Doric and Ionic orders of architecture perpetuate, in their names, the honour of their inventors. Painting was firſt reduced to rule, and practiſed with ſucceſs among the Greeks; and we may be aſſured, that, during the ſeventh century before Chriſt, the Ionians ſurpaſſed all their neighbours, and even the Phœnicians, in the arts of deſign, ſince the magnificent preſents which the far-famed oracle of Delphi received from the oſtentation or piety of the Lydian kings, were chiefly the productions of Ionian artiſts. In the following century Ionia gave birth to philoſophy; and both ſcience and taſte were diffuſed from that country over Greece, Italy, and Sicily. (Gillies, ubi ſupra.) The Ionians, however, ſoon degenerated from the valour of their anceſtors, and became a ſuperſtitious, effeminate, and voluptuous people, inſomuch that, in the time of Herodotus, they were looked upon as quite unfit for any military ſervice. They and the Greek colonies ſettled in Aſia, enjoyed their liberties, and lived, according to their own laws, from the time of their migration in the reign of Crœſus, king of Lydia, to whoſe ſuperior power they were forced to ſubmit, after having baffled all the attempts of his predeceſſors. Before Cyrus invaded Lower Aſia, he earneſtly intreated the Ionians (B. C. 547) to ſhare the glory of his arms; but having lived at eaſe under the mild government of Crœſus, they preferred their allegiance to him before the friendſhip of another unknown maſter. Accordingly they oppoſed him when he firſt invaded Lydia, and rejected the advantageous propoſals of that prince: but after the defeat of Crœſus they ſent ambaſſadors to the conqueror, offering ſubmiſſion upon the terms which had been formerly granted them by Crœſus. Cyrus having heard them with attention, anſwered them by the following apologue: "A piper ſeeing numerous ſhoals of fiſhes in the ſea, and imagining he might entice them aſhore by his muſic, began to play; but finding his hopes diſappointed, he threw a net into the water, and drew a great number to the land. When he ſaw the fiſh leaping on the ground, ſince you would not dance, ſaid he, to my pipe before, it is unneceſſary for you now to dance, ſince I have ceaſed to play." They now perceived that if they would eſcape the rigour of ſervitude, they muſt owe their ſafety to the ſtrenuous exertions of a brave defence, not to the clemency of Cyrus. The Lacedæmonians, to whom they applied, interpoſed in their behalf, and remonſtrated with Cyrus againſt his deſign of ſubduing the Aſiatic Greeks: but without effect. The Ionians had previouſly formed a powerful confederacy with the other ſtates. Cyrus, having ordered Crœſus into captivity, was eager to return towards the Eaſt to complete his conqueſts in Upper Aſia; and he committed the reduction of all the countries of Lower Aſia to the ſkill of his lieutenant, Harpagus (B. C. 539.) This general, in a few months, completely executed his commiſſion, and made himſelf maſter of all the countries in Lower Aſia, poſſeſſed by either Greeks or Barbarians. In the reign of Darius Hyſtaſpes, they made an attempt to recover their ancient liberty, and maintained a war againſt the whole power of the Perſian monarchy for ſix years: but they were conſtrained to ſubmit, and puniſhed with great ſeverity for their preſumption in endeavouring to regain their rights. The Ionians aſſiſted Xerxes in his expedition againſt Athens with 100 ſhips; but they were perſuaded by Themiſtocles to abandon the Perſians, and their flight contributed not a little to the famous victory gained by the Athenians at Salamis. A ſimilar expedient was recurred to at Mycale, ſo that few Perſians eſcaped ſlaughter. The Lacedæmonians were ſo pleaſed with their behaviour on this occaſion, that they propoſed to tranſplant them out of Aſia into Greece; but they declined accepting the propoſal. On the concluſion of the peace between the Greeks and Perſians, which happened in the reign of Artaxerxes, one of the articles ſworn to by both parties was, that all the Greek ſtates of Aſia ſhould be made free, and allowed to live according to their own laws. The Ionians, thus delivered from the Perſian yoke, formed an alliance with the Athenians; but were treated by them rather like ſubjects than allies. Their fortune was various; at one time ſubject to the Perſians, and at another time revolting from them, till they were at length delivered by Alexander, who reſtored all the Greeks in Aſia to the enjoyment of their ancient rights and privileges. After the death of Alexander, they fell under the power of the kings of Syria, till the Romans obliged Antiochus III. ſurnamed the Great, to grant the ſame liberty to the Greek colonies in Aſia, which they had procured for the Greek ſtates in Europe. On this occaſion, moſt of the free cities entered into an alliance with Rome, and enjoyed that kind of liberty which the Romans uſed to grant; till they were again brought under ſubjection by the famous Mithridates, king of Pontus, whom they joined againſt the Romans. By his order they maſſacred, without diſtinction, all the Romans and Italians whom trade, or the ſalubrity of the climate, had drawn into Aſia. Nor would they ſuffer even their famous temple of Diana to be an aſylum to thoſe who fled to it for refuge. Upon Sylla's arrival in Aſia they abandoned Mithridates, and declared for the Romans. Sylla, having routed all the armies of Mithridates, and reduced all the Leſſer Aſia, revenged on the Aſiatics the death of ſo many thouſand Romans, whom they had inhumanly murdered in compliance with the ſavage orders of Mithridates, by depriving them of their liberty, and laying ſuch heavy taxes and fines on their cities, as reduced them to beggary. The city of Epheſus was treated with the greateſt ſeverity; Sylla having ſuffered his ſoldiers to live there at diſcretion, and obliged the inhabitants to pay every officer 50 drachmas, and every ſoldier 16 denarii a-day. The whole ſum which the revolted cities of Aſia paid Sylla, amounted to 20,000 talents, that is, three millions eight hundred and ſeventy-five thouſand pounds ſterling; for the raiſing of which they were forced to ſell not only their moveables, but even a great part of their lands. This was a moſt fatal blow to Aſia; nor did the inhabitants ever after recover their ancient ſplendour, notwithſtanding the favour ſhewn them by many of the emperors, under whoſe protection they enjoyed ſome ſhew of liberty. Gillies's Hiſt. of Greece. Anc. Un. Hiſt. vol. vi.

IONIC Order, an order of *Architecture*, which owes its invention to the people of Ionia, and was firſt employed in the temple of Diana, at Epheſus. This order is an improvement upon the Doric; the column is more ſlender and graceful, and, according to Vitruvius, is intended to deſcribe the delicate proportions of the female figure, as the Doric indicates the ſtronger characteriſtics of the male. This idea, he ſays, is preſerved throughout its decorations: the capital having two ſpirals, peculiar to this order, on either ſide, in imitation of ringlets of hair projecting from the head; the cymatium indicates the locks hanging over the forehead; while the mouldings of the baſe repreſent the turn and ſhape of the ſhoes worn by women in the age when the order was invented. Its general appearance is ſimple, though graceful and majeſtic; and as forming a medium between the maſculine Doric and the virginal ſlenderneſs of the Corinthian; it has been, in figurative language, compared to a ſedate matron in decent, rather than in rich attire

This order may be uſed in all places conſecrated to peace and tranquillity; accordingly we meet with it in churches, colleges, and libraries; and the ancients uſed it in temples dedicated to Diana, Juno, Apollo, Fortune, Concord, &c. It may alſo be employed in palaces, halls of juſtice, and private houſes.

In erecting the temple at Epheſus, the bold characteriſtics of the original hut were omitted; and inſtead of the triglyphs and mutules of the Doric order, the more delicate dentils of the Ionic were ſubſtituted. The omiſſion of theſe large members obviates the difficulty experienced in the execution of the Doric in confined ſituations, particularly in internal angles.

The Ionic baſe, according to Vitruvius, conſiſts of a torus and two ſcotiæ, with aſtragals between them. In the Athenian Ionics, the baſe conſiſts of two tori, with a ſcotia or trochilus between them, and two fillets, each ſeparating the ſcotia from the torus above and below. The fillet above the torus generally projects as far as the extremity of the upper torus, and the lower fillet beyond it. The ſcotia is very flat, and its ſection forms an elliptic curve, joining the fillet on each ſide. The tori and ſcotia are nearly of equal heights. In the Ionic temple on the Illyſus, a bead and fillet are employed above the upper torus, joining the fillet to the ſcape of the column. In this temple, and in that of Erectheus, the upper torus is fluted, except the lower part, where it joins the upper ſurface of the fillet, which is preſerved entire. The baſes of the antæ of the latter temple are alſo receſſed. In the temple of Minerva Polias, the upper ſcotia is enriched with a guilloche, and the baſes of the antæ are ſtriated, the flutes being ſeparated from each other by two ſmall cylindric mouldings of a quadrantal ſection, which join each other at their convexities. This is the true Attic bow, it was invented by the Athenians, and is the moſt favourite baſe both with the ancients and moderns, being lighter in its upper part than the Ionic, more pleaſing in its contour, and elegant in its general appearance. The Romans did not confine the uſe of this baſe to their Ionics, but very frequently adopted it in the Corinthian and Compoſite orders. They, however, differed very much from the Greeks in the proportions they aſſigned to it; for they always make the upper torus of a leſs height than the lower one, have both tori plain, and give the ſcotia a much greater concavity. The baſes of the Ionic and Corinthian orders on the Coliſeum, the Ionic on the theatre of Marcellus, and the temple of Fortuna Virilis at Rome, have nearly the ſame proportions with thoſe deſcribed by Vitruvius. In the temples of Minerva Polias, at Priene, and of Apollo Didymæus, near Miletus, the Ionic baſes conſiſt of a large torus, three pair of aſtragals, ſeparated by two ſcotiæ inverted towards each other; the upper pair of aſtragals lying below the torus. In the former temple the torus is elliptical, and ſeparated from the ſhaft by the intervention of an aſtragal. The under part of this torus is alſo fluted, and there is a flute cut in the upper part near the bead. In the latter temple, the upper torus is plain, of a ſemi-circular ſection, with a narrow fillet between each bead of every pair. The baſe of the Aſiatic Ionics differ very little from that of Vitruvius, except that they have the ſcotiæ inverted towards each other, which gives a greater variety in the profile than when both ſtand in the ſame poſition. The Ionians alſo ſometimes uſed the Attic baſe, as may be ſeen in the temple of Bacchus, at Teos.

The Ionic ſhaft is ſometimes plain, but more frequently ſtriated into 24 flutes, with an equal number of fillets.

The volute is a diſtinguiſhing feature in this order, and is variouſly executed. In all the Athenian Ionics, and in the temple of Minerva Polias, at Priene, the lower edge of the canal between the volutes is formed into a graceful curve, bending downwards, and coiling round the ſpirals which form the volutes. The volutes of the capitals of the temples of Minerva Polias, and of Erectheus at Athens, exceed every other remain of antiquity for ſingularity and beauty: each volute has a double channel, formed by two diſtinct ſpiral borders, which leave between them a deep receſs or groove, diminiſhing gradually in its breadth till it is entirely loſt on the ſide of the eye. In the former temple, the ſhaft is terminated with a ſingle fillet below the lower edges of the volutes; and in the latter, with a fillet and aſtragal. In both, the Colorino is decorated with woodbines, formed alike in the alternate courſes, but differing in the adjoining ones. The upper annular moulding of the column is of a ſemi-circular ſection, embelliſhed with a guilloche. In the temple of Bacchus, at Teos, the great theatre at Laodicea, and in all the Roman Ionics, the connecting channel of the volutes has no border on the lower edge, but is terminated with a horizontal line, which falls a tangent to the beginning of the ſecond revolution of each volute. When columns are given to the flanks as well as the front of a building, the angular volute of the outſide column is double, and made to face both the contiguous ſides of the building; examples of which are to be met with in the temples of Fortuna Virilis at Rome, of Minerva Polias at Priene, of Bacchus at Teos, and of Erectheus, and the temple on the Illyſus, at Athens. Sometimes the capitals of all the columns are made to face the four ſides of the abacus alike, as in the temple of Concord at Rome, from which example the Scammozzian capital, as it is called, was firſt imitated by Michael Angelo, as may be ſeen in the Conſervatorium, embelliſhed by him with this capital during the pontificate of Paul III. before Scammozzi was known as an architect.

Both Grecian and Roman Ionic capitals have the echinus, aſtragal, and fillet. The echinus is uniformly cut into eggs, ſurrounded with borders, and tongues between every two borders. The aſtragal conſiſts of a row of beads, two large and two ſmall alternately. In all the Roman buildings, except the Coliſeum, theſe mouldings are cut alike, differing only in the taſte of the foliage.

In the temple of the Illyſus, the architrave conſiſts of one broad facia, crowned with a cymatium. The parts of the cornice viſible in front are the corona, with its cymatium and ſima. The cymatium of the frieze is wrought under the cornice, and conſiſts of a ſima reverſa, and bead below it. The height of the architrave is about two-fifths of the entablature; and by dividing the upper three-fifths into five other parts, the plain part of the frieze will be found to occupy three, and the cornice two parts. The architraves of the temples of Erectheus and Minerva Polias at Athens, conſiſt of three faciæ and cymatium; the cymatium of the frieze being moſtly wrought under the corona. Divide the height of the entablature, from the bottom of the lower facia to the top of the cymatium of the corona, into 19 parts, and the architrave, with the part of the frieze that is ſeen, will be found to occupy 16, *viz.* eight for the architrave, and as many for the frieze; the other three parts will compriſe the corona, including the larmer and cymatium.

In general, the height of the entablature may be two diameters; but in buildings requiring grandeur as well as elegance, it ſhould not be leſs than a fourth.

The Aſiatic Ionic differs materially from the European or Attic. In the former, moſt of the remains are without the friezes, ſo that the height of the entablatures cannot be preciſely determined, notwithſtanding that the architraves and cornices have been accurately meaſured. In the great theatre at Laodicea, however, this order has a pulvinated frieze, whoſe height is rather leſs than a fifth of that of the whole entablature. In the temples of Bacchus at Teos, and of Minerva Polias at Priene, the architraves are divided into three faciæ below the cymatium. In all the Aſiatic ſpecimens, the crowning moulding is a ſima recta, leſs in projection than in height; the dentils are conſtantly uſed, and their height is about a mean proportion between that of the ſima recta and that of the larimer; it being always greater than the height of the larimer, and leſs than that of the ſima recta. The cymatium of the denticulated band being wrought almoſt entirely out of the ſoffit of the corona, receſſed upwards, its elevation is almoſt concealed from the eye of the beholder. The height of the cornice, from the top of the ſima, to the lower edge of the dentils, is about equal to that of the architrave. The altitude of the frieze, excluſive of its cymatium, or upper mouldings, may be taken at about a fourth of the whole entablature. To give it a greater proportion, would make the entablature too high for the columns.

In the Ionic examples of Greece, there is a conſtant ratio between the upper part of the cornice, from the lower edge of the corona upwards, and the height of the entablature, which is nearly as two to nine. This is a very diſtinct diviſion, occaſioned by the great receſs of the mouldings under the corona; for which reaſon the cornice is not reckoned too clumſy, though the whole denticulated band and cymatium of the frieze be introduced below it; and this ſeems to be the characteriſtic difference between the European and Aſiatic Ionics. This order, as found in Ionia, is complete; while the ſpecimens of Attica want the dentil band, though in other reſpects they are very beautiful. But the moſt exquiſite remains we have of this order, are to be found in the temple of Minerva Polias at Priene, which, for beauty of proportion and elegance of decoration, exceeds every other ſpecimen.

Plate XXVIII. exhibits a repreſentation with the proportions of this magnificent example, the proportions being marked upon the outline.

Plate I. exhibits in *figs.* 1, 2, 4, 5, different baſes applicable to the Ionic orders, *fig.* 1. from the temple of Jupiter Olympius; *fig.* 2. from that of Minerva Polias, at Athens; *fig.* 4. an Ionic baſe according to Vignola; *fig.* 5, elevation of the capital of the temple of Minerva Polias, at Athens. This is perhaps the moſt elegant ſpecimen that is to be found of the Ionic capital.

IONIC *Architrave, baſe, capital, corniche, entablature, freeze, pedeſtal.* See the ſubſtantives.

IONIC *Dialect,* in *Grammar,* a manner of ſpeaking peculiar to the people of Ionia.

At firſt, it was the ſame with the ancient Attic; but paſſing into Aſia, it did not arrive at that delicacy and perfection to which the Athenians attained; inſtead of that it rather degenerated in Aſia Minor; being corrupted by the admiſſion of foreign idioms.

In this dialect it was that Herodotus, Hippocrates, and Galen wrote. See DIALECT.

IONIC *Sect* was the firſt of the ancient ſects of philoſophers, and was called the Ionic ſchool.

The founder of this ſect was Thales, (ſee his article,) who, being a native of Miletus, in Ionia, occaſioned his followers to aſſume the appellation of Ionic.

It was the diſtinguiſhing tenet of this ſect, that water was the principle of all natural things.

This is what Pindar alludes to in the beginning of his firſt Olympic Ode.

But Thales could not mean to aſſert, that water is the efficient cauſe of the formation of bodies; but merely, that this is the element from which they are produced. It is not improbable, that by "water," he meant to expreſs the ſame idea, which the Coſmogoniſts expreſſed by the word chaos, the notion annexed to which was that of a turbid and muddy maſs, from which all things were produced. (See CHAOS.) It has been much debated, whether Thales, beſides the paſſive principle in nature, which he called water, admitted an intelligent, efficient cauſe. Thoſe who have maintained the affirmative lay great ſtreſs upon ſundry aphoriſms concerning God, which are aſcribed by the ancients to this philoſopher, particularly the following; that God is the moſt ancient being, who has neither beginning nor end; that all things are full of God; and that the world is the beautiful work of God. They alſo allege the teſtimony of Cicero, who ſays, (De Nat. Deor. l. i. c. 10.) that Thales taught, that water is the firſt principle of all things, and that God is that mind which formed all things out of water. Thoſe who are of the contrary opinion, urge that the ancients, and even Cicero himſelf, though not very conſiſtently, aſcribe to Anaxagoras the honour of having firſt repreſented God as the intelligent cauſe of the univerſe, and they add that the evidence in favour of Thales reſts only upon traditional teſtimony, which may be oppoſed by other authorities. (Clem. Alex. Strom. l. ii. p. 364. Aug. de Ca. Dei. l. viii. c. 2. Euſeb. Prep. Evang. l. i. c. 7.) The truth may probably be this; that Thales, though he did not expreſsly maintain an independent mind as the efficient cauſe of nature, admitted the ancient doctrine concerning God, as the animating principle or ſoul of the world. Concerning the material world, Thales taught, that night exiſted before day, which doctrine he probably borrowed from the Grecian theogonies, which placed Night, or Chaos, among the firſt divinities. He held that ſtars are fiery bodies; that the moon is an opaque body illuminated by the ſun, and that the earth is a ſpherical body, placed in the middle of the univerſe. In mathematics, Thales is ſaid to have invented ſeveral fundamental propoſitions, which were afterwards incorporated into the elements of Euclid; particularly the following theorems, *viz.* that a circle is biſected by its diameter; that the angles at the baſe of an iſoſceles triangle are equal; that the vertical angles of two interſecting lines are equal; that, if two angles and one ſide of one triangle be equal to two angles and one ſide of another triangle, the remaining angles and ſides are reſpectively equal; and that the angle in a ſemicircle is a right angle. Of his knowledge of the principles of menſuration, and conſequently of the doctrine of proportion, his inſtructions to the Egyptian prieſts for finding the height of their pyramids, are a ſufficient proof. His method was this; at the termination of the ſhadow he erected a ſtaff perpendicular to the ſurface of the earth; and thus obtained two right-angled triangles, which enabled him to infer the ratio of the height of the pyramid to the length of its ſhadow, from the ratio of the height of the ſtaff to the length of its ſhadow. (Laert. l. i. § 24, 25. 27. Proclus in Euclid. l. i. Plin. Hiſt. Nat l. xxxviii. c. 17.) Aſtronomy, as well as mathematics, ſeems to have received conſiderable improvement from Thales. He was able to predict an eclipſe, though probably with no great degree of accuracy as to the time; for Herodotus, who relates this fact (l. i.), only ſays, that he foretold the year in which it would happen. He taught the Greeks the diviſion of the heavens into five zones, and the ſolſtitial and equinoctial points, and approached ſo near to the knowledge of the true length of the ſolar revolution, that he corrected their calendar, and made their year to contain 365 days. The ſeeds of natural ſcience, which had been ſown by Thales, the father of the Grecian philoſophy, were ſucceſsfully cheriſhed in their growth by Anaximander. He was followed in the Ionic ſchool by Anaximenes, Anaxagoras, Diogenes Apollionetes, and Archelaus of Miletus, who may be conſidered as the laſt preceptor in the original Ionic ſchool. See the ſeveral biographical articles. Socrates is commonly reckoned to have been the diſciple of Archelaus. He was himſelf the founder of a ſchool; for an account of which ſee Socrates and Socratic *ſchool.* The inferior ſects in the Ionic ſucceſſion were tne *Cyrenaic,* the *Megaric,* and the *Eliac* or *Eretriac.* Thoſe of higher celebrity were the *Academic* and the *Cynic,* from which latter aroſe the *Peripatetic* and the *Stoic,* which was the laſt branch of the Ionic ſchool. See each of theſe articles.

The Ionic philoſophy, notwithſtanding the celebrity of its firſt profeſſors, ſoon failed in the Grecian ſchools, and never afterwards recovered its ancient reputation and authority. This was owing to the ſuſpicion of impiety under which it lay in Athens, to the early growth of new branches from the Socratic ſtock, and to the riſe and ſpread of the Eleatic and Epicurean philoſophy. In later times, the univerſal prevalence of the Platonic and Ariſtotelian ſyſtems precluded every idea of reviving the phyſiology of the Ionic ſchool, till, in the 17th century, an attempt was made for this purpoſe by Berigard, but in a manner ſo circumſpect and covert, that this philoſopher was commonly ranked among the followers of Ariſtotle, and even ſuppoſed to be deeply tinctured with the impiety of his ſyſtem. Claud Berigard was born at Molena in Spain in the year 1592, and ſtudied firſt at Aix, then at Paris, and afterwards at Piſa, where, by the favour of the duke of Tuſcany, he was appointed profeſſor of mathematics and botany. His fame, which ſpread through Italy, induced the republic of Venice, in the year 1640, to appoint him, with a liberal ſtipend, profeſſor of philoſophy in Padua. Here he remained till his death in 1668. In the year 1632, he publiſhed, under a fictitious name, a work entitled "Dubitationes in Dialogos Galilæi de Terræ Immobilitate;" but his principal work is his "Circuli Piſani," in which he relates the diſputations which were held at Piſa, on the phyſical writings of Ariſtotle, and gives his own ſentiments upon them. Berigard, having perceived the folly of that implicit obedience which had been long paid to the authority of the ſtagyrite, became a determined opponent of his philoſophy, not openly, which would have been hazardous, but in the indirect and concealed method of dialogue. Adopting the Ionic ſyſtem, he framed a diſputation between the Ariſtotelians and Ionics, in which he made Ariſtæus refute the reaſoning of Charileus, and ſupport the doctrine of the Ionic ſchool, by an appeal to experience, as well as by many ingenious arguments. However he ſaw, and confeſſed, that both the Peripatetic and Ionic ſyſtems were materially defective, and in many particulars erroneous; and therefore much inclined to philoſophical ſcepticiſm. Neverthleſs he endeavoured to prove, that the followers of Thales approached nearer to truth than thoſe of Ariſtotle, the dangerous tendency of whoſe tenets, in ſeveral particulars, he clearly expoſed. Among the doctrines of the ſtagyrite, thoſe which he chiefly reprobated were the following, *viz.* that the world is eternal; that the reſidence of the firſt mover is confined to the outer ſphere of the univerſe; that neither the world, nor any being, can properly be ſaid to have been created; and that there is one ſoul common to the whole human ſpecies. In oppoſition to theſe opinions, which Berigard rejected as capital errors, from which many others muſt ariſe, he maintained the Ionic doctrine of the eternity of the primary particles of matter; of a forming and preſiding mind, by whoſe agency theſe particles were collected into diſtinct bodies; and of the combination and diſperſion of theſe as conſtituting the formation and diſſolution of all things. In ſhort, Berigard ſeems to have prepared the way for the revival of the Atomic ſyſtem of Epicurus, which was, ſoon after this time, reſtored and defended by Gaſſendi. Brucker's Hiſt. of Philoſ. by Enfield. Bayle.

Ionic *Tranſmigration* was heretofore a celebrated epocha, which took its riſe from the retreat of the Athenian colonies; who, upon the death of Codrus, put themſelves under the command of his ſon Neleus, and eſtabliſhed the twelve cities of Ionia in Aſia.

Thoſe colonies, according to Eratoſthenes, were eſtabliſhed fifty years after the return of the Heraclidæ; and, according to Marſham, ſeventy-ſeven years after the taking of Troy. See Ionia.

Ionic, or Ionian *Mode,* in the *Ancient Greek Muſic.* The Ionian mode, reckoning from the grave to the acute, was the ſecond of the five middle modes in the Grecian ſyſtem. This mode was alſo called *Jaſtian,* and Euclid ſtill terms it the *grave Phrygian mode.* See Mode.

IONIS, in *Surgery,* a carbuncle of a violet colour.

JONKAKONDA, in *Geography,* a town of Africa, in the kingdom of Yani, on the N. ſide of the Gambia. N. lat. 13° 37′. W. long. 13° 50′.

JONKIOPING, a town of Sweden, in the province of Smaland, beautifully ſituated between two ſmall lakes, at the ſouthern extremity of the Wetter lake; it is the capital of the province, and the ſeat of the parliament or ſuperior court of juſtice for the kingdom of Gothland. The town is two miles in circumference, and contains 3000 inhabitants; the houſes are moſtly of wood, covered with turf. This town contains two fauxbourgs, three churches, an arſenal, and a manufacture of arms; 156 miles S.W. of Stockholm. N. lat. 57° 45′. E. long. 13° 59′.

JONKS, or Jonques, in *Ship Building,* veſſels very common in the Eaſt Indies, about the bigneſs of our fly-boats, but differing in form of building, according to the various methods of the nations in thoſe parts. See Junk.

JONOOL, in *Geography,* a town on the N.W. coaſt of the iſland of Timor. S. lat. 8° 59′. E. long. 125° 13′.

JONQUETIA, in *Botany,* was ſo called after Denis Jonquet, who, in the year 1665, publiſhed the *Hortus Regius Pariſinus,* in folio. This catalogue contains about 4000 plants, of which indeed the greater part are only varieties; but amongſt them are many Canadian and Alpine plants.— Schreb. 308. Willd. Sp. Pl. v. 2. 750. Mart. Mill. Dict. v. 2. (Tapirira; Aubl. Guian. v. 1. 470.—Tapiria, Juſſ. 372.) Claſs and order, *Decandria Pentagynia.* Nat. Ord. *Terebintaceæ,* Juſſ.

Gen. Ch. *Cal.* Perianth of five, roundiſh, deciduous leaves. *Cor.* Petals five, roundiſh, concave, ſpreading, longer than the calyx. *Stam.* Filaments ten, ſhorter than the corolla, affixed to a gland; anthers roundiſh. *Piſt.* Germen five-ſided, ſurrounded by a glandule; ſtyles none; ſtigmas five. *Peric.* Capſule ſomewhat globular, roundiſh, five-fruited, of one cell and five valves. *Seeds* five, ovate, arillated, each affixed to the valves.

Eſſ. Ch. Calyx of five leaves. Petals five. Capſule ſubglobular, of one cell, five valves, and five arillated ſeeds.

1. J. *paniculata.* Willd. (J. guianenſis; Mart.—Tapirira guianenſis; Aubl. Guian. t. 188.)—A native of woods in Guiana, where it flowers in November, and brings forth fruit in April. It is there called Tapiriri.—This *tree* riſes to the height of fifty feet, has a ſmooth ruſſet *bark,* and a white uncompact *wood.* *Leaves* alternate, unequally pinnate; conſiſting of four or five pairs of ſmooth, thin,

entire, oval, pointed leaflets. *Flowers* ſmall, numerous, white, axillary, and terminating in large, wide, ſcattered panicles.

JONQUIL. See NARCISSUS.

JONSAC, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Lower Charente; nine miles S.S.E. of Pons. The place contains 2509, and the canton 11,941 inhabitants, on a territory of 187½ kiliometres, in 20 communes.

JONSBERG, a town of Sweden, in Eaſt Gothland, near the coaſt of the Baltic; 22 miles E. of Nordkioping.

JONSON, or JOHNSON, BENJAMIN, in *Biography*, an Engliſh poet, was born, in 1574, at Weſtminſter, about a month after his father's death. He was educated at Weſtminſter ſchool under the learned Camden, and had made great progreſs in his ſtudies, when his mother, who had married a bricklayer for a ſecond huſband, took him from ſchool to work under his father-in-law. From this employment he eſcaped, enliſted for a common ſoldier, and ſerved in the army, contending with the Spaniards in the Netherlands. On his return from a ſervice in which he had gained much reputation, he entered himſelf at St. John's college, Cambridge; but the ſtate of his finances obliged him ſoon to quit this reſidence. He next attempted the profeſſion of an actor on the ſtage, but his talents were but ill adapted to this buſineſs; and from the life of an actor he undertook the more arduous taſk of dramatic writing. He was patronized by the immortal Shakſpeare. The firſt piece which Jonſon printed was "Every Man in his Humour," acted in 1598; his ſucceſs in this effort led him to furniſh a play yearly, till his time was occupied by the compoſition of the maſques, &c. with which the acceſſion of king James was celebrated. In 1609, he produced his "Epicene, or Silent Woman," which is accounted the moſt perfect of his comedies; and in the following year "The Alchemiſt" was performed with great applauſe. So induſtrious had his Muſe been, that in 1616 he publiſhed a folio volume of his works, and in the ſame year he received a grant from the king of the ſalary of poet-laureat for life; the office being at that time occupied by another, but to the duties of which Jonſon ſucceeded in 1619. He continued to write for the court and ſtage, but, in 1629, one of his comedies was hiſſed off the ſtage. From this time he fell into neceſſitous circumſtances, owing as well to the negligence of his diſpoſition, as to his fondneſs for convivial ſociety. It has been aſſerted, that king Charles I. hearing of his diſtreſs, ſent him ten pounds, a preſent very unſuitable to the means of a great monarch, and which the poet received with an ill grace: the fact has, however, been doubted, becauſe in Jonſon's works is to be found an epigram, "To king Charles for an hundred pounds he ſent me in my ſickneſs, 1629." From this period the powers of his mind and body ſeemed to droop together, and his later productions are but mendicant poems addreſſed to different patrons. He died in 1637, at the age of ſixty-three. He was interred in Weſtminſter Abbey, and the inſcription "O rare Ben Jonſon" was placed over his grave. This ſhort ſentence ſhews in what eſtimation his talents had been held. He had indeed been regarded as at the head of Engliſh poetry, and was addreſſed by the wits with the reverential title of "Father Ben." The buſt that now marks his place in Weſtminſter Abbey, was put up by the ſecond earl of Oxford. The fame of Jonſon is principally founded upon his comedies, which were for a long time reckoned the moſt perfect in the Engliſh language: but they have gradually diſappeared from the ſtage. It is now generally admitted that his excellence was compriſed within narrow limits, and chiefly conſiſted in the preſervation of the unities and the ſkilful management of the plot, but he was defective in almoſt every thing which makes comedy pleaſant. "As a general poet, Jonſon is for the moſt part harſh, frigid, and tedious, perpetually in purſuit of ſome uncommon thought, which he wants taſte and genius to render ſtriking and agreeable." Biog. Brit.

JONTHLASPI, in *Botany*. See CLYPEOLA.

JONTHOS, ἴονθος, in *Medicine*, ſignifies ſmall inflamed tumours, or pimples, which occur in the face. It was tranſlated *varus* by the Latins, which term they alſo applied to the *acne* of the Greeks. The *ionthi*, or *vari*, according to Sauvages, "are thoſe ſmall, red, hard, and obſtinate tumours, which ſcarcely ever ſuppurate, do not itch, are not painful, and only appear in the face." He conſiders them as of the ſame nature with the *Gutta roſea*.

JOOD-BOODANG, in *Geography*, a town on the W. coaſt of the iſland of Celebes. S. lat. 1° 39′. E. long. 119° 21′.

JOODPOUR, a circar of Hindooſtan, being one of the three great principalities into which Rajpootana is divided. It was alſo named Marwar. In Acbar's diviſion of the empire, theſe principalities were claſſed as belonging to the ſoubah of Agimere, which is ſometimes called Marwar. This principality lies to the N.W., bordering angularly on the other two, *viz.* Oudipour and Jyenagur. The revenues are ſtated to have been, in 1759, 40 lacks of rupees. This, as well as Oudipour, is very mountainous, with a ſandy ſoil in the vallies. (See RAJPOOTANA.)—Alſo, a town in the above circar, in the country of Agimere; 85 miles W.S.W. of Agimere. N. lat. 26° 7′. E. long. 73° 48′.

JOOGDANPOUR, a town of Bengal; 16 miles N.W. of Kiſhenagur.

JOOGDYA, a town of Bengal; 70 miles S.E. of Dacca.

JOOKY, a town of Bengal; 14 miles N.E. of Boglipour.

JOOSTLAND, ST., a ſmall iſland of Holland, ſeparated from the iſland of Walcheren, by a narrow channel, and containing one village.

JOOTSI-SIMA, or JAOTSIMA, two ſmall iſlands of Japan, near the N. coaſt of Niphon. N. lat. 37° 56′. E. long. 137 50′.

IOPÆAN, among the ancients, an exclamation uſed on account of a victory, or ſome proſperous event. Hoffman thinks that *Io Pæan* is a contraction of the Hebrew *Jao*, from *Jehovah*, and פנה, *reſpexit*; and was the ſame with *Jehovah Penoch, i. e. Dominus reſpiciat in nos.* Something like this exclamation ſtill remains among the Symerones, a people of the Weſt Indies, who, on any joyful occaſion, frequently cry out *Yo Peko*.

JOPPA, in *Ancient Geography*, a town of Phœnicia, ſituated at the ſouthern extremity of the plain of Saron, on a high hill, which commanded a full proſpect of the ſea on one ſide, and of a fertile country on the other. It had the town of Jamnia on the S.; Cæſarea Paleſtina on the N.; and Rama, or Ramula, on the E.; and it is often mentioned both in the Old and New Teſtament. The Greeks and Phœnicians aſcribe to it a very high antiquity; and it is certain that it exiſted 500 years before the Chriſtian era, ſince Joſhua marks the limits of the tribe of Dan in the vicinity of Japho, the Phœnician name of this town. Joppa, which had a good port, and the only one that the Jews had on the Mediterranean, belonged ſucceſſively to the Chaldeans, Perſians, the Lagidæ of Egypt, and the Seleucidæ of Syria; and it was under the dominion of theſe laſt 163 years B.C. The inhabitants of this place provoked the indignation of Judas Macchabæus, by a violation of their treaties, and by precipitating 200 Jews into the ſea, which induced him to fall upon them by ſurpriſe in the night and to burn all their veſſels. Joppa underwent various revolutions until the arrival of Pompey in Syria, about 64 years before our era. This general reſtricted Judea within its ancient bounds, and obliged Hyrcanus to evacuate the towns of Phœnicia; but Auguſtus gave this town to Herod. In conſequence of the revolt of the Jews, Gallus-Ceſtius, governor of Syria, took it and ſet it on fire, A.D. 66. The Jews made ſeveral efforts to re-eſtabliſh it; but Veſpaſian, in the year 67, diſpatched a body of troops from Cæſarea, who took it without difficulty. The Jews betook themſelves for refuge to the ſea; but being beſet by a violent tempeſt, more than 4000 of them periſhed. The Romans again deſtroyed it. (Joſephus de Bell. Jud.) The town was ſo entirely ruined during the holy war, that it had ſcarcely any buildings left ſtanding but the old caſtle, ſituated on an eminence above it, and another near the ſea-ſide. The town was afterwards rebuilt towards the ſea with good ſtore-houſes; and is now called *Jaffa*, or *Yafa*, which ſee.

JOPPA, in *Geography*, a ſmall town of America, in Harford county, Maryland; 20 miles E. by N. of Baltimore.

JORBORG, a town of Samogitia, on the Niemen; 20 miles S. of Roſienne.

JORDAENS, JACOB, in *Biography*, a painter of hiſtory and portraits, poſſeſſed of very ſuperior abilities in his art, was born at Antwerp in 1594. He firſt ſtudied with Adam Van Oort, whoſe daughter he married at an early period of his life; but it was to Rubens he ſtood indebted for the principal part of his knowledge; though it is dubious whether he ever was admitted into the ſchool of that maſter. Certain it is, however, that he more forcibly carried into effect his principles than any of his diſciples, except Vandyke.

It is ſaid by Sandrart, that Rubens was jealous of him, and if ſo great a man were capable of that mean paſſion, certainly the talents of Jordaens might well excite it. He painted with almoſt incredible force and brilliancy. Neither Rubens nor Tintoretto, in that reſpect, excel him; his compoſitions are full of buſtle, and deſigned with great truth, even grandeur of form. His defect (and it muſt be allowed that it is a great one, in an art whoſe principal end is to adorn, to improve, to pleaſe mankind) is groſſneſs of ſubject and of form; not indecent, but vulgar, low common life.

His power to give rotundity and relief to his figures, is amazing; and his execution is of the moſt maſterly kind.

The French have poſſeſſed themſelves of many of his principal works; two are particularly noticeable in the gallery of the Louvre, the Flemiſh celebration of Twelfth night, known by the appellation of "Le Roi boit," and Chriſt driving the money-changers from the temple.

He was remarkable for the rapidity of his execution, and appears to have ſtudied his figures and effects by candle light, or in bright ſun-ſhine. Having obtained great renown and ſucceſs, he died in 1678.

JORDAN, in *Ancient Geography*, the chief river of Paleſtine, which had its ſource in the lake of Phiala, about 10 miles N. of that of Samachon; which origin of the river was aſcertained by Philip the tetrarch, who made the experiment of throwing ſome ſtraw or chaff into the lake, which came out at the Panion, or Paneas, where the river emerges out of the earth, after having run about 120 furlongs under ground. This lake Phiala, a name commonly given to all other reſervoirs of that kind, is ſituated in a moſt delightful country, ſo well adapted for commerce, that marts and fairs are held in the adjacent places through the ſummer by the neighbouring inhabitants. The etymology of the name has been variouſly aſſigned. Jordan, in Hebrew *Jarden*, is derived from *jerad, deſcendit*, or *jarden, deſcenſus*, from its rapid deſcent through that country. This origin is more probable than ſeveral others which have been given by different writers. Some ſay that it is formed of the oriental *Ior*, a ſtream, and *Dan*, a town, near which it had its ſource. Hardouin ſays that this name ſignifies the "river of delight," or the "delightful river." Others ſay, that *dan* or *dun* ſignifies depth, whence it was named the "deep river," to diſtinguiſh it from others in Paleſtine, all which were comparatively brooks or rivulets. The Arabs call it Arden or Harden, or Ordounon; the Perſians, Aerdun; and the Nubian geographer Edriſi gives it the name of Zacchar, which, in Arabic, ſignifies ſwelling or overflowing. Jordan is ſo conſiderable, in compariſon with others, that it is ſometimes ſtyled, by way of emphaſis, "the river." The courſe of the Jordan is moſtly ſouthward, bending a few degrees towards the weſt. After a run of about ten or twelve miles, it paſſes quite through the Samachonite lake, whence, after a courſe of about eighteen or twenty miles more, excluſive of its windings, it enters into the ſea of Tiberias on the N. ſide, and comes out again on the S. ſide, at a ſmall diſtance from a city of that name. Thence it proceeds ſtill ſouth-weſtward through a plain and deſert of about 60 miles, and falls into the Aſphaltite lake. Its courſe is very rapid, though its bed is deep. Pococke compares its breadth to that of the Thames at Windſor. Shaw gives it only 30 yards, whilſt he ſtates its depth, even at its brink, to be three yards. Its banks are occaſionally beautiful, and in ſome places covered with high and thick reeds, canes, and trees, ſuch as willows and tamariſks, which afford a convenient lodgment for lions and other wild beaſts. This river, it is ſaid, conſtantly overflowed its banks about the time of the early harveſt, or ſoon after Eaſter; and in this reſpect differed from other rivers, which commonly ſwell moſt during the winter. This inundation has been aſcribed to its ſubterraneous communication with the Nile. But it is more probably owing to the melting of the ſnows about that time, and the early rain which falls in great abundance. Modern travellers inform us, that it is no longer ſubject to theſe overflowings: becauſe, as they conceive, it has, by the rapidity of its current, worn its channel deeper than formerly, or, perhaps, diverted ſome of its waters another way. Its water is commonly very turbid, occaſioned by its rapidity; but it is ſaid to be very wholeſome and incorruptible: and ſuperſtition has even inveſted it with the property of waſhing away the ſins of mankind. Dr. Pococke, who mentions this circumſtance, adds, that not only men, but women, are ambitious of deriving benefit from theſe ſalutiferous waters, by bathing and ſwimming in it, even at the hazard of their lives. The Latin prieſts erect altars along its banks, where they ſay maſs to the devout pilgrims. We ſhall only add, that the plain on both ſides of this river, from the ſea of Tiberias to the Aſphaltite or Dead ſea, is very dry, ſultry, and inſalubrious during the heat of ſummer, and every where barren, except in that part which lies near the river, and is watered by it. Anc. Un. Hiſt. vol. ii.

JORDEN, EDWARD, M. D. in *Biography*, was born in the year 1569, at High Halden, in Kent, and probably educated at Hart-hall, Oxford. After completing his ſtudies in his own country, he travelled abroad, viſiting ſeveral foreign univerſities, and taking his degree of doctor in that of Padua. On his return, he practiſed for a time in London, where

where he became a member of the College of Phyſicians, and was in great reputation for learning and abilities. He gave an inſtance of his good ſenſe in detecting the impoſture of one Ann Gunter, who was affected with ſtrange and ſingular ſymptoms, which were imputed to witchcraft. Dr. Jorden removed, after ſome time, from London to Bath, where he ſpent all the latter part of his life, univerſally reſpected as well in his private character as in his medical capacity. The ſtudious and ſedentary life which he led, aggravating the diſorders to which he was conſtitutionally ſubject, the gout and ſtone, he died in his ſixty-third year, on January 7th, 1632. He was author of two publications: "A brief Diſcourſe of a Diſeaſe called the Suffocation of the Mother, &c." Lond. 1603; and 2. "A Diſcourſe of Natural Baths and Mineral Waters;" Lond. 1631, 4to. This ſoon went through a ſecond edition, and was afterwards reprinted in 1669, in 8vo., by Dr. Guidott, and again in 1673. It is a work of conſiderable learning and ingenuity, written in a clear ſtyle and judicious method. Aikin's Biog. Mem. of Med.

JORE, in *Geography*, the higheſt mountain in the Cherokee country, through which the Teneſſee river forces its waters.

JORGA, a town of Aſiatic Georgia, in the province of Kaket; 85 miles S.E. of Teflis.

JORGE Grego, a ſmall iſland near the coaſt of Braſil.

Jorge, *St.*, a town of Braſil, in the government of St. Salvador, and chief place of the capitaincy of Illicos, ſituated on land projecting into the Atlantic. S. lat. 14° 45′. W. long. 22° 40′.—Alſo, a town of New Mexico, on the Bravo; 20 miles E. of Sumas.

Jorge *de Olancho*, *St.*, a town of Mexico, in the province of Honduras; 100 miles E. of Valladolid. N. lat. 14° 35′. W. long. 86° 36′.

JORGEN, a town of Norway, in the dioceſe of Bergen; 33 miles S.W. of Romſdal.

Jorgen, *St.*, a town of the duchy of Stiria; 14 miles S.S.E. of Gratz.—Alſo, a town of Auſtria; 12 miles S.E. of Ips.—Alſo, a town of the duchy of Bremen; 8 miles N.N.E. of Bremen.

JORGENAW, a town of Pruſſia, in the circle of Natangen; 22 miles S.S.E. of Konigſberg.

JORGENBURG, a town of Auſtria; 14 miles S.S.W. of Steyr.

JORGENTAL, a town of Pruſſia, in the province of Oberland; 6 miles S.W. of Leibſtadt.

JORGENTHAL, a town of Bohemia, in the circle of Leitmeritz; 6 miles N.E. of Kamnitz.

JORJAN, or Corcan, a town of Perſia, and capital of a diſtrict, to which it gives name, in the weſtern part of Choraſan, bordering on the Caſpian ſea, ſituated on the Abiſcoun. It was anciently the capital of Hyrcania, and named Syringes; 300 miles N. of Iſpahan. N. lat. 36° 54′. E. long 54° 54′.

JORKOW, a town of Bohemia, in the circle of Saatz; 13 miles N. of Saatz. N. lat. 50° 28′. E. long. 13° 26′.

JOROPOUR, a town of Bengal; 38 miles N.N.E. of Calcutta.

JORQUERA, a town of Spain, in New Caſtile, on the Xucar; 38 miles S.S.E. of Alarçon.

JORRACH, a town of Arabia, in the province of Hedſjas; 188 miles S.S.E. of Mecca.

JORSA, one of the ſmaller weſtern iſlands of Scotland, between Scarba and Kerrera.

JORTIN, John, in *Biography*, born in London in 1698, was ſon of Renatus Jortin, a native of Bretagne, in France, who came over as a refugee on the repeal of the edict of Nantes, and who was appointed one of the gentlemen of the privy-chamber to king William III. in 1691. He was afterwards ſecretary to admiral Ruſſel, earl of Orford, and ſir Cloudeſley Shovel, and periſhed with the latter when his ſhip ſtruck on the rocks of Scilly. This was in October 1707, when his ſon John, only nine years of age, was ſent to the Charter-houſe as a day-ſcholar, where he laid the foundation of an exact and elegant claſſical taſte. In 1715 he was admitted penſioner of Jeſus college, Cambridge, and ſo diſtinguiſhed himſelf by his talents and application, that, while he was under-graduate, he was engaged, by the recommendation of Dr. Thirlby, to tranſlate ſome of Euſtathius's notes on Homer for Mr. Pope. He performed the work to the ſatisfaction of the poet, who, however, did not think it worth while to make any perſonal enquiry after a young ſtudent at college. "I was," ſays Mr. Jortin, "in ſome hopes, in thoſe days (for I was young), that Mr. Pope would make enquiry about his coadjutor, and take ſome civil notice of him. But he did not, and I had no notion of obtruding myſelf upon him—I never ſaw his face." Mr. Jortin was admitted to the degree of bachelor of arts in January 1718-19, and was elected fellow of Jeſus college in October, 1721, and in the following year he took his degree of M. A. In this latter year he was appointed one of the moderators at the diſputations, and appeared likewiſe as a writer, by the publication of his "Luſus Poetici," a collection of Latin poems, which have been ranked among the moſt elegant and truly claſſical compoſitions of the kind produced by a modern ſcholar. They have been frequently reprinted, and retain their original reputation. He was admitted to prieſt's orders in 1724, and in 1727 was preſented by his college to the vicarage of Swaveſey, near Cambridge. In 1730-1, he reſigned his vicarage, and ſettled in London, where he ſerved a chapel belonging to St. Giles in the Fields, in New-ſtreet, Bloomſbury, about ſixteen years. His firſt publication, after his arrival in the metropolis, conſiſted of four ſermons on the truth of Chriſtianity, which have ſince been incorporated in ſome of his ſubſequent publications. In the years 1731 and 1732, Mr. Jortin, in conjunction with biſhop Pearſe, Dr. Taylor, Mr. Upton, Dr. Thirlby, and others, publiſhed, in a ſeries of twenty-four ſix-penny numbers, "Miſcellaneous Obſervations upon Authors, ancient and modern," which were highly applauded by the learned of his own country, and which were tranſlated into the Latin language at Amſterdam. He next publiſhed "Remarks on Spenſer's Poems," to which were ſubjoined "Remarks on Milton:" he publiſhed likewiſe "Remarks on Seneca." In 1747 he was appointed by his friend Dr. Pearſe, then rector of St. Martin in the Fields, to be afternoon preacher at a chapel in Oxendon-ſtreet. In 1749, Mr. Jortin, at the recommendation of archbiſhop Herring and biſhop Sherlock, was appointed preacher of Boyle's lecture. The ſubſtance of the diſcourſes which he delivered on this occaſion, was afterwards inſerted in his "Remarks upon Eccleſiaſtical Hiſtory." Of this work, the firſt volume was publiſhed in 1751, and the ſecond and third in the years 1752 and 1754, the other volumes were given to the world after the author's death. In 1751, he had been preſented by archbiſhop Herring with the rectory of St. Dunſtan in the Eaſt; and in the year 1755 he was preſented by the ſame prelate with a Lambeth degree of D. D. The principal work of Dr. Jortin was his "Life of Eraſmus," of which the firſt part was publiſhed in 1758, in one volume 4to.; the ſecond volume, printed in 1760, conſiſted only of obſervations on the writings of Eraſmus. The groundwork of this piece of biography, is one drawn up by the celebrated Le Clerc, and publiſhed in his "Bibliotheque

Choiſie:" "The life of Eraſmus," ſays Dr. Knox, "abound with matter intereſting to the ſcholar; but the ſtyle and method are ſuch as will not pleaſe every reader. There is a careleſsneſs in it, and a want of dignity and delicacy." Nevertheleſs it extended the reputation of Dr. Jortin beyond the limits of his native country, and eſtabliſhed his literary character in the remoteſt univerſities of Europe. The declining years of Dr. Jortin were cheered by ſome ſubſtantial proofs of the eſteem which he had inſpired for his character and abilities. In 1762, he was collated by biſhop Oſbaldiſton to a prebend in the cathedral of St. Paul's, and in the ſame year he was preſented by the ſame friend to the valuable vicarage of Kenſington. The biſhop, as another proof of his determined patronage of our author, appointed him archdeacon of London, in April 1764, and it is believed he offered him the rectory of St. James, Weſtminſter, upon the death of Dr. Samuel Nicolls, in November 1763, but he choſe to continue at Kenſington, that being a ſituation better adapted to his advanced age. Dr. Jortin died on the 5th of Sept. 1770, in the 72d year of his age. The tranquil compoſure of his laſt moments was expreſſed in the words he ſpoke to his nurſe, who urged him to take more nouriſhment: "No," ſaid he, "I have had enough of every thing." He left a widow and two children. The private character of Dr. Jortin was truly eſtimable: he had a ſpirit which raiſed him above every thing mean and illiberal, and would not permit him to ſtoop for preferment. His manners were ſimple, and in ſome reſpects ruſtic: he had true urbanity in his temper, and benevolence in his heart. As a public defender of religion, he is claſſed by biſhop Watſon among thoſe great and eminent names who have honourably and ſucceſsfully laboured to eſtabliſh the truth and illuſtrate the doctrines of Chriſtianity. Dr. Knox, ſpeaking of his "Diſcourſes on the Chriſtian Religion," which was one of the firſt fruits of his theological purſuits, ſays they abound with ſound ſenſe and ſolid argument, which entitled their author to a rank very near the celebrated Grotius. He farther adds, "as a poet, a philoſopher, and a man, he ſerved the cauſe of religion, learning, and morality." Beſides the works already noticed, Dr. Jortin was author of an "Eſſay on Muſical Expreſſion:" of "Six Diſſertations on different Subjects;" and after his death his "Sermons and Charges," in ſeven volumes, were given to the world. His works were publiſhed a few years ſince in an uniform manner, and may be had with or without the life of Eraſmus. Of theſe works a full account will be found in the "Memoirs of the Life and Writings of Dr. Jortin," by the Rev. Dr. John Diſney, who has alſo given the character of the author as drawn by the energetic pen of Dr. Parr. "Jortin," ſays he, "whether I look back to his verſe, to his proſe, to his critical, or to his theological works, there are few authors to whom I am ſo much indebted for rational entertainment, or for ſolid inſtruction. Learned he was, without pedantry. He was ingenious without the affectation of ſingularity. He was a lover of truth, without hovering over the gloomy abyſs of ſcepticiſm, and a friend to free inquiry, without roving into the dreary and pathleſs wilds of latitudinarianiſm. He had a heart which never diſgraced the powers of his underſtanding. With a lively imagination, an elegant taſte, and a judgment moſt maſculine, and moſt correct, he united the artleſs and amiable negligence of a ſchool-boy. Wit without ill nature, and ſenſe without effort, he could at will ſcatter upon every ſubject, and in every book the writer preſents us with a near and diſtinct view of the real man."

JORVIS, in *Geography*, a town of Sweden, in the government of Kuopio; 43 miles S. of Kuopio.

IOS, in *Ancient Geography*, one of the Cyclades iſlands, E.N.E. of the iſland Sicinos, N.N.W. of Thera, and S.S.W. of Nayos. This iſland derived its name from a colony of Ionians, who were its firſt inhabitants. It is famous only for being the place of Homer's death and burial. It is ſaid that the town of Argos was accuſtomed to ſend every five years a deputation to this iſland, commiſſioned to offer libations in its name on the tomb of the poet, which was an object of public veneration.

JOSEF, St., in *Geography*, a town of California, where the Manila ſhip generally took in water on its voyage to Acapulco; 45 miles S. of Loreto. N. lat. 23° 4'. W. long. 109° 48'.—Alſo, a town of the iſland of Cuba; 125 miles W.S.W. of Havanna.—Alſo, a town of South America, in the province of Chiquitas.—Alſo, a town of South America, in the province of Moxes.—Alſo, a ſmall iſland in the Atlantic, near the coaſt of Patagonia. S. lat. 44° 30'.—Alſo, a town of New Mexico, in the province of Sonora; 35 miles S. of Pitquin.—Alſo, a town of New Mexico, on the Bravo; 27 miles N.W. of Santa-Fé.—Alſo, a town of South America, in the government of Buenos Ayres; 185 miles E. of Corientes.—Alſo, a ſmall iſland in the bay of Los Camarones, near the coaſt of Patagonia. S. lat. 44° 30'.—Alſo, a town and fort of South America, in the province of Tucumar; 90 miles S.S.E. of Salta.—Alſo, a town of South America, in the government of Buenos Ayres, and province of Moxes; 80 miles S.W. of Trinidad.

Josef *de Chiquitas, St.*, a town of South America, in the government of Buenos Ayres; 36 miles N.W. of Santa Cruz de la Sierra la Nueva.

Josef *de Huales, St.*, a town of South America, in the audience of Quito, on the Napo; 220 miles E.S.E. of Quito. S. lat. 1° 50'. W. long. 74° 26'.

JOSEFGROD, a town of Ruſſian Poland, in the palatinate of Braclaw, ſituated on a river which runs into the Bog; 76 miles S.S.E. of Braclaw.

JOSEPH, in *Scripture Biography*, a Hebrew patriarch, who ſuſtained a rank and character that entitle him to particular notice. He was the ſon of Jacob by his wife Rachel, and born about the year 1745 B.C. As he was the favourite of his father, on account of his perſonal and mental endowments, he became the object of the jealouſy and hatred of his brethren; and they ſold him to ſome Iſhmaelites who were travelling to Egypt (B.C. 1728), feigning a tale that he had been devoured by wild beaſts. When the Iſhmaelites arrived in Egypt, thay ſold Joſeph to Potiphar, an officer of the royal houſhold. In this ſituation Joſeph conducted himſelf with ſuch prudence, induſtry, and fidelity, that his maſter committed all his affairs to his management. After ten years ſervice Potiphar's wife aſſailed him with a temptation, which every principle of gratitude and honour, as well as of religion, induced him to reſiſt; but the conſequence of his integrity was her reſentment, and a reſolution, as far as ſhe could prevail, to effect his ruin. Accordingly ſhe formed an artful ſtory, intimating that Joſeph had made an attempt upon her virtue; and ſhe contrived to impoſe upon her huſband Potiphar, and to procure Joſeph's commitment to priſon. The patriarch's conduct, during his impriſonment, engaged confidence, and he was entruſted with the care of his fellow-priſoners. Among theſe were two perſons of ſome diſtinction, who had belonged to Pharaoh's houſhold. Both of them had dreams in the ſame night, which they communicated to Joſeph, and which he undertook to interpret. One of them was to be reſtored to his office, and the other was to be hanged; and the events correſponded to his predictions. Upon the future advancement of one of theſe perſons, who was the chief butler, the other being the chief baker, he was altogether unmindful of Joſeph, and made no effort, notwithſtanding his application to him, to procure for him his liberty. In proceſs of time Pharaoh had two dreams, by which his mind was much impreſſed, and which none of the wiſe men who belonged to his court were able to interpret. The chief butler was thus reminded of Joſeph, and acknowledging to the king his ingratitude for neglecting him, related the circumſtances pertaining to himſelf and the chief baker. Upon this information, Pharaoh ordered Joſeph to be brought to him. The king imparted to him his dreams; and Joſeph, modeſtly diſclaiming all pretenſions to ſuperior wiſdom, and relying on that divine ſuggeſtion with which he hoped to be favoured, interpreted them to his ſatisfaction. (B.C. 1715.) Theſe dreams and their interpretation it is unneceſſary for us minutely to recite. It is ſufficient to obſerve, that the king was then forwarned of ſeven years of fertility and abundance, which were to be ſucceeded by the ſame period of ſterility and famine; and he found it neceſſary to make previous proviſion accordingly. With this view Joſeph, who was near thirty years of age, was appointed general ſuperintendant of the affairs of the kingdom, and inveſted with authority next to that of Pharaoh himſelf, who alſo gave him in marriage the daughter of Potipherah, prieſt of On. The courſe of events was preciſely ſuch as Joſeph had pre-ſignified by his interpretation of Pharaoh's dreams; ſo that granaries were eſtabliſhed under his direction in the cities of Egypt, and corn collected in great quantities, and laid up in ſtore, during the years of plenty, for the ſupply, not only of Egypt, but of neighbouring countries in the ſucceeding years of ſcarcity. The years of famine began B.C. 1708. In this period of general diſtreſs Jacob ſent 10 of his ſons, from Canaan to Egypt, in order to purchaſe corn. As this buſineſs was wholly committed to the management of Joſeph, they were referred to him. Joſeph inſtantly recognized their perſons, though he was unknown to them; but in order the more effectually to prevent their diſcovery of him, and, probably, to excite in their minds a due ſenſe of their paſt crime, he queſtioned them in an angry tone, and by an interpreter, concerning their country; and being informed that they had come from the land of Canaan, charged them with being ſpies, which charge they obviated by giving a true account of their father and family. A younger brother, they ſaid, was left at home with his father, and another was now no more. Joſeph ſtill perſiſted in the charge, and required their verifying the account which they had given of themſelves, by diſpatching one of their number to fetch their younger brother, while the reſt remained in cuſtody. However, he afterwards relented, and propoſed that one of them ſhould remain till the arrival of the younger brother, and that all the reſt ſhould go home with corn for their families. During their detention they accuſed one another for the cruelty of their conduct towards Joſeph, who, ſtill feigning himſelf a ſtranger to their language, heard their mutual reproaches with an emotion which he could not ſuppreſs, and which, therefore, required his withdrawing from them. At length he gave them leave to depart, informing them, that if their account of themſelves was true, they would be permitted to traffic in the land. Simeon, who is ſuppoſed to have been the principal aggreſſor in the treatment of Joſeph, was kept in cuſtody; and the others were diſmiſſed. Before their departure orders had been given that when the ſacks were filled with corn, each man's money ſhould be returned in his ſack's mouth. This circumſtance, when it was diſcovered in their journey homewards, very much alarmed them; and they concluded that this was done in order to furniſh a pretence for enſlaving them when they next viſited Egypt. Jacob heard their adventures with ſurpriſe and concern; more eſpecially when he found that Simeon was left behind in cuſtody, and that they were pledged to take Benjamin with them before they could obtain his releaſe. At length, as the ſcarcity increaſed, and their ſupply was nearly exhauſted, Jacob, with great reluctance, conſented to part with Benjamin; and having ordered them to provide preſents for the ruler of Egypt, and to carry with them twice as much money as before, he committed them to the bleſſing of heaven, and diſmiſſed them. Upon their arrival in Egypt, they haſtened to preſent themſelves before Joſeph; and were kindly received and liberally entertained at a public dinner which he had provided for them. Some circumſtances occurred on this occaſion which might have brought their brother to their recollection; but they again departed with their ſacks and money as before, and in Benjamin's ſack was the ſilver cup out of which Joſeph himſelf drank. Upon their return towards Canaan they were followed by an officer, who charged them with ingratitude for the hoſpitality with which they had been treated, and with the theft of his lord's ſilver cup. All of them proteſted their innocence; but upon ſearching the ſacks, the cup was found to their great ſurpriſe and concern in that of Benjamin. They were therefore taken back to Joſeph, who inſiſted upon detaining Benjamin as a ſlave, whilſt they might be allowed to return home in peace. Recollecting the reluctance with which his father had parted with his ſon Benjamin, and that they were ſureties for his return, they urged various pleas for his being allowed to accompany them. Judah was the advocate for his brother's liberty; and he offered himſelf as a ſubſtitute if he were permitted to return. Joſeph was at length overcome; diſguiſe became intolerably irkſome to him; and he could no longer refrain from diſcovering himſelf to his brethren. (B.C. 1706.) This part of the ſacred hiſtory is wrought up with incomparable beauty and pathos, and muſt ſuffer by any attempt to abridge it, or to relate it in different language. The diſcovery being made, they were all received, and particularly Benjamin, his brother by the ſame mother, with expreſſions of the tendereſt and moſt affectionate regard; nor did Joſeph, the viceroy of Egypt, for ſuch was the high rank he occupied, loſe any time in acquainting Pharaoh with the arrival of his brethren, and with the circumſtances of his father and his family. The king immediately gave orders for their being ſent for to Egypt, and for ſettling them in the richeſt part of the country. Goſhen was the diſtrict which Joſeph allotted to them; and there they were ſupplied with ample means of ſubſiſtence, whilſt the inhabitants of other parts of Egypt were ſuffering great diſtreſs on account of the famine, which ſtill continued. The long duration of this calamity drained the people of all their money, and conſtrained them at length to part with their cattle, their houſes, their land, and even their perſonal freedom for ſupport. (B.C. 1705.) Thus the whole kingdom of Egypt, the lands of the prieſts excepted, became the demeſne of the crown; and all the people were reduced to the ſervile condition of bondſmen to the crown. Moreover, the old owners were ſeparated from one another, and diſperſed through different parts of the kingdom, that they might thus forget their intereſt in the lands which they had ſold, and precluded from forming combinations for regaining them. In this inſtance, Joſeph's zeal for Pharaoh's intereſt cauſed him to overſtep the bounds which ſound policy and juſtice preſcribed; and contributed to eſtabliſh a deſpotiſm, which eventually proved very oppreſſive to the deſcendants of Joſeph, and the reſt of the

Iſraelites. In the laſt year of the famine, Joſeph informed the Egyptians that they might expect a crop during the following year; and that he would enable them to renew their attention to agriculture, by diſtributing among them freſh lands, cattle, and corn: but he ſtipulated this condition with them, that from henceforwards the fifth part of all the products of their lands ſhould be reſerved for the king, and that the reſidue ſhould be their own. From this time, (B.C. 1702,) as the people conſented to this regulation, it became a law, that remained in force for ſeveral centuries, that the fifth part of the produce of the whole kingdom of Egypt, the lands of the prieſts excepted, ſhould belong to the crown. After the death of Jacob, and the return of his brethren to Egypt from Canaan, whither they had attended the remains of their father (ſee JACOB), they were apprehenſive that Joſeph might retaliate the injuries which they had done him; and therefore they informed him, by a meſſenger, that it was their father's dying requeſt that he would forgive them, and continue to afford them his protection. Joſeph immediately took an opportunity of removing their ſuſpicion and anxiety, by repeated aſſurances of his unabated affection and zealous concern for their welfare. Having ſurvived his father about 60 years, he informed his brethren (B.C. 1635), that God, according to his promiſe, would bring their poſterity from Egypt to the land of Canaan; and he therefore made them pledge themſelves on oath, to bury him with his anceſtors. Joſeph, having occupied under ſix ſovereigns the office of viceroy of Egypt, during 80 years, retained it till his death, which happened when he had attained the age of 110 years, in the year 1635 B.C. When the Iſraelites took their departure from Egypt, they obſerved his injunction concerning the removal of his body; and as we read in Joſh. xxiv. 32. it was buried at Schechem, in the field which Jacob bought of Hamor. From Jerome we learn, that the Iſraelites erected a noble monument to his memory, which was to be ſeen in his time. We ſhall not enlarge this article by an account of the tales of the Talmudiſts and of the Koran (chap. xii.), but refer the reader to D'Herbelot's Bibl. Orient. art. *Jouſouph*, for ſpecimens of theſe legendary tales. Gen. xxx—l. Anc. Un. Hiſt. vol. iii.

JOSEPH I., in *Biography*, emperor of Germany, ſon of the emperor Leopold, was born in 1678. He was declared hereditary king of Hungary, and crowned in 1687. In 1690 he was elected king of the Romans, and aſcended the imperial throne on the death of his father, in 1705. He purſued the ſyſtem of the late emperor, and maintained the alliance againſt France, with England, Holland, and Savoy, in ſupport of the claim of the archduke Charles to the crown of Spain; in which war the allies were ſucceſsful. Joſeph was of a haughty and arbitrary diſpoſition, employed violent meaſures againſt all the oppoſers of his authority, and ſupported with a high hand all the claims of his houſe. In 1706 he put the electors of Bavaria and Cologne to the ban of the empire, for taking part with France; and having deprived thoſe princes of a great part of their eſtates, he beſtowed the ſame on his own relations and favourites. He quarrelled with the pope, whom he afterwards obliged to recognize his brother the archduke Charles as king of Spain. He made himſelf maſter of Italy, and levied contributions on Mantua, Parma, Modena, Lucca, Genoa, and other places. His armies defeated the revolted Hungarians; but in the midſt of his ſucceſſes, he was carried off by the ſmall-pox, in April 1711, at the age of thirty-three, owing, it was believed, to the unſkilfulneſs of his phyſicians. His character has been variouſly repreſented. He was impatient of oppoſition, active, and enterpriſing; and frequently purſued from motives of reſentment what he had firſt undertaken from policy. In his imperial capacity, he governed with more deſpotiſm than any of his predeceſſors; and the houſe of Bavaria was a monument of the inflexibility of his temper. Univer. Hiſt.

JOSEPH II., emperor of Germany, ſon of Francis of Lorraine and the empreſs-queen Maria Thereſa, was born at Vienna, in March 1741. Great care was taken of his education; and at the age of nineteen, he was married to Iſabella, the infanta of Parma. He had, at an early period, diſplayed a deſire of diſtinguiſhing himſelf, and military glory was his firſt paſſion. He was crowned king of the Romans in 1764; and having loſt his firſt wife, to whom he was tenderly attached, he married, in 1765, the ſiſter of the elector of Bavaria. In this ſame year, on the death of his father Francis I., he ſucceeded to the imperial crown without oppoſition. He now diſplayed great talents and activity, by new-modelling the armies, and reforming all the departments of government. He travelled through his dominions, and viſited Pruſſia, Italy, France, and Ruſſia: and on his return, among many other wiſe and excellent regulations which he adopted, he ſet apart one day in every week for receiving petitions and complaints from all his ſubjects, without any diſtinction of birth or fortune; and the officers of his court were expreſsly forbidden to repulſe any, even the meaneſt object, who came to implore his protection. "It behoves me," ſaid the emperor, "to do juſtice; and it is my invariable intention to render it to all the world, without reſpect of perſons." In the year 1771, Germany ſuffered the horrors of a famine, which was more or leſs felt in all the countries of Europe. But in ſeveral parts of Germany, the ſcarcity was ſo great, that vaſt numbers of people actually periſhed for the want of the commoneſt neceſſaries of life. During theſe calamities, the emperor joined the monarchs of Pruſſia and Ruſſia in the diſmemberment of Poland. The firſt treaty for this iniquitous buſineſs was ſigned in 1772, and which finally terminated in the total extinction of that unhappy kingdom. In 1780, by the death of the empreſs-queen, Joſeph ſucceeded to the crown of Hungary and Bohemia; and in the following year, he iſſued a decree in favour of the liberty of the preſs, which was followed by others equally liberal, particularly one in favour of a more liberal toleration. The ſuppreſſion of the inquiſition at Milan may be attributed to the prevalence of a ſimilar ſpirit in the imperial councils. He extended the privileges of ſubjects to the Jews; and he ſhewed his attention to economy, by certain regulations relative to penſions, and by retrenching many which had been granted by the benevolent facility of his mother. He promulgated a decree in favour of the liberty of the preſs; and by one of the articles, he allowed a free circulation to literary reviews, and other periodical publications: he even permitted that all ſtrictures upon the throne itſelf might be publiſhed with full ſecurity, provided they did not deſcend to the character of libels or paſquinades. "If," ſaid he, "they be founded in juſtice, we ſhall profit by them; if not, we ſhall diſregard them." In a journey to the Netherlands, the emperor gained the love of the people by his courteſy and generoſity. He carried into effect a project for reſuming that line of fortreſſes which was called the Dutch barrier, and was garriſoned by their forces. Theſe were all diſmantled, and the materials ſold. On this viſit he declared Oſtend a free port, and ordered ſeveral improvements to be made in the harbour at his own expence. The emperor afterwards demanded of the Dutch the free navigation of the Scheldt; but in this he was unſucceſsful. On his return to Vienna, he aboliſhed the ſyſtem of vaſſalage;

and took the moſt deciſive ſteps in eccleſiaſtical reform, and the reduction of the power of the church. Numerous ſuppreſſions of religious houſes took place throughout all his dominions; and in an imperial reſcript, all ſubordination whatever, in ſecular affairs, to the holy ſee was formally diſclaimed. Such proceedings awakened the moſt lively alarms in the papal court; and on this occaſion, pope Pius VI. made a journey to Vienna: but notwithſtanding the very flattering attentions which he received on his arrival, he found it impoſſible to procure an intermiſſion of thoſe reforms, which were now extended to the ſecular clergy and hierarchy, as well as to the religious orders or regulars; and only obtained a reſpite for ſome threatened religious foundations. In 1786 the emperor followed his attack on the papal authority, by calling an aſſembly of the eccleſiaſtical princes at Ratiſbon, in which it was reſolved to withdraw from the juriſdiction of the pope. In 1788 a declaration of war was publiſhed againſt the Turks, and in the ſame year the emperor in perſon reduced Schabatz; but this was followed by the defeat of prince Linchenſtein, who fell in the action. Soon after a bloody battle was fought between the Imperialiſts and the Turks, on the heights of Rohadin, in which neither party could claim the victory. The emperor now prepared to attempt the reduction of Belgrade; but notwithſtanding the great preparations made on this occaſion, his plans were defeated, and he had the mortification to witneſs the rapid deſtruction of his troops by a dreadful mortality. Putrid fever and dyſenteries of the moſt malignant kind ſpread their influence through the imperial armies: diſcontent and complaint became univerſal; and in a ſhort time, one of the fineſt armies in the world was reduced, in a ſingle campaign, to leſs than half the number of its original combatants; the remainder being loſt by mortality, deſertion, and the ſword, or rendered incapable of preſent ſervice by diſeaſe. In the mean time, Joſeph was labouring under the rapid decline of health, but ſtill continued to employ himſelf indefatigably in public affairs. Theſe, however, were moſtly of a kind to aggravate, by vexation and anxiety, his bodily diſorder. The Low Countries were again in a flame, and the moſt violent meaſures were taken to reduce the people to ſubmiſſion. Military execution took place in ſeveral cities, and a general gloom, bordering on deſpair, overſpread the provinces. At length an open inſurrection broke out, conducted with ſo much prudence and valour, that the imperial troops were repeatedly defeated: ſeveral important cities were taken poſſeſſion of by the inſurgents; and the ſtates of Flanders, on November 20th, 1789, ſeized the government of the province, openly declaring that the emperor had forfeited all title to ſovereignty. By the end of the year, Bruſſels had expelled its garriſon; and a treaty of confederation was formed between all the Belgic provinces as independent ſtates. Joſeph, almoſt on his deathbed, was farther mortified by a remonſtrance from the Hungarian nobility, demanding the reſtoration of their ancient rights and privileges. Willing to die in peace, he conſented to all their requiſitions, but inſiſted upon retaining three articles, which were highly creditable to his heart, *viz.* a general toleration, proviſion for the parochial clergy out of the revenues of ſome ſuppreſſed monaſteries, and certain conceſſions in favour of the liberty of the peaſants. He died with great compoſure, on the 20th of February 1790. Leaving no iſſue, he was ſucceeded by his brother Leopold. Joſeph had many private virtues, as well as many of the qualities of a great and good ſovereign. He was patient of fatigue, and poſſeſſed of an ardent mind. He applied himſelf with unremitting diligence to the ſuppreſſion of intolerance and ſuperſtition, and the promotion of induſtry, throughout his dominions. He has been accuſed of encroaching on the liberties of his Flemiſh ſubjects; and it will be readily conceded that he was not perfect: but his faults almoſt vaniſh among the truly glorious actions which contributed to the aggrandizement of his own name, and the permanent felicity of his people. Univer. Hiſt.

Joseph, king of Portugal, of the family of Braganza, was born in the year 1714, and ſucceeded his father in 1750. He was much beloved by his people, a circumſtance that enabled him to effect ſeveral important regulations, in which his good ſenſe and moderation were eminently conſpicuous. Senſible of the danger of ſudden changes, he advanced his deſigns by almoſt imperceptible ſteps, ſo as to prevent all juſt grounds of alarm and complaint. He ſubjected the powers of the infamous Inquiſition to ſome reſtriction, by directing that none of its ſentences ſhould be carried into execution till reviewed and approved by the privy council. He carried into effect a treaty concluded between Spain and Portugal juſt before his father's death, which was conſidered as inimical to his country, on the principle "that all engagements among ſovereigns ſhould be held ſacred and inviolable." This reign was marked, in 1755, with the terrible diſaſter of an earthquake, which deſtroyed a great part of the capital. A conſpiracy in 1758, headed by the duke of Aveiro, and favoured by the Jeſuits who had been baniſhed from court, brought his life into great danger. The principal conſpirators were ſeized and executed, and the whole order of Jeſuits was baniſhed the kingdom. Joſeph had afterwards a diſpute with the court of Rome, and a war with Spain: in the latter, Portugal was aſſiſted by the Engliſh, whoſe battalions, under general Burgoyne, checked the career of the invaders, and obliged them, before the end of the campaign, to retreat within their own limits. After the peace of 1763, little of importance occurred in the affairs of Portugal. The king's councils, in the latter years of his reign, were entirely governed by the marquis de Pombal, a man of enlarged views, but of a haughty and violent diſpoſition. A diſpute with Spain, about the limits of the two nations on the borders of Rio de la Plata in South America, occaſioned hoſtile preparations on both ſides, but little was effected by either. Joſeph died February 1777, and was ſucceeded by his daughter, Maria Frances Iſabella, who is ſtill queen, though in a deranged ſtate of mind, and an exile in South America. See PORTUGAL.

JOSEPH *of Exeter*, or JOSEPHUS ISCANUS, is mentioned as a remarkable example of purity of literary taſte and elegance of ſtyle, in an age generally reputed barbarous. He was a native of Devonſhire, and flouriſhed in the cloſe of the twelfth, and the commencement of the thirteenth centuries. He was an eccleſiaſtic, and patronized by Baldwin, archbiſhop of Canterbury. According to the learned Camden, he accompanied Richard I. of England into the Holy Land. He was author of two epic poems in Latin heroics. The firſt, in ſix books, is on the Trojan war; the other is entitled "Antiocheis," the war of Antioch, or the Cruſade; of this laſt only a fragment remains, in which the heroes of Britain are celebrated. The ſtyle of Joſeph is not only, for the moſt part, pure, but rich and ornamented, and his verſification approaches the beſt models of antiquity. His diction is compounded chiefly of Ovid, Statius, and Claudian, the favourite poets of the age. "Italy," ſays Mr. Warton, in his Hiſtory of Engliſh Poetry, "had at that time produced no poet comparable to him." He was author of love verſes, epigrams, and miſcellaneous poems.

JOSEPHINIA, in *Botany*, ſo named by Ventenat, in honour of his munificent patroneſs Joſephine, the now divorced empreſs of Buonaparte, whoſe claim to ſuch commemoration we have already admitted; ſee Humea. Venten. Malmais. 67. Brown. Prodr. Nov. Holl. v. 1. 519. Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Luridæ*, Linn. *Bignoniæ*, Juſſ. *Pedalinæ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, in five deep, nearly equal, acute ſegments. *Cor.* of one petal, ringent; tube not much longer than the calyx; throat dilated, bell-ſhaped; limb five-lobed, ſpreading, two-lipped, the upper lip in two equal rounded ſegments, lower in three, of which the middle one is largeſt. *Stam.* Filaments four, awl-ſhaped, ſhorter than the corolla, two of them ſhorter than the reſt, with the rudiment of a fifth; anthers heart-ſhaped, of two cells. *Piſt.* Germen ſuperior, pyramidal, rugoſe; ſtyle cylindrical, about equal to the ſtamens; ſtigma in four equal, oblong, acute ſegments. *Peric.* Nut angular, muricated, of from four to eight cells. *Seeds* ſolitary, erect, oblong.

Eſſ. Ch. Calyx in five deep ſegments. Corolla ringent; throat bell-ſhaped; limb five-lobed, the middle ſegment of the lower lip longeſt. Stigma four-cleft. Nut of ſeveral cells, muricated. Seeds ſolitary, erect.

1. J. *Imperatricis.* Vent. Malmais. t. 67.—Germen of about four cells. Leaves lanceolate; elliptical, acute, downy beneath like the ſtem. Segments of the calyx equal. *Brown.*—Gathered by the French voyagers on the weſt ſide of New Holland, who brought ſeeds to the garden of La Malmaiſon, where they ſucceeded well. The plant is biennial, flowering in the middle of ſummer, decumbent, of an inelegant or lurid aſpect, with large, toothed, dull-green *leaves*. *Flowers* axillary, ſolitary, about an inch long, whitiſh, variegated and ſpotted with dull purple.

2. J. *grandiflora.* Brown. Prodr. v. 1. 520.—Germen of eight cells. Leaves lanceolate, pointed, ſlightly downy beneath. Stem ſmooth. Upper ſegment of the calyx half the length of the reſt. Loweſt ſegment of the corolla more than twice as long as the others. *Brown.*—Gathered by Mr. Brown in the tropical part of New Holland.

JOSEPHSTHAL, in *Geography*, a town of Bohemia, in the circle of Boleſlau; 12 miles N.N.E. of Turnau.

JOSEPHUS, Flavius, in *Biography*, an eminent Jewiſh hiſtorian, was born in the year 37, when Caligula was emperor. His father was Mattathias, deſcended from the ancient high-prieſts of the Jews: by his mother he was of the royal lineage of the Aſmonæans, who, for a conſiderable time, had the ſupreme government of the Jewiſh nation. He was educated together with his brother Mattathias, and made ſuch proficiency in knowledge, that when he was but fourteen years of age, the high prieſts, and ſome of the principal people of the city, came frequently to conſult him about the right interpretation of things in the law. In his ſixteenth year he retired into the wilderneſs, where he lived in great abſtemiouſneſs, and habits of ſelf-denial during the ſpace of three years. He ſtudied the principles of the leading ſects, and embraced, as the rule of his life and conduct, thoſe of the Phariſees, and being now nineteen years of age, he began to act in public. At the age of twenty-ſix he went to Rome, where, by means of a ſtage-player of his own nation, he obtained an introduction to Poppæa, the emperor Nero's wife, by whoſe intereſt he procured the releaſe of ſome prieſts, whom Felix had ſent priſoners from Jeruſalem. Returning home, he was appointed by the revolted Jews governor of the two Galilees, in which capacity, as a general, he bravely defended Jotapata againſt Veſpaſian, but which was taken after a ſiege of forty-ſeven days. When the city was in the hands of the conqueror, he gave orders to ſearch for Joſephus, who had eſcaped the general maſſacre, by concealing himſelf in a cavern cut in a rock. In this gloomy receſs he met with forty men of eminence who had concealed themſelves, and had with them proviſions ſufficient for their ſupport ſeveral days. Upon being diſcovered, he propoſed to the forty men who had taken refuge there with him, that they ſhould all ſurrender, and upon their determination rather to periſh by mutual wounds, he perſuaded them to caſt lots ſucceſſively, who ſhould kill the next man, and by an extraordinary circumſtance he and one other were left the ſurvivors of the reſt. This ſingle companion was eaſily prevailed upon to join him in accepting the proffered mercy of the Romans. On being taken before Veſpaſian, he boldly predicted that within a ſhort time the empire would fall to the ſhare of that general, by which prediction, which was afterwards fulfilled, he ſecured a favourable reception from him; though he was retained as a priſoner on account of the uſe which Veſpaſian intended to make of him in the farther proſecution of the war againſt the Jews. It ſhould ſeem that Joſephus flattered himſelf with the notion that he was inſpired with a knowledge of future events. "It is likely" ſays the judicious and learned Lardner, "that he often thought of Joſeph in Egypt, and of Daniel in Babylon, and was in hopes of making a like figure at the court of Rome. But I ſuppoſe it may be no diſparagement to Joſephus to ſay, that he was not equal to them in wiſdom, or in virtue and integrity." As ſoon as Veſpaſian was ſeated on the imperial throne, Joſephus was ſet at liberty, and was taken by Titus with him when he marched to lay ſiege to Jeruſalem. Here he ſaw the ruin of his country, of which he afterwards became the hiſtorian. He was ſent into the city with offers of peace upon condition of the ſubmiſſion of his countrymen. They deſpiſed his offers, and rejected his counſels with ſcorn. The Jews now conſidered him as a deſerter and traitor to their cauſe, and it is a fact that they never manifeſted any great reſpect for his writings. During the progreſs of the ſiege he did not ceaſe exhorting them to avoid their inevitable fate by a timely ſurrender, and once, approaching too near the walls, he received a wound which laid him ſenſeleſs on the ground. At the capture of the city, Joſephus obtained the liberation

Strahan and Preſton,
New-Street-Square, London.

tion of Matthias and ſeveral friends without ranſom; he had permiſſion alſo to ſave what he pleaſed out of the ruins; but he contented himſelf with a copy of the ſacred writings. The emperor heaped upon him his favours, and as a mark of his gratitude, he aſſumed their family ſurname of Flavius. He employed his leiſure in drawing up thoſe works which have immortalized his name. Theſe are, 1. "The Hiſtory of the Jewiſh war, and the taking of Jeruſalem," in ſeven books. It was written in the language of his own country, and he afterwards publiſhed it in Greek for the benefit of other nations. He profeſſes to have written with great fidelity, and appeals, for the truth of his hiſtory, to living witneſſes. He preſented the work to Veſpaſian and Titus, of whom the latter ordered it to be publiſhed, and ſigned it with his own hand to ſhew that it was authentic. 2. "The Jewiſh Antiquities" in twenty-four books, or the hiſtory of the Jews from the creation to the 12th year of Nero, in which the war began. To this is ſubjoined his life, written by himſelf, and dedicated to Epaphroditus, of whom we know nothing but from Joſephus himſelf, who deſcribes him as a lover of all kinds of learning, but as principally delighted with the knowledge of hiſtory, and this on account of his having been himſelf concerned in great affairs, and many turns of fortune, and having ſhewn a wonderful vigour of an excellent nature, and an immoveable virtuous reſolution in them all. 3. He wrote alſo "Two books againſt Apion of Alexandria," which is a vindication of the Jewiſh people againſt the calumnies of that Egyptian author. "A Diſcourſe on the Martyrdom of the Maccabees" is ſometimes aſcribed to him, but its genuineneſs is diſputed, and Mr. Whiſton who tranſlated the other works would not give this a place in his volumes. The works of Joſephus, though ſlighted by the Jews, are held in high eſtimation by Chriſtians; his ſtyle is pure, agreeable, and ſometimes eloquent; he has been called the Greek Livy; and, like that Roman writer, he is fond of diſplaying the powers of his own imagination by long ſpeeches. The hiſtory of the Jewiſh war, of which he was a ſpectator, is a moſt intereſting narrative. The beſt editions of the works of Joſephus, are thoſe of Hudſon in two vols. folio. Oxford, 1720, and of Havercamp, in two vols. Amſterdam 1726. There have been a multitude of Engliſh tranſlations; to that of Whiſton we have already referred. Univer. Hiſt. Lardner, vols. i. and vii. edit. 1788. And Joſephus's own Life.

JOSHUA, a canonical book of the Old Teſtament, containing a hiſtory of the wars and tranſactions of the perſon whoſe name it bears, who ſucceeded Moſes in the government of the Iſraelites, in the year 1451 B.C. at the age of 90 years, and was their conductor to the land of Canaan. He was the ſon of Nun, of the tribe of Ephraim, and born in the land of Goſhen, in the year 1536 B.C. At the period of the *Exodus* (which ſee), Joſhua was diſtinguiſhed by his talents and virtues, ſo that he was taken into the confidence of Moſes, and ſelected to command the Iſraelites, when they were attacked by the Amalekites, in their march from mount Horeb to mount Sinai. He was likewiſe honoured with the privilege of accompanying Moſes to mount Sinai, and of remaining with him forty days, when he received directions for the future government of the Iſraelites, and the laws written on the firſt tables of ſtone. He alſo accompanied Caleb, and other ten perſons who were deputed to examine the land of Canaan, previous to the invaſion of it by the Iſraelites. When Moſes was apprized of his approaching diſſolution, he confirmed Joſhua as his ſucceſſor in the moſt public and ſolemn manner. Although he was advanced in years when he conducted the Iſraelites to Canaan, he performed this arduous undertaking with ſingular prudence and valour. When they were paſſing the river of Jordan, in the extraordinary manner which is recorded in their hiſtory, he directed two monuments to be erected as a memorial of their miraculous paſſage, one on the ſpot where the ark had ſtood in the bed of the river, and the other on the ſhore; and from the banks of Jordan he proceeded towards the plains of Jericho, and pitched his tent for the firſt time in Canaan, the land of which he was taking poſſeſſion at Gilgal. For the conflicts and ſucceſſes that attended his future progreſs, we refer to his hiſtory. Having ſurveyed and divided the lands among the ſeveral tribes (B.C. 1445), he governed Iſrael in peace; and when he became ſenſible that the termination of his life could be at no great diſtance, he ſummoned all the tribes of Iſrael to Schechem, and recited the extraordinary operations of the providence of God in their favour, and having awakened in their minds a becoming ſenſe of gratitude, enforced upon them the wiſdom and duty of perſevering obedience to his laws, and exhorted them to renew the covenants by which they had already engaged to worſhip and ſerve him. This tranſaction was then ſolemnly regiſtered, and a monument for perpetuating it was erected near a great oak which was in Schechem. Soon after this event, *viz.* in the year B.C. 1426, Joſhua, having exhibited ample evidence of the propriety of his name, which denoted "Saviour," died in his retirement at Timnath-ſera, at the age of 110 years. The book of Joſhua, ſuppoſed to have been written by himſelf, and to have received ſome additions from Samuel and Ezra, (ſee BIBLE and CANON,) may be divided into three parts; the firſt of which is a hiſtory of the conqueſt of the land of Canaan; the ſecond, which begins at the twelfth chapter, is a deſcription of that country, and the diviſion of it among the tribes; and the third, compriſed in the two laſt chapters, contains the renewal of the covenant he cauſed the Iſraelites to make, and the death of their victorious leader and governor. The whole comprehends a term of ſeventeen, or, according to others, of twenty-ſeven years.

JOSIAH, king of Judah, deſerves particular mention on account of his wiſdom and piety, and ſome memorable events that occurred in the courſe of his reign. He ſucceeded to the throne, upon the aſſaſſination of his father Amon, at the age of eight years, in the year B.C. 640, and at a period when idolatry and wickedneſs, encouraged by his father's profligate example, very generally prevailed. Joſiah, who manifeſted the influence of pious and virtuous principles at a very early age, began in his ſixteenth year to project the reformation of the kingdom, and to adopt means for reſtoring the worſhip of the true God. At the age of twenty years he vigorouſly purſued the execution of the plans which he had meditated. He began with aboliſhing idolatry, firſt at Jeruſalem, and then through different parts of the kingdom; deſtroying the altars which had been erected, and the idols which had been the objects of veneration and worſhip. He then proceeded, in his twenty-ſixth year, to a complete reſtoration of the worſhip of God, and the regular ſervice of the temple. Whilſt he was proſecuting this pious work, and repairing the temple which had been long neglected, and which had ſunk into a ſtate of dilapidation, the book of the law, which had been concealed in the temple, was happily diſcovered. This was probably a copy of the Pentateuch, which had been lodged there for ſecurity by ſome pious prieſt in the reign of Ahaz or Manaſſeh. Joſiah, deſirous of averting from himſelf and the kingdom threatened judgments, determined to adhere to the directions of the law, in the buſineſs of reformation which he had undertaken, and to obſerve the feſtivals enjoined by Moſes, which had been ſhamefully neglected. With this view he aſſembled all the elders of the people in the temple at Jeruſalem, and

Strahan and Preſton,
New-ſtreet Square London.

having aſcended the throne, read the book of the Moſaic law, and then entered into a ſolemn covenant to obſerve the ſtatutes and ordinances which it enjoined. To this covenant the whole aſſembly teſtified their conſent. The ark was reſtored to its proper place; the temple was purified; idolatrous utenſils were removed; and thoſe appropriate to the worſhip of God ſubſtituted in their room. After theſe preparations, the paſſover was obſerved with ſingular zeal and magnificence. This took place in the eighteenth year of Joſiah's reign. But in purſuing his laudable plans of reformation, he was reſiſted by the inveterate habits of the Iſraelites, ſo that his zealous and perſevering efforts were ineffectual. Their degeneracy was ſo invincible, that the Almighty ſovereign was provoked to inflict upon them thoſe calamities which were denounced by the prophet Zephaniah. In the thirty-ſecond year of Joſiah's reign, Pharaoh Necho, king of Egypt, advanced with his army againſt Carchemiſh, a city ſituated on the river Euphrates; and he was oppoſed by the king of Judah; ſo that a bloody battle enſued at Megiddo, in which Joſiah received a mortal wound, which terminated in his death, after he had been conveyed to Jeruſalem, in the thirty-ninth year of his reign, B.C. 609. His death was greatly lamented by all his ſubjects; and an elegy was written on the occaſion by the prophet Jeremiah, which is not now extant. 2 Kings, xxii. xxiii. 2 Chron. xxxiv. xxxv.

JOSQUIN des Prez, or, as he is called in Latin, *Joſquinus*, or *Jodocus Pratenſis*, and in Italian *Gioſquino del Prato*, in *Biography*, a Netherlander, the diſciple of Okenheim, and maeſtro di cappella to Louis XII. king of France, was the greateſt muſician of his time; and, in many particulars, of any time, ſince the invention of counterpoint.

His compoſitions for the church, though long laid aſide, and become obſolete by the gradual changes in notation, continue ſtill to merit the attention of the curious. Indeed the laws and difficulties of canon, fugue, augmentation, diminution, reverſion, and almoſt every other ſpecies of learned contrivance allowable in eccleſiaſtical compoſitions for voices, were never ſo well obſerved, or happily vanquiſhed, as by Joſquin; who may juſtly be called the father of modern harmony, and the inventor of almoſt every ingenious contexture of its conſtituent parts, near a hundred years before the time of Paleſtrina, Orlando di Laſſo, Tallis, or Bird, the great muſical luminaries of the ſixteenth century, whoſe names and works are ſtill held in the higheſt reverence, by all true judges and lovers of what appears to us the true and genuine ſtyle of choral compoſitions.

This ingenious, learned, and voluminous compoſer, is enumerated, by Lewis Guicciardini, among Flemiſh muſicians. However, the conſtant addition of Pratenſis, or Del Prato, to his name, ſeems rather to make him a native of Prato, in Tuſcany; and the frequent mention that is made of him by Italian writers, implies at leaſt, if he was not a native of Italy, that he had lived there, and that his works were very familiar to them; for not only by the name of Joſquino, Jodoco del Prato, is he often mentioned by Franchinus, and all the muſical writers of Italy in the next age, as a moſt excellent compoſer, but by miſcellaneous writers, who only ſpeak of muſic incidentally. As a proof of this, we need give no better authority than the following paſſage in Caſtiglione's admirable "Cortegiano."

This author, ſpeaking of the operations of prejudice in favour of great names, tells us of the eagerneſs and delight with which a polite company of his acquaintance had read a copy of verſes, ſuppoſing them to have been written by Sannazaro, who afterwards, when it was certain that they were not of his compoſition, thought them execrable. "So likewiſe," ſays one of the interlocutors, "a motet ſung before the ducheſs of Urbino was unnoticed, till it was known to be the production of Joſquin."

Franchinus, enumerating the great muſicians of his time, ſpecifies Tinctor, Gulielmus, Guarnerius, Juſquin de Pret, Gaſpar, Agricola, Loyſet, Obrecht, Brumel, Iſaac, and calls them *moſt delightful compoſers*.

The ſame author, in another work, lets us know that he had been perſonally acquainted with Joſquin: for, ſpeaking of ſome inaccuracies in the ſeſquialterate proportion, he ſays: "Di queſti inconvenienti ne advertite gia molti anni paſſati Juſquin Deſpriet et Gaſpar digniſſimi Compoſitori." This was printed in 1508, ſo that "many years ago," muſt throw theſe compoſers far back into the fifteenth century; and, he adds, "though they acquieſced in my opinions, yet, having been corrupted by *long habit*, they were unable to adopt them."

Zarlino, who likewiſe ſpeaks of him among the *pratici periti*, gives another inſtance of predilection in favour of Joſquin at Rome, "which," ſays he, "was at the expence of my friend, the admirable Adrian Willaert, who has often himſelf confirmed the fact." The motet "verbum bonum et ſuave," for ſix voices, having been long performed in the pontifical chapel at Rome, on the feſtival of our Lady, as the production of Joſquin, was thought to be one of the fineſt compoſitions of the time; but Willaert, having quitted Flanders, in order to viſit Rome, in the time of Leo X. and finding that this motet was ſung as the compoſition of Joſquin, whoſe name was affixed to it in the chapel books, ventured to declare it to be his own work, and not that of the famous Joſquin: but ſo great was the ignorance, envy, and prejudice of the ſingers, that, after this declaration, the motet was never again performed in the pontifical chapel.

Adami, in his hiſtorical liſt of the ſingers in the pope's chapel, mentions Joſquin next to Guido, as one of the great cultivators and ſupporters of church muſic; he calls him "Uomo inſigne per l'inventione," and ſays that he was a ſinger in the pontifical chapel during the time of Sixtus IV.

After quitting Italy, he was appointed maeſtro di cappella to Lewis XII. of France, who reigned from 1498 to 1515, and it is hardly probable that ſuch an honour ſhould have been conferred upon him till he had arrived at great eminence in his profeſſion; he muſt either have acquired the public favour by his works or performance, before he could be noticed by a ſovereign; indeed the impediments to their approximation muſt have been reciprocal, and it has been well obſerved, that it is as difficult for a prince to get at a man of merit, as it is for a man of merit to approach a prince.

It is related, that when Joſquin was firſt admitted into the ſervice of Lewis, he had been promiſed *a benefice* by his majeſty; but this prince, contrary to his uſual cuſtom, for he was in general both juſt and liberal, forgot the promiſe he had made to his maeſtro di cappella; when Joſquin, after ſuffering great inconvenience from the ſhortneſs of his majeſty's memory, ventured, by a ſingular expedient, to remind him publicly of his promiſe, without giving offence; for being commanded to compoſe a motet for the chapel royal, he choſe part of the 119th Pſalm: "Memor eſto verbi tui ſervo tuo;" "Oh think of thy ſervant, as concerning thy word;" which he ſet in ſo ſupplicating and exquiſite a manner, that it was univerſally admired, particularly by the king, who was not only charmed with the muſic, but felt the force of the words ſo effectually, that he ſoon after granted his petition, by conferring on him the promiſed preferment: for which act of juſtice and munificence, Joſquin, with equal felicity, compoſed, as a hymn of gratitude, another part of the ſame Pſalm : " Bonitatem feciſti cum ſervo tuo, Domine," " Oh Lord, thou haſt dealt graciouſly with thy ſervant."

Joſquin ſeems to have been poſſeſſed of a certain vein of wit and humour, as well as muſical genius ; of which Glareanus has given his readers ſeveral inſtances, beſides thoſe juſt related. In conſequence of the long procraſtination of the performance of Lewis XIIth's promiſe relative to the benefice, Joſquin applied to a nobleman, in high favour at court, to uſe his intereſt with this prince in his behalf, who, encouraging his hopes with proteſtations of zeal for his ſervice, conſtantly ended with ſaying, " I ſhall take care of this buſineſs, *let me alone*"—*Laiſſe faire moi* (*laiſſer moi faire*), when, at length, Joſquin, tired of this vain and fruitleſs aſſurance, turned it into ſolmiſation, and compoſed an entire maſs on theſe ſyllables of the hexachords *La ſol fa re mi* ; which maſs is among the productions of our author in the Britiſh Muſeum, and is an admirable compoſition.

The following circumſtance, which likewiſe happened during Joſquin's reſidence at the court of France, has been recorded both by Glareanus and Merſennus. Theſe writers inform us, that Lewis, though muſic afforded him great pleaſure, had ſo weak and inflexible a voice, that he never was able to ſing a tune, and that he defied his maeſtro di cappella to compoſe a piece of muſic in which it was poſſible for him to bear a part. However the muſician accepted the challenge, and compoſed a canon for two voices, to which he added two other parts, one of which had nothing more to do than to ſuſtain a ſingle ſound, and the other only the key note, and its fifth, to be ſung alternately. Joſquin gave his majeſty the choice of theſe two parts, and beginning with the long note, after ſome time, his royal ſcholar was enabled to continue it, as a drone to the canon, in deſpite of nature, which had never intended him for a ſinger.

Rabelais, in his prologue to the third book of Pantagruel, places Joſquin des Prez at the head of all the fifty-nine *Joyeulx Muſicines* whom he had formerly heard. Joſquin, among muſicians, was the giant of his time, and ſeems to have arrived at univerſal monarchy and dominion over the affections and paſſions of the muſical part of mankind. Indeed his compoſitions ſeem to have been as well known and as much practiſed throughout Europe, at the beginning of the 16th century, as Handel's were in England ſixty years ago.

In the muſic book of prince Henry, afterwards Henry VIII., which is preſerved in the Pepys' collection, at Cambridge, there are ſeveral of his compoſitions, and we are told that Anne of Boleyn, during her reſidence in France, had collected and learned a great number of them. In a very beautiful MS. in the Britiſh Muſeum, conſiſting of French ſongs of the 15th century, in three and four parts, there are likewiſe many of Joſquin's compoſitions. But the moſt capital collection of his works, and of contemporary contrapuntiſts which we believe is now ſubſiſting, is in the Britiſh Muſeum, conſiſting of the firſt and third ſet of the maſſes of Joſquin, compoſed for the pope's chapel, during the pontificate of Sixtus IV., who reigned from 1471 to 1484; with maſſes by Pierre de la Rue, Ant. Fevin, John Moreton, &c.

All theſe were printed by Ottavio Petruccio da Foſſombrone, under a patent from Leo X. ſigned by cardinal Bembo, his ſecretary. Theſe maſſes were the firſt muſical productions that iſſued from the preſs after the invention of printing. And theſe very curious compoſitions muſt have been ſtudied, and frequently rehearſed, before their performance ; for though no rapidity of execution is required, yet, as there are no bars, and the value of the notes is frequently changed by poſition, as well as by the modal ſigns, upon very ſhort notice, this, joined to the difficult ſolution of the canons, muſt have made it impoſſible for them to have been ſung at ſight, even by thoſe who were accuſtomed to the notation.

Specimens of theſe compoſitions in ſcore may be ſeen in Burney's Hiſtory of Muſic, vol. ii., and whoever examines them will find that no notes have had admiſſion by chance, or for the ſake of *rempliſſage*, but that, like the prints of Hogarth, every thing not only contributes to the principal deſign and harmony of the whole, but has a ſpecific character of its own.

But Joſquin's maſſes, though more frequently cited and celebrated by muſical writers than thoſe of any other author, and indeed than any of his other works, ſeem inferior to his motets in every reſpect ; for theſe are not only compoſed on ſubjects of his own invention, or in fragments of the moſt beautiful and ſolemn chants of the church, but in a ſtyle more clear and pleaſing.

In the third and fourth collection of motets publiſhed at the beginning of the ſixteenth century, under the title of " Motteti della Corona," there are many by Joſquin, which are truly admirable, particularly a miſerere for five voices, which, as it conſiſts of three movements, is too long to be inſerted in a work of this kind, but appears to us a model of choral compoſition, without inſtruments ; as the ſubjects of fugue and imitation are ſimple, and free from ſecular levity ; the ſtyle is grave and reverential ; the harmony pure ; the imitations are ingenious, and all conſtructed upon a fragment of canto fermo, to which the ſecond tenor is wholly confined : repeating it, in the firſt part, a note lower every time, beginning at the fifth of the key, and deſcending to its octave ; in the ſecond part, aſcending in the ſame manner ; in the third part, beginning at the fifth, and deſcending to the key note.

This ſpecies of laboured compoſition has been frequently cenſured, and ſtigmatized by the name of pedantry, and Gothic barbariſm, which, perhaps, it would *now* deſerve, out of the church ; but in the time of Joſquin, when there was little melody, and no grace in the arrangement, or meaſure of ſingle notes ; the ſcience of harmony, or ingenuity of contrivance in the combination of ſimultaneous ſounds, or muſic in parts, as it was the chief employment of the ſtudent, and ambition of the compoſer, ſo the merit of both, and the degree of regard beſtowed upon them by poſterity, ſhould be proportioned to their ſucceſs, in what was their chief object, and not in what had no exiſtence at the time in which theſe muſicians lived.

With reſpect to ſome of Joſquin's contrivances, ſuch as augmentations, diminutions, and inverſions of the melody, expreſſed by the barbarous Latin verb *cancrizare*, from the retrograde motion of the *crab*, they were certainly purſued to an exceſs ; but to ſubdue difficulties has ever been eſteemed a merit of a certain kind, in all the arts, and treated with reſpect by artiſts. Michael Angelo, in delineating the difficult attitudes into which he choſe to throw many figures in his works, and which other artiſts had not courage, or perhaps abilities to attempt, procured himſelf a great name among the judges of correct drawing, and bold deſign ; though a great part of the ſpectator's pleaſure in viewing them muſt ariſe from reflecting on the difficulty of the undertaking. There are different roads to the temple of Fame in every art ; and that which was followed by Joſquin, and his emulators, was too full of thorns, brambles, and impediments, to be purſued by men of common genius and abilities. Painting and ſculpture, which are to delight and deceive the eye, do not, any more than muſic, confine their powers to the mere endeavour at pleaſing the ſenſe of which they are the object; and there are pictures, ſtatues, and muſical compoſitions, which afford very little pleaſure but what is intellectual, and ariſing from reflection on the learning, correctneſs, and great labour which the artiſt muſt have beſtowed on them.

Canons of difficult ſolution were, to muſicians, a ſpecies of problem, and ſerved more to exerciſe the mind than pleaſe the ſenſe; and though a peculiar genius, or penetration, is requiſite for the quick diſcovery of riddles and rebuſſes, yet, ſtill more cunning is neceſſary to their production; and, however contemptuouſly theſe harmonical contrivances may be treated by the lazy lovers of more airy and ſimple compoſitions, the ſtudy of them is ſtill of ſuch uſe to muſical ſtudents, in their private exerciſes, that a profound and good contrapuntiſt has, perhaps, never yet been made by other means. Thoſe who deſpiſe this ſeeming Gothic pedantry too much, reſemble ſuch half-bred ſcholars, as have expected to arrive at a conſummate knowledge of the Roman claſſics, without ſubmitting to the drudgery of grammar and ſyntax. Indeed a great compoſer has, perhaps, never exiſted ſince the invention of counterpoint, who, at his moments of leiſure, has not attempted to manifeſt ſuperior learning and ſkill in the production of canons, and other difficult arrangements and combinations of ſound; and who, if he ſucceeded, was not vain of his abilities. Before the cultivation of dramatic muſic, as canon and fugue were univerſally ſtudied and reverenced, they were brought to ſuch a degree of perfection, as is wonderful; and though good taſte has long baniſhed them from the theatre, yet the church and chamber ſtill, occaſionally, retain them, with great propriety: in the church they preclude levity, and in the chamber exerciſe ingenuity.

As Euclid ranks firſt among ancient geometricians, ſo Joſquin, for the number, difficulty, and excellence of his muſical canons, ſeems entitled to the firſt place among the old compoſers, who have been moſt aſſiduous and ſucceſsful in the cultivation of this difficult ſpecies of muſical calculation.

But though the ſtyle of Joſquin, even in his ſecular compoſitions, is grave, and chiefly in fugue, imitation, and other contrivances, with little air or melody; yet this defect is amply ſupplied to contrapuntiſts, and lovers of choral muſic, by purity of harmony and ingenuity of deſign. Indeed, we have never ſeen, among all his productions that we have ſcored, a ſingle movement which is not ſtamped with ſome mark of the great maſter. And though fugue and canon were ſo univerſally cultivated in his time, when there were many men of abilities in this elaborate and complicated kind of writing; there is ſuch a manifeſt ſuperiority in his powers, ſuch a ſimple majeſty in his ideas, and ſuch dignity of deſign, as wholly juſtify the homage which he received.

It will, perhaps, be thought that too much notice has been taken of this old compoſer and his works; but as he is one of the great heroes of the art, and the type of all muſical excellence at the time in which he flouriſhed, the leſs need be ſaid of his contemporaries, who, in general, were but his imitators.

Joſquin, according to Walther (Muſicaliſches Lexicon), was buried in the church of St. Gedule, at Bruſſels, where his figure and epitaph are ſtill to be ſeen. His death muſt have happened early in the 16th century.

JOSS, or JOOSTJE, in *Mythology*, an idol worſhipped by the Chineſe at ſome of their grand feſtivals, which they obſerve by way of interceſſion for the ſick at Batavia and elſewhere. To this idol they offer coſtly preſents; and they alſo make a large veſſel of paper and combuſtible materials, adorning it with flags, and then ſetting it on fire till it is conſumed. The name Jooſtje, given to this idol by the Dutch, which the Engliſh ſeamen call Joſs, is a Dutch nick-name for the devil, and was probably given to this idol by the Dutch, when they firſt ſaw it, either from its appearance, or from the principle that all idolatry is demonolatry.

JOSSELIN, in *Geography*, a town of France, in the department of Morbihan, and chief place of a canton, in the diſtrict of Ploermel; 19 miles N.N.E. of Vannes. The place contains 2678, and the canton 14,157 inhabitants, on a territory of 215 kiliometres, in 10 communes. N. lat. 47° 57′. W. long. 2° 28′.

JOSSLIOKA, a town of Poland, in the palatinate of Sandomirz; 76 miles S.S.W. of Sandomirz.

JOSVO, a town of Hungary; 16 miles W. of Caſchau.

JOTAKO, a ſmall iſland in the Mediterranean; 2 miles E. of Teaki.

JOTAN, a town of Aſiatic Turkey, on the W. coaſt of Natolia, near cape Arbre; 10 miles N. of Milets.

JOTAPATA, in *Ancient Geography*, a town of Phœnicia, ſituated in the vicinity of Ptolemais. It was defended by Joſephus the hiſtorian, but at laſt taken by Veſpaſian, in the reign of Nero, A.D. 67. Its defence laſted for ſeven weeks, and 40,000 Jews were killed. Joſeph. de Bel. Jud.

JOUAN *de* L'ISLE, *St.*, in *Geography*, a town of France, in the department of the North Coaſts, and chief place of a canton, in the diſtrict of Dinan; 24 miles S. of St. Malo. The place contains 683, and the canton 8543 inhabitants, on a territory of 150 kiliometres, in 8 communes. N. lat. 48° 12′. W. long. 2° 29′.

JOUBERT, LAURENT, in *Biography*, a learned phyſician, and royal profeſſor at Montpellier, was born at Valence, in the province of Dauphiné, in France, on the 16th of December 1529, of a good family. After he had finiſhed his ſchool education, he went to Montpellier, where he was matriculated in the faculty of medicine on the 1ſt of March 1550, and took his degree of bachelor the following year. He afterwards ſtudied at Padua, where he attended the lectures of the celebrated Fallopius, and at ſome other places; but returning to Montpellier, he finiſhed his exerciſes, and received the degree of doctor in the year 1558. The manner in which he had performed his acts procured for him ſo much of the confidence and eſteem of Honoré Caſtellan, that this profeſſor, being ſummoned to court in the following year, to hold the office of firſt phyſician of Catharine de Medicis, queen of Henry II. he nominated Joubert to give the lectures in the ſchools during his abſence; and his nomination met with the ſanction of the faculty. Joubert ſhewed himſelf worthy of the honourable appointment, and acquitted himſelf in ſo diſtinguiſhed a manner, that on the death of profeſſor Rondelet in 1566, he was immediately named his ſucceſſor in the chair. He was likewiſe the ſecond ſucceſſor of Rondelet in the dignity of chancellor, having followed Saporta in 1574. He was called to Paris by Henry III. in 1579, who entertained hopes that Joubert would be able to cure the barrenneſs of Louiſa de Lorraine, his queen. But his attempts proved unſucceſsful; and he returned to Montpellier with the title of phyſician in ordinary to the king, and continued to practiſe his profeſſion there to the end of his life, which happened on the 21ſt of October 1583, when he was on the road from Thouloufe.

This phyſician was the author of ſeveral works, and wrote with much correctneſs and even elegance. A collection of thoſe, which were written in the Latin language, has been frequently reprinted under the title of "Operum Latinorum Tomus primus et ſecundus." The firſt edition is that of Lyons, in 1582, folio; the ſubſequent ones appeared at Frankfort, in 1599, 1645, and 1668, alſo in folio. The following have been publiſhed ſeparately: "Paradoxa Medica, ſeu de Febribus," Lyons, 8vo. 1566; "De Peſte, Quartana, et Paralyſi," ibid. 1567, 8vo. The treatiſe on the plague was alſo publiſhed in French, in 1581; "De affectibus pilorum et cutis, præſertim capitis, et de Cephalalgia. De affectibus internis partium Thoracis," Genevæ, 1572. Lugd. 1577, 1578; "Traité du Ris, ſon eſſence, ſes cauſes et effets," Paris, 1574, 1579, 8vo.; "Medicinæ Practicæ Libri tres," Lugd. 1577, 12mo.; "Pharmacopœia à Joanne Paulo, ſangmaiſtero, edita," ibid. 1579, 8vo.; "Traité des arcbuſades," ibid. 1581. This, however, is the third edition; the work was ſeveral times printed, and contains very correct opinions and precepts reſpecting the nature of gun-ſhot wounds; "Guidonis de Cauliaco Chirurgia Magna," ibid. 1585, with notes by the editor. The ſame work was tranſlated into French, by Iſaac Joubert, his ſon, and went through nine or ten editions; "Traitè des Eaux," Paris, 1603, 12mo. But of all the works of Laurent Joubert, that in which he ventured to raiſe his voice againſt popular medical errors, was the moſt diſtinguiſhed; "Erreurs populaires touchant la Médécine," Bourdeaux, 1579. This work made ſo great an impreſſion upon the public mind, that it was printed ten ſucceſſive times in the courſe of ſix months. Eloy. Dict. Hiſt. de la Med.

JOUER *des* Instrumens, *Fr.* to play upon muſical inſtruments. The French ſay *jouer du violon, de la baſſe, du hautbois, de la flute; toucher le clavecin, et les orgues; ſonner la trompette; donner du cor; pincer la guitarre.* They *play* on the violin, the violoncello, the hautbois, and the flute; but they *touch* the harpſichord and the organ; *ſound* the trumpet and French horn; and *pinch* the guitar.

JOUGH-HOLES, in *Mining*, is the name, in ſome parts of Derbyſhire, for lenticular cavities, principally in the vertical joints or in the veins, which are lined with cryſtals. Theſe are called tick-holes, druſes, lochs, neſts, &c. in other ſituations. The manner in which theſe curious holes were formed and left is endeavoured to be explained in Mr. Farey's Report on Derbyſhire, vol. i. p. 247.

JOVIALE Arcanum. See Arcanum.

Joviale *Bezoardicum.* See Bezoardicum.

JOVIAN, in *Biography*, a Roman emperor, born about the year 331, was a native of Singidunum, in Pannonia, and ſon of count Varronian, who had a high reputation in the ſtate, and who was enjoying, in honourable retirement, the fruit of his long ſervices. The ſon had been brought up to arms, and had obtained ſo much reputation as a commander, that although an avowed Chriſtian, the emperor Julian would not ſuffer him to reſign, upon offering to do ſo rather than quit his religion. On the death of Julian, in his expedition againſt the Perſian empire, June 363, Jovian, who was but the firſt of domeſtics, was nominated to the purple. At firſt a few voices only ſaluted him with the names of Emperor and Auguſtus. The tumultuary acclamation was inſtantly repeated by the guards who ſurrounded the tent, and paſſed, in a few minutes, to the extremity of the line. No prince was ever raiſed to the throne under more critical circumſtances. The Roman army, diſtreſſed and diſpirited, was retreating from the enemy's country towards its own frontiers, purſued and continually haraſſed by a much ſuperior force. He made a diſadvantageous peace with Perſia, ſhut up the heathen temples, recalled the baniſhed clergy, and from henceforth it was determined that Chriſtianity ſhould enjoy an uninterrupted triumph over heatheniſm. On arriving at Antioch he diſplayed his attachment to the orthodox doctrine, by reſtoring the churches to all the adherents of the council of Nice. At the ſame time, in order to quiet the minds of his ſubjects of the old religion, he iſſued a decree of toleration, permitting the exerciſe of the ceremonies of the pagan worſhip. He left Antioch in the winter-ſeaſon, and proceeded to Conſtantinople. He cauſed ſome ornaments to be added to the tomb of Julian, at Tarſus, as he paſſed. At Ancyra he aſſumed the title and enſigns of the conſulſhip, and conferred the ſame on his infant ſon. Dadaſtana, an obſcure town, at about an equal diſtance from Ancyra and Nice, was marked for the fatal term of his journey and his life. After indulging in a plentiful, perhaps an intemperate ſupper, he retired to reſt, and in the next morning he was found dead in his bed. The body of the deceaſed emperor was ſent to Conſtantinople to be interred with his predeceſſors. His ſudden death was imputed either to the effects of an overloaded ſtomach, or to the gas ariſing from burning charcoal, which had been placed in his chamber to dry the walls. This event happened in the eighth month of his reign, and in the thirty-third year of his age. Gibbon. Univ. Hiſt.

JOVIUS, Paul, an eminent hiſtorian, was born at Como, in Lombardy, in 1433. Having received a good education, he went to Rome, where he wrote a work, entitled "De Piſcibus Romanis." He had a penſion from Francis I. king of France; and Clement VII. gave him the biſhopric of Nocera, an office to which he did no credit, on account of his debauched manner of living. He died at Florence in 1452. His principal work is a hiſtory of his own time, which was publiſhed at Straſburgh in 1556. He alſo wrote the lives of illuſtrious men. He had a brother who wrote a hiſtory of Switzerland. Moreri.

JOULOPPED, in *Heraldry*, a term applied to the gills of a cock, when borne of a different tincture from his head.

JOULTS, in *Mining*, is applied, in Derbyſhire, to pieces of ſpar and lead-ore intermixed, from the ſize of walnuts to that of the fiſt. Sometimes theſe are called knockings, or hannaway. See Farey's Derbyſhire Report, vol. i. p. 369.

JOUNPORA, in *Geography*, a town of Hindooſtan, in Bahar; 25 miles S.W. of Patna.

JOURA, a barren iſland in the Grecian Archipelago, about 10 miles in circuit; 12 miles S.W. of Andros. N. lat. 37° 37′. E. long. 24° 46′.

JOURKOUP, a town of Aſiatic Turkey, in Caramania; 50 miles E.N.E. of Akſerai.

JOURNAL, a day-book, regiſter, or account of what paſſes daily. See Dairy.

Journal, in *Merchants' Accounts*, is a book into which every particular article is poſted out of the waſte book, and made debtor. This is to be very clearly worded, and fairly engroſſed. See Book-keeping.

Journal, in *Sea Affairs*, is a regiſter kept by the pilot, and others, wherein notice is taken of every thing that happens to the ſhip, from day to day, and from hour to hour, with regard to the winds, the rhumbs, the rake, ſoundings, &c. in order to enable him to adjuſt the reckoning, and determine the place where the ſhip is.

In all ſea-journals, the day, or what is called the twenty-four hours, begins at noon, and is counted thence twenty-four hours to the next noon: the firſt twelve hours, from noon to midnight, are marked with P. M. ſignifying after mid-day; and the ſecond twelve hours from midnight to noon are marked with A. M. ſignifying after midnight; ſo that the ſhip account is twelve hours earlier than the ſhore account of time. There are various ways of keeping journals, according to the different notions of mariners concerning the articles that are to be entered. Some writers direct the keeping ſuch a kind of journal as is only an abſtract of each day's tranſactions, ſpecifying the weather, what ſhips or lands were ſeen, accidents on board, the latitude, longitude, meridional diſtance, courſe, and run. Theſe particulars are to be drawn from the ſhip's log-book, or from that kept by the perſon himſelf. Other authors recommend the keeping only of one account, including the log-book, and all the work of each day, with the deductions drawn from it. The form of the latter kind of journal, with an example of the work of a ſingle day, is as follows:

Abſtract of a Journal from England towards Madeira.

Log-Board.

Remarks on Board.

♃. 13th of October.

Theſe twenty-four hours hard gales, and cloudy, weather accompanied with hard rains.

Handed fore-top-ſails.

At 10 P. M. heard a gun at a diſtance.

At 2 A. M. ſaw to the N. N. E. ½ E. the flaſh of a gun, and after ſifty-ſix beats of the pulſe at the wriſt, we heard the ſound, by which we judged the diſtance to be about eleven miles, and a ſhip in diſtreſs. Bore away to ſpeak with her.

At ſix, having greatly over-run the diſtance, and finding nothing, concluded ſhe was gone down, ſo hauled our wind, and ſtood to the S. W.

No obſervations this day.

Variation of 1¼ point weſt.

Journal is now become a common name for newſpapers, which detail the daily tranſactions of Europe.

Journal is alſo uſed for the title of ſeveral books which come out at ſtated times; and give abſtracts, accounts, &c. of the new books that are publiſhed, and the new improvements daily made in arts and ſciences.

The firſt journal of this kind was, the “Journal des Sçavans,” printed at Paris: the deſign was ſet on foot for the eaſe of ſuch as are too buſy, or too lazy, to read the entire book themſelves. It ſeems an excellent way of ſatisfying a man's curioſity, and becoming learned upon eaſy terms; and ſo uſeful has it been found, that it has been executed in moſt other countries, though under a great variety of titles.

Of this kind are the “Acta Eruditorum of Leipſic;” the “Nouvelles de la Republique des Lettres” of M. Bayle, &c.; the “Bibliotheque Univerſelle, Choiſie, et Ancient et Moderne,” of M. le Clerc; the “Memoires de Trevoux, &c.” In 1692, Juncker printed in Latin, an “Hiſtorical Treatiſe of the Journals of the Learned,” publiſhed in the ſeveral parts of Europe; and Wolſius, Struvius, Morhof, Fabricius, &c. have done ſomething of the ſame kind. The “Philoſophical Tranſactions of London;” the “Memoirs of the Royal Academy of Sciences;” thoſe of the “Academy des Belles Lettres;” the “Miſcellanea Naturæ Curioſorum;” the “Experiments of the Academy del Cimento;” the “Acta Philo-exoticorum Naturæ et Artis,” which appeared from March 1686, to April 1687, and which are a hiſtory of the Academy of Breſſe; the “Miſcellanea Berolinenſia,” or Memoirs of the Academy of Berlin; the “Commentaries of the Academy of Peterſburg,” the “Memoirs of the Inſtitute at Bologna,” the “Acta Literaria Sueciæ,” the “Memoirs of the Royal Academy at Stockholm,” begun in 1740, the “Commentarii Societatis Regiæ Gottingenſis,” begun in 1750, &c. &c. are not ſo properly journals, though they are frequently ranked in the number. Juncker and Wolſius give the honour of the firſt invention of journals to Photius. His “Bibliotheca,” however, is not altogether of the ſame nature with the modern journals; nor was his deſign the ſame. It conſiſts of abridgments, and extracts of books which he had read during his embaſſy in Perſia. M. Salo firſt began the “Journal des Sçavans,” at Paris, in 1665, under the name of the Sieur de Hedouville; but his death ſoon after interrupted the work. The abbé Gallois then took it up, and he, in the year 1674, gave way to the abbé de la Roque, who continued it nine years, and was ſucceeded by M. Couſin, who carried it on till the year 1702, when the abbé Bignon inſtituted a new ſociety, and committed the care of continuing the Journal to them, who improved and publiſhed it under a new form. The other French journals are the “Memoirs and Conferences of Arts and Sciences, by M. Dennis, during the years 1672, 1673, and 1674;” “New Diſcoveries in all the Parts of Phyſic,” by M. de Blegny; the “Journal of Phyſic,” begun in 1684, and ſome others, diſcontinued almoſt as ſoon as begun. “Rozier's Journal de Phyſique,” begun in July, 1771; “Annales Chimiques,” &c. &c. The “Nouvelles de la Republique des Lettres,” News from the Republic of Letters, were begun by M. Bayle in 1684, and carried on by him till the year 1687, when M. Bayle being diſabled by ſickneſs, his friends, M. Bernard and M. de la Roque, took them up, and continued them till 1699. After an interruption of nine years, M. Bernard reſumed the work, and continued it till the year 1710. The “Hiſtory of the Works of the Learned,” by M. Baſnage, was begun in the year 1686, and ended in 1710. The “Univerſal Hiſtorical Library,” by M. Le Clerc, was continued to the year 1693, and contained twenty-five volumes. The “Bibliotheque Choiſie,” of the ſame author, began in 1703. The “Mercury of France” is one of the moſt ancient journals of that country, and was continued by different hands; the “Memoirs of a Hiſtory of Sciences and Arts,” uſually called Memoires des Trevoux, from the place where they are printed, began in 1701. The “Eſſays of Literature” reached but to a twelfth volume in 1702, 1703, and 1704; theſe only take notice of ancient authors. The “Journal Literaire,” by father Hugo, began and ended in 1705. At Hamburgh, they have made two attempts for a French journal, but the deſign failed: an “Ephemerides Sçavantes” has alſo been undertaken, but that ſoon diſappeared. A “Journal des Sçavans,” by M. Dartis, appeared in 1694, and was dropped the year following. That of M. Chauvin, begun at Berlin in 1696, held out three years, and an eſſay of the ſame kind was made at Geneva. To theſe may be added, the “Journal Literaire,” begun at the Hague in 1715, and that of Verdun, and the “Memoires Literaires de la Grande Bretagne,” by M. de la Roche; the “Bibliotheque Angloiſe,” and “Journal Britannique,” which were confined to Engliſh books alone. The Italian journals are, that of abbot Nazari, which laſted from 1668 to 1681, and was printed at Rome. That of Venice began in 1671, and ended at the ſame time with the other: the authors were Peter Moretti, and Francis Miletti. The “Journal of Parma,” by Roberti and father Bacchini, was dropped in 1690, and reſumed again in 1692. The “Journal of Ferrara,” by the abbé de la Torre, began and ended in 1691. “La Galerio di Minerva,” begun in 1696, was the work of a ſociety of men of letters. Seignior Apoſtolo Zeno, ſecretary to that ſociety, began another journal in 1710, under the protection of the grand duke: it was printed at Venice, and ſeveral perſons of diſtinction had a hand in it. The “Falti Eruditi della Bibliotheca Volante,” were publiſhed at Parma. There has appeared ſince, in Italy, the “Giornale del Letterati.”

The principal among the Latin journals is that of Leipſic, kept under the title of “Acta Eruditorum,” begun in 1682: P. P. Manzani began another at Parma. The “Nova Literaria Maris Balthici,” laſted from 1698 to 1708. The “Nova Literaria Germaniæ,” collected at Hamburgh, began in 1703. The “Acta Literaria ex Manuſcriptis,” and the “Bibliotheca Curioſa,” began in 1705, and ended in 1707, are the work of Struvius. Meſſrs. Kuſter and Sike, in 1697, began a “Bibliotheca Novorum Librorum,” and continued it for two years. Since that time there have been many Latin journals; ſuch, beſides others, is the “Commentarii de Rebus in Scientia Naturali et Medicini geſtis,” by M. Ludwig. The Swiſs journal, called “Nova Literaria Helvetiæ,” was begun in 1702, by M. Scheuchzer; and the “Acta Medica Hafnenſia,” publiſhed by T. Bartholin, make five volumes, from the year 1671 to 1679.

There are two Low Dutch journals; the one under the title of “Boockzal van Europe;” it was begun at Rotterdam, in 1692, by Peter Rabbus; and continued, from 1702 to 1708, by Sewel and Gavern: the other was done by a phyſician, called Ruiter, who began in 1710. The German journals of beſt note are, the “Monathlichen Unterredungen,” which held from 1689 to 1698. The “Bibliotheca Curioſa,” begun in 1704, and ended in 1707, both by M. Tenzel. The “Magaſin d'Hambourg,” begun in 1748; the “Phyſicaliſche Beluſtigunzen,” or Philoſophical Amuſements, begun at Berlin in 1751. The “Journal of Hanover,” began in 1700, and continued for two years by M. Eccard, under the direction of M. Leibnitz, and afterwards carried on by others. The Theological Journal, publiſhed by M. Loeſcher, under the title of "Altes & Neus," that is, Old and New. A third at Leipſic and Frankfort, the authors Meſſrs. Walterck, Krauſe, and Groſchuſſius, and a fourth at Hall, by M. Turk.

The Engliſh journals are, the "Hiſtory of the Works of the Learned," begun at London, 1699. "Cenſura Temporum," in 1708. About the ſame time there appeared two new ones, the one under the title of "Memoirs of Literature," containing little more than an Engliſh tranſlation of ſome articles in the foreign journals, by M. de la Roche; the other a collection of looſe tracts, entitled "Bibliotheca Curioſa," or a Miſcellany. Theſe, however, with ſome others, are now no more; but are ſucceeded by the "Monthly Review," which began in the year 1749, and gives a character of all Engliſh literary publications, with the moſt conſiderable of the foreign ones; the "Critical Review," which begun in 1756, nearly on the ſame plan: the "Anti-jacobin Review," begun in 1798; the "American Review," in 1811; the "Britiſh Critic," in 1798; the "Britiſh Review," in 1811; the "Eclectic Review," in 1805; the "Edinburgh Review," in 1803; the "London Medical Review," in 1808; the "Quarterly Review," in 1809. Beſides theſe we have ſeveral monthly pamphlets, called Magazines, which, together with a chronological ſeries of occurrences, contain letters from correſpondents, communicating extraordinary diſcoveries in nature and art, with controverſial pieces on all ſubjects. Of theſe are the following: *viz.* the "Agricultural," begun in 1799; the "Baptiſt," in 1809; the "Botanical," in 1786; the "Britiſh Farmer's," in 1811; the "European," in 1782; the "Evangelical," in 1793; the "Farmer's," in 1800; "Flower's Political," in 1807; "Freethinking; in 1811; "Gentleman's," in 1731; "Goſpel," in 1806; "Lady's," in 1771; "Methodiſt," in 1777; the "Monthly," in 1796; "Muſical," in 1809; "Military," in 1811; "Philoſophical," in 1798; "Sporting," in 1792; "Univerſal," in 1747. To theſe may be added ſeveral other periodical publications under different titles, ſuch as "Ackerman's Repoſitory," begun in 1810; "Antiquarian Cabinet," in 1806; "Arcana," in 1810; "Army Liſt," in 1809; "Chriſtian Obſerver," in 1802; "Chriſtian Guardian," in 1809; "Dramatic Cenſor," in 1811; "Edinburgh Medical Journal," in 1805; "General Chronicle," in 1811; "La Belle Aſſemblée," in 1806; "Lady's Muſeum," in 1798; "Literary Panorama," in 1806; "Medical Obſerver;" "Medical Compendium," in 1809; "Medical Journal," in 1799; "Monthly Repoſitory," in 1806; "Military Chronicle," in 1810; "Naturaliſt's Miſcellany," in 1789; "Naval Chronicle," in 1799; "Nicholſon's Journal," in 1802; "Philanthropiſt," in 1810; "Repertory of Arts," in 1794; "Retroſpect," in 1806; "Reflector," in 1810; "Satiriſt," in 1807; "Scourge," in 1811; &c. &c.

JOURNCHOPPERS, in our *Old Writers*, regrators of yarn; which formerly, perhaps, was called *journ*. They are mentioned in the ſtat. 8 Hen. VI. c. 5.

JOURNET, Françaiſe, in *Biography*, one of the greateſt actreſſes that has appeared on the ſtage of the French ſerious opera. She was at firſt admired for the mellifluence of her voice, her noble figure, and the charms of her action. She had an air and carriage ſo ſtriking, and ſomething ſo intereſting and touching in her countenance, that ſhe drew tears from thoſe who only looked at her in the part of Iphigenia. She had eyes and arms which guided to the heart all the expreſſion of what ſhe had to paint. She quitted the ſtage in 1720, after fifteen years applauſe and admiration, and died in 1722. Eſſais ſur la Muſique.

JOURNEY, in *Huſbandry*, ſignifies as much ground as can be ploughed over in a day, though it is not applied in the ſame way in all diſtricts, or has the ſame ſignification, as in ſome it is uſed to expreſs a much leſs proportion of labour. It often ſignifies the length of time the team is engaged in labour, either in ploughing or any other ſort of work. With all horſes under team labour, great attention ſhould be paid by the perſon who has the care of them, in feeding and dreſſing them. See Team.

Journey, *Sabbath-day's*. See Sabbath.

JOURNEY-MAN, formed from the French *journée, a day's work*; anciently ſignified a perſon who wrought with another by the day; though now, by the ſtatute, it extends to thoſe likewiſe who covenant to work with another in their occupation or trade by the year.

JOUTRA, in *Geography*, a town of Sweden, in Tavaſtland; 65 miles N.E. of Tavaſthus.

JOUVENCY, Joseph, in *Biography*, a learned Jeſuit, was born at Paris in 1643. He entered the ſociety of Jeſus in 1659, and was choſen profeſſor of rhetoric in its ſeminaries, firſt at Caen, then at La Fleche, and finally at Paris, where he taught with great reputation for nearly twenty years. He was invited to Rome in 1699, to aſſiſt in writing the continuation of the hiſtory of the ſociety, and died in that city in 1719. His part of the hiſtory of the Jeſuits compriſes the period from 1591 to 1616, and was printed in folio in the year 1710. As a philologiſt he is known by his "Latin Harangues delivered on different occaſions," in two volumes, 12mo.: "Appendix de Diis et Heroibus Poeticis," which is a compendium of the heathen mythology: "Notes on Terence, Ovid, Horace, Perſius, Juvenal, Martial, and ſome of the works of Cicero." He gave alſo a Latin verſion of the firſt Philippic of Demoſthenes. He is ſaid to have diſplayed, in his ſeveral works, great purity, elegance, and facility of ſtyle, for which he is more diſtinguiſhed than for novelty or depth of thought. Moreri.

JOUVENET, John, an hiſtorical painter, born at Rouen, in Normandy, in 1644. He received his firſt inſtructions from his father; but his principal teacher was Pouſſin, and his moſt uſeful ſtudies the works of that maſter.

He had a ready invention, and was therefore employed to adorn the apartments of Verſailles and the Trianon. In the Hoſpital of the Invalids at Paris, he painted the twelve apoſtles; each figure 14 feet high. It muſt be acknowledged, however, that he failed in true taſte. His ſtyle partakes too much of French flippancy; the ſubſtitution of ſomething ſtriking for what is ſolid and good; and his colouring is heavy. It is ſaid, that, being deprived of the uſe of his right hand by paralyſis, he painted ever after with his left. He died in 1717.

JOUVENU, in *Geography*, a town of France, in the department of the Saone and Loire, and chief place of a canton, in the diſtrict of Macon. The place contains 1469, and the canton 10,491 inhabitants, on a territory of 165 kiliometres, in 23 communes.

JOUX *la* Ville, a town of France, in the department of the Yonne; 9 miles N. of Avallon.

Joux, *Mont*, a part of mount Jura, near the ſource of the river Doubs, on the borders of Switzerland, and that part of the canton of Berne which borders on France.

Joux, a lake of Switzerland, in the canton of Berne, ſituated on a part of mount Jura; 4 miles W. of Romainmotier.

JOWA Town, *Lower*, a town of North America, on the

E. ſide of the river Miſſiſippi; which, between twenty and thirty years ago, could furniſh 300 warriors. N. lat. 40° 30'. W. long. 91° 15'.—The *Upper Jowa town* is about 15 miles below the mouth of the river Jowa, on the E. ſide of the Miſſiſippi, and could formerly furniſh 400 warriors.

JOWAN *el* Mugrah, a town of Algiers; 30 miles S.W. of Seteef.

JOWGONG, a town of Bengal; 18 miles S. E. of Burdwan.

JOWRASSER, a town of Hindooſtan, in Oude; 16 miles S E. of Lucknow.

JOWRIES, a cluſter of ſmall iſlands in the Mediterranean, near the E. coaſt of Tunis, oppoſite to Lempta, anciently called Tarichiæ, and thought by Cæſar to be of ſo much importance, that he appointed ſeveral ſtationary veſſels to ſecure them. N. lat. 35° 38'. E. long. 10° 56'.

JOY, in *Ethics*, is that paſſion which is produced by love, regarding its object as preſent, either immediately or in proſpect; in reality or imagination. This paſſion has been found to increaſe the perſpiration and urine of human bodies. See Pleasure and Pain.

JOYEUSE, in *Geography*, a town of France, in the department of the Ardèche, and chief place of a canton, in the diſtrict of L'Argentiere, 21 miles S.S.W. of Privas. The place contains 1074, and the canton 12,616 inhabitants, on a territory of 212½ kiliometres, in 18 communes. N. lat. 44° 29'. E. long. 4° 19'.

JOYNAGUR, a town of Meckley; 8 miles N.W. of Munnypour.

JOYNARANSHAUT, a town of Bengal; 18 miles E N E. of Iſlamabad.

JOYNER's Press. See Press.

JOYNERY, the art of working in wood, and of fitting or joining various parts or members of it together.

The French call it *menuiſerie*, from *minutaria*, ſmall work; by which it is diſtinguiſhed from *carpentry*, which is converſant in the larger and leſs curious work. See Joinery.

Joynery, *Column of*. See Column.

JOYPOUR, in *Geography*, a town of Bengal; 18 miles E N.E. of Iſlamabad.—Alſo, a town of Aſſam; 16 miles S.S.E. of Gentia.

JOZE, St., a town of Brazil, on the Tapajos; 45 miles S. of Pauxis.—Alſo, a town of Brazil, in the government of Minas Geraes; 80 miles S.W. of Villarica.—Alſo, a town of Brazil, in the government of Goyas; 75 miles E.N.E. of Villa Boa.

Joze, *St., de Dera*, a town of Brazil, on the Rio Negro; 205 miles from Fort Rio Negro.

Jozé *Azu*, a town of Brazil, in the government of Para; on the river Tocantin; 70 miles S.W. of Para.

JOZO, in *Ichthyology*, the name of a ſmall ſea-fiſh, of the ſea-gudgeon, or rock-fiſh kind, common in the Mediterranean, and called *gobius albus* by ſome authors. It is brought to market at Rome and Venice. See Gobius.

JOZZI, Giuseppe, in *Biography*, an Italian opera ſinger of the ſecond claſs, with a ſoprano voice, came into England with Monticelli, at the beginning of lord Middleſex's regency in 1742. He was a much better performer on the harpſichord than a ſinger. He gained great reputation here by his very accurate, brilliant, and expreſſive manner of executing Alberti's leſſons, and a conſiderable ſum of money by printing and ſelling them as his own compoſitions.

IPAM, in *Geography*, a town of Africa, on the Gold coaſt; 30 miles S.W. of Acra.

IPANEMA, a town of Brazil; 160 miles S.W. of Fernambuco.

IPECACUANHA, or Ipecacoanha, in *Pharmacy*, a little wrinkled root about the thickneſs of a moderate quill, brought hither from ſeveral parts of the Weſt Indies; much uſed as an emetic, and againſt diarrhœas and dyſenteries.

The firſt European who brought this root into uſe was an apothecary of Brazil, whoſe name was Michael Triſtaon. The book which the author publiſhed on this ſubject falling into the hands of the Engliſh, is tranſlated into our language, and ſtands, among a number of like accounts, among Purchas's Pilgrims.

He ſays it is an excellent remedy againſt dyſenteries and fluxes of all kinds. He ſays alſo, in its deſcription, that the ſtalks are a quarter of a yard long, and the roots nearly as much; and that the leaves grow only four or five upon a plant.

This agrees very well with all that we have ſince diſcovered of this plant: and the method of uſing it at that time, we find, was not as a vomit; but they bruiſed the freſh root, and ſteeped it about twelve hours in water, at the end of which time the patient drank the water early in the morning: it operated by ſtool; but after its operation, the natural purging and voiding of blood ceaſed. This ſeems the original account we have of this drug. De Laet, from this, compiled his account, which is almoſt a literal tranſlation of this into Latin: from his hint Piſo and Marggrave enquired after it more carefully upon the ſpot, and from them came the firſt accurate accounts we had of it; ſo that all ſeems, *ab origine*, deduced from Michael Triſtaon's account of it. Miller apprehends that the plant which furniſhes the true ipecaçuanha belongs to the genus of *Trioſteum*, or *falſe ipecacuanha*. It is, as ſome have thought, the *Pſychotria emetica* of Linnæus the younger. But the authority on which Mutis received the information is not to be implicitly followed.

Piſo divides this root into two ſorts, the white and the brown; or, according to Geoffroy, the Peruvian and Brazilian ipecacuanha: but three ſorts, ſays Dr Woodville, are diſtinguiſhable in our ſhops; *viz.* aſh-coloured or grey, brown, and white. The *aſh-coloured* is brought from Peru, and is a ſmall wrinkled root, bent and contorted into a great variety of figures, brought over in ſhort pieces full of wrinkles and deep circular fiſſures, down to a ſmall white woody fibre that runs in the middle of each piece; the cortical part is compact, brittle, and appears ſmooth and reſinous upon breaking; it has very little ſmell, the taſte is bitteriſh and ſub-acrid, covering the tongue, as it were, with a kind of mucilage. The *brown* is ſmall, ſomewhat more wrinkled than the foregoing; of a brown or blackiſh colour without, and white within: this is brought from Brazil. The *white* ſort is woody, has no wrinkles, and no perceptible bitterneſs in taſte. The firſt, that is, the aſh-coloured or grey ipecacuanha, is that uſually preferred for medicinal uſe. The brown has been ſometimes obſerved, even in a ſmall doſe, to produce violent effects. The white, though taken in a large one, has ſcarcely any effect at all.

There are divers falſe ſpecies of ipecacuanha, or roots, which, on account of their external appearance, bear the denomination of ipecacuanha, and are ſometimes ſold for it. Dr. Douglas mentions two: the one white, reſembling the true white, only larger in ſize, ſtraighter, and ſofter to the touch; the other brown, of a deeper colour than the true brown, and ſometimes mixed with red, whence it has alſo been called red ipecacuanha. Theſe are both produced in Maryland and Virginia, where they are uſed as vomitives by the lower ſort. Sir Hans Sloane has diſcovered that the latter is no other than the root of a poiſonous apocynum, deſcribed by him in his Natural Hiſtory of Jamaica. See Phil. Tranſ. N. 410.

The genuine ipecacuanha has ſcarcely any ſmell, unleſs during its pulverization, or infuſion in liquors; when it emits a faint nauſeous one. Geoffroy obſerves, that in pulverizing conſiderable quantities, the finer powder that flies off is apt to affect the operator with difficulty of breathing, a ſpitting of blood, a bleeding at the noſe, or a ſwelling and inflammation of the eyes and face, and ſometimes of the throat; which ſymptoms go off in a few days, ſpontaneouſly, or by the aid of veneſection.

Dr. Irving aſcertained by experiments, that this root contains a gummy and reſinous matter, and that the gum is in much greater proportion, and is more powerfully emetic, than the reſin: that the cortical part is more active than the ligneous; and that the whole root manifeſts an antiſeptic and aſtringent power. He alſo found its emetic quality to be moſt effectually counteracted by means of the acetous acid, inſomuch that 30 grains of the powder, taken in two ounces of vinegar, produced only ſome looſe ſtools.

The bark of ipecacuanha is ſaid to be preferable to its root, as an emetic; acting equally well, and with equal ſafety, in a ſmaller doſe, either in powder, or infuſion. Six grains of the bark, infuſed for a night in an ounce and a half of old Rheniſh, proves a good emetic. See Phil. Tranſ. N 476. ſect. 10.

The brown ipecacuanha yields, by diſtillation, a ſmaller quantity of oil than the grey; and the laſt portion of the ſpirit which comes over with the oil, on urging the fire to the greateſt violence, though it be conſiderably acid to the taſte, yet does not ſeem to contain leſs, but rather more volatile particles than the ſpirit drawn in the ſame manner from the grey. On mixing the ſpirits of both kinds alſo with ſalt of tartar, the volatile parts of that from the brown eſcape with more rapidity than thoſe from the ſpirit of the grey, and affect the noſe more ſenſibly.

It is rational to conclude from hence, that if the brown ipecacuanha contains leſs oil than the grey, it alſo contains leſs reſin; and that as this laſt portion of ſpirit contained more volatile parts, it muſt naturally be expected that it ſhould prove more violent in its operation than the grey. This obſervation alſo, which is countenanced by fact, may in ſome degree favour the opinion of thoſe who affirm, that the purgative virtues of medicines are excited by a volatile ſalt, and that they are more or leſs violent, as they contain more or leſs of this ſalt.

The brown ipecacuanha, as well as the grey, will afford two ſorts of extracts, a reſinous and a ſaline one; but both theſe are yielded in a ſmaller quantity from the brown than from the grey, and conſequently the reſiduum is always greater from the brown. Eight ounces of the grey ipecacuanha yield, with ſpirit of wine, ten drams of the reſinous extract; the ſame quantity of the brown, treated in the ſame manner, yields only ſix drams. From the reſiduum of this quantity of the grey kind, thus diveſted only of its reſin by the ſpirit, there may be procured, by a watery ſolvent, two ounces of a ſaline extract; but the reſidue of the ſame quantity of the brown will yield only five or ſix drams of this extract, by the ſame treatment. The reſidue of the grey, thus diveſted of its reſinous and ſaline parts, will weigh four ounces; and the reſidue of the brown, after the ſame treatment, will weigh ſix ounces. Hence it is very evident, that the active principles are much more abundant in the grey than in the brown kind of this uſeful root.

Neumann ſays that ſixteen ounces of good ipecacuanha will yield three ounces of reſinous matter, in which its virtue conſiſts, by means of ſpirit of wine; and from the ſame quantity, by means of water, five ounces of gummy matter were extracted.

If the proceſs of this analyſis be varied, and the watery menſtruum uſed firſt, the proportion of the ſaline extract will be greatly increaſed by it, and that of the reſinous greatly diminiſhed; eight ounces of the grey ipecacuanha, thus treated, yielding three ounces and a half of ſaline extract, and only thirty-ſix grains of the reſinous one afterwards by ſpirit of wine; and the ſame quantity of the brown yielding one ounce and three drams of the ſaline extract, and only twenty-four grains of the reſinous one, by means of ſpirit of wine afterwards uſed. From all this it is eaſy to perceive, that the brown ipecacuanha contains much leſs of the active parts, and much more of the terreſtrial, than the grey; and yet it is equally certain from trial, that the brown is much more violent in its operation than the grey.

This ſeems a perplexing ſort of paradox; but to explain it we muſt remember, that the virtues of medicines are not to be meaſured by their bulk nor their weight, the moſt powerful of all acting in the ſmalleſt quantities. It has been obſerved, that the laſt portion of ſpirit drawn from the brown is more pungent and ſtrong than that from the grey; and probably this part of the root has as much power to irritate the internal parts of the inteſtines as the reſinous parts.

The beſt menſtruum for extracting the entire virtue of the root, appears to be a mixture of one part of pure ſpirit, with two or three parts of water. In the ſhops, wine is employed: an ounce of the root is macerated or digeſted in a pint of Canary, or fifteen ounces of mountain, to which ſome add a quarter of an ounce of dried orange-peel. Theſe tinctures, in doſes of from half an ounce, or leſs, to an ounce and upwards, prove mildly emetic. Lewis Mat. Med.

It has been found by experience, that this is the mildeſt and ſafeſt emetic with which we are acquainted; having this peculiar advantage, that if it does not operate by vomit, it readily paſſes off by the other emunctories. It was firſt introduced to us with the character of an almoſt infallible remedy in dyſenteries and other inveterate fluxes, as diarrhœa, menorrhagia, and leucorrhœa, and alſo in diſorders proceeding from obſtructions of long ſtanding; nor has it loſt much of its reputation by time. The uſe of ipecacuanha in theſe fluxes is thought to depend upon its reſtoring perſpiration; for in theſe caſes, eſpecially in dyſentery and diarrhœa, the ſkin is dry and tenſe; and while the common diaphoretics uſually paſs off by ſtool, ſmall doſes of this root have been adminiſtered with the beſt effects, proving both laxative and diaphoretic. Dr. Cullen attributes its good effects entirely to its purgative quality. In common caſes of dyſentery, it is ſaid ſoon to perform a cure, by bringing on a free diaphoreſis, or plentiful ſweat, after the patient has taken a puke or two, and is covered up warm in bed. In putrid or malignant dyſenteries, it requires to be continued for ſeveral days, and repeated as an evacuant, with the aſſiſtance of rhubarb, cordial antiſeptics, and mild opiates, or aſtringents. In caſes requiring plentiful evacuation, or when the offending matter is lodged deep, ſir John Pringle recommends it to be given in ſmall doſes, and repeated at proper intervals, till vomiting and purging come on.

In the ſpaſmodic aſthma, Dr. Akenſide remarks, that when nothing contraindicates repeated vomiting, he knew no medicine ſo effectual as ipecacuanha. In violent paroxyſms, a ſcruple procures immediate relief. When the complaint is habitual, from three to five grains every morning, or from five to ten every other morning, may be given for a month or ſix weeks. This medicine has been alſo ſucceſsfully uſed in hæmorrhages. Several caſes of menorrhagia are mentioned by Dahlberg, in which one-third or half of a grain was given every four hours, till it effected a cure. Theſe ſmall doſes are likewiſe found of great uſe in catarrhal and even conſumptive caſes, as well as in various ſtates of fever. Dr. Cullen (Mat. Med. vol. ii.) informs us, that he knew a practitioner who cured intermittents by giving five grains of ipecacuanha, or enough to excite nauſea, an hour before the acceſſion of the fit was expected; and that Dr. Thompſon, formerly of Montroſe, propoſed to cure agues by the employment of emetics given at the time of acceſſion, or at the end of the cold ſtage; and this practice has alſo been ſucceſsful, and may indeed be executed by tartar emetic: but in trying ſuch practices, the ipecacuanha was found more manageable than the other, and generally more eaſy to the patient. Woodv. Med. Bot.

Ipecacuanha, *Baſtard*, in *Botany*, is a ſpecies of *aſclepias*, or ſwallow-wort.

Ipecacuanha, *Falſe*, or Dr. Tinkar's weed, from his having been one of the firſt perſons who brought the root into uſe. See Triosteum.

IPECA-GUACA, in *Ornithology*, the name of a Braſilian ſpecies of duck. It is of a middle ſize between the duck and gooſe, and is kept tame there for breeding and eating. It will fatten as well on dry land as when it has the uſe of water, and lays a vaſt number of eggs.

IPECATI-APOA, the name of a Braſilian ſpecies of duck called *pata* by the Portugueſe; the word in that language expreſſing gooſe. It is nearly of the ſize of the gooſe, but is exactly of the ſhape and figure of the common duck. It is very common in the Braſilian rivers, and is fleſhy and well taſted.

IPECU, the name of a Braſilian bird of the wood-pecker kind, called by Mr. Ray, *picus varius Braſilienſis*. It is of the ſize of a common pigeon. Its beak is ſtraight, and very hard and ſharp, and it pierces the bark and wood of trees with it, in the ſame manner as the European kinds. See Picus *lineatus*.

IPEK, in *Geography*, a river of Servia, which riſes in mount Hæmus, and runs into the Danube, near Galomtatz.

IPERSHEIM, a town of Germany, in the county of Schwarzenburg; 13 miles S.W. of Schainfeld.

IPERUQUIBA, in *Ichthyology*, a name by which ſome have called the *remora*, or ſucking-fiſh; called alſo by the Portugueſe, *piexe pogador*, and *piexe pioltho*. See Echinus.

IPHICRATES, in *Biography*, a celebrated Athenian general, was born in a humble rank of life; but by improving the ſituation in which he was thrown, he, at an early age, raiſed himſelf to a high military command. As he advanced in the army, he ſhewed himſelf a ſtrict diſciplinarian, and attentive to every circumſtance of military improvement. He made war againſt the Thracians, obtained ſome victories over the Spartans, and aſſiſted the Perſian king againſt Egypt. He changed the dreſs and arms of his ſoldiers, and rendered them more alert and expeditious in uſing their weapons. In the ſocial war, a fleet was fitted out by the Athenians for the recovery of Byzantium, under the joint commands of Iphicrates, Timotheus, and Chares. The two former differed from the latter on his propoſal to attack the enemy's fleet during a violent ſtorm, and were in conſequence charged by him with treaſonable intentions. They were recalled by the people of Athens, and publicly proſecuted. Timotheus was condemned, and went into exile: Iphicrates defended himſelf with great ſpirit, and was acquitted. He was indebted for this not only to his eloquence, but to the menacing appearance, round the tribunal, of ſeveral military partizans. When reproached for allowing and encouraging ſo violent a proceeding, he replied, "I have long borne arms for the ſafety of my country, and ſhould be a great fool not to employ them to ſave myſelf." From this time, however, he ceaſed to ſerve in the army. He lived to a great age, and ſaw his countrymen fully reconciled to him. He left one ſon, named Menetheus, by the daughter of the king of Thrace. Univer. Hiſt. Corn. Nepos.

IPHOFEN, in *Geography*, a town of Germany, in the duchy of Wurzburg; 15 miles E.S.E. of Wurzburg.

IPIALES, a town of South America, in the province of Popayan; 36 miles S. of Paſto.

IPOMŒA, in *Botany*, ſo called by Linnæus, from ἶψ, which he unaccountably miſtakes for the Convolvulus plant, whereas it means a creeping ſort of worm that infeſts and corrodes vines; and ὅμοιος, *like*. By this appellation he evidently intended to expreſs the cloſe reſemblance of *Ipomæa* to the genus *Convolvulus*, with which it agrees in habit altogether. Linn. Gen. 87. Schreb. 116. Willd. Sp. Pl. v. 1. 879. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed 2. v. 1. 338. Brown. Prodr. Nov. Holl. v. 1. 484. Juſſ. 134. Lamark Illuſtr. t. 104. (Quamoclit; Tourn. t. 39.) Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Campanaceæ*, Linn. *Convolvuli*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, oblong, ſmall, in five deep ſegments, without any appendages, permanent. *Cor.* of one petal, funnel-ſhaped, or bell-ſhaped; tube ſomewhat cylindrical, very long; limb five-cleft, ſpreading, with five plaits. *Stam.* Filaments five, awl-ſhaped, nearly the length of the corolla; anthers roundiſh. *Piſt.* Germen ſuperior, roundiſh; ſtyle thread-ſhaped, the length of the corolla; ſtigma capitate, nearly globoſe, in two or three lobes. *Peric.* Capſule roundiſh, of two or three cells. *Seeds* few, large, roundiſh, ſometimes hairy.

Eſſ. Ch. Calyx deeply five-cleft, naked. Corolla with five plaits, ſomewhat funnel-ſhaped. Stigma capitate and globoſe, lobed. Capſule of two or three cells. Seeds two in each cell.

A large genus, more correctly diſtinguiſhed from *Convolvulus* by the globoſe form of its ſtigma, than by the more narrow or tubular ſhape of the corolla. For want of attending to this, Linnæus and others have miſplaced ſeveral ſpecies. Jacquin in his *Collectanea*, v. 3. 303, has called the attention of botaniſts to this ſubject, and Mr. R. Brown in his *Prodromus* has recently thrown further light upon it, indicating, moreover, the want of bracteas or appendages to the calyx in *Ipomæa*, which are found in *Convolvulus*.

Examples of *Ipomæa*, eminent for their beauty, are I. *Quamoclit*, Linn. Sp. Pl. 227. Curt. Mag. t. 244, a native of the Eaſt Indies, remarkable for its finely pectinated leaves, and rich crimſon bloſſoms:—I. *coccinea*, Linn. Sp. Pl. 228. Curt. Mag. t. 221, found in the Weſt Indies, and eaſily cultivated, as an annual, in our gardens:—I. *Bona nox*, Linn. Sp. Pl. 228. Curt. Mag. t. 752, found alſo in the Weſt Indies, and rarely ſeen with us. The flowers of the laſt are large and white; we ſhould from the name, as well as their appearance, gueſs them to be fragrant in an evening.

Ipomœa, in *Gardening*, comprehends plants of the herbaceous flowery kinds; of which the ſpecies chiefly cultivated are the winged-leaved ipomœa (I. quamoclit), and the ſcarlet-flowered ipomœa (I. coccinea).

Of the ſecond ſpecies there is a variety with orange coloured flowers.

Method of Culture.—Theſe plants are increaſed by ſowing the well-ripened ſeeds in ſmall pots, plunging them in a mild hot-bed, or in the earth of the bed, in the early ſpring months, proper air and water being given. When the plants have attained ſome growth, and in the firſt ſort begin to climb, they ſhould be removed, with balls of earth about their roots, into the places where they are to grow; or, which is better for the firſt kind, into ſeparate large pots, replunging them in the bark hot-bed. They ſhould have proper ſticks ſet for them to twine about; ſome pots of the firſt kind being placed in the ſtove, as being more tender in their nature.

The firſt ſort affords variety in the ſtove, and among other tender potted plants in the ſummer; and the latter, in the fronts of warm borders, as well as among the leſs tender potted flowering plants.

IPOMOPSIS, in *Botany*, ſo called, by Michaux, from ἰπόω, *to ſtrike forcibly*, and ὄψις, *the ſight*, in alluſion, as it ſhould ſeem, to the dazzling brilliancy of the flowers of the original ſpecies. Michaux Amer. v. 1. 141. Sm. Exot. Bot. v. 1. 23. Ait. Hort. Kew. ed. 2. v. 1. 342. Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Campanaceæ*, Linn. *Polemonia*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, bell-ſhaped, membranous at the baſe; its limb in five, long, equal, linear, erect ſegments. *Cor.* funnel-ſhaped; tube cylindrical; limb in five, deep, ovate, nearly equal ſegments. *Stam.* Filaments five, inſerted into the upper part of the tube, awl-ſhaped, ſhorter than the limb; anthers roundiſh, two-lobed. *Piſt.* Germen ſuperior, ovate; ſtyle thread-ſhaped, about as long as the tube; ſtigma in three, deep, oblong, downy, ſpreading ſegments. *Peric.* Capſule rather ſhorter than the calyx, ovate, obtuſe, of three cells, and three valves. *Seeds* ſeveral in each cell, in two rows, acutely angular.

Eſſ. Ch. Calyx in five ſegments, membranous at the baſe. Corolla funnel-ſhaped. Stamens ſpringing from the tube. Stigma three-cleft. Capſule ſuperior, of three cells and three valves. Seeds ſeveral, angular.

1. *I. elegans.* Scarlet Ipomopſis. Michaux Amer. v. 1. 142. Sm. Exot. Bot. t. 13. (Ipomæa rubra; Linn. Syſt. Veg. ed. 14. 204. Polemonium rubrum; Linn. Sp. Pl. 231. Cantua coronopifolia; Willd. Sp. Pl. v. 1. 879. Quamoclit pennatum erectum, floribus in thyrſum digeſtis; Dill. Elth. 321. t. 241.) "Stem erect, ſtraight. Corolla thrice as long as the calyx."—A native of South Carolina, whence it was originally brought to Sherard's garden at Eltham. It has occaſionally been imported ſince from the ſame country, and was lately raiſed in great perfection at Meſſrs. Lee and Kennedy's, where the excellent figure in exotic botany was drawn. It flowers in September or October, and conſequently ripens ſeed with difficulty. According to all appearance this beautiful plant is a *biennial.* *Root* fibrous. *Stem* ſolitary, erect, becoming panicled at the height of four or five feet, round, leafy, and clothed, like the whole herbage, with ſhort, glandular, white hairs. *Leaves* pinnatifid; ſegments long and narrow, thoſe of the radical leaves ſhorter and broader; floral leaves ſimple. *Flowers* on ſhort ſtalks, drooping. *Corolla* equally five-cleft, of a brilliant ſcarlet, elegantly dotted on the inſide. *Stamens* ſlender, red; anthers yellow. *Germen* ſmooth, pale green. *Capſule* almoſt membranous, the partitions from the centre of the valves. *Seeds* in two rows, ſmall, not winged.

2. *I. inconſpicua.* Little Blue Ipomopſis. Sm. Exot. Bot. t. 14. Ait. Hort. Kew. ed. 2. v. 1. 342.—"Stem much branched and ſpreading. Corolla ſcarcely longer than the calyx. Segments of all the leaves linear."—Native of North America, and firſt raiſed, in 1793, at Sion Houſe, by Mr. Thomas Hoy, F.L.S. It flowered in November. *Root* annual. *Stems* numerous, about a foot high, leafy, round, pubeſcent as in the laſt ſpecies. *Leaves* alternate, pinnatifid; ſegments long and narrow, generally ſimple. *Flower-ſtalks* various in length, ſimple, ſolitary or in pairs, erect. *Calyx* with rather broader teeth than the foregoing. *Corolla* blue, with a white tube, by no means ſtriking or beautiful. *Stigma* purpliſh. *Capſule* ovate, thin, whitiſh.

Dr. Smith has obſerved, that this ſpecies ſerves to confirm the *Ipomopſis* of Michaux, with which it agrees ſo completely in every botanical character, that we find it not very eaſy to eſtabliſh even a ſpecific difference on ſound principles; while, on the other hand, it ſhews how different this natural genus is from *Cantua*, and all others to which it has been referred. The ſame author mentions a third ſpecies, *I. albida*, gathered by Dombey, at Lima, much like this, but upright; its leaves doubly pinnatifid, with ſomewhat elliptical lobes, and its flowers whitiſh.

IPPO, in *Natural Hiſtory*. See MACASSAR *Poiſon*.

IPS, in *Geography*, a town of Auſtria, ſituated near the conflux of the Ips and Danube, on the ſcite of the ancient Pons Iſis, on Iſipontium; 48 miles W. of Vienna. N. lat. 48° 13'. E. long. 15° 5'.

IPSALA, or SKIPSILAR, a town of European Turkey, in Romania; 53 miles S.W. of Adrianople.

IPSARA, called by the ancients *Pſyrea* or *Pſyria*, an iſland in the Grecian Archipelago, about ſix miles long and three wide; the ſoil is in general ſtony, and affords no great reſources to agriculture and commerce. It, however, produces figs, grapes, a ſmall quantity of cotton, and ſome corn, and red wine is an article of commerce. The inhabitants are chiefly Greeks, about 1000 in number, who pay a tribute of about 1000 crowns, and are ſubject to the cadi of Scio; ſix miles N.W. of Scio. N. lat. 38° 43'. E. long. 25° 35'. About a league from Ipſara lies a ſmaller and deſert iſland, called "Anti-ipſara, ſcarcely two leagues in circumference. Between theſe two iſlands ſhips find a very good anchorage.

IPSHEIM, a town of Germany, in the principality of Culmbach; 17 miles N.N.W. of Anſpach.

IPSILI, a ſmall iſland in the gulf of Engia.

IPSUS, in *Ancient Geography*, a town and river of Aſia, in Phrygia, S.E. of Synnada; famous for a battle fought here in the year 300 B.C. between Antigonus and Demetrius, having an army of 70,000 foot, 10,000 horſe, and 75 elephants, and the kings of Seleucus, Lyſimachus and Caſſandra, who had 74,000 infantry and 10,500 cavalry, 400 elephants, and 20 chariots of war. Antigonus was defeated and killed. Demetrius fled into Greece. The conquerors divided their lands between them.

IPSWICH, formerly called *Gippeſwich*, *Gippeſwid*, *Gyppewicus*, &c. in *Geography*, a borough and the county town of Suffolk, England, is ſeated on the northern bank of the river Orwell, at the diſtance of 18 miles N.E. from Colcheſter, 54 S.W. of Yarmouth, 12 N.W. of Harwich, and 69 N.E. of London. In the year 1800, it contained 2221 houſes, and 74,292 inhabitants. Near this place the river Gippen, or Gipping, unites its waters with the Orwell, which is navigable for 12 miles to the ſea at Harwich, where is a commodious haven, or harbour. Ipſwich appears to have been a town of ſome conſequence during the Anglo-Saxon dynaſty; for it was fortified with a vallum and foſs when the Danes made their depredatory incurſions into this part of the iſland. Within the ſpace of ten years they pillaged this town twice: firſt in, or near the year 991, and again in 1000. In the fifth year of king John's reign, the fortifications were repaired and materially ſtrengthened. The walls were provided with, at leaſt, four fortified gates; which were reſpectively called, from their relative ſituations, Eaſt-Gate, Weſt-Gate, North-Gate, and South-Gate; and the town was alſo divided into four leets or wards. Some fragments and parts of the old walls are ſtill remaining. Of the caſtle, no veſtige is left, either to prove its ſcite, or define its character. The liberties of the borough, however, extend beyond the walls, and comprehend the four hamlets of Stoke-Hall, Wikes-Ufford, Brooks-Hall, and Wikes-Biſhop. The extent of theſe liberties compriſes an area, meaſuring about four miles from eaſt to weſt, and nearly five miles in a tranſverſe direction. The corporation has alſo juriſdiction and advantageous privileges by water, on the Orwell to the ſea-port of Harwich. In the time of king Edward the Confeſſor, his queen held two parts of the borough, and her brother, earl Guert, a third part. When the Domeſday book was made, Roger Bigot, earl of Norwich, poſſeſſed the half hundred of Gippeſwid. At the former period, there were 538 burgeſſes reſiding here, who paid cuſtom to the king, but at the conqueſt there were only 110 burgeſſes, and in the Norman record it is ſtated, that "328 houſes are now empty." The firſt charter granted to the borough is dated 25th of May 1199, 1ſt of king John; this grants to the burgeſſes, 1, "The borough with all its appurtenances, liberties, &c. to be holden of the king and his heirs by the payment of the right and uſual annual farm, and 100 ſhillings more at the exchequer." This ſum is ſuppoſed to have amounted to ſixty marks, or 40*l.*: 2. The burgeſſes were alſo exempted from the payment of all taxes under the names of tholl, leſtage, ſtallage, paſſage, pondage, and all other cuſtoms by land, and at ſea-ports: 3. To have a merchant's gild, and hanſe of their own: 4. No perſon to be quartered on them without conſent, or any thing taken from them by force: 5. That they might hold their lands and recover their juſt dues from whomſoever they be owing:" which implies that the inhabitants were then conſtituted lawful ſubjects: "6. That they ſhould hold their lands and tenures within the borough, according to the cuſtom of the borough of Ipſwich: 7. That none of them ſhall be fined or amerced, but according to the laws of the free-boroughs: 8. And that they might chooſe two bailives and four coroners out of the more lawful men of the ſaid town." Suffolk Traveller.

After this charter was ratified and obtained, the burgeſſes aſſembled in the church-yard of St. Mary at Tower, and there held their firſt great court; appointed officers, &c. Here they continued to tranſact their public buſineſs till the 13th year of Edward I.'s reign, when that monarch ſeized the borough, and held it in ſubordination for ſix years. He then renewed and confirmed the charter, by public act, dated at Berwick, A. D. 1291. For this liberty the burgeſſes were required to pay an annual rent of 60*l.* to the king. Another charter was granted by king Henry VI.; but the moſt material act of this kind was procured in the 17th year of king Charles II. Among the privileges conferred on the burgeſſes by theſe charters, is that of ſending two members to parliament, who are elected by the votes of about 700 burgeſſes. The officers of theſe, and who are entruſted with the civil government of the place, are two bailiffs, a recorder, 10 portmen, and 24 common-councilmen. The borough is ſaid to have returned members *ab origine*. Like the generality of parliamentary boroughs, this has been the cauſe of much bribery, corruption, and litigation. A memorable inſtance of the latter occurred before a committee of the houſe of commons in 1780, when Mr. Cator, who had obtained a majority of votes by bribery, &c. was declared diſqualified to take a ſeat in the houſe, and a new writ was iſſued to elect another perſon. The particulars of this caſe are fully narrated in Oldfield's "Hiſtory of Boroughs," vol. ii.

In addition to the privileges already noticed, the corporate officers of Ipſwich are authorized to paſs fines and recoveries, try civil and criminal cauſes, and hold pleas of the crown. They alſo hold aſſizes of wine, bread, beer, &c. and have an admiralty juriſdiction, whereby they are entitled to all waifs, ſtrays, and goods caſt on ſhore. No freeman can be compelled to ſerve on juries out of the town; and every burgeſs is entitled to ſeveral advantageous privileges on ſailing to different ports.

Ipſwich at preſent contains twelve pariſh churches. In the Domeſday book nine are ſpecified: and in the year 1287 it is related in Stowe's Annals that ſome churches in this town, at Yarmouth, at Dunwich, &c. were deſtroyed by a violent ſtorm, and by the waves of the agitated ſea. The names of the preſent pariſhes, are, 1. St. Clement's, which is conſolidated with St. Helen's, and has no church: 2. St. Helen's, or Hellen's, is a rectory; 3. St. Lawrence's church is ſaid to have been begun by John Bottold, who died A.D. 1431. The chancel was erected by John Balwyn, who died in 1449; and a chantry was founded here, in 1514, by Edmund Dauntry, a poſtman of this town, who alſo cauſed the market croſs to be built: 4. St. Margaret's was impropriated to the priory of the Holy Trinity, the church of which was formerly ſtanding near St. Margaret's church-yard: 5. St. Mary's, at Elms: 6. St. Mary's, at Kay: 7. St. Mary's, at Stoke: 8. St. Mary's, at Tower: 9. St. Matthew: 10 St. Nicholas's: 11. St. Peter's: 12. St. Stephen's. Beſides theſe, the three following churches are in the vicinity of the town: 1. Thurleſton: 2. Whitton: and 3. Weſterfield. The monaſtic eſtabliſhments within the town were formerly very numerous, and ſeveral houſes, parts of buildings, and places, ſtill retain the names of the reſpective ſocieties. Theſe were, 1. The Holy Trinity, or Chriſt Church, a priory of Black canons: 2. St. Peter and St. Paul, a priory of Black canons: 3. St. Mary Magdalen, and St. James, a hoſpital for leprous perſons: 4. Dandy's Almſhouſes: 5. A houſe of Auſtin friars: 6, 7, and 8. Black friars, Gray friars, and White friars. For accounts of theſe eſtabliſhments, ſee Tanner's Notitia Monaſtica.

Ipſwich formerly contained ſeveral large houſes belonging to wealthy merchants and eminent perſons. Of theſe a few remain in reduced and dilapidated conditions. Among theſe are walls and a brick gateway to a building called Wolſey-college, which was appropriated and enlarged by Cardinal Wolſey for a dean, 12 ſecular canons, 8 clerks, and 8 choiriſters. To this college was annexed a grammar ſchool: but before the founder's deſign was carried into effect he was arreſted by king Henry VIII. and is ſuppoſed to have taken poiſon to eſcape an ignominious trial and execution. The ſcite of the college compriſed about ſix acres of land. The biſhop of Norwich had a palace called Curſon's-houſe, in Silent-ſtreet. Sir Andrew Windſor, afterwards lord Windſor, had a houſe in the pariſh of St. Mary, at Stoke. The archdeacon of Suffolk poſſeſſed a houſe, called Place or Palace, in Upper Brook-ſtreet. Part of the outer wall and gates lately remained. In the pariſh of St. Stephen were formerly two houſes, or manſions of conſiderable note: one of which belonged to, and was inhabited by Charles Brandon, duke of Suffolk; and the other to ſir Anthony Wingfield, knight of the Garter, vice-chamberlain and privy-counſellor to king Henry VIII. Some apartments of the latter ſtill remain, and are curious examples of the ſtyle in which ſuch manſions were ornamented. Several little houſes in this town are embelliſhed, both externally and internally, with carved and ſtuccoed devices; but theſe are chiefly of the age of James I. and Charles I.

The commerce and trade of Ipſwich, though not upon a large ſcale, furniſh employment to many of the poorer inhabitants, and fortunes to thoſe who poſſeſs property to ſpeculate with. Several veſſels belong to this town, and many have been built here. Four building yards are attached to the port. The chief trade of the place is malting. Ipſwich is ſupplied with five fairs annually, and five days out of the ſeven are appropriated for markets. For the accommodation of perſons frequenting theſe, a large, commodious market-place has been erected from deſigns by Mr. Brown, an architect of this town. A ſeries of buildings, on pillars, is diſpoſed round two quadrangular courts, in which perſons who frequent the market may be provided with ſhelter and accommodation for a ſmall annual, or weekly rent. The plan is judicious, and admirably adapted to its purpoſe. In this town are five charity-ſchools for the education and clothing of poor children.

On the quay is a cuſtom houſe: it was determined in the reign of Edward III. that the bailiff and burgeſſes of Ipſwich had the ſole right to take cuſtom-houſe duties for goods landed at the port of Harwich: whence it is inferred that the latter was a ſubordinate, and dependant port to the former. The tide commonly riſes from 10 to 12 feet: but at low water the river is ſhallow and narrow. At Ipſwich are the following public buildings: a town-hall, council-chamber, and ſhire-hall; a workhouſe, or hoſpital, and ſome alms-houſes.

Adjoining the town is a ſeat and park called Chriſtchurch, occupying the ſeite and lands of an ancient priory; and to the ſouth of Ipſwich are the following ſeats: Tattingſton-hall, Wolverſton-hall;—to the weſt are Chauntry, Sproughton, Burſtal, and Bramford, Hintleſham-hall, Stoke-hall, and Hill-houſe. Among the eminent natives of this town, the name of Thomas Wolſey is particularly diſtinguiſhed. He is ſaid to have been the ſon of a butcher, but this is doubted by the editor of the ſecond edition of "The Suffolk Traveller." It is evident, however, that he rapidly advanced from a low rank in ſociety, to be even the maſter of his tyrannical and ſelfiſh monarch; but at length he fell a ſacrifice to his own ambition and to the caprice of his king. He was born here March 1471, and died at Leiceſter Nov. 29, 1530. Several memoirs and accounts of him have been publiſhed, but an "*impartial* life" of him "is ſtill a deſideratum in Engliſh biography." Chalmers, in his intereſting "Hiſtory of the Colleges and Halls, &c. of Oxford," has given a ſhort and diſcriminating memoir of him, with references to, and obſervations on the cardinal's different biographers. The following names occur as "worthies" of Ipſwich: Ralph Brownrigg, D.D. and biſhop of Exeter: William Butler, phyſician, who, according to Fuller, "Worthies of England," (vol. ii. p. 340.) was the Æſculapius of the age." Mr. Raw, a reſpectable bookſeller of Ipſwich, is printing a hiſtory of this town. Suffolk Traveller, 2d edit. 8vo. 1764.

Ipswich, the Agawam of the Indians, a poſt-town and port of entry in America, pleaſantly ſituated on both ſides of Ipſwich river, in Eſſex county, Maſſachuſetts, 30 miles N.E. by N. of Boſton, and about a mile from the ſea. The townſhip of Ipſwich is divided into four pariſhes, and contains 601 houſes, and 3305 inhabitants, who are chiefly farmers; a few veſſels are employed in the fiſhery, and ſome few trade to the Weſt Indies: ſilk, thread, and lace, of an elegant texture, are manufactured here in large quantities, by women and children, and ſold for uſe and exportation in Boſton and other mercantile towns. Ipſwich townſhip was incorporated in 1634. It was formerly a place of conſiderable importance; but its decline is attributed to a barred harbour, and ſhoals in the river. N. lat. 42° 43′. W. long. 70° 50′.

Ipswich, *New*, a townſhip in Hillſborough county, Hampſhire, containing 1266 inhabitants; ſituated on the W. ſide of Souhagan river, and ſeparated from Whatſhook mountain by the N. line of Maſſachuſetts; 56 miles N.W. of Boſton. It was incorporated in 1762, and has a flouriſhing academy.

IQUEIQUY, or Iquique, an iſland in the Pacific ocean, near the coaſt of Peru, about a mile in circumference, ſituated in a ſmall gulf, which affords ſhelter for veſſels, but no freſh water. It is inhabited by Indians and ſlaves belonging to the Spaniards, who are employed in collecting a yellow earth, formed by the dung of birds, as manure for vines, and with which eight or ten ſhips have been loaded annually for a century. S. lat. 20 20′.

IQUISENQUI, one of the iſlands of Japan, ſituated near the S.E. coaſt of the iſland of Ximo. This iſland is very ſmall. N. lat. 32°. E. long. 132 40′.

IRABAD. See Hirabad.

IRABATTY, a name given to the river Ava, in ſome part of its courſe.

IRAC, Arabian, a country of Arabia Deſerta, ſituated to the ſouth of the Tigris and Euphrates; the ancient Babylonia or Chaldæa. This country, towards the N.E., is watered by branches of the Euphrates, and is fertile, containing a number of cities and towns: towards the S.W. it is a dreary wilderneſs. One of the principal places in it is Baſſora.

Irac, or *Irac-Ajemi*, a province of Perſia, chiefly correſponding with the ancient Ecbatana; is bounded on the N. by Ghilan and Mazanderan, on the E. and N.E. by Choraſan, on the S. by Farſiſtan, and on the W. by Khoſiſtan or Chuſiſtan, and the Arabian Irac. This province contains a part of ancient Media and Parthia: it is about 150 leagues in length, and 120 in breadth; and part of it conſiſts of barren mountains, or ſandy plains, which are altogether unproductive, but near the rivers there are extenſive and fertile plains. The air is healthy, but very dry; the climate is hot; and it hardly ever rains in the ſummer for ſix months together. Mount Taurus, which traverſes the province, furniſhes the animal that yields muſk: manna, of an exquiſite whiteneſs, is found in ſeveral places: galbanum is collected in the mountains near Iſpahan; and in ſeveral places they cultivate grapes, ſome of which are dried, and others afford white wine. In this province are reckoned about 40 towns or cities. Iſpahan, the capital of Perſia, is the chief.

IRACOUBO, a river of Guiana, which runs into the Atlantic. N. lat. 5° 35′. W. long. 54° 27′.

IRACUNDUS Musculus, in *Anatomy*, a name given by ſome authors to one of the muſcles of the eye, called alſo the rectus exterior and abducens. It is one of the quatuor recti oculi of Albinus, and is called by him and Douglas, as well as many others, the abductor.

IRAMALLY, in *Geography*, a town of Hindooſtan, in the circar of Dindigul; 30 miles W.N.W of Dindigul.

IRAPILLY, a town of Hindooſtan, in the Myſore country; 12 miles S.E. of Sankeridurgum.

IRASBURG, a townſhip of America, in Orleans county, Vermont, ſituated on Black river; 12 miles S. of the Canada line; containing 15 inhabitants.

IRASCIBLE, in the *Old Philoſophy*, a term applied to an appetite, or a part of the ſoul, where anger and the other paſſions, which animate us againſt things difficult, or odious, were ſuppoſed to reſide.

Of the eleven kinds of paſſions attributed to the ſoul, philoſophers aſcribe five to the iraſcible appetite; *viz.* wrath, boldneſs, fear, hope, and deſpair: the other ſix are charged on the concupiſcible appetite; *viz.* pleaſure, pain, deſire, averſion, love, and hatred.

Plato divided the ſoul into three parts; the reaſonable, iraſcible, and concupiſcible parts. The two laſt, according to that philoſopher, are the corporeal and mortal parts of the ſoul, which give riſe to our paſſions.

Plato fixes the ſeat of the iraſcible appetite in the heart; and of the concupiſcible in the liver: as the two ſources of blood and ſpirits, which alone affect the mind.

IRAVAT, or Iravati, in *Hindu Mythology*, the name of an elephant on which Indra, the regent of the firmament, and prince of the beneficent genii, rides. (See Indra.) It is generally painted with three trunks, or proboſci, and is driven by Indra's charioteer named Matali. The Hindus aſſign vehicles, which they call vahan, to their different deities, male and female. Thus, the vahan of Indra is Iravat (ſee Vahan); but not, it would appear, excluſively, for Major Moore, in the Hindu Pantheon, p. 261, ſays, that he has pictures in which other deities, Rama and Kriſhna in particular, are mounted on this favoured animal. Indra being a perſonification of the viſible heavens, his attributes and diſtinctions partake of firmamental alluſions. In his wars he employs many elephants, who are in fact clouds; and their names tranſlated mean *thunder*, *bearer*, *black*, *white*, *rumbler*, *growler*, &c. The chief of all theſe is Iravat, which means *watery*, the aqueous property of clouds being that moſt apparent; and we may, in this appropriate nomenclature, fancy that we diſcern ſome appearance of connection in the mythological machinery of the Hindus, generally at the firſt view ſo apparently anomalous and extravagant.

IRBEN, in *Geography*, a town of the duchy of Courland, on the coaſt of the Baltic; 18 miles E.N.E. of Windau.

IRBITSKAIA, a town of Ruſſia, in the government of Perm, on the Irbit; 100 miles N.E. of Ekaterinburg.

IRCUNDA, a town of Hindooſtan, in the circar of Cicacole; 20 miles S.W. of Cicacole.

IRE Holmes, two iſlands among the Orkneys, a little to the W. of the iſland of Sanda.

IREBY, High, or *Market-Ireby*, a pariſh and market-town in Allerdale-ward, in the county of Cumberland, England, is ſituated near the ſource of the river Ellen, 303 miles diſtant from London, and contained, according to the population return of the year 1800, 73 houſes, and 358 inhabitants. Here are two annual fairs, and a weekly market on Thurſday. The town, though now inconſiderable, is of great antiquity, and was, in the opinion of Camden, the "Arbeia of the Romans, where the Barcarii Tigrienſes were ſtationed;" but Horſley diſſents from this evidence, and aſſerts, that no Roman antiquities were ever found here; and that the affinity of names has leſs force in this inſtance, as there is another Ireby in Lancaſhire, on the borders of Weſtmoreland and Yorkſhire. This gentleman, with Mr. Ward, places the Arbeia at Moreſby, where remains have been dug up, and the ſcite of a ſtation is evident. Beauties of England and Wales, vol. iii.

IREDELL, a county of America, in Saliſbury diſtrict, North Carolina, ſurrounded by Surry, Rowan, and Burke. The climate is ſalubrious, the lands beautifully variegated with hills, and the ſoil rich. It contains 8761 inhabitants, of whom 1481 are ſlaves. Iredell court-houſe has a poſt-office; 25 miles from Saliſbury.

IREGA, a town of Hindooſtan, in the circar of Adoni; 50 miles W.N.W. of Adoni.

IREJ, a town of Hindooſtan, in the circar of Gohud; 70 miles E. of Narwa. N. lat. 25° 37'. E. long. 79° 40'.

IRELABOO, a town on the N. coaſt of the iſland of Sumatra. N. lat. 5° 9'. E. long. 96° 15'.

IRELAND, a large and fertile iſland in the Atlantic ocean, lying on the weſt of Great Britain, from which it is ſeparated by the Iriſh ſea, or St. George's Channel. It contains the moſt weſtern land in Europe, if we except Iceland, and it has no country between it and the coaſt of Labrador in North America. The ſea which ſeparates it from Great Britain, varies in breadth from 14 to 40 leagues; but is contracted between Scotland and the county of Down to a channel only ſix leagues wide, and farther north to a ſtill narrower ſtrait of leſs than four, between the N.E. point of the coaſt of Antrim and the Mull of Cantyre.

The general figure of Ireland ſomewhat reſembles a parallelogram, the greateſt length of which that can be meaſured along a meridian, is from Bloody Farland Point, in the county of Donegal, to the Stags of Cork harbour; this does not exceed 185 Iriſh, or 235½ Engliſh miles. It is much indented on the eaſt by the Iriſh ſea, and on the weſt by the Atlantic ocean, ſo that its breadth is very unequal. Between Emlagh Raſh, in Mayo, and the mouth of Strangford lough, which is the greateſt, there are 143 Iriſh (182 Engliſh) miles, whilſt between the bays of Dublin and Galway there are but 86 Iriſh miles, and between Dundalk and Ballyſhannon no more than 67. It will not, therefore, appear ſurpriſing, that there is not a ſpot in Ireland which is fifty miles diſtant from the ſea. If a diagonal line be drawn from Fairhead, the north-eaſtern point, to Mirenhead, the ſouth-weſtern point, it will meaſure 241 Iriſh, or 306 Engliſh miles, which is the greateſt diſtance between any two points of the iſland. The number of Iriſh plantation acres is above 12 millions, which is nearly equal to 20 millions of Engliſh acres.

The ſituation of Ireland is peculiarly favourable for receiving and beſtowing the reciprocal benefits of external commerce. Its communication is open and direct with England, France, Spain, Portugal, the coaſt of Africa, the Eaſt Indies, South America, the Weſt Indies, the United States of America, Newfoundland, Hudſon's Bay, Greenland, &c., with by far the greateſt part of the richeſt, the moſt fertile, the moſt commercial, and the moſt mutually dependent countries in the world; with countries abounding in an endleſs variety of commodities, furniſhing every material on which the varied induſtry of man can be employed, and preſenting the utmoſt allurements to the enterpriſing trader. It ſeems deſtined by nature, ſays Mr. Newenham, to be the great emporium of the commodities of Europe and America; and, indeed, of thoſe of almoſt every maritime country upon the ſurface of the globe.

The face of the country affords a pleaſing variety. In ſome parts there are rich and fertile plains, watered by large and beautiful rivers; in others frequent hills produce that intereſting ſucceſſion of objects with which a flat country can never abound. In two or three counties, there are moſt romantic and pictureſque ſcenes, whilſt in others, extenſive plains have been converted into moſſy moraſſes. A ſufficient quantity of wood, however, is wanting in moſt parts to render the views as intereſting as the general character of the country would lead us to expect. That this was not the caſe in former times, is evident from various accounts. Giraldus Cambrenſis, quoted by Camden, Stanihurſt, and other old writers, ſpeak of it as covered with woods, which are alſo often referred to in acts of parliament, and other public documents. Theſe were partly cut down to deprive the natives of their faſtneſſes, and partly for the purpoſe of extending agriculture. In the reigns of James I. and Charles I., during the continuance of peace, a very extenſive exportation took place, chiefly of pipe ſtaves and other ſmall timber; and beſides what was conſumed in domeſtic fuel, immenſe quantities were charred for the iron works which were carried on in different parts of the iſland. As no attention was paid to renewing them, the foreſts were ſpeedily reduced. Yet Boate, whoſe work was publiſhed about the middle of the ſeventeenth century, informs us that there were ſtill ſundry great woods remaining in all the provinces, ſome of them many miles long and broad. All theſe have ſince been demoliſhed, and there does not exiſt in Ireland any tract deſerving the name of a foreſt: but the whole country is cleared for the purpoſes of agriculture, and retains none of the vaſt woods to be found in the ſavage ſtate, yet Ireland is not deſtitute of woods that are both uſeful and ornamental. A ſpirit of planting has been prevalent for ſome years paſt, which has been powerfully encouraged by the premiums of the Dublin Society, as well as by ſeveral acts of parliament for the protection of timber, ſo that the country begins to aſſume a leſs naked appearance, and will, perhaps, become once more entitled to its old name of the Woody iſland.

Ireland has been ever celebrated for the fertility of its ſoil. The richeſt land is that which lies near the principal rivers, but there is not much which can be called bad; and the proportion of that which is waſte was not thought by Mr. Arthur Young, ſo long ago as the year 1778, to be as great as in England. The moſt uncultivated tracts are the mountainous diſtricts in all the weſtern counties, which ſeem placed as barriers againſt the fury of the vaſt Atlantic. In every part of Ireland there is ſtone either near the ſurface or at no great depth, which Mr. Young conſidered as the greateſt ſingularity of Ireland. "May we not recognize in this," he continues, "the hand of bounteous Providence, which has given, perhaps, the moſt ſtony ſoil in Europe to the moiſteſt climate in it? If as much rain fell upon the clays of England, (a ſoil very rarely met with in Ireland, and never without much ſtone,) as falls upon the rocks of her ſiſter iſland, thoſe lands could not be cultivated. But the rocks here are clothed with verdure; thoſe of limeſtone, in particular, with only a thin covering of mould, have the ſofteſt and moſt beautiful turf imaginable." Light ſandy ſoil is ſeldom met with, and chalk has not been found in any part of the iſland, though there is a white limeſtone ſomewhat reſembling it.

The mountainous chains in Ireland are neither numerous nor important; but an upland ridge divides the country from the N.E. to the S.W., giving birth to ſeveral of the rivers. The Iriſh hills generally form ſhort lines or detached groups, which are ſo diſperſed through the country, that there is ſcarcely any part in which the proſpect is not terminated by this ſpecies of majeſtic ſcenery. There are none, however, equal in height to ſeveral in Great Britain, the higheſt probably falling ſhort of 3000 feet; yet there are a few, ſuch as Mangerton and M'Gillicuddy's Reeks, near the lake of Killarney, and Brandon, near Dingle, in Kerry; Croagh Patrick and Nephin in Mayo; and Sliebh-Donard, one of the Mourne mountains, in the county of Down, which deſerve the attention of the naturaliſt, as they have been found to produce many of thoſe plants peculiar to Alpine regions.

As the whole of the country is found to have ſtone near the ſurface, it was natural to expect that it contained valuable minerals; and we accordingly find that ſuch an expectation was early formed, though, hitherto, much pains do not ſeem to have been taken to diſcover them, and render them uſeful. A plan was indeed recommended by Mr. Kirwan, which, if it had been adopted, would have eſtabliſhed a complete mineralogical ſchool in Ireland, and would thus have not only led to the diſcovery of the minerals, but have alſo inſtructed in the mode of procuring them with moſt advantage. As, latterly, attention has been excited to the ſubject, much progreſs may be ſhortly expected. The limeſtone quarries, which abound almoſt every where, are now generally worked, and afford a moſt valuable manure. A great variety of marbles is found, ſome of which are uncommonly beautiful, and capable of a very high poliſh, ſo as to leave little cauſe to regret the difficulty of procuring Italian marbles. Gypſum, ſo valuable a material in the hands of the ornamental artiſt, is found in great abundance near Belfaſt, and fuller's-earth has been found in ſeveral counties. The mountains of granite in Wicklow and Carlow ſupply the capital with this uſeful ſtone for building; and ſlates of excellent quality are found in many parts of the iſland. The beds of coal, to be ſeen in various regions of Ireland, have not yet been properly explored. That of Kilkenny, found at Caſtlecomer, is deſervedly celebrated among mineralogiſts as the pureſt coal of the kind to which it belongs, which is the *ſtone* or *uninflammable* coal. This is the kind generally found in the ſouthern parts of Ireland; but in the counties of Tyrone and Antrim ſome mines of ſlate-coal have been worked. Iron ore is very abundant; and before the foreſts were conſumed, there was a great number of iron works in various parts. Boate divides the iron mines of Ireland into three deſcriptions: 1. What he ſtyles the bog-mine, or, what is now termed lowland ore, found in moors and bogs; the ore reſembling yellow clay, but mouldering into a blackiſh ſand. 2. The rock mine; a bad ſort; the ore intimately combined with ſtone. 3. That found in various mountains; the ore ſpheric and of a whitiſh grey colour; balls of the beſt ore contained kernels full of ſmall holes, whence the name honey-comb ore. Boate praiſes this iron as frequently rivalling that of Spain; and Mr. Kirwan affirmed, before the houſe of commons, that the Arigna iron was better than any iron made from any ſingle ſpecies of ore in England. A defective ſupply of coal renders, however, the abundance of this ore of no avail. There are alſo valuable mines of lead, copper, and cobalt, ſome of which have been wrought to advantage; and gold has been found in the county of Wicklow, though not of ſuch conſequence as to promiſe much national advantage.

The bogs of Ireland form a very remarkable feature of the country. Theſe are of different kinds, and in ſome places are very extenſive. As trees, and even utenſils of different kinds have been found in theſe bogs, they are ſuppoſed not to be of very great antiquity; and the moſt probable account ſeems to be, that when foreſts had been cut down, the trees were ſuffered to lie on the ſpot, and the cultivation of the ground neglected. Theſe trees intercepted and confined ſtreams of water with the various rubbiſh they brought with them; and became gradually covered with a vegetation of moſs, ſedgy graſs, ruſhes, and various aquatic plants. Notwithſtanding attention was directed to the recovery of theſe extenſive waſtes more than a century ago, very little has yet been effected, which is rather to be attributed to want of proper exertion, than to ſuch recovery being impracticable. In the year 1809, however, on the recommendation of the Right Hon. John Foſter, at that time chancellor of the exchequer, who will be long remembered as a zealous promoter of the intereſts of Ireland, when party animoſity will be forgotten, com-

commiſſioners

miſſioners were appointed "to enquire into the nature and extent of the bogs of Ireland; and the practicability of draining and cultivating them." As the vaſt extent of theſe bogs has not enabled the commiſſioners to complete the taſk committed to them, it can only be obſerved, that the firſt of a number of diſtricts contains 36,430 Engliſh acres of bog, and that the expence of the operations which a very able engineer deemed neceſſary for completely draining it, was 70,014*l.* 7*s.* 3*d.* The bogs in the King's county alone, exceeding 500 acres each, contain at leaſt 124,000 acres. The drainage of theſe bogs is, therefore, a matter of vaſt importance, not only to Ireland, but to the empire at large, as theſe lands, now of little or no value, would, when drained and properly cultivated, yield a vaſt ſupply of food, for which England has had to pay large ſums in gold to her moſt bitter enemy. It has alſo been made evident, that this drainage would increaſe the quantity of turf fuel, ſo as to render it both more eaſily procurable and cheaper. At preſent only the ſmall bogs, which it is not intended to drain, and the edges of the large ones, are acceſſible to the turf-digger, but the drainage would enable an approach to the interior parts of them; and ſuch is the quantity, that after every exertion to reclaim, there will remain more for turf than an increaſed conſumption can poſſibly exhauſt in the courſe of ages. This is an obſervation of much importance, becauſe the want of this excellent fuel would be very ſeverely felt in a country where few coal mines are worked, and where the ſupply of coal is conſequently uncertain and expenſive. The inſtructions of the commiſſioners do not authoriſe them to examine the numerous boggy tracts on the ſides of mountains, which not being in general deep, afford at times good paſturage. The beſt mode of reclaiming theſe would be to introduce the culture of Fiorin, as recommended by the Rev. Dr. Richardſon, and thus render them good meadows.

Perhaps no country of the ſame extent is more bountifully watered by fine rivers and lakes, or more indented by noble harbours, than Ireland is, ſo as to poſſeſs, in an eminent degree, thoſe great requiſites for agriculture, manufactures, and the moſt extenſive commerce. The rivers, beſides abounding with an infinite variety of fiſh, communicate uncommon fertility to the lands which they beautify, and afford a multitude of the beſt ſituations for the machinery of manufactures, ſo that wind-mills are very rarely met with in this country. But though many of theſe rivers are very conſiderable in point of ſize, and run a pretty long courſe, and ſome of them are capable of bearing large boats many miles above their fall into the ſea; yet there are none which can be called navigable in the ſame ſenſe as the Thames or the Severn. This is partly occaſioned by rocks running acroſs their beds, and thus forming cataracts; partly by the practice of breaking down the banks to make fords for the convenience of travellers, when bridges were leſs frequent than they are at preſent; and partly by weirs made either to ſerve mills, or for the ſake of catching ſalmon. Much, however, may be done by labour, attention, and expence, to remove theſe impediments, and extend internal navigation; and ſo ſenſible was the Iriſh legiſlature of this, that a ſum of money has been appropriated, under the direction of commiſſioners, for this purpoſe. The Shannon is the principal river of Ireland, which, riſing in the northern part of Connaught, almoſt inſulates that province and the county of Clare, and after a courſe of 150 miles, in which it expands into ſix different lakes, it flows into the Atlantic ocean, between the counties of Clare and Kerry, being navigable for large veſſels as far as Limerick. The Suir, the Barrow, and the Nore, which Spenſer has deſcribed as three brothers, proceeding in different directions from Sliebhbloom, a ridge of mountains between the King's and Queen's counties, and in the north of Tipperary, pour their united ſtreams into the bay of Waterford.

The number of lakes or loughs in Ireland is very great, and ſome of them are large, and even magnificent. Many of thoſe ſheets of water, however, which are called by this name, are in reality arms of the ſea, as Lough-Swilly, Lough Foyle, and others. Of thoſe which are, ſtrictly ſpeaking, lakes, Lough Neagh, Lough Erne, and Lough Corrib, are the moſt conſiderable in point of extent; as Lough Lane, or the lake of Killarney, is the moſt diſtinguiſhed for its beauties. There are alſo many mineral ſprings in different parts, the moſt remarkable of which will be noticed under their reſpective counties.

The harbours of Ireland are very numerous. Theſe have been divided into the principal havens, and the leſſer or barred havens; but the diſtinction ſeems of little uſe, as they will deſerve notice, rather on account of their being frequented, than on account of natural advantages. Theſe indeed which are moſt capacious, on the S. and S.W. have hitherto been little frequented, except by the ſmuggler, or by veſſels unable to reach their deſtined port. Waterford and Cork harbours on the S.; Bantry and Dingle bays on the S.W.; the eſtuary of the Shannon, and the vaſt bay of Galway on the W.; that great opening on the N.W. of which the bay of Sligo is a part; Lough Swilly and Lough Foyle on the N., are the moſt conſiderable. On the eaſtern ſide, there are none poſſeſſed of great natural advantages, yet from the greater improvement of the adjoining country and the vicinity of England, there are many which are much frequented, eſpecially the harbours of Belfaſt and Newry, and the barred havens of Dublin, Drogheda, and Wexford. The principal commercial towns are Dublin, Cork, Belfaſt, Limerick, and Waterford.

With reſpect to the climate of Ireland, ſtrangers ſoon perceive that it is in general leſs hot in ſummer, and leſs cold in winter than in England, and other countries in the ſame latitude; and that very hot or very cold weather, when it does take place, continues for a much ſhorter time. If, however, the climate be more temperate, it is alſo much damper, both on account of a greater fall of rain, and of a moiſture in the atmoſphere when there is no rain, which produces a very ſtriking effect on the walls of houſes, on furniture, and various other articles. This prevalence of moiſture ſeems to be occaſioned by the winds blowing from the vaſt Atlantic ocean, and is more perceivable in the weſtern and ſouthern parts. Though the frequent ſhowers anſwer very well for paſturage, and clothe the limeſtone rocks with verdure, yet they often interfere with the gathering in of the harveſt, and render expedition on the part of the farmer, in uſing fine weather whilſt in his power, more neceſſary. This ſhort continuauce of heat is not ſufficient to ripen peaches, grapes, and other fruits, without great care and attention; but the broad-leaved myrtle (Myrtus communis) grows luxuriantly, with very little care, in the ſouthern counties, being ſeldom injured by the cold of winter; and the arbutus (Arbutus unedo) is not found as a native in any other country ſo far diſtant from the equator. Perſons advanced in life complain of an unfavourable change in the climate, ſaying that it is much ſeverer and more uncertain than it uſed to be; and an ingenious writer, Dr. W. Hamilton, (in the 6th vol. of Tranſactions of the Royal Iriſh Academy), has ſtated ſome facts which appear to add credibility to ſuch complaints. The pine-tree, eſpecially that ſpecies called the Scotch fir, formerly grew on many of the mountains of this iſland, and on parts of the northern and weſtern coaſts exceedingly bare and open to ſtorms. Vaſt roots and noble trunks of this ſpecies of pine have been ſeen, and examined with attention, in ſituations where human induſtry cannot now rear a twig of the hardieſt tree. The devaſtation occaſioned by ſands in ſome parts of the northern coaſt, and even in the ſouth, and the greater influxes of the tide, ſeem to prove the more frequent recurrence and greater violence of the Atlantic ſtorms. The deſtruction of the foreſts may perhaps account ſatisfactorily for ſome of theſe facts, whilſt others may have been occaſioned by circumſtances not yet ſufficiently attended to. Dr. Paterſon, in his "Obſervations on the Climate of Ireland," has adduced many facts to controvert the opinion of a change; and the obſervations made a century and a half ago, are ſo applicable to the country at preſent, that it may be inferred the preſent ſeaſons do not materially differ from former ones, and that the influence of the Atlantic has always been much the ſame. The winds moſt prevalent in Ireland are the weſt and ſouth-weſt, which, contrary to the poetical deſcription of zephyrs, are frequently attended with rain and ſtorms. Eaſterly winds are leſs common, and are generally dry and keen; theſe are found prejudicial to health, and invalids avoid being expoſed to them. On the whole, if the climate of Ireland be not the moſt agreeable, it is found very wholeſome; inſtances of longevity are frequent, and if peculiar circumſtances occaſion much ſickneſs in many of the large towns, the peaſantry are very healthful, and, in conſequence of it, robuſt and hardy. The bogs, which ſome have ſuppoſed to be unwholeſome, are of a very different nature from the moraſſes in other countries, which appears both from the timber preſerved in them, and from the effect produced on the ſkins of animals unfortunately loſt in them.

The productions of Ireland, and the animals found in it, do not differ much from thoſe in England. The moſt valuable ones in both ſeem to have been imported from other countries, and the variety of theſe muſt be greater in England, on account of its ſuperior cultivation. The domeſtic animals are the ſame, and from the care taken of late years to improve the breeds, it may be expected that our ſheep and oxen will not be ſurpaſſed. Bede, who has commemorated the praiſe of Ireland for abundance of honey and milk, alſo mentions numerous herds of deer, which animal the progreſs of cultivation has now rendered rare. In various parts of Ireland are dug up enormous horns of deer, which ſome writers have imagined to be of the ſpecies called mooſe deer in America; but Mr. Pennant has demonſtrated that the animal muſt have almoſt doubled in ſize the American monſter, which is ſometimes found ſeventeen hands in height. The Iriſh horns have been found of the extent of fourteen feet from tip to tip, furniſhed with brow antlers, and weighing 300 pounds; the whole ſkeleton is frequently found with them. It is ſuppoſed that the animal muſt have been about twelve feet high. Wolves infeſted the country formerly, but are ſaid to have been extirpated by Oliver Cromwell. It has been aſſerted that no poiſonous animal will live in Ireland, and even that no ſpiders will haunt Iriſh timber, which, as is ſaid, was the cauſe why it was often employed in magnificent ceilings in the middle ages. "Whether it be owing to the ſoil or the climate," ſays Dr. Beaufort, "certain it is that in Ireland there are neither moles nor toads, nor any kind of ſerpents; and it is not a hundred years ſince frogs, of which there are now abundance, were firſt imported from England. But though the ſame experiment has been made with ſnakes and vipers, it has happily been unſucceſsful." The rivers, lakes, and ſeas are ſtocked with a great variety of fiſh, which yield a plentiful article of food to all ranks of people. The fiſheries on the coaſt give employment to great numbers, and have become, in ſome inſtances, an object of national attention and legiſlative encouragement, though they have never yet been carried on as extenſively as they might be, or there could have been no occaſion for an importation of fiſh from foreign countries. Jephſon Oddy, eſq. in his proſpectus of a weſtern fiſhery company, mentions that the Nymph bank, and others near the coaſt of Ireland, abound with the fineſt cod, ling, hake, turbot, pollock, &c., and that the adjoining ſeas are frequented at different periods by mackarel and herrings in great quantities; and he forcibly urges that if this fiſhery was carried on with ſpirit, it would ſupply both England and Ireland with abundance of fiſh, ſo as to render importation unneceſſary, whilſt it would at the ſame time give employment to numbers, and prove a valuable nurſery for ſeamen.

The native graſſes are thoſe eſteemed moſt valuable by the farmer, ſo that Ireland has ever been celebrated for the excellence of its paſtures; the number of cultivated vegetables is daily increaſing; and in conſequence of the attention lately paid to botanical knowledge, it appears that native plants have not been beſtowed with a ſparing hand. The introduction of the potatoe, the value of which is univerſally acknowledged, and which forms the principal part of the food of the Iriſh peaſantry, has been commonly attributed to ſir Walter Raleigh.

To this general and brief account of the natural ſtate of Ireland, it may be proper to ſubjoin a liſt of the counties into which Ireland is divided. The population of each, as ſtated by Dr. Beaufort, is added; at the ſame time it muſt be obſerved, that this moſt probably falls far ſhort of the real population, as in ſo many years as have elapſed ſince its publication, there muſt have been a conſiderable increaſe. It may ſerve, however, to give ſome idea of the comparative population of different counties, until more ſatisfactory documents than at preſent exiſt enable us to give a more correct ſtatement. The number of counties is 32, which are contained in four provinces. A particular account of each will be found under their reſpective names.

ULSTER.

County.	Shire Town.	Population.
Antrim	Carrickfergus	160,000
Down	Downpatrick	201,500
Armagh	Armagh	120,000
Tyrone	Omagh	158,000
Londonderry	Londonderry	125,000
Donegal	Liſſord	140,000
Fermanagh	Enniſkillen	71,800
Cavan	Cavan	81,570
Monaghan	Monaghan	118,000

LEINSTER.

County.	Shire Town.	Population.
Louth	Dundalk	57,750
Meath	Trim	112,400
Weſtmeath	Mullingar	69,000
Longford	Longford	50,100
King's county	Philipſtown	74,500
Queen's county	Maryborough	82,000
Kildare	Naas	56,000
Dublin	Dublin	198,000
Wicklow	Wicklow	58,000
Wexford	Wexford	115,000
Carlow	Carlow	44 000
Kilkenny	Kilkenny	100,000

CONNAUGHT.

Sligo	Sligo	60,000
Leitrim	Carrick on Shannon	50,000
Roſcommon	Roſcommon	86,000
Mayo	Caſtlebar	140,000
Galway	Galway	142,000

MUNSTER.

Clare	Ennis	96,000
Limerick	Limerick	170,000
Kerry	Tralee	107,000
Cork	Cork	416,000
Tipperary	Clonmell	169,000
Waterford	Waterford	110,000

Mr. Pinkerton is of opinion that Ireland was early diſcovered by the Phœnicians. "On the firſt dawn of hiſtory," ſays he, "and when the north-weſt of Europe was as obſcure to the Greeks, as the iſlands on the north-eaſt of Siberia were recently to us, it would ſeem that Ireland conſtituted one of the Caſſiterides. The poems aſcribed to Orpheus deſerve no credit, but it appears that the iſland was known to the Greeks by the name of Juveona, about two centuries before the birth of Chriſt. When Cæſar made his expedition into Britain, he deſcribes Hibernia as being about half the ſize of the iſland which he had explored; and while the Romans maintained their conqueſts in the latter region, Ireland continued, of courſe, to be well known to them, and Ptolemy has given a map of the iſland, which is ſuperior, in accuracy, to that which repreſents Scotland. Towards the decline of the weſtern empire, as the country had become more and more known, and had been peopled with various tribes, the Romans diſcovered that the ruling people in Ireland were the Scoti; and thenceforth the country began to be called *Scotia,* an appellation retained by the monaſtic writers till the eleventh century, when the name Scotia having paſſed to modern Scotland, the ancient name of Hibernia began to re-aſſume its honours. It is ſuppoſed that this name, and the Gothic denomination Ireland, are mere modifications of the native term *Erin,* implying the country of the weſt."

"It is probable," ſays the ſame writer, whoſe attention to the ſubject of antiquities gives great weight to his opinion, "that the original population of Ireland paſſed from Gaul, and was afterwards increaſed by their brethren the Guydil from England. About the time that the Belgæ ſeized on the ſouth of England, it appears that kindred Gothic tribes paſſed to the ſouth of Ireland. Theſe are the Firbolg of the Iriſh traditions; and appear to have been the ſame people whom the Romans denominated Scoti, after they had emerged to their notice by not only extending their conqueſts to the north and eaſt in Ireland, but had begun to make maritime excurſions againſt the Roman provinces in Britain. But Ireland had been ſo much crowded with Celtic tribes, expelled from the continent and Britain by the progreſs of the German Goths, that the Belgæ almoſt loſt their native ſpeech and diſtinct character; and from intermarriage, &c. became little diſtinguiſhable from the original population, except by ſuperior ferocity, for which the Scoti, or thoſe who affected a deſcent from the Gothic colonies, were remarkable; while the original Gael ſeem to have been an innocuous people." Such is Mr. Pinkerton's account of the early ſtate of Ireland, but as very different ones have been given reſpecting this, and as it ſtill continues to be a ſubject of controverſy, it will be proper to give a brief abſtract of the principal opinions, and the authority on which they reſt. The celebrated Edmund Spenſer, in his "View of the State of Ireland," ſuppoſes it to have been firſt peopled by the Scythians, from whom the name Scotia was derived. Theſe ſettled in Ulſter, and a colony from them went to Scotland. Another nation came out of Spain to the weſt part of Ireland, and finding it waſte, or weakly inhabited, poſſeſſed it. Theſe he ſuppoſed to have been Gauls, who had learned letters in Spain, where they were introduced by the Phœnicians, and brought them to Ireland, where it is certain they were known at a very early period. From the Scythians, Spenſer ſuppoſes the Iriſh to have derived, 1ſt, the cuſtom of keeping their cattle, and living themſelves, for the moſt part of the year, in *boolies* or hordes, paſturing upon the mountains and waſte wild places; and removing ſtill to freſh land, as they had depaſtured the former. This cuſtom, which ſeems to have continued to Spenſer's time, was very injurious. The boolies were receptacles for outlaws and looſe people, who there evaded juſtice; and thoſe who lived in them grew more barbarous, and lived more licentiouſly than they could in towns, uſing what manners they liſted, and practiſing what miſchiefs and villanies they would either againſt the government, or private individuals. Another Scythian cuſtom was the wearing of mantles, and long glibbes, which is a thick curled buſh of hair, hanging down over their eyes, and monſtrouſly diſguiſing them. Theſe mantles Spenſer deſcribes as convenient for outlaws, rebels, and thieves. As the paſſage is curious, and the work leſs known than it ought to be, the inſertion of it may afford ſome entertainment to the reader. "Firſt the outlaw being for his many crimes and villanies baniſhed from the townes and houſes of honeſt men, and wandering in waſte places, far from danger of law, maketh his mantle his houſe, and under it covereth himſelfe from the wrath of heaven, from the offence of the earth, and from the ſight of men. When it raineth, it is his pent-houſe; when it bloweth, it is his tent; when it freezeth, it is his tabernacle. In ſommer he can wear it looſe; in winter he can wrap it cloſe; at all times he can uſe it; never heavy, never cumberſome. Likewiſe for a rebell it is as ſerviceable. For in his warre that he maketh (if at leaſt it deſerve the name of warre) when he ſtill flyeth from his foe, and lurketh in the thick woods and ſtraite paſſages, waiting for advantages, it is his bed, yea, and almoſt his houſhold ſtuff. For the wood is his houſe againſt all weathers, and his mantle is his couch to ſleep in. Therein he wrappeth himſelfe round, and coucheth himſelfe ſtrongly againſt the gnats, which in that country doe more annoy the naked rebells, whilſt they keepe the woods, and doe more ſharply wound them than all their enemies ſwords, or ſpears, which can ſeldome come nigh them; yea, and oftentimes their mantle ſerveth them, when they are neare driven, being wrapped about their left arme, inſtead of a target, for it is hard to cut thorough with a ſword, beſides it is light to beare, light to throw away, and being (as they commonly are) naked, it is to them all in all. Laſtly, for a thiefe it is ſo handſome, as it may ſeem it was firſt invented for him, for under it he may cleanly convey any fit pillage that commeth handſomly in his way, and when he goeth abroad in the night in free-booting, it is his beſt and ſureſt friend; for lying, as they often doe, two or three nights together abroad to watch for their booty, with that they can prettily ſhroud themſelves under a buſh, or a bank ſide, till they may conveniently doe their errand; and when all is over, he can, in his mantle, paſſe thorough any town or company, being cloſe hooded over his head, as he uſeth, from knowledge of any to whom he is indangered. Beſides this, he, or any man els that is diſpoſed to miſchiefe or villany, may under his mantle goe privily armed without ſuſpicion of any, carry his head-peece, his ſkean or piſtol if he pleaſe, to be alwayes in readineſs." In like manner he conſiders the long hair or glibbe as ſerving the purpoſe of concealment. The Iriſh cry, or *hubub* as he calls it, which the kerne or ſoldiery uſe at their firſt encounter, he alſo conſiders of Scythian origin; and alſo the calling upon the name of ſome chieftain, as *Ferragh* for inſtance, which he ſuppoſes to be the name of a chief under whom they fought ſucceſsfully againſt the Africans. To this he adds their lamentations at their burials, "with diſpairful out-cryes and immoderate waylings," which ſavour greatly of the Scythian barbariſm. Our ingenious author next proceeds to ſhew that the Iriſh arms and weapons are Scythian, and the ſame alſo as thoſe uſed by the old Scots, who were of the ſame ſtock; that the Iriſh reſembled the Scythians in their confuſed kind of march without order or array; and alſo in certain religious ceremonies. From all theſe circumſtances he infers that the Iriſh are anciently deduced from the Scythians. He afterwards adduces cuſtoms derived from the Spaniards and Gauls in proof of colonies of them having been eſtabliſhed in Ireland, but they are fewer in number and leſs remarkable. The uſe of ſaffron ſhirts, the giving the charge of all houſhold affairs at home and abroad to their women, the manner in which theſe ſat on horſe-back, with a few others, are ſtated as of Spaniſh origin; whilſt the uſe of long darts and wicker ſhields is mentioned as derived from the Gauls. Such is Spenſer's opinion reſpecting the origin of the Iriſh, founded, as may be ſeen, on conjectures, for the inferences drawn from cuſtoms can ſcarcely deſerve any other name. The colony from Spain, which he admits, though he ſpeaks doubtfully of the origin of the people, and gives no particulars, is laid great ſtreſs on by the advocates for the ancient glory of Ireland. "Not to ſpeak of the original ſettlement by Partholan," ſays Dr. Leland, "it is maintained that about 500 years before the Chriſtian era, a colony of Scythians, immediately from Spain, ſettled in Ireland, and introduced the Phœnician language and letters into this country; and that however it might have been peopled ſtill earlier, yet Heber, Heremon, and Ith, the ſons of Mileſius, gave a race of kings to the Iriſh, diſtinguiſhed from their days by the names of Gadelians and Scuits or Scots. Hence their writers trace a gradual refinement of their country from a ſtate of barbarous feuds, factions, and competitions; until the monarch, celebrated in their annals by the name of Ollam-Fodla, eſtabliſhed a regular form of government, erected a grand ſeminary of learning, and inſtituted the *Fes*, or triennial convention of provincial kings, prieſts, and poets, at Teamor or Tarch, in Meath, for the eſtabliſhment of laws and regulation of government. Keating, the Iriſh hiſtorian, who tranſcribed his accounts from poetical records, mentions little more of this boaſted aſſembly, than that its great object was to introduce civility, and to guard againſt thoſe crimes which predominate in days of rudeneſs and violence. The magnificent detail of its grandeur and ſolemnity, the ſcrupulous attention paid by its members to the national hiſtory, annals, and genealogies, are nothing more (as I am aſſured) than the interpolations of an ignorant and preſumptuous tranſlator. But whatever were the inſtitutions of this monarch, it is acknowledged that they ſoon proved too weak for the wildneſs and diſorder of the time. To Kimbath, one of his ſucceſſors, the annaliſts give the honour of reviving them; beſides that of regulating Ulſter, his family province, and adorning it by the ſtately palace of Eamania, erected near Armagh." One of his ſucceſſors, to ſecure his power, divided the iſland into twenty-five dynaſties, inſtead of five; but the pentarchal government was reſtored about a century before the Chriſtian era. Anarchy, ſedition, and murder continued prevalent, notwithſtanding the wiſe laws occaſionally enacted; and an Iriſh chieftain is ſaid to have addreſſed himſelf to Agricola, and to have encouraged him to make a deſcent on Ireland. Theſe, however, who warmly contend for the honour of Ireland, ſay that ſuch deſcent would not have been effectual; and record with triumph that the Iriſh monarch of this time, inſtead of dreading an invaſion of the Romans, ſailed to the aſſiſtance of the Picts, led an irruption into the Roman province, and returned in triumph laden with foreign ſpoils. After this, the old Firbolgs or Belgic inhabitants grew ſo powerful and turbulent as to eſtabliſh a monarch of their own race, and to haraſs the country by what was called the Attacotic war. Tuathel, a Mileſian prince, reſtored the power of his family; and in the time of his grandſon, in the third century, Finn, the ſon of Comhal, better known by the name of Fingal, is ſaid to have lived, and to have been general of his troops. The ſucceſſion of kings of the Mileſian family, to the year 1198, is ſaid to have been 171.

General Vallancey, who has paid very great attention to the antiquities of Ireland, and whoſe great learning and perſonal reſpectability, as well as his exertions for the good of ſociety, ſhould ſecure him from petulant and wanton abuſe, has, in his "Vindication of the ancient Hiſtory of Ireland," maintained the truth of the leading facts mentioned by Keating and others. The Scythians, by whom the country was peopled, were, according to him, not the Northern, but Southern Scythians, the ſame people as the Phœnicians, who are to be diſtinguiſhed from the Canaanites, and were the navigators of the latter, acknowledged as ſubjects, but never admitted to a ſhare in the government, or to the rank of nobleſſe. They had the uſe of letters, a knowledge of aſtronomy, of marine aſtronomy in particular, and of navigation; but had no knowledge of the fine arts, their religion forbidding it. Theſe Phœnicians are ſuppoſed to have been originally Perſians or Indians, proceeding from that eaſtern diſtrict, the ſuppoſed ſource of all civilization; and the late writers on Indian antiquities produce many circumſtances tending to eſtabliſh a knowledge of Ireland in that oriental people, and an intercourſe with it at a very early period. It would occupy more room than the nature of a Cyclopædia would allow, to enter upon the arguments adduced by the learned general in ſupport of his opinions. Suffice it to ſay, that they chiefly reſt on the etymology of names, on a reſemblance in certain words, and on a reſemblance alſo in certain religious ceremonies and old cuſtoms, which are thought to have originated in fire-worſhip, which is ſuppoſed to have been once prevalent throughout Ireland. The Rev. Dr. Ledwich, author of an elaborate work on the "Antiquities of Ireland," endeavours, with all the eagerneſs of a partizan, to expoſe and ridicule all pretenſions to early civilization. He contends that Ireland was firſt peopled from Great Britain by the Celts, who were wandering ſavages, of whom little is recorded, and that little proclaims their ignorance and barbariſm. The Belgæ and other northern tribes afterwards ſettled in it; and it had at no time arrived to a greater degree of improvement than when viſited by the Engliſh under Henry II. To be qualified to form an opinion on the preceding ſubject would require a long courſe of ſtudy, the acquiſition of languages of little uſe except to the antiquary, and the peruſal of many volumes in the higheſt degree dry and unintereſting; and after all, ſuch is the want of written documents of an early date, that the moſt we could arrive at would be probable conjecture. At the ſame time, it does not appear improbable, much leſs abſurd to ſuppoſe, that the Phœnicians might have colonized Ireland at an early period, and introduced their laws, cuſtoms, and knowledge, with a comparatively high ſtate of civilization; and that theſe might have been gradually loſt amidſt the diſturbances of the country, and at laſt completely deſtroyed by the irruptions of the Oſtmen, ſo as to have reduced Ireland to a barbarous ſtate, previous to the Engliſh invaſion.

The converſion of Ireland to Chriſtianity is generally attributed to Patrick, who has been called the "tutelar ſaint of Ireland." He is ſaid to have landed in Ireland A.D. 430. The people were, however, prepared for his preaching by the labours of ſome former miſſionaries. Notwithſtanding the introduction of Chriſtianity, the petty princes and people retained their ferocity of manners; and the annals abound in horrid inſtances of revenge, and hideous effects of avarice and ambition. "Yet Chriſtianity, as then taught," ſays Dr. Leland, "although it could not eradicate, at leaſt reſtrained the national vices. A numerous body of eccleſiaſtics, ſecular and regular, quickly ſwarmed over the whole country; frequently became umpires between contending chieftains; and when they could not confine them within the bounds of reaſon and religion, at leaſt terrified them by denouncing vengeance againſt their exceſſes. An ignorant people liſtened to their tales of pretended miracles with a religious horror. In the midſt of every provincial conteſt, and every domeſtic ſtrife, they were ſacred and inviolate. They ſoon learned to derive their own emolument from the public veneration. The infant church was every where amply endowed, and the prayers of holy men repaid by large donations. Some of the oldeſt remains of Iriſh literature, as they have been explained to me, inform us, that the people were taught to dedicate the firſt-born of all cattle to the church, as a matter of indiſpenſible obligation. But if the clergy thus acquired riches, they applied them to the nobleſt purpoſes. The monks, ſays Mr. O'Connor, fixed their habitations in deſerts, which they cultivated with their own hands, and rendered the moſt delightful ſpots in the kingdom. Theſe deſerts became cities; and it is remarkable enough, that to the monks we owe ſo uſeful an inſtitution in Ireland, as bringing great numbers together into one civil community. In theſe cities the monks ſet up ſchools, in which they educated the youth, not only of the iſland, but of the neighbouring nations. The teſtimony of Bede is unqueſtionable, that about the middle of the ſeventh century, in the days of the venerable prelates Finian and Colman, many nobles and other orders of the Anglo-Saxons retired from their own country into Ireland, either for inſtruction, or for an opportunity of living in monaſteries of ſtricter diſcipline; and that the Scots (as he ſtyles the Iriſh) maintained them, taught them, and furniſhed them with books, without fee or reward:—a moſt honourable teſtimony, ſays the elegant lord Lyttelton, not only to the learning, but likewiſe to the hoſpitality and bounty of that nation! A conflux of foreigners to a retired iſland, at a time when Europe was in ignorance and confuſion, gave peculiar luſtre to this ſeat of learning: nor is it improbable or ſurpriſing that ſeven thouſand ſtudents ſtudied at Armagh, agreeably to the accounts of Iriſh writers; though the ſeminary of Armagh was but one of thoſe numerous colleges erected in Ireland. But the labours of the Iriſh clergy were not confined to their own country. Their miſſionaries were ſent to the continent. They converted heathens; they confirmed believers; they erected convents; they eſtabliſhed ſchools of learning; they taught the uſe of letters to the Saxons and Normans; they converted the Picts, by the preaching of Columb-kill, one of their renowned eccleſiaſtics. Burgundy, Germany, and other countries received their inſtructions: and Europe with gratitude confeſſed the ſuperior knowledge, the piety, the zeal, the purity of the "Iſland of Saints." Such are the events on which Iriſh writers dwell with an enthuſiaſtic delight. The firſt Chriſtian miſſionaries ſeem to have induſtriouſly avoided all unneceſſary violence to the ancient manners of the Iriſh. Their poets they favoured and protected; the remains of the Druidical order were not perſecuted; and although divine vengeance was thundered againſt the worſhippers of the ſun, ſtars, and winds, it is evident that ſome Pagan ſuperſtitions were overlooked with too great indulgence, for they ſubſiſt at this day in Ireland: fires are lighted up at particular times, and the more ignorant Iriſh ſtill drive their cattle through thoſe fires, as an effectual means of preſerving them from future accidents." Such is the abſtract given by Leland, in his preliminary diſcourſe of the introduction and eſtabliſhment of Chriſtianity. Dr. Ledwich, however, not only gives a different account of theſe, but even calls in queſtion the exiſtence of St. Patrick, regarding him as an ideal perſonage. He ſuppoſes, and with great appearance of reaſon, that Chriſtianity, which had been brought to Gaul by Pothinus and Irenæus, diſciples of Polycarp, who had been himſelf inſtructed by John the Evangeliſt, from Gaul reached Britain, and from Britain was carried to Ireland, in the third or fourth century, as early as the ſuppoſed time of St. Patrick, or even earlier. It ſeems a ſtrong circumſtance in favour of this opinion, that the Iriſh Chriſtians, or the Saxons converted by them, did not acknowledge the Roman pontiff till long after the reſt of the Chriſtian world; which would not have been the caſe, had their inſtruction proceeded from one ſent immediately from Rome to convert them, as Patrick is ſaid to have been. If ſuch a perſon as Patrick really preached Chriſtianity in Ireland, it ſeems at leaſt to be certain that not only the miracles aſſigned to him are monkiſh inventions, but that his epiſcopal dignity, and many other circumſtances recorded, are without foundation. Columba appears to have been the founder of the Iriſh monaſteries; and, like the Scotch, the Culdee ſect was prevalent amongſt them, and was not completely overthrown until pope Adrian, in the plenitude of his preſumption, beſtowed Ireland on Henry II. in 1155. See CULDEES.

Ireland was divided into five ſeparate kingdoms, and in each of theſe were powerful and factious dynaſties. All indeed acknowledged one monarch, but his power was remarkably weakened; and if the people were not wretched, it was becauſe the evils of their political conſtitution were in ſome meaſure corrected by the reverence paid to religion and learning. As the armies collected by ſuch governments are temporary, they are ill calculated for reſiſting a foreign invaſion; and ſuch was found to be the caſe in Ireland. Bede mentions, that, in 684, the general of Egfrid, king of Northumberland, made a deſcent on Ireland. But inſtead of mentioning any gallant reſiſtance made by the natives, he inſinuates that they truſted more to prayers than arms; and in the plaintive ſtyle of compaſſion laments the miſerable havock of a people, inoffenſive, and ever moſt friendly to the Engliſh. But Ireland experienced a ſtill more formidable invaſion, when the Danes, Norwegians, and other Scandinavian adventurers began to rove in ſearch of new ſettlements. Theſe were called Normans, Eſterlings, or Oſtmen, and alſo Gal's or foreigners. Their piratical expeditions commenced about the end of the eighth century, and whilſt they infeſted England and France, Ireland did not eſcape. Their firſt invaſions were made in ſmall parties for the ſake of plunder, and were frequently repulſed. By degrees the invaders, either by force or treaty, obtained ſome ſmall ſettlements; and at length Turgeſius, a warlike Norwegian, in 815, landed with a powerful armament, and committed every kind of outrage. Having reduced the inhabitants to ſlavery, after a reſidence of 30 years, he was proclaimed monarch of the kingdom; but at length Melachlin, prince of Meath, contrived to ſeize upon the tyrant in a time of apparent peace, and the Danes, ſurpriſed by a ſudden inſurrection, were maſſacred or diſperſed. A new colony, however, arrived, and were allowed to ſettle in ſome maritime towns. Theſe gradually ſtrengthened themſelves, and maintained their independence, though frequently engaged in wars with the Iriſh princes, and repeatedly overcome in battle. The moſt celebrated of theſe engagements was at Clontarf, near Dublin, in 1012, when the Iriſh were ſucceſsful, but loſt their monarch, Brian Boiromhe, at the age of 88, and his ſon Morchard. After this event Ireland continued to be diſtracted by civil wars, and the ſituation of the people was as wretched as can almoſt be conceived; ſo that the iſland was rendered an eaſy prey to any daring invader.

It has been already noticed that the clergy of Ireland were of the Culdee ſect, by which the Roman pontiff was not acknowledged. This is indeed matter of controverſy; but it ſeems indubitable that they were very irregular, and that it was an object with the pope to bring them to obedience. The pontificate, however, by the intereſted zeal of its numerous and active emiſſaries, at length contrived to extend its influence even to this remote iſland, alarmed the Iriſh clergy with fears of the irregularity of their eccleſiaſtical conſtitution, and perſuaded them to ſubmit to a reform, modelled and dictated by Rome. Cardinal Papire, or Papeſon, came to Ireland as legate in 1148; and in 1151, or 1152, ſummoned a council, which was attended by about 3000 eccleſiaſtics, and four palls were ſolemnly received from the pope by the prelates of Armagh, Dublin, Caſhel, and Tuam. At the ſame time, it is ſaid that the celebration of Eaſter was adjuſted according to the Romiſh deciſions, the celibacy of the clergy was enforced, and the pre-eminence of Rome formally acknowledged. Whether Adrian, at that time pope, did not think this ſubmiſſion of the Iriſh clergy ſufficiently eſtabliſhed, or, as an Engliſhman, was willing to gratify the Engliſh monarch, though at the expence of his newly-acquired dependents, he iſſued a bull in 1155 conformable to the wiſhes and purpoſes of Henry, who, at the very commencement of his reign, meditated the ſubjugation of Ireland, and ſent his chaplain to ſolicit the pope's countenance. For ſuch an invaſion no juſt pretence could be aſſigned. Ireland was entirely independent; and, though aſſiſtance had been afforded in a former reign to the ſons of Harold, yet there had been for many years nothing which could be reckoned hoſtile. It was aſſerted, indeed, that Engliſhmen had been ſold as ſlaves in Ireland; but this was a crime in which both nations were equally involved, and which, therefore, could not be urged to juſtify ſuch an attempt. The depravity and barbariſm of the Iriſh were, however, inſiſted on; the honour of God was to be promoted by their ſubjugation; and the pope was to receive the tribute of St. Peter's pence as the reward of his compliance. A bull was accordingly iſſued, which, as Leland obſerves, affords a ſhocking inſtance of the profligacy and impiety of papal uſurpation. Much has been ſaid of the depraved ſtate of the Iriſh at this period; but the accounts proceed from a very ſuſpicious ſource, thoſe whoſe object it was to defend the proceedings of the Engliſh monarch; and it may be queſtioned whether they were really worſe than their neighbours, or ſo bad as thoſe who have thus ſtigmatiſed them. But whatever their moral defects might be, their political ones were very great; they were truly a divided people. A monarch, little more than titular, depending on his own abilities and vigour for power and influence, was haraſſed by faction, and oppoſed by powerful rivals; whilſt a number of provincial chieftains, who aſſumed the title and the rights of royalty, paid a precarious tribute to their ſuperior, and united, if they were diſpoſed to unite with him, as allies rather than ſubjects. This was in a great degree the ſtate of France and ſome other countries; but in Ireland the monarchical dignity was not hereditary, and was the ſubject of frequent diſpute. Favourable as ſuch a ſtate was to the wiſhes of Henry, yet it was long before he could avail himſelf of the bull he had received. In France and England he found full employment for many years; and ſcarcely had he ſecured his dominions before he was involved in that conteſt with Becket, which kept him in a continual ſtate of agitation. The circumſtance which led to the accompliſhment of his deſign, was the expulſion of Dermod, king of Leinſter, from his dominions, and that prince's taking refuge in England. Dermod, a man of a turbulent and oppreſſive ſpirit, had, by his conduct, provoked the vengeance of Roderic O'Connor, the monarch of Ireland, whilſt his own immediate dependants deſerted him in the hour of his diſtreſs. He applied to Henry for aſſiſtance to recover his dominions; but, whether from the perplexity of his own affairs, or, as ſir John Davies ſuppoſes, a wiſh to avoid the expence, this monarch did not undertake the cauſe, but gave licenſe, by his letters patent, that ſuch of his ſubjects might paſs over into Ireland as would at their own charge become adventurers in that enterpriſe. Notwithſtanding this permiſſion, he did not for ſome months ſucceed in obtaining ſuccour; but at length he prevailed on Richard, earl of Pembroke, generally called Strongbow, to eſpouſe his cauſe, promiſing him his daughter Eva in marriage, and with her the inheritance of his kingdom. And on his return to Ireland, to prepare for Strongbow's arrival, he engaged two Welſh leaders, Fitzſtephen and Fitzgerald, with their followers, on the condition of ceding to them the town of Wexford, with a large adjoining territory, as ſoon, as by their aſſiſtance, he could be re-inſtated in his rights. The invaſion of Ireland was therefore the act of private adventurers. Fitzſtephen and Fitzgerald firſt broke the ice with a party of 390 men in 1170. The earl Strongbow followed them with 1200 more; and their good ſucceſs on the ſea coaſts of Leinſter and Munſter drew over the king in perſon, who landed at Waterford in 1172, with 500 knights and about 4000 ſoldiers. Strongbow immediately ſurrendered to him the city of Waterford, and did homage to him for the principality of Leinſter, which he claimed in right of his wife, the daughter of Dermod, whoſe death had taken place in the preceding year. The neighbouring Iriſh princes in like manner ſubmitted, and acknowledged his authority; and even Roderic, after ſome delay, thought it more prudent to follow their example. Henry aſſumed the title of lord of Ireland, but his authority was very weak; and, within five months after his arrival, he departed out of Ireland without ſtriking one blow, or building one caſtle, or planting one garriſon among the Iriſh. Such was the conqueſt of Ireland by Henry II.; which, as it was unjuſtifiable, ſo was it inefficient. As ſir John Davis obſerves, "though king Henry II. had the title of ſovereign and lord over the Iriſh, yet did he not put thoſe things in execution which are the true marks of ſovereignty. For, to give laws unto a people; to inſtitute magiſtrates and officers over them; to puniſh and pardon malefactors; to have the ſole authority of making war and peace, and the like, are true marks of ſovereignty, which king Henry II. had not in the Iriſh countries; but the Iriſh lords did ſtill retain all theſe prerogatives to themſelves: for they governed their people by the Brehon law; they made their own magiſtrates and officers; they pardoned and puniſhed all malefactors within their ſeveral countries; they made war and peace one with another without controlment; and this they did, not only during the reign of Henry II. but afterwards, in all times, even until the reign of queen Elizabeth." In fact, the Iriſh only acknowledged the ſuperiority of Henry in the ſame way as the Welſh princes often did before their ſubjection; and in the ſame way as Henry himſelf did homage to the king of France, as his liege lord for the vaſt territories he held in France. Henry himſelf, in the treaty of agreement made in 1175, acknowledged Roderic as king of Connaught, and in his commiſſion to William Fitz-Adeline gave the Iriſh lords the title and ſtyle of kings. It is unneceſſary to enter into a detail of the petty wars between the Engliſh ſettlers and Iriſh chieftains, or of the jealouſy entertained of the former by their ſovereigns, who, though prevented by family diſtreſſes from going over, ſent agents to watch and check them. Had Ireland been at this time ſubdued by a competent force, and the Engliſh laws introduced into every part of it, it would have contributed to the quiet and happineſs of all claſſes; but as it was, the Engliſh ſettlers added to the confuſion. Their only object appears to have been to acquire territories for themſelves; and few croſſed to Ireland except rude and barbarous warriors, little, if at all, ſuperior to thoſe amongſt whom they went. In 1185, Henry ſent John, his youngeſt ſon, whom he had previouſly made lord of Ireland, to that country. This young prince, being but 12 years of age, with a train of young noblemen and gentlemen to the number of 300, but not with any conſiderable army, arrived at Waterford, and was attended there by the Iriſh chieftains, who, diſunited among themſelves, and terrified by the repreſentations of his force, flocked to Waterford to pay their reſpects and do homage. But the youthful courtiers about the prince were not calculated to conciliate; they treated their viſitors with the utmoſt ſcorn and contempt, and ſo highly rouſed their indignation as to produce a general ſpirit of reſiſtance. The original ſettlers, too, were ill uſed, and the Engliſh intereſt was with great difficulty maintained in the towns which they had fortified. Henry found it neceſſary to recal his ſon, and the government of Ireland was committed to John de Courcy, a valiant knight, who had already acquired conſiderable poſſeſſions in Ulſter. "From this time forward," ſays that judicious writer ſir John Davies, "until the 12th year of king John, (which was a ſpace of more than 30 years,) there was no army tranſmitted out of England to finiſh the conqueſt. Howbeit, in the mean time, the Engliſh adventurers and colonies already planted in Ireland did win much ground upon the Iriſh; namely, the earl Strongbow, having married the daughter of Mac Morrogh in Leinſter; the Lucies in Meath; the Giraldians and other adventurers in Munſter; the Audelies, Gernons, Clintons, Ruſſels, and other volunteers of ſir John de Courcy's retinue in Ulſter; and the Bourkes (planted by William Fitz-Adeline) in Connaught. Yet were the Engliſh reputed but part owners of Ireland at this time, as appears by the commiſſion of the pope's legate in the time of king Richard I., whereby he had power to exerciſe his juriſdiction in England, Wales, and *thoſe parts of Ireland* in which John earl of Morton has power and dominion, as it is recorded by Matthew Paris." During this interval, not only the Iriſh chieftains frequently revolted, but ſome of the great Engliſh ſettlers aſſumed independence. This was particularly the caſe after the acceſſion of John to the Engliſh throne, and the ſuppreſſion of one of theſe was the avowed object of his viſit to Ireland in the year 1210. He brought with him a conſiderable force, though not perhaps ſufficient for the complete reduction of the iſland, even if he had remained a ſufficient time to perform ſo great an action. This, however, he did not, for he arrived in June and returned in September the ſame year. The Iriſh lords, for the moſt part, ſubmitted themſelves to him, as they had done before to his father; "which," ſays ſir John Davies, "was but a mere mockery and impoſture: for his back was no ſooner turned, but they returned to their former rebellion: and yet this was reputed a ſecond conqueſt." At this time twelve counties were eſtabliſhed in Leinſter and Munſter, and ſheriffs appointed for them, and courts of judicature were alſo ſettled in Dublin, for the regular and effectual execution of the laws of England in that part of the iſland which acknowledged allegiance to the crown. Some caſtles were built upon the borders of the Engliſh colonies, but the king carrying back with him the army he had brought, the former ſettlers were left to defend their poſſeſſions, and increaſe them in the beſt manner they were able.

The long and turbulent reign of Henry III. was diſtinguiſhed by no remarkable change in the ſtate of Ireland. The families of Burgh and Fitzgerald received a large acceſſion of power and territory, and the clergy, though themſelves oppreſſed both by the king and the pope, were not deficient in turbulence and preſumption. Edward I. an active monarch, was too much engaged in regulating the diſordered ſtate of England, and in reducing Wales and Scotland, to devote much attention to the affairs of Ireland. At the commencement of his reign, the Engliſh ſettlers experienced ſome heavy loſſes, and were nearly expelled from their ſouthern poſſeſſions, but the Iriſh were not united, and the advantages gained in one year were often loſt the next, through the diſſentions of the conquerors. Many of the Iriſh were at this time anxious to ſhare the protection of the Engliſh laws, for, to the diſgrace of the Engliſh government, this advantage had been withheld, and whilſt the murder of an Engliſhman by one of the *mere Iriſh*, as they were termed, was avenged with the utmoſt rigour, the murder of an Iriſhman was ſcarcely deemed a puniſhable offence. An application was made early in this reign to Ufford, the chief governor, offering the king 8000 marks, provided he would grant the free enjoyment of the laws of England to the Iriſh inhabitants. The petitioners muſt have been the Iriſh reſiding within what was called the "Engliſh pale," for the reſt were ſo much attached to their own Brehon laws, as to be adverſe to a change at a much later period; though it is probable that if the wiſe policy of aſſimilating *all* the inhabitants had been now adopted, the objection to it would have been leſs, than at the time it was actually attempted. The king was well inclined to comply with the requeſt of the petitioners, but this did not ſuit thoſe, whoſe violence and oppreſſion would have been thus controlled, and whoſe influence was great enough to counteract the intended meaſure. Individuals, however, of the Iriſh race ſued for, and obtained charters of denization, particularly on their intermarriage with the Engliſh. That ſuch conduct irritated the old inhabitants cannot be ſurpriſing. "As long as they (the Iriſh) were out of the protection of the law," ſays ſir John Davies, "ſo as every Engliſhman might oppreſs, ſpoil, and kill them without controlment, how was it poſſible they ſhould be other than outlaws, and enemies to the crown of England? If the king would not admit them to the condition of ſubjects, how could they learn to acknowledge and obey him as their ſovereign? When they might not converſe or commerce with any civil men, nor enter into any town or city without peril of their lives, whither ſhould they fly but into the woods and mountains, and there live in a wild and barbarous manner? If the Engliſh magiſtrates would not rule them by the law which doth puniſh murder, and treaſon, and theft with death, but leave them to be ruled by their own lords and laws, why ſhould they not embrace their own Brehon law, which puniſhes no offence, but with a fine or ericke? If the Iriſh be not permitted to purchaſe eſtates of freeholds or inheritance, which might deſcend to their children, according to the courſe of our common law, muſt they not continue their cuſtom of taniſtry, which makes all their poſſeſſions uncertain, and brings confuſion, barbariſm, and incivility? In a word, if the Engliſh would neither in peace govern them by the law, nor in war root them out by the ſword, muſt they not needs be pricks in their eyes and thorns in their ſides, till the world's end."

Sir John Wogan, appointed to the government in the year 1295, endeavoured to enforce the laws, and to keep in order the turbulent nobles of Engliſh extraction. For this purpoſe a parliament was ſummoned more regularly than ſuch aſſemblies had hitherto been convened in Ireland. The regulations made by it, however, though calculated to check the diſorders of the time, were either of little avail, or their effect of ſhort duration; and the country ſtill continued in a diſtracted ſtate. The weak government of the ſecond Edward left the great lords at full liberty to purſue their reſpective ſchemes of private intereſt, when an invaſion by Edward, the brother of Robert Bruce, now eſtabliſhed king of Scotland, ſupported by the chieftains of Ulſter, reduced them to the greateſt diſtreſs. Bruce was even crowned king of Ireland at Dundalk, and proceeded into Munſter, carrying devaſtation wherever he went. His troops, however, waſted away by peſtilence and famine, were reduced to a ſmall number, and in a battle, which he too eagerly fought, he was ſlain the third year after his landing in Ireland. On his defeat, matters reverted to the old channel, and ſo continued through the ſucceeding reign, until the appointment of Lionel, the king's ſecond ſon, to be chief governor in 1361. Before notice is taken of his proceedings, it will be neceſſary to obſerve, that in the reign of Edward II., Maurice Fitz-Thomas of Deſmond, being chief commander againſt the Scots, began that extortion of coin and livery, which is called, in the old ſtatutes, *a damnable cuſtom*, and the impoſing and taking of them declared high treaſon. Theſe words imply that he and his army exacted food for themſelves and their horſes, and money at pleaſure, without any ticket, or other ſatisfaction. And this was, after that time, the general fault of all the governors and commanders of the army in Ireland, though ſome were more cruel in the exaction than others. "Beſides," ſays Davies, "the Engliſh colonies, being diſperſed in every province of this kingdom, were enforced to keep continual guards upon the borders and marſhes round about them; which guards, conſiſting of idle ſoldiers, were likewiſe impoſed as a continual burden upon the poor Engliſh freeholders, whom they oppreſſed and impoveriſhed in the ſame manner. And becauſe the great Engliſh lords and captains had power to impoſe this charge, when and where they pleaſed, many of the poor freeholders were glad to give unto theſe lords a great part of their lands, to hold the reſt free from that extortion; and many others, not being able to endure that intolerable oppreſſion, did utterly quit their freeholds, and returned into England. By theſe means the Engliſh colonies grew poor and weak, though the Engliſh lords grew rich and mighty; for they placed Iriſh tenants upon the lands relinquiſhed by the Engliſh; upon them they levied all Iriſh exactions; with them they married, and foſtered, and made goſſips; ſo as within one age the Engliſh, both lords and freeholders, became degenerate and mere Iriſh in their language, in their apparel, in their arms and manner of fight, and all other cuſtoms of life whatſoever."

Lionel, ſoon after created duke of Clarence, was, in right of his wife, poſſeſſed of a conſiderable territory in Ireland, and his firſt object ſeems to have been to recover parts of it from thoſe who were now called *rebels*. His military proceedings were of no great moment, but he applied himſelf with zeal and diligence to the reformation of the Engliſh ſettlers. A parliament was ſummoned at Kilkenny, which was more reſpectable and numerous than any preceding one, and the reſult of the deliberation of which was that ordinance, known by the name of the Statute of Kilkenny: this was in 1367. The great object of this ſtatute was to reduce the Engliſh colonies to obedience of the Engliſh law and magiſtrates. "The preamble of it recites," (to uſe the abſtract given of it by Dr. Leland,) "with a deciſion not without colour, but yet too general and indiſcriminate, that the Engliſh of the realm of Ireland, before the arrival of the duke of Clarence, were become mere Iriſh in their language, names, apparel, and manner of living; had rejected the Engliſh laws, and ſubmitted to thoſe of the Iriſh, with whom they had united by marriage alliance to the ruin of the general weal. It was, therefore, enacted, that marriage, nurture of infants, and goſſipzed with the Iriſh, ſhould be conſidered and puniſhed as high treaſon. Again, if any man of Engliſh race ſhall uſe an Iriſh name, the Iriſh language, or the Iriſh apparel, or any mode or cuſtom of the Iriſh, the act provides that he ſhall forfeit lands and tenements, until he hath given ſecurity in the court of chancery to conform in every particular to the Engliſh manners. The Brehon law was pronounced to be a pernicious cuſtom and innovation lately introduced among the Engliſh ſubjects. It was, therefore, ordained, that in all their controverſies they ſhould be governed by the common law of England: and that whoever ſhould ſubmit to the Iriſh juriſdiction, was to be adjudged guilty of high treaſon. As the Engliſh had been accuſtomed to make war and peace with the bordering enemy at their pleaſure, they were now expreſsly prohibited from levying war upon the Iriſh without ſpecial warrant from the ſtate. It was alſo made highly penal to the Engliſh, to permit their Iriſh neighbours to graze their lands, to preſent them to eccleſiaſtical benefices, or to receive them into monaſteries or religious houſes; to entertain their bards, who perverted their imaginations by romantic tales; or their news-tellers, who ſeduced them by falſe reports. It was made felony to impoſe or ceſs any forces upon the Engliſh ſubject againſt his will. And as the royal liberties and franchiſes were become ſanctuaries for malefactors, expreſs power was given to the king's ſheriffs to enter into all franchiſes, and there to apprehend felons and traitors. Laſtly, becauſe the great lords, when they levied forces for the public ſervice, acted with partiality, and laid unequal burdens upon the ſubjects, it was ordained that four wardens of the peace in every county ſhould adjudge what men and armour every lord and tenant ſhould provide. The ſtatute was promulged with particular ſolemnity; and the ſpiritual lords, the better to enforce obedience, denounced an excommunication on thoſe who ſhould preſume to violate it in any inſtance." After obſerving that theſe inſtitutions did not apply to any except the Engliſh ſettlers, Dr. Leland goes on to remark upon the want of equity and good policy towards the Iriſh. "Extenſive views, liberal ſentiments, and a generous zeal for public happineſs would have prompted them to ſome meaſures for conciliating the affections as well as for ſubduing the perſons and poſſeſſions of the Iriſh; would have led them to demonſtrate that they were the protectors and benefactors, not the arbitrary maſters of thoſe Iriſh natives whom they held in ſubjection; and to convince the moſt obſtinate inſurgents, that an honourable ſubmiſſion to the king of England was the only means of reſcuing them from the miſeries of their own petty factions and tyrannies; a glorious exchange of the rudeneſs, the diſorders, and diſtreſſes of anarchy for the peace, the dignity, and the valuable advantages of ſocial and civil life."

The next attempt that was made to reduce Ireland was by Richard II., who, in 1394, went there with an army of 4000 men at arms, and 30,000 archers, attended by a number of diſtinguiſhed noblemen. The preſence of ſuch an army induced all the chieftains to make ſubmiſſion in a formal manner, with which Richard was contented. By this expedition he did not extend the Engliſh juriſdiction, nor add to his revenue; and he had no ſooner departed than the Iriſh lords laid aſide their maſks of humility, and ſcorning the weak forces which the king had left behind him, began to infeſt the borders, and in defence of theſe, Mortimer, the king's lieutenant, and heir apparent of the crown, was ſlain. To revenge his death, Richard went to Ireland a ſecond time with a great force; but during his abſence, an inſurrection took place in England, which terminated in his depoſition. During the reigns of Henry IV. and V. nothing was attempted beyond the defence of the Engliſh pale, including four counties, *viz.* Dublin, Kildare, Meath, and Louth; and during the early part of the reign of Henry VI., ſo much had the Iriſh, and thoſe Engliſh who had adopted their cuſtoms, increaſed in ſtrength, that even the defence of thoſe countries was become a matter of great difficulty. Towards the latter end of the reign of Henry VI., Richard, duke of York, was appointed chief governor, who, though he gained little advantage over the Iriſh, ſucceeded in attaching to himſelf not only the lords of the pale, but others of Engliſh race, numbers of whom engaged warmly in the ſupport of his claim to the crown. An attachment to his deſcendants long continued to influence the Anglo-Iriſh, as was conſpicuous in the reign of Henry VII. During the period of the civil wars, the ſtate of Ireland was very bad, in conſequence of the neglect of the Engliſh government; and the exaction of coin and livery, which grew exceſſive and intolerable. Such was the violence of faction, that the earl of Deſmond, the moſt powerful nobleman in Ireland, was ſeized and beheaded under the pretext of offences which were generally committed with impunity. In 1474, the earl of Kildare, being lord deputy, formed an aſſociation of the principal noblemen and gentlemen within the pale for its defence againſt ſudden invaſion, called the "Brotherhood of St. George," and this continued till the tenth year of Henry VII. This prince, as ſoon as he found leiſure to attend to the affairs of Ireland, was determined to break the power of thoſe lords who, by their influence in the country, had hitherto managed every thing as ſuited their own private views. For this purpoſe he ſent ſir Edward Poynings as lord deputy, accompanied by an Engliſh chancellor and treaſurer, and Engliſh judges. In a parliament held at Drogheda, by this deputy in 1495, moſt of the ſtatutes of Kilkenny were revived and confirmed, with many others tending to leſſen the influence of the great lords, and to reform the manners of the pale. Amongſt others was a ſtatute, which has ſince been the ſubject of much diſcuſſion, under the name of Poynings' law. This enacted, that no parliament ſhould be held without the king's previous permiſſion, and that no acts ſhould be paſſed until they had been previouſly ſubmitted to the king and his council in England, approved by them, and returned under the great ſeal of that realm. Some alteration was afterwards made in the mode of preparing and tranſmitting the bills, but the effect of this law, which was to render the Iriſh government more dependent on England, continued until the reign of his preſent majeſty, king George III. At the time, and long after, this law was conſidered by the Engliſh ſettled in Ireland as a deſirable check on the chief governors, who had frequently ſummoned parliaments, and given aſſent to various acts, not only without communication with the ſovereign or his Engliſh council, but even contrary to his intereſt, and to ſerve their own private purpoſes. The vigorous adminiſtration of the earl of Kildare effectually preſerved the pale, and though an ignominious tribute, which had been long paid to many Iriſh chieftains, was not yet withdrawn, the hoſtilities of ſuch chieftains were oppoſed and chaſtiſed. The ſuperiority of the Engliſh government over the *whole* of Ireland was once more aſſerted, and even ſome of the moſt ferocious chieftains became the avowed friends of the Engliſh power. On the other hand, the old Engliſh ſettlers had become ſo connected with the Iriſh as to be ſcarcely diſtinguiſhable from them; they adopted their language and cuſtoms, and were even more adverſe to the government than the native Iriſh. During the early part of the reign of Henry VIII. no material change took place in the ſtate of Ireland, which Kildare, with ſome little interruption, continued to govern. The great poſſeſſions of this nobleman, and his connections in Ireland, eſpecially with the houſe of Deſmond, another branch of the Geraldine family, and with the great Iriſh ſept of O'Nial, gave weight to his government, whilſt his alliance to ſome powerful Engliſh families ſtrengthened his intereſt at court. Francis I. of France, having, however, ſent an agent to tamper with Deſmond, with a view to diſtreſs Henry, and this having been diſcovered, Kildare was ordered to arreſt that nobleman, but was either unwilling or unable to effect it. This diſpleaſed the king and involved him in difficulties, and the raſhneſs of his ſon having involved him in open rebellion, all the members of his family were put to death, except a youth of twelve years old, who eſcaped to Italy, and was protected by cardinal Pole, notwithſtanding the king's efforts to deſtroy him.

Whilſt theſe diſturbances took place in Ireland, the king, influenced by very unworthy motives, though his conduct was attended with the moſt happy effects, had thrown off the yoke of the pope, and had been declared by parliament, and by a convocation of the clergy, "ſupreme head, on earth, of the church of England." His new queen was partial to the reformation, and Cromwell, his prime miniſter, was active in promoting it. Henry was reſolved to extend his new power to Ireland, and Browne, archbiſhop of Dublin, a creature of Cromwell's, was zealous in promoting his views. Ireland, however, was much leſs prepared for ſuch meaſures than England had been. The continual hoſtilities in which all parties were engaged, prevented the progreſs of knowledge and civilization, even within the Engliſh pale, and the clergy, eſpecially in remote parts, were amongſt the moſt ignorant, and conſequently the moſt bigotted, partiſans of Rome. A decided oppoſition was therefore given to the acknowledgment of the king's ſupremacy, headed by the primate, and encouraged by the emiſſaries of Rome. Fear indeed induced the parliament to paſs the propoſed act, Browne having pronounced thoſe, who made any difficulty of concurring with him, to have no right to be regarded or treated as loyal ſubjects; but great reſiſtance was made to the carrying of it into effect. Lord Leonard Grey, the deputy, who had reduced the power of the Geraldines, now ſhewed equal activity in ſuppreſſing the advocates of Rome, and by a great victory over O'Nial and his aſſociates at Bellahoe, put an end for a time to open reſiſtance. The ſuppreſſion of the monaſteries was carried into effect, and the moſt powerful and turbulent chieftains appeared earneſt to expreſs their attachment to the crown. Sir Anthony St. Leger aſſumed his charge as governor in 1541, with the faireſt preſages of tranquillity and public happineſs. A parliament ſummoned by him declared Henry king of Ireland; this title, now firſt aſſumed, was acknowledged by O'Nial, and the other chieftains by indenture, and they at the ſame time renounced the papal authority in the fulleſt manner. Various regulations were paſſed for the government of Munſter, where the laws of England, though formerly eſtabliſhed, had been diſuſed for 200 years. St. Leger alſo prevailed upon O'Nial, O'Brien, and the head of the Burkes called Mac William, to go into England, and preſent themſelves to the king, who conferred on them the dignity of earls, and granted unto them their ſeveral countries by letters patent. He alſo granted to each a houſe and lands near Dublin, that they might, by frequent reſidence there, learn obedience and civility of manners. The reign of Edward VI. was chiefly occupied in endeavours to introduce the reformed liturgy, which was effected in Dublin and ſome other places, but was very generally diſagreeable. On the acceſſion of Mary, popery was reſtored without any difficulty, except that occaſioned by the alienation of church property in the preceding reigns; but the regulations which the change required occupied much time and attention. The diſtricts of Leix and Ophaly, which had been before reduced, were now made ſhires under the names of the Queen's and King's counties, and the native Iriſh were, in general, not adverſe to a government which favoured their religion. The reign of Mary, however, was ſhort; and her ſucceſſor Elizabeth was friendly to the reformation. Before we proceed to notice the more intereſting tranſactions of this long reign, it will be uſeful briefly to conſider the ſtate of the country. The inhabitants have been claſſed in four diviſions: 1. The native, or, as they were contemptuouſly called, the *mere* Iriſh. 2. The degenerate Engliſh, or thoſe of Engliſh deſcent who had intermarried with the Iriſh, and adopted their cuſtoms and language, ſo as to be ſcarcely diſtinguiſhable from them. They were alike governed by the Brehon law, for an account of which ſee the article BREHON; and alike uſed the mode of ſucceſſion called Taniſtry, for which ſee TANISTRY. 3. The Engliſh of blood, ſome of whom were poſſeſſed of large eſtates, and though the ſituation of the country did not allow of much refinement, yet their occaſional intercourſe with England, or with the Engliſh conſtantly coming over, enabled them to keep up an exterior appearance of Engliſh manners. Theſe chiefly reſided within the pale. 4. The Engliſh of birth, ſent over to fill the principal offices of ſtate, and who generally acquiring property in the country, their deſcendants were continually forming an addition to the 3d claſs. Theſe, who might have been called *mere* Engliſh, as they were ever diſpoſed to ſacrifice the intereſt of Ireland to that of England, were the perſons countenanced and aſſiſted by the Engliſh government. Spenſer the poet, who reſided in Ireland for ſome years in this reign, has deſcribed ſeveral of the Iriſh cuſtoms in his dialogue on the ſtate of Ireland; and, though it muſt be remembered that he ſaw every thing through the eye of prejudice, yet a quotation or two may enable us to form a more correct idea of the licentiouſneſs of manners of the Iriſh chieftains. Whatever opinion we may form of the impolicy and injuſtice of the Engliſh ſettlers and government on many occaſions, it muſt be acknowledged that the Iriſh laws and cuſtoms were favourable to a ſavage wildneſs of manners inconſiſtent with the happineſs of ſocial and civil life. After noticing the barbarous manners of the Gallowglaſſes or infantry, of the Kernes or predatory cavalry, and of the horſe boys, Spenſer alſo deſcribes two claſſes of men who contributed very much to the diſſoluteneſs of the chieftains, *viz.* the Bards and the Carrows. "Theſe Iriſh bards," ſays he, "are ſo far from inſtructing young men in moral diſcipline, that they themſelves do more deſerve to be ſharply diſciplined; for they ſeldom uſe to chooſe unto themſelves the doings of good men for the arguments of their poems, but whomſoever they find to be moſt licentious of life, moſt bold and lawleſs in his doings, moſt dangerous and deſperate in all parts of diſobedience and rebellious diſpoſition, him they ſet up and glorify in their rhymes, him they praiſe to the people, and to young men make an example to follow." Then, having deſcribed the youth of one of theſe chieftains, he adds "in which, if he ſhall find any to praiſe him, and to give him encouragement, as thoſe bards and rythmen do for little reward, or a ſhare of a ſtolen cow; then waxeth he moſt inſolent, and half mad with the love of himſelf and his own lewd deeds. And as for words to ſet forth ſuch lewdneſs, it is not hard for them to give a goodly and painted ſhow thereunto, borrowed even from the praiſes which are proper to virtue itſelf. As of a moſt notorious thief and wicked outlaw, who had lived all his lifetime of ſpoils and robberies, one of their bards in his praiſe will ſay, That he was none of the idle milkſops that was brought up by the fire-ſide, but that moſt of his days he ſpent in arms and valiant enterprizes, that he did never eat his meat before he had won it with his ſword; that he lay not all night ſlugging in a cabin under his mantle, but uſed commonly to keep others waking to defend their lives, and did light his candle at the flames of their houſes, to lead him in the darkneſs; that the day was his night, and the night his day; that he loved not to be long wooing of wenches to yield to him, but where he came, he took by force the ſpoil of other men's love, and left but lamentation to their lovers; that his muſic was not the harp, nor lays of love, but the cries of people, and the claſhing of armour; and finally, that he died not bewailed of many, but made many wail when he died that dearly bought his death." At the ſame time, in anſwer to a queſtion reſpecting theſe poems, "Whether they be any thing witty or well favoured as poems ſhould be," this excellent judge replies, "Yea truly, I have cauſed divers of them to be tranſlated unto me, that I might underſtand them, and ſurely they ſavoured of ſweet wit and good invention, but ſkilled not of the goodly ornaments of poetry; yet were they ſprinkled with ſome pretty flowers of their natural device, which gave good grace and comelineſs unto them, the which it is great pity to ſee abuſed, to the gracing of wickedneſs and vice, which, with good uſage, would ſerve to adorn and beautify virtue." Theſe bards probably had as great effect in rouſing a ſpirited oppoſition to the Engliſh as the Welſh bards, whom the policy of the firſt Edward led him moſt iniquitouſly to deſtroy. As to the Carrows, they are "a kind of people that wander up and down to gentlemen's houſes, living only upon cards and dice, the which, though they have little or nothing of their own, yet will they play for much money, which, if they win, they waſte moſt lightly, and if they loſe, they pay as ſlenderly, but make recompence with one ſtealth or another, whoſe only hurt is not, that they themſelves are idle loſſels, but that, through gaming, they draw others to like lewdneſs and idleneſs. And to theſe may be added another ſort of like looſe fellows, which do paſs up and down amongſt gentlemen by the name of jeſters, but are indeed notable rogues, and partakers not only of many ſtealths, by ſetting forth other men's goods to be ſtolen, but alſo privy to many traiterous practices, and common carriers of news, with deſire whereof you would wonder how much the Iriſh are fed."

Almoſt the whole of the two firſt claſſes, and the greater part of the Engliſh of blood, were zealouſly and blindly attached to the doctrines and diſcipline of the church of Rome, in which they had been educated, and were therefore eaſily inſtigated to ſupport Philip of Spain, a Catholic prince, to whom they had once been ſubject againſt their Proteſtant miſtreſs. In 1560, the firſt parliament in this reign was aſſembled for the purpoſe of re-eſtabliſhing the queen's ſupremacy and the reformed worſhip. The houſe of commons conſiſted of only 76 members, from thoſe parts where the Engliſh intereſt was ſtrongeſt, yet the change was not effected without much clamour and oppoſition. Laws, however, were paſſed, reſtoring eccleſiaſtical juriſdiction to the crown, enforcing the uſe of the common prayer, and obliging all ſubjects to attend the public ſervice of the church. But though the deputy ſucceeded with parliament, the meaſures were very unpalatable. "The numerous partizans of Rome inveighed againſt the heretical queen, and her impious miniſters. The clergy who refuſed to conform abandoned their cures; no reformed miniſters could be found to ſupply their places; the churches fell to ruin; the people were left without any religious worſhip or inſtruction. Even in places of moſt civility, the ſtatutes lately made were evaded or neglected with impunity. The ignorant were taught to abominate a government, which they heard conſigned to all the terrors of the divine vengeance; were exhorted to ſtand prepared for a glorious opportunity of aſſerting the cauſe of religion; and aſſured of effectual ſupport, both from the pope, whoſe authority had been profaned, and from the king of Spain, now particularly offended at Elizabeth."

Beſides the diſorder occaſioned by theſe efforts to force upon the people a religion they deteſted, much uneaſineſs was occaſioned to the government by the reſtleſs turbulence of Shane or John O'Nial, the moſt powerful chieftain in Ireland. Sir Henry Sidney, to whom Elizabeth entruſted the government for many years, and who deſerved her confidence, ſucceeded in attaching to him ſeveral inferior chieftains whom O'Nial had injured, and with their aid completely ſubdued him. But ſcarcely was the northern diſturbance allayed, than another broke out in the ſouth, headed by the earl of Deſmond, which was of longer continuance. Sir John Perrott, preſident of Munſter, an office lately inſtituted, not only ſuppreſſed the rebellion, but enforced ſuch a ſtrict execution of Engliſh law, as to give an unuſual appearance of peace, induſtry, and civility, to the whole province. Peace, however, was of ſhort continuance, and an attempt of Sidney to raiſe a tax by order of council, without authority of parliament, excited a moſt determined oppoſition on the part of the nobility and gentry of the pale. Theſe diſcontents were encouraged by the emiſſaries of Philip II.; a body of Spaniards landed in Kerry, who acted in concert with Deſmond; and a protracted warfare was maintained, which, as uſual, terminated in favour of the Engliſh. The enormous demeſnes of Deſmond were forfeited, and divided amongſt a number of Engliſh *Undertakers*, as they were called, who entered into a ſtipulation to plant a certain number of Engliſh families on their eſtates, in proportion to the number of acres, a ſtipulation frequently neglected to the great injury of the ſettlement. Amongſt others who received portions, were ſir Walter Raleigh, who had ſerved with reputation for bravery, though not without the ſtain of cruelty, and Edmund Spenſer, the poet, who has introduced ſeveral alluſions to Ireland into his Fairy Queen. In 1584, ſir John Perrott was ſent over as chief governor, and as war and inſurrection ſeemed to be then extinguiſhed, he applied himſelf to the general extenſion of Engliſh law with conſiderable ſucceſs. He nominated ſheriffs for the counties of Connaught, and alſo for ſeven new counties inſtituted in Ulſter, with other neceſſary officers; but his plans for more extenſive improvement were thwarted in England from ill-timed economy, and notwithſtanding all his exertions, a parliament, ſummoned by him in the following year, rejected almoſt every meaſure propoſed to them. The oppreſſion of the natives by the Engliſh ſettlers, which Perrot in vain endeavoured to repreſs, ſupplied new cauſes of diſcontent; and this active governor was at length obliged to leave Ireland. A more general ſpirit of inſurrection than at any former period was now excited, and Elizabeth found it neceſſary to make uncommon efforts, leſt England ſhould be placed between the forces of Spain collected in the Netherlands, and their naval ſtrength and armaments ſtationed in the harbours of Ireland. The miſconduct of ſucceſſive governors, eſpecially of Elizabeth's favourite, the earl of Eſſex, who had an army of 20,000 men, increaſed the danger, and before the rebels were ſubdued, a Spaniſh army took poſſeſſion of Kinſale, and a nuncio arrived from the pope to inſtigate the friends of Rome to make every exertion. The abilities and exertions of Blount, lord Mountjoy, lord deputy, and of ſir George Carew, preſident of Munſter, aſſiſted by conſiderable reinforcements from England, at length effected the ſurrender of the Spaniards, and the complete reduction of all the lords and chiefs, who, until then, had ruled in the iſland, after a war which laſted about ſeven years. Elizabeth did not live to ſee this event, the final capitulation not having been ſigned until a few days after her death, though before the news of it had reached Ireland.

The reign of James I. was one of at leaſt comparative tranquillity. All violent oppoſition to the authority of the Engliſh government and crown was put an end to. "The ſpirit of Iriſh reſiſtance," to uſe the expreſſions of ſir John Davies, "was brayed, as it were, in a mortar, with the ſword, famine, and peſtilence altogether." Both the degenerated Engliſh and the native Iriſh were alike overcome. At the ſame time the power of the judges and of the Engliſh government was extenſively fixed, the Iriſh laws and cuſtoms were aboliſhed, and the Engliſh laws eſtabliſhed in all caſes, without exception, through the whole iſland. Numerous colonies were alſo ſent from England and Scotland, eſpecially from the latter, to occupy the forfeited eſtates, and ſeven entire northern counties were allotted to undertakers, which was called the "Plantation of Ulſter," a meaſure which was certainly attended by the introduction of induſtry and order into that province. With a view to ſtrengthen the Proteſtant party, great care was taken that theſe ſettlers ſhould be Proteſtants, and they were chiefly Scotch Preſbyterians, or Engliſh Puritans, the latter of whom found their ſituation at home uneaſy, from James's zealous attachment to their adverſaries. For the ſame purpoſe, many new boroughs were erected, ſo as to give a majority in parliament to the ſame party, which they could not otherwiſe have accompliſhed, as the county members were likely to be almoſt all Papiſts. It would have been at this time a wiſe and liberal policy to have completely united the two countries, ſo as to have but one parliament, which might have been eaſily effected at that time. This would have rendered ſuch extraordinary proceedings entirely unneceſſary, and would in all probability have prevented much of the miſchief which afterwards occurred; but the ſettlers were conſidered as a colony, dependent on the mother country, to whoſe intereſt they were to be ſubſervient, without preſuming to interfere in any but the petty regulations of their own iſland, and all but the colony were regarded as ſecret enemies, who could not be too carefully watched, or too ſtrictly kept in ſubjection. In conſequence, the diſtinctions which had ſubſiſted amongſt them were in a great meaſure done away, and they united in defence of a religion to which they were equally attached, and of rights which they conceived to be equally invaded. Such was the prevailing ſentiment, when, after an interval of *twenty-ſeven* years, a parliament, ſummoned by Chicheſter, the deputy, met in 1613. The recuſants, (as they were called, from their refuſal to acknowledge the king's ſupremacy, and to attend the eſtabliſhed worſhip,) were prepared to diſpute every ſtep, and were numerous in both houſes. Such indeed was their reſiſtance, that, although the biſhops in the upper, and the new borough members in the lower houſe, gave government a majority, it was found neceſſary to prorogue them until the following year, when acts for acknowledging the king's title, for ſettling upon him a revenue, and for confirming the northern attainders, were paſſed. During the remainder of this reign, and for the early part of the ſucceeding one, the two contending parties often ſhewed their rancour without proceeding to extremities, whilſt the period of peace was employed by ſome in active exertions for the eſtabliſhment of manufactures, and the extenſion of cultivation. In 1633, lord Wentworth, better known by his later title of earl of Strafford, commenced his adminiſtration. He treated Ireland with ſeverity, as a conquered country, the ſubjects of which had forfeited the rights of men and citizens, and depended ſolely on the royal grace. The recuſants and the Puritans were equally offended by his meaſures; yet, by artfully plying one party againſt the other, he contrived to manage a parliament which he ſummoned, and to perform many acts of ſeverity with a vigour beyond the law.

At length the time arrived when Ireland was to be once more involved in war and bloodſhed. The impeachment of lord Strafford before the Engliſh parliament was one of the firſt ſteps to the overthrow of the royal authority. The ſevere reſtrictions impoſed on the Catholic party, which, as before obſerved, included almoſt all the inhabitants, except the new ſettlers, led them to watch for an opportunity of revenge; and the diſtracted ſtate of affairs in England affording a favourable opportunity, a general inſurrection was planned, and carried into execution on the 23d of October 1641, an event productive of the moſt baneful conſequences to the peace, union, and proſperity of Ireland. This civil war, or rebellion, as it is juſtly called, even admitting the palliations that have been urged, was begun by the native Iriſh, and they were afterwards joined by moſt of the Catholics. Happy would it be for the country if the acts of violence then committed could be for ever buried in oblivion. The writers on both ſides are charged with partiality by their opponents; yet what they admit reſpecting their own parties is enough to ſhew that there was on both ſides much to blame, and much to lament. For eleven years Ireland was a ſcene of confuſion, there being no leſs than five different parties, of whom it has been ſaid, that each, in the courſe of the war, at one time or other, fought againſt the faction with which it had formerly ſided. At length, in 1652, Cromwell aſſumed the command of the parliamentary army, to which he brought a conſiderable reinforcement, and ſoon completely reduced the whole iſland. The lands which had belonged to thoſe who had been killed, or who were deprived of their poſſeſſions by force of arms, were now given to new coloniſts, many of whom had been officers in the victorious army. Limits were aſſigned to the Iriſh, beyond which they were not to come, and theſe continued to be ſtrictly enforced till the reſtoration. The Proteſtant and Engliſh intereſt was now more completely eſtabliſhed than at any former time; but though the Catholics had loſt the power to injure, they retained their animoſity. At this period, indeed, the intereſt and power of the old native Iriſh, as a diſtinct claſs of inhabitants, was entirely broken, their numbers being from that time much exceeded by thoſe of the old and new inhabitants of the Britiſh race.

On the reſtoration it was hoped that the king would have overturned all the meaſures of Cromwell; but he confirmed all the grants, and the ſituation of the Catholics was little, if at all, amended. The duke of Ormond, who had great influence in Iriſh affairs, was a ſteady Proteſtant; and whatever might be the king's private wiſhes, no ſteps were taken in favour of the oppoſite party till near the concluſion of his reign, when his brother the duke of York appears to have had great influence over him. On the acceſſion of James II. the Romiſh party in Ireland were inſpired with the moſt extravagant expectations; they fancied themſelves already reſtored to the eſtates of their anceſtors, and poſſeſſed of every advantage to be derived from a king of their own religion. "At length," ſays Mr. Newenham, "the infatuated James, yielding to the impolitic counſels of men who, perhaps, might have governed a religious fraternity well, but who were utterly ignorant of the government of an empire; and taught to regard the Iriſh Roman Catholics as fit inſtruments for the accompliſhment of his viſionary and deſpotic projects, gradually raiſed, invigorated, and encouraged them. By the obſequious forbearance, or conſtrained acquieſcence of Clarendon, and the indefatigable exertions of the zealous and plenipotent Tyrconnel, they were once more prepared to renew the terrible conflict; and animated by no ordinary combination of forcible motives, recurred to arms; after incautiouſly co-operating with their bigoted ſovereign, in perſecuting their Proteſtant countrymen without meaſure and without remorſe; and thus, in ſome degree, juſtifying that ſevere retaliation which they themſelves were ſoon after to experience.

——— Eheu,
Quam temere in noſmet legem ſancimus iniquam.

But England was not then, as on the preceding occaſion, paralyzed by internal commotions. The prince who had aſcended the abdicated throne was an experienced general, and a ſound politician. The viſionary James was greatly overmatched. The Iriſh Roman Catholics were, in conſequence, completely vanquiſhed; ſtripped of political power; hurled from every poſt of truſt and emolument, and almoſt entirely diſpoſſeſſed of their remaining lands. The work of vengeance, however, was not yet finiſhed, nor could it perhaps have terminated thus, conſiſtently with the weakneſs and wickedneſs inſeparable from human nature. The Iriſh Proteſtants, ſtill horrified by the remembrance of the ferocious maſſacre of 1641; recollecting the havoc and miſery of the long war which ſucceeded that event; dreading a repetition of the tyrannical meaſures, the relentleſs, and, for the moſt part, unprovoked perſecution from which they had been recently reſcued; and a renewal of thoſe bloody ſcenes which they had juſt ſurvived; yielding, in ſhort, to the united impulſe of revenge and fear, and thereby hurried beyond the bounds of political honour and prudence, reſorted in the following reign, when they were rather encouraged to do ſo, to every expedient which legiſlative ingenuity could ſupply, however likely to prove ultimately detrimental to themſelves, with a view of reducing their inveterate enemies, the Roman Catholics, to abſolute and irremediable political impotence. A code of defenſive and preventive ſtatutes, being the ſtamp of the paſſions by which it was originated, was in the end compiled: a code which was not merely limited to the precluſion of hoſtilities on the part of the Roman Catholics, but extended to the abolition of their venerated religion, which, in Ireland, had ſcarcely ever been fairly combated by the only weapons that ever ſhould have been employed againſt it, the pens or tongues, and attractive examples of Proteſtants: a code which impeded the progreſs of the former in the paths of induſtry; thwarted every ſpecies of laudable ambition by which they might have been actuated; placed them on the footing of aliens in their native land; expoſed them to vexatious outrages and ſpoliation; reduced them almoſt to the condition of ſlaves; obſtructed matrimonial alliances between them and the Proteſtants, from whence, it is probable, the happieſt effects might have flowed; and, worſe than all, held forth incitements to filial contumacy, to a violation of one of the commandments of God; and introduced amongſt them principles of duplicity and treachery. A code, which, while it oppreſſed, and ſeemed to overwhelm the Roman Catholics, facilitated the obtruſion of thoſe jealous meaſures, thoſe commercial reſtraints which had long been the effect of retaining one of the faireſt portions of the globe in a ſtate of poverty and political inſignificance. The maſſacre of 1641, which had been induſtriouſly exhibited in the moſt horrifying colours, together with the cruel perſecution experienced during the ſhort reign of king James in Ireland, both ſtill freſh in the recollection of the Proteſtants, neceſſarily heightened their animoſity to the utmoſt; while repeated diſcomfitures and diſaſters, and aggravated oppreſſion, together with the accumulated miſery produced by this revengeful code, certainly inconſiſtent with the principles of ſound policy and true religion, naturally rendered the hatred of the Roman Catholics virulent beyond example. An unparalleled combination of irritating, maddening circumſtances fomented, on both ſides, the moſt rancorous malignity. The idea of a Proteſtant in the mind of a Roman Catholic, and that of the latter in the mind of the former, now became cloſely aſſociated with every idea that could engender wrath, malice, and vengeance in the heart of man. Each abhorred the other; each longed for the extirpation of the other."—"This among countrymen, among the friendly, cheerful, and hoſpitable people of Ireland, among Chriſtians, among thoſe who looked forward to eternal happineſs through the mediation of the ſame Saviour, among thoſe who adored the ſame Trinity, among thoſe who agreed in all the eſſential points of religion, the maintenance of a few different ſpeculative articles, and the obſervance of a few different rites, confeſſedly inoperative in ſocial life, and conſequently unworthy of ſerious notice, being unhappily combined with oppoſite intereſts, being coeval and concurrent with the moſt energetic principles of diſcord, ſerving as the teſts, ſymbols, or diſtinctive characters of two parties inveterately and unappeaſably hoſtile to each other, became at length, what in their natural unconnected ſtate they could never poſſibly have become, alimentary to the moſt vehement deteſtation."

Though we cannot agree with the reſpectable writer of the preceding paſſage in all his remarks, eſpecially in thoſe which ſeem to think lightly of the difference between the Proteſtant and Catholic faith; yet it, on the whole, contains ſo juſt and candid a repreſentation of the unhappy differences between the parties, and is evidently written with ſuch a deſire of conciliation, that we have copied it without change, anxiouſly wiſhing that all the gentlemen of Ireland, of every ſect, ſaw the matter in the ſame light, and were equally deſirous of improving paſt evils to preſent harmony.

The events peculiar to Ireland, excepting the penal code, juſt remarked on, will not require much notice during the four reigns ſucceeding the revolution. The uniform policy was to keep Ireland in a ſtate of dependency, and to prevent her manufactures or commerce interfering with thoſe of England.

Encouragement was indeed given to the linen manufacture, and it proved a ſource of great benefit to the country, but the woollen manufacture was kept down, and the reſtrictions on commerce ſhewed a moſt unwarrantable jealouſy. As the dependence of Ireland on England was never loſt ſight of, ſo ſome occaſions occurred in which the parliament of the latter directly exerted its authority. In the reign of William acts were paſſed, by which Ireland was bound. In the year 1698, Mr. Molyneux publiſhed a pamphlet, entitled "The Caſe of Ireland being bound by Acts of Parliament in England, ſtated," in which he called in queſtion their right to do ſo, and his ſentiments were known to be thoſe of the Iriſh parliament and people. This book was condemned by the Engliſh parliament, which addreſſed the king on the pernicious aſſertions it contained, and on the dangerous tendency of the proceedings of the Iriſh parliament, and promiſed to give his majeſty their ready concurrence and aſſiſtance to preſerve and maintain the dependence and ſubordination of Ireland to the imperial crown of this realm. William promiſed on his part to fulfil their wiſhes, and notwithſtanding the diſcontent of the Iriſh people, ſuch was their divided ſtate, and ſuch the apprehenſion each party entertained of the other, that they were obliged to ſubmit. Another cauſe of controverſy occurred in 1719, in conſequence of an appeal being carried from the Iriſh to the Engliſh houſe of lords. The barons of the exchequer, who had carried into effect the decree of the Engliſh houſe, were impriſoned by the Iriſh one, but the diſpute terminated in a new act, by which it was enacted, "that the kingdom of Ireland is ſubordinate unto, and dependent upon, the imperial crown of Great Britain; and that the king's majeſty, by and with the conſent of the lords and commons of Great Britain, has full power and authority to make laws and ſtatutes to bind the people and the kingdom of Ireland." Soon after this, in 1723, a circumſtance occurred, which deſerves notice, both on account of the example it ſet, that the united, determined, and perſevering voice of a people muſt be ultimately ſucceſsful, and on account of the active part taken by the celebrated dean Swift, then reſident in Dublin. This was the well known affair of *Wood's halfpence*. A patent had been granted to a Mr. Wood, to ſupply Ireland with a certain quantity of copper halfpence and farthings for 14 years. It was alleged in Ireland, that this coin was greatly inferior in value to what it was made to paſs for. The parliament of Ireland addreſſed the crown againſt the meaſure of ſending the coin; and during their following biennial receſs, great complaints continued to be made both by individuals and by public corporations. It would appear that though the badneſs of Wood's halfpence was the pretext, the diſpute was, in reality, a queſtion of rights and independence. Dean Swift contributed much to the public diſcontent, by a ſeries of letters ſigned *A Drapier*, for diſcovering the author of the fourth of which, a reward of 300 pounds was offered. As ſuch precautions had been taken, that no evidence could be procured againſt the author, the printer was indicted, but the grand jury, inſtead of finding the bill, approved the publication. The ferment was ſo great, that if miniſters had perſevered, a new civil war would probably have ariſen, though it, like all preceding ones, would have only contributed, in all probability, to rivet the chains of Ireland more firmly. As it was, the patent was cancelled; and the ferment allayed. At this time the complaints of the people, on other accounts, were loud, of which dean Swift takes particular notice in his "Short View of the State of Ireland;" he compares this kingdom, in which a few placemen from England enjoyed plentiful ſalaries, to an hoſpital, in which all the houſhold officers grow rich, while the poor, for whoſe ſake it was built, are almoſt ſtarving for want of food and raiment. Such are the principal events in Ireland, in the interval between the revolution and the acceſſion of his preſent majeſty to the throne in 1760. The Catholics were under the diſabilities already ſtated, but the penal laws againſt them were ſeldom, if ever, enforced; and as the diſtance of time increaſed, the irritation occaſioned by former events was conſiderably abated. Many of that body acquired wealth in the way of trade, and the nobility and gentry enjoyed their eſtates in quiet. The Proteſtants alſo gradually loſt their apprehenſions, and were taken up with the conteſts againſt Britiſh ſovereignty, which about this time gave a continual intereſt to the proceedings of parliament, where ſome able men diſtinguiſhed themſelves by their oppoſition to government. This parliament was unchanged during the life of the ſovereign, and met every ſecond year; and as the preſent mode of vacating ſeats was unknown, when a vacancy happened by death, the greateſt exertions were uſed by the contending parties, and the election was uſually decided by the majority of the houſe. The Iriſh government was peculiarly circumſtanced. It was neceſſary that every act of parliament ſhould have the ſanction both of the Britiſh privy council, *i. e.* of the Britiſh miniſtry, and of the Iriſh parliament. It was therefore neceſſary for the former to be able to influence a majority of the latter. To do this, places and penſions were beſtowed on thoſe, whoſe powers of eloquence, or whoſe parliamentary intereſt made them ſerviceable; and beſides this, the miniſtry were obliged to gratify the leading faction, by complying with ſuch meaſures as were for their private advantage, although inconſiſtent with ſound policy, and the true intereſt of Ireland. Hence a number of parliamentary grants, which have been juſtly ſtigmatized as jobs, and hence the undetermined conduct of the Britiſh miniſtry reſpecting Iriſh meaſures, even on occaſions not long preceding the Union. The leading party in the Iriſh parliament muſt be gratified, becauſe otherwiſe the public buſineſs would be at a ſtand. The lord lieutenant was not reſident, except during the parliamentary ſeſſion; and the management of affairs was, at other times, entruſted to lords juſtices, generally the primate, the chancellor, and the ſpeaker of the houſe of commons; the two former invariably Engliſhmen, in whom confidence was chiefly placed, and the laſt, a man always poſſeſſed of great parliamentary influence from his talents and connections. The firſt ſtep to a change was the rendering parliaments octennial, which was moved by G. D. Lucas, and paſſed in 1768. The lord lieutenant now became conſtantly reſident, and the ſeſſions were held every year. The ſpirit of the Iriſh parliament increaſed; ſeveral men of great talents ſprung up, and whilſt the Britiſh miniſtry were engaged in their unhappy conteſt with America, they were obliged to yield to the people of Ireland firſt a free trade, and afterwards a repeal of the ſtatutes which rendered Ireland dependent. The volunteers, a body originally armed for the defence of the country againſt French invaſion, probably contributed to theſe meaſures by the terror they occaſioned to the miniſtry, whilſt the agitation in England towards the cloſe of the American war, and the unſettled ſtate of adminiſtration between the reſignation of lord North, and the appointment of Mr. Pitt, prevented that determined oppoſition which would have been made in a more ſettled ſtate of affairs. In 1778 the grievances of the Roman Catholics began to receive attention, and that body was reſtored to many privileges, of which they had been harſhly deprived. This was the commencement, and ſince that time all the moſt haraſſing diſabilities have been removed, though ſome ſtill remain, which are frequently the ſubject of parliamentary diſcuſſion. The events of the laſt 20 years are too recent to be enlarged on without that partiality from which human nature is ſcarcely ever exempt, and the detail would be perhaps unſuitable to a work of this general nature. Notwithſtanding the miſery occaſioned by the rebellion of 1798, and the low ſtate of many branches of trade and manufacture, Ireland has rapidly improved within that period, eſpecially in agriculture, and ſhould it be bleſſed with internal peace and union, it will ſoon, under the foſtering care of the legiſlature, riſe to a great degree of proſperity, and eſſentially contribute to the welfare and happineſs of the *United Kingdom.* See UNION. Beaufort's Memoir. Pinkerton's Geography. Spenſer. Cox. Davis. Hollingſhead. Leland. Curry. Newenham's State of Ireland, &c. &c.

IRELAND's *Eye*, a ſmall iſland in the Iriſh ſea, north of the hill of Howth, in the county of Dublin, Ireland, about a mile from the main land.

IRELAND, *New*, an iſland in the Pacific ocean, which is a long ſlip of land ſtretching from N.W. to S.E. about 270 miles, and ſeparated from *New Britain* (which ſee) by a channel through which Capt. Carteret paſſed in 1767, who gave its name to this iſland. This navigator found the nation very hoſtile, having lances headed with flint. Their faces were ſtreaked with white, and their hair beſprinkled with powder of the ſame colour. They are black, and ſaid to be woolly-headed, but without the thick lips or flat noſe of the negro. Some of the canoes of this iſland were 90 feet in length, formed out of a ſingle tree. Bougainville alſo viſited this country, and obſerved here the pepper-plant, and that ſingular inſect, the walking leaf; among its numerous birds was the great crowned pigeon. To the weſt of New Ireland, and approaching New Guinea, a ſucceſſion of little Archipelagos is found; in which are the Portland iſles, the Admiralty iſles, the Hermit and Exchequer iſles; all of which preſent one principal iſland, the centre of the group, of which the circumference is formed by a number of flat iſlets linked together by reefs. The principal iſland of the ADMIRALTY *iſlands* (which ſee) is mountainous. The inhabitants are not very black. Their phyſiognomy is agreeable, and differs but little from that of the Europeans; they appear little ſociable, and thieves; they have chiefs who exerciſe great authority; they are armed with darts headed with a volcanic glaſs. They wear at the extremity of the natural parts the ſhell "bulla ovum;" and are otherwiſe entirely naked. The women have only a garment about the waiſt. They live chiefly upon cocoa-nuts, of which theſe iſles have abundance. Their hair is curly, and of a black colour, which they ſometimes redden with ochre mixed with oil; many parts of the body are alſo thus painted, and eſpecially the face. In theſe iſlands it was once hoped to find Lá Perouſe.

The archipelago of *Hermits* is ſcarcely 14 leagues in circumference; it produces Cytherean apples, "ſpondia cytherea," and many fruits of different ſpecies of "Eugenia," all good to eat. The natives appear more mild and pacific than thoſe of the Admiralty iſles, though they ſeem to be more robuſt. They are wholly naked, not even wearing the ſhell. All theſe iſlands, and thoſe about them, are covered with trees. Labillardiere. Pinkerton. The moſt ſoutherly point of New Ireland is ſituated in S. lat. 4° 59′. E. long. 152° 17′.

IRELAND, one of the Bermuda iſlands.

IRELLY, a town of Hindooſtan, in Golconda; 25 miles E. of Hydrabad.

IRENÆUS, in *Biography*, a native Greek, probably of Aſia, and biſhop of Lyons, in Gaul, in the ſecond century. The time of his birth, and the preciſe place of his nativity, cannot be ſatisfactorily aſcertained. Dodwell refers his birth to the reign of Nerva, A.D. 97, and thinks that he did not outlive the year 190. Grabe dates his birth about the year 108. Dupin ſays that he was born a little before the year 140, and died a martyr in 202. Tillemont thinks that he was born about the year 120, and died in 202. It is generally allowed that he was educated in the principles of the Chriſtian religion, and that he was a diſciple of St. Polycarp; and it has been ſuppoſed that he came to Rome with his maſter, in the time of Anicetus, about the year 157, and from thence paſſed into Gaul. He was firſt preſbyter of the church of Lyons, and ſucceeded Pothinus, after his martyrdom in the year 177, as biſhop of that church. Tertullian mentions him as one of the moſt conſiderable writers of the Chriſtian church, and ſays of him that he was "a diligent inquirer of all ſorts of opinions;" meaning, probably, that he had well ſtudied the ſentiments of the heathen philoſophers, and of heretics, as well as the principles of the Chriſtian religion. It has been commonly ſaid that Irenæus died a martyr; but from the ſilence of Tertullian and Euſebius, and others, concerning the manner of his death, it is juſtly argued (ſays Lardner) by Cave, Baſnage, and Dodwell, that this ſuppoſition is not well founded, and that he cloſed his life in the ordinary courſe of nature. He was the author of many works, of which none are now extant beſides his five books "Againſt Hereſies," and fragments of ſome other pieces; and thoſe five books, written by him in Greek, now exiſt only in an ancient Latin verſion, excepting ſome fragments preſerved by Euſebius, and other Greek writers who have quoted them. In this large work "Againſt Hereſies," Irenæus has ſhewn that he was well acquainted with heathen authors, and the abſurd and intricate notions of heretics, as well as with the ſcriptures of the Old and New Teſtament, which he has frequently and copiouſly cited with peculiar and very diſtinguiſhed reſpect. In his writings "we have full, expreſs, and abundant teſtimony to the four goſpels, the acts of the apoſtles, and twelve of Paul's epiſtles. The omiſſion of the epiſtle to Philemon may well be aſcribed to its brevity. He knew the epiſtle to the Hebrews, but was not ſatisfied that it was Paul's. As for the Catholic epiſtles, we have expreſs quotations of the firſt of Peter, and the firſt and ſecond of John; and the reaſon of not quoting the third may be well allowed to be its brevity. But to the epiſtle of James, the ſecond of Peter, and the epiſtle of Jude, there are none, or very obſcure references, hardly any that can be reckoned material. Nevertheleſs, on account of a general paſſage concerning the writings of the apoſtles, it may be queſtioned, whether he did not alſo know the epiſtles of James and Jude. The book of the Revelation is expreſsly aſcribed to John, the diſciple of the Lord. His teſtimony for this book is ſo ſtrong and full, that, conſidering the age of Irenæus, he ſeems to put it beyond all queſtion, that it is the work of John the apoſtle and evangeliſt."

Irenæus appears to have been very humble and modeſt, and agreeable to his name (formed of ειρηνη, *peace*) a lover of peace. This is manifeſt in his letter to Victor, on occaſion of the controverſy about the time of keeping Eaſter. Although his writings may not be free from imperfections, he has given ſuch proofs of learning, integrity, and good ſenſe in the main, that all good judges muſt eſteem him an ornament to the ſect to which he belonged. The works of Irenæus were firſt publiſhed at Baſil by Eraſmus, in 1526, in folio; and they have ſince undergone various impreſſions. The moſt valuable of theſe are that of Grabe, publiſhed at Oxford in 1702, folio; and that of Maſſuet, a Benedictine of the congregation of St. Maur, publiſhed at Paris in 1710, folio. Fabricius. Cave. Dupin. Lardner, in his Works, vol. ii.

IRENARCHA, ειρηναρχης, compoſed of ειρηνη, *peace*, and αρχος, *prince*, from αρχη, *command*, a military officer in the Greek empire, whoſe buſineſs was to provide for the peace, ſecurity, and tranquillity of the provinces.

In Juſtinian's code it is mentioned, that irenarchæ are ſent into the provinces to maintain the public peace, by puniſhing crimes, and puting the laws in execution.

Beſides this there was another irenarcha in the cities, to whom belonged the preſerving of peace, and quelling ſedition among the citizens. This officer was ſometimes called *præfectus urbis*.

The emperors Theodoſius and Honorius ſuppreſſed the office of irenarchæ, on account of their abuſing their truſt, and diſtreſſing and perſecuting the people, inſtead of maintaining peace among them.

IRENE, in *Biography*, empreſs of Conſtantinople, born in the year 752, was an Athenian orphan, but being diſtinguiſhed by her great accompliſhments ſhe was married, at the age of 17, to Leo, ſon of the emperor Conſtantine V. This prince afterwards ſat upon the imperial throne as Leo IV. and at his death, in 780, left his wife guardian of their ſon, Conſtantine VI. then but 10 years old. During his childhood, Irene moſt ably and aſſiduouſly diſcharged, in her public adminiſtration, the duties of a faithful mother; and her zeal in the reſtoration of images, has given her the title and honours of a ſaint, which ſhe ſtill holds in the Greek church. As the young emperor attained the maturity of youth, the ſtruggle for power between him and his mother was carried on with the utmoſt ardour. He liſtened to his favourites, who ſhared his pleaſures, and were ambitious of his power, and was convinced of his right, and of his ability to reign, and determined to reward the ſervices of his mother by a perpetual baniſhment to the iſle of Sicily. She, on the other hand, ſaw through his projects in time to fruſtrate, for the preſent, his plans. The conteſt, however, was not over; and the ſoldiers determining for the prince, he was proclaimed lawful emperor, and his mother was diſmiſſed to a life of ſolitude. Here ſhe excited a powerful conſpiracy againſt Conſtantine, and, in 797, not only dethroned him, but moſt barbarouſly cauſed him to be deprived of his ſight. After this ſhe entered Conſtantinople in a chariot of ſtate, attended by ſeveral patricians as her ſlaves, and aſſumed the reins of empire. "But theſe patricians," ſays Gibbon, "were for the moſt part eunuchs; and their black ingratitude juſtified, on this occaſion, the popular hatred and contempt. Raiſed, enriched, entruſted with the firſt dignities of the empire, they baſely conſpired againſt their benefactreſs: the great treaſurer Nicephorus was ſecretly inveſted with the purple; her ſucceſſor was introduced into the palace, and crowned at St. Sophia by the venal patriarch. In their firſt interview, ſhe recapitulated with dignity the revolutions of her life, gently accuſed the perfidy of Nicephorus, inſinuated that he owed his life to her unſuſpicious clemency, and, for the throne and treaſures which ſhe had reſigned, ſolicited a decent and honourable retreat. His avarice refuſed this modeſt compenſation; and, in her exile in the iſle of Leſbos, the empreſs earned a ſcanty ſubſiſtence by the labours of her diſtaff." In this forlorn condition ſhe died in the ſucceeding year. Her zeal for orthodoxy, and her liberality to the church and the poor, have, in the eyes of eccleſiaſtical hiſtorians, almoſt wholly obliterated her ſavage cruelty and injuſtice towards her ſon. It is univerſally admitted that ſhe was endowed with a ſtrong underſtanding, and with great talents for government. Univ. Hiſt. Gibbon.

IRESINE, in *Botany*, is derived from ειρος, *wool*, becauſe this plant, when it bears fruit, is covered with a ſort of woollineſs. Ειρεσιωνη was the appellation of an olive-branch entwined with wool, ſuch as was cuſtomary for the Greeks to hang up in their houſes, in order to avert famine.—Linn. Gen. 521. Schreb. 687. Mart. Mill. Dict. v. 2. Browne Jam. 358. Swartz Obſ. 376. Juſſ. 88. Lamarck Dict. v. 3. 292. Illuſtr. t. 813.—Claſs and order, *Diœcia Pentandria*. Nat. Ord. *Holeraceæ*, Linn. *Amaranthi*, Juſſ.

Gen. Ch. Male, *Cal.* Perianth of two leaves, very ſmall, acute, ſhining. *Cor.* Petals five, ſeſſile, lanceolate, erect; nectary of five ſcales, the ſtamens being interpoſed. *Stam.* Filaments five, erect; anthers roundiſh. Female, *Cal.* and *Cor.* like the male. *Piſt.* Germen ovate, ſuperior; ſtyle none; ſtigmas two, roundiſh. *Peric.* none, except the permanent calyx. *Seeds* few, downy.

Eſſ. Ch. Calyx two-leaved. Corolla of five petals. Male, Nectaries ſeven. Female, Stigmas two, ſeſſile. Seeds woolly.

Obſ. Profeſſor Swartz has remarked that he never found this plant but with hermaphrodite flowers. He is of opinion that the plant deſcribed by Browne might be a diſtinct ſpecies with diœcious flowers. Swartz alſo ſays that *Ireſine* is ſo cloſely allied to *Celoſia*, that it almoſt appears to be a ſpecies of this latter genus.

1. *I. celoſioides.* Linn. Sp. Pl. 1456. (Amarantus panicula flavicante gracili holoſericea; Sloan. Jam. v. 1. 142. t. 90. f. 2.)—A native of Virginia and the Weſt Indian iſlands, particularly Jamaica.—*Root* perennial. *Stems* varying in height from two to ten or twelve feet, jointed, furrowed, divided at the top. *Branches* oppoſite, a little ſpreading. *Leaves* oppoſite, on foot-ſtalks, lanceolate or nearly ovate, acute, ſmooth. *Panicles* terminal. *Flowers* in a ſort of ſpike, ſmall, ovate, whitiſh, ſcaly at their baſe. *Filaments* ſhorter than the corolla; anthers yellow. The *calyx* reſembles a *capſule*, incloſing one or more black ſhining *ſeeds*. A white wool is protruded from between the ſegments when the time of flowering is paſt.

We ſuſpect that another ſpecies of this genus, with narrower leaves, is found in Jamaica.

IRETON, Henry, in *Biography*, a celebrated commander and ſtateſman of the parliamentary party in the civil wars of Charles I., was deſcended of a good family, and brought up to the profeſſion of the law. In the conteſts of the period in which he flouriſhed, Ireton joined the parliament army, and by his ſuperior talents, and the intereſt of Cromwell, whoſe daughter he married, roſe to the high office of commiſſary-general. At the famous battle of Naſeby he was wounded and taken priſoner. By his addreſs he ſoon obtained his liberty, and had a great ſhare in all thoſe political tranſactions which threw the parliament into the power of the army, and afterwards changed the conſtitution from a monarchy to a republic. His councils had great influence with his father-in-law; and his education as a lawyer cauſed him to be employed in drawing up many of the public papers of his party. From his ſuggeſtion, Cromwell ſecretly called, at Windſor, a council of the chief officers, in order to deliberate concerning the ſettlement of the nation, and the future diſpoſal of the king's perſon, and he had a principal hand in framing the ordinance for the king's trial, at which he ſat as one of the judges. Through his inſtigation Fairfax put to death, by martial law, Lucas and Liſle, taken at the ſiege of Colcheſter. This unuſual ſeverity was loudly exclaimed againſt by all the priſoners. Lord Capel reproached Ireton with it; and challenged him, as they were all engaged in the ſame honourable cauſe, to exerciſe the ſame impartial vengeance upon all. Ireton accompanied Cromwell to Ireland in 1649, and in the following year was left by him in that iſland as lord-deputy. Having finiſhed his military career with the capture of Limerick, he was ſeized with a peſtilential diſeaſe in that place, of which he died in November 1651; ſincerely lamented by the republicans, who revered him as a ſoldier, a ſtateſman, and a ſaint. According to Hume, he was "fierce in his nature, though probably ſincere in his intentions; he propoſed, by arbitrary power, to eſtabliſh liberty, and in the proſecution of his imagined religious purpoſes, he thought himſelf diſpenſed from all the ordinary rules of morality, by which inferior mortals muſt allow themſelves to be governed." And again he was "much celebrated for his vigilance, induſtry, and capacity, even for the ſtrict execution of juſtice in that unlimited command which he poſſeſſed in Ireland. He was obſerved to be inflexible in all his purpoſes, and it was believed by many that he was animated with a ſincere and paſſionate love of liberty, and never could have been induced by any motive to ſubmit to the ſmalleſt appearance of regal government. In gratitude for his great public ſervices, the parliament voted an eſtate of 2000*l.* *per ann.* to his family, and honoured him with a magnificent funeral at Weſtminſter Abbey, a circumſtance which, if he could have foreſeen, ſays Ludlow, "he would certainly have made it his deſire that his body might have found a grave where his ſoul left it; ſo much did he deſpiſe thoſe pompous and expenſive vanities; having erected for himſelf a more glorious monument in the hearts of good men, by his affection to his country, his abilities of mind, his impartial juſtice, his diligence in the public ſervice, and his other virtues." Ludlow's Memoirs. Hume Hiſt. Life of Cromwell in the Biog. Brit.

IRJAB, a town of Candahar, taken by Timur Bec in 1398; 46 miles S.E. of Cabul. N. lat. 33° 50'. E. long. 69° 8'.

IRIARTE Ignacio, in *Biography*, a Spaniſh painter of landſcapes, of whom Murillio ſaid, that he would only aſcribe the beauty of his works to divine inſpiration. He was ſecretary to the academy at Seville, where he died, in 1685.

IRIDES, in *Botany*, the 18th natural order in Juſſieu's Syſtem, and the 8th of his 3d claſs. It is equivalent to the *Enſatæ* of Linnæus, which latter appellation is properly, in our opinion, retained by Mr. Gawler (now Ker), in his illuſtration of this order; ſee ENSATÆ.—Its characters are thus given, the character of the claſs being *monocotyledonous, with ſtamens inſerted into the calyx or corolla.*

Corolla, which Juſſieu terms *calyx*, ſuperior, coloured, tubular at the baſe, its limb in ſix more or leſs deep ſegments, equal or unequal. *Stamens* three, inſerted into the tube, oppoſite to three alternate ſegments of the flower, their filaments diſtinct, or rarely united into a tube embracing the ſtyle. *Germen* inferior; with a ſingle ſtyle and three-fold ſtigma. *Capſule* inferior, of three cells, and three valves, with many, generally roundiſh, ſeeds.

Root either fibrous, tuberous, or bulbous. *Stem* moſtly herbaceous, leafy, rarely almoſt wanting. *Leaves* alternate, ſheathing, moſtly ſword-ſhaped. *Flowers* growing out of ſheaths, either ſolitary, or many together, which ſheaths often conſiſt of two valves.

The leading genera in Linnæus and Juſſieu are *Siſyrinchium*, *Iris*, *Ixia*, *Gladiolus*, *Antholyza*, *Crocus*, &c. which Mr. Ker has greatly ſub-divided. See HESPERANTHIA and GLADIOLUS.

IRIDIUM, in *Chemiſtry*, is a ſimple ſubſtance, and a metal. It was diſcovered by Mr. Smithſon Tennant in 1803, and an account of it was publiſhed in the Phil. Tranſ. for 1804. It appears that, previous to its publication, the ſame diſcovery was made, to a certain degree, by Deſcotils, which was afterwards taken up and enlarged upon by Fourcroy and Vauquelin.

Mr. Tennant found that the ſmall black ſcales exiſting in crude platina, and which are left after the platina has been diſſolved, contained two metals which had not been previouſly noticed. (See PLATINA.) He ſubjected the above ſubſtance to the alternate action of potaſh and muriatic acid, by which means he obtained two ſolutions. The black ſcales are heated to redneſs in a ſilver crucible, with their own weight of potaſh. When the heated maſs has water added to it, the potaſh diſſolves in combination with one of the metals, the ſolution being of an orange colour. The reſiduum being treated with muriatic acid, a ſolution is obtained, which at firſt is blue, then becomes olive green, and ultimately of a red colour, conſiſting of the acid united to the oxyd of the other metal. By this alternate treatment, the oxyd of oſmium, the other metal alluded to, is diſſolved in the potaſh, and the oxyd of iridium in the muriatic acid. The acid ſolution, on being evaporated to dryneſs, affords cryſtals of an octahedral form, which is, no doubt, a pure muriat of iridium. The ſolution of theſe cryſtals is of a deep red colour. When a plate of zinc, or any other metal, having a greater affinity for oxygen than itſelf, is placed in the ſolution, a black powder is precipitated, which, on being heated, becomes white, and puts on metallic luſtre. This metal, like gold and platina, has ſo little attraction for oxygen, that it may be obtained by expoſing the cryſtals of its muriat to a ſtrong heat. In this ſtate it is deemed pure iridium. It is a white metal, having the appearance of platina. Owing to its great infuſibility, we are not acquainted with ſome of its phyſical properties, ſuch as its ſpecific gravity and malleability. It has not been fuſed by Mr. Tennant nor the French chemiſts. It has, however, ſince been made to aſſume the liquid form, by means of the very intenſe heat produced by the large Galvanic battery lately exhibited at the Royal Inſtitution by Mr. Davy. This heat was ſo great, that at the ſame time the earths alumine and zirconia were fuſed, and charcoal was volatilized.

It forms malleable alloys with ſeveral of the metals, a preſumptive proof that it is itſelf malleable. Mr. Tennant found that it did not combine with arſenic, but that it eaſily united with lead; from which, like the noble metals, it may be ſeparated by cupellation. It forms malleable alloys with copper and ſilver. Its alloy, with gold, differs little from pure gold, even when the iridium is in conſiderable quantity. It appears to ſtand next above gold and platina in its affinity for oxygen. It may be inferred, from the change of colour in the acid ſolution, that it admits of at leaſt two ſtages of oxydation. When the metal is in its pure ſtate, it is not acted upon by any acid except the nitro-muriatic, and even this acid, according to Fourcroy and Vauquelin, diſſolves only $\frac{1}{300}$dths its weight. Its combinations with the other acids, and with combuſtible bodies, have not been attended to. See OSMIUM.

IRIJU, in *Geography*, a river of Guiana, which runs into the Atlantic, N. lat. 0° 58′. W. long. 51° 30′.

IRINON. See IRIS.

IRIS, in *Anatomy*. See EYE.

IRIS, *Prolapſus*, or *Procidentia of*, in *Surgery*, denotes a protruſion of a piece of the iris through a wound, or ulcerated opening in the cornea, after the eſcape of the aqueous humour. To this diſeaſe ſeveral writers have applied the name of ſtaphyloma; though, in all probability, the influence of Scarpa will in future confine the latter term to a morbid thickening and projection of the cornea itſelf, a caſe which will be deſcribed in its proper place. See STAPHYLOMA.

The prolapſus of the iris is produced by ſuch wounds and ulcers of the cornea as penetrate the anterior chamber of the aqueous humour, and ſometimes by blows, which have been ſo violent as to rupture the tranſparent membrane inveſting the fore-part of the eye. If the lips of a wound of the cornea (as, for inſtance, thoſe of the inciſion practiſed in the extraction of the cataract, or in opening an hypopium) are not immediately put into reciprocal contact, ſo as to keep the aqueous humour from running out of the anterior chamber, as faſt as it is ſecreted, the iris, drawn by the current of this fluid towards the wound in the cornea, is urged between the lips of the inciſion, and, becoming elongated, projects upon the preceding membrane in the form of a ſmall tumour. The ſame accident happens, when the globe of the eye receives a blow, or is too much compreſſed with a bandage, while a diſunited wound of the cornea exiſts. In ſuch a caſe, likewiſe, the prolapſus of the iris might be produced by a violent ſpaſm of the muſcles of the eye, exceſſive and long-continued vomiting, or repeated coughing. A prolapſus of the iris ariſes even more frequently from ulcers which extend through the cornea, than from wounds of that membrane; and Scarpa aſſigns as a reaſon for this fact, the loſs of ſubſtance always attending the former caſes. The little ſwelling muſt of courſe be of the ſame colour as the iris, namely, brown or grey; and its baſe is ſurrounded by a ſmall opaque circle, formed by the cornea that has been for ſome time ulcerated or divided.

It ſeldom happens that more than one prolapſus of the iris preſents itſelf in the ſame eye, ſince it does not often occur that the cornea is ulcerated or wounded in more than one place. However, we muſt not imagine that the iris is never protruded in ſeveral places at once: Scarpa has ſeen three diſtinct procidentiæ upon the ſame cornea, in conſequence of three ſeparate ulcers of that membrane.

Small as the tumour may be, (and, indeed, it is ſometimes not larger than a fly's head,) it is neverthele ſs apt to give riſe to very ſevere ſymptoms. Nor are we to wonder at this circumſtance, as the iris is ſupplied with numerous blood-veſſels and nervous filaments; and that part of it which is protruded muſt ſuffer exceſſive irritation, as well from the friction of the eye-lids, as from the action of the air, tears, and other matter upon it. Beſides, it is a fact, that the projecting piece of the iris inflames and ſwells ſoon after its protruſion, and conſequently it ſuffers a great deal more from the compreſſion and irritation. The patient at firſt complains of a pain like that of a thorn in the eye, and is alſo afterwards afflicted with an uneaſy ſenſation of tightneſs or conſtriction of the organ. To theſe complaints are ſoon added an inflammation of the conjunctiva and eye-lids, a diſcharge of irritating tears, and an inability to bear the light. The protruded piece of the iris unavoidably drags towards it the reſt of this membrane; and hence the ſhape of the pupil is changed from round to oval, and its ſituation undergoes an approximation to the wound or ulcer, through which the prolapſus of the iris has taken place.

When the diſeaſe has prevailed a conſiderable time, the intenſity of the pain, inflammation, and other ſymptoms, is ſometimes leſſened, inſtead of increaſed. Scarpa informs us of ſuch an example in a man, fifty years of age, who for ten weeks had had a prolapſus of the iris twice as large as a millet-ſeed. The patient bore the diſeaſe with the utmoſt indifference, being merely troubled with a ſlight chronic redneſs of the conjunctiva, and a difficulty in moving the eye-ball with freedom. The little tumour felt to the finger hard, and almoſt callous.

In the treatment of this diſeaſe, ſome practitioners have recommended puſhing the iris back again into its natural ſituation, by means of a whale-bone probe; and, in caſe of this being found difficult of accompliſhment, they have adviſed the wound or ulcer of the cornea to be dilated as far as neceſſary, in the ſame manner as the ſtricture of a ſtrangulated hernia is divided, for the purpoſe of enabling the ſurgeon to reduce the protruded bowels. Others have ſuggeſted irritating the projecting portion of the iris, in order to make it contract and return into its proper place again; and, with the ſame intention, it has been propoſed to expoſe the eye ſuddenly to a very vivid light. The experienced and judicious Scarpa, however, ſets down all theſe methods as ineffectual, if not dangerous; for, ſays he, admitting that we could, in any of theſe ways, replace the iris, without lacerating or hurting it, ſtill there would continue in the wound or ulcer of the cornea an opening, through which the aqueous humour would eſcape, and carry out with it again a fold of the iris.

It cannot be denied that a prolapſus of the iris is a moſt unpleaſant kind of accident; but yet, as we are utterly unpoſſeſſed of any means whereby we can ſtop the eſcape of the aqueous humour through certain wounds and ulcers of the cornea, we ought, according to Scarpa, to conſider the prolapſus of the iris a beneficial occurrence, and preventive of the total deſtruction of the eye, inaſmuch as the protruded fold of this membrane, acting like a plug, prevents the entire loſs of the aqueous humour, which ſoon collects again in the anterior chamber, and hinders a further protruſion of the iris, by ſeparating this membrane from the cornea, and re-eſtabliſhing the equilibrium between it and the other humours of the eye. Hence Scarpa reprobates the foregoing plans as uſeleſs and dangerous.

The principles laid down by this eminent ſurgeon tend to eſtabliſh two chief indications, in caſes of recent prolapſus of the iris: one is to diminiſh the extreme ſenſibility of the piece of the iris projecting out of the cornea; the other is to effect a gradual deſtruction of the protruded portion of the iris, to ſuch a depth as will render the wound or ulcer capable of healing, but not ſo deeply as to break the adheſion which the iris has contracted to the bottom of the breach in the cornea.

Both theſe indications may be fulfilled by touching the projecting part of the iris with the antimonium muriatum, or, with what is ſtill preferable, the argentum nitratum. An aſſiſtant, ſtanding behind the patient's head, is to keep the upper eye-lid raiſed with Pellier's elevator; and the patient is to hold his eye as ſteady as poſſible, by fixing it on one object. While the aſſiſtant raiſes the upper eye-lid, the ſurgeon is to depreſs the lower one with the index and middle fingers of his left hand, and with his right touch the protruded piece of the iris with the argentum nitratum, cut in the ſhape of a crayon. The cauſtic ſhould be preſſed upon the centre of the little tumour, ſo as to form an eſchar of the proper depth. The pain ſuffered at this inſtant is exceedingly ſevere; but it quickly ſubſides, as ſoon as the eye has been bathed with warm milk. The cauſtic expeditiouſly deſtroys the ſenſibility of the protruded part of the iris, and the eſchar prevents the effects of the friction of the eye-lids, and hinders the air and tears from cauſing any irritation of the projecting portion of that membrane. Hence the pricking and painful tenſion, previouſly felt in the eye, are diminiſhed; as likewiſe are the ophthalmy and ſecretion of ſcalding tears.

The benefit thus produced laſts only as long as the eſchar continues adherent to the tumour formed by the iris. Immediately the ſlough is detached, all the annoying complaints again come on, though in a ſomewhat mitigated degree, in conſequence of the projecting part of the iris not being quite ſo prominent as it was before the cauſtic was applied. The eſchar frequently ſeparates on the ſecond or third day; but whenever it happens, the painful ſymptoms recur; and the ſurgeon's duty is to uſe the argentum nitratum again without delay. The application is in this way to be repeated, until the protruded part of the iris is deſtroyed ſo deeply, that it can no longer hinder the wound or ulcer of the cornea from healing.

The employment of the argentum nitratum muſt not be continued, after the prolapſus of the iris has been ſufficiently depreſſed; as we learn from Scarpa, that ſuch a plan would bring on all the pain and inflammation again in an aggravated form. When the little tumour has been levelled as much as the indication requires, the cauſtic is not to be applied again; and the ſurgeon is ſimply to introduce between the eye and eye-lids a collyrium, containing ſulphate of zinc and mucilage of quince-ſeeds, and afterwards inſinuate a ſmall quantity of the following ointment under the eye-lids, every morning and evening:

℞ Adipis ſuillæ ℥ß.
Tutiæ ptt.
Bol. Armen. ſubtiliſſimé pulv. *ā ā* ʒij.
Calcis hydrarg. alb. ʒj. Miſce.

This ointment muſt be at firſt weakened with twice or thrice its quantity of lard.

When the foregoing applications are not too ſtimulating, the ulcer is gradually diminiſhed, and generally quite healed in about a fortnight.

As the union, which takes place in the courſe of the treatment, between the protruded piece of the iris and the internal edges of the wound, or ulcer, of the cornea, always continues after the cure is completed, the pupil muſt for ever remain of an oval ſhape, and a little inclined towards the cicatrix in the cornea. This muſt happen even when the treatment has been as ſucceſsful as poſſible. It is pleaſing, however, to learn from the experienced Scarpa, that ſuch alteration in the ſituation and poſition of the pupil cauſes little or no diminution of the power of ſeeing the moſt minute objects, and occaſions much leſs impairment of the ſight than might be ſuppoſed, unleſs it unfortunately happen that the ſcar in the cornea is in the middle of it. Beſides, we are alſo aſſured by the ſame diſtinguiſhed ſurgeon, that the power of diſcerning things is the leſs injured, inaſmuch as the pupil, which was in the beginning of the diſeaſe narrow and oblong, becomes afterwards more capacious. This fact is likewiſe confirmed by Richter in his Obſ. Chir. faſcicul. i. p. 80.

Scarpa has found the preceding treatment more ſucceſsful than any other, not excepting the method of cutting off the protruded part of the iris with a pair of ſciſſors. This laſt plan, he thinks, is only advantageous when the iris is ſtrongly adherent to the internal lips of the wound or ulcer of the cornea, or when the prolapſus has exiſted a long while, and the projecting portion of the iris has become indurated and callous, while its baſe, conſtricted by the edges of the wound, or ulcer of the cornea, not only adheres to them, but has put on the appearance of a kind of pedicle. Scarpa, indeed, has ſeen one inſtance, where the little tumour fell off of itſelf in conſequence of the compreſſion made upon its neck by the edges of the ulcer of the cornea.

Iris, *Imperforate.* See Pupil, *Cloſure of.*

Iris, in *Botany*, ιρις of the ancient Greeks, ſo named from the various, and ſomewhat concentric, hues of the flower, which give an idea of the rainbow. The modern Greeks call it κρίνος, and the Turks *ſuſen*, both which words are ſynonymous with our *lily*, and the French *lis*, or *fleur-de-lis* —Linn. Gen. 27. Schreb. 36. Willd. Sp. Pl. v. 1. 224. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 115. Sm. Fl. Brit. 41. Juſſ. 57. Lamarck. Illuſtr. t. 33. Gærtn. t. 13.—Claſs and order, *Triandria Monogynia.* Nat. Ord. *Enſatæ*, Linn. *Irides*, Juſſ.

Gen. Ch. *Cal.* Spathas of two valves, ſeparating the flowers, permanent. *Cor.* in ſix deep ſegments, united into a tube by their narrow baſes; each oblong, obtuſe; the three outermoſt reflected, three inner erect and moſt acute. *Stam.* Filaments three, awl-ſhaped, lying on the reflexed ſegments of the corolla, and not half ſo long; anthers vertical, oblong, ſtraight, depreſſed. *Piſt.* Germen inferior, oblong; ſtyle ſimple, cloſely enfolded by the tube of the corolla; ſtigmas three, each with a petal-like, dilated, oblong appendage, keeled on the inſide, furrowed at the outer, lying over each ſtamen, two-lipped, the lower lip ſmall and notched, upper larger, cloven, ſlightly reflexed. *Peric.* Capſule oblong, angular, of three cells and three valves. *Seeds* ſeveral, large, more or leſs compreſſed and angular.

Eſſ. Ch. Corolla in ſix deep ſegments, alternately reflexed, ſuperior. Stigmas with a petal-like two-lipped appendage.

Obſ. Botaniſts have differed about the really efficient part of the ſtigmas of the *Iris.* The whole petal-like expanſion was ſuppoſed by Linnæus and his followers to be the actual ſtigma, or at leaſt they had no preciſe idea of the excluſive action of any particular part. The late Abbé Cavanilles conceived the pollen to be received into a tubular opening between the baſe of each ſtamen and the extremity of the ſtyle, and there to perform its office. Kölreuter and Sprengel, with much more probability, believe the upper or inner ſurface of the ſmall lower lip of the petal-like expanſion, which is glandular in that part, to be the real ſtigma, and the latter has curiouſly explained the mode in which bees convey the pollen to this ſpot. See Sims and Konig's Annals of Botany, v. 1. 412. The ſtigma of ſeveral ſpecies of *Moræa* comes very near that of *Iris*, and there has always been ſome ambiguity between theſe two genera, which we ſhall endeavour to remove when we come to Moræa.

Iris is a large and very natural genus. Tournefort ſubdivided it into ſeveral by the roots, which in ſome ſpecies are tuberous, in others bulbous. Some moreover have the upper ſurface of the reflexed ſegments of the corolla ſmooth, whilſt in others that part is beautifully bearded.

In the *Species Plantarum* of Linnæus are 22 ſpecies; in Syſt. Veg. ed. 14. twice that number, Thunberg, who wrote a diſſertation on this genus, having greatly augmented it. Pallas diſcovered many new ſpecies in his Siberian travels. Willdenow has 54 in all. Mr. Ker differs from the latter in the arrangement of many of them, even Linnæan ones, which he removes to *Moræa*, and he is followed implicitly by Mr. Dryander in the new edition of the *Hortus Kewenſis.* The whole are divided into four ſections.

* *Root thick, ſolid, horizontal. Flowers beardleſs.*

Of this the common Engliſh *I. Pſeud-acorus*, Engl. Bot. t. 578, leſs accurately figured in Curt. Lond. faſc. 3. t. 4, is an example. It grows in watery places, flowering in July, and like every known *Iris* is perennial. The *flower* is bright yellow, ſtreaked with darker lines.

* * *Root thick, ſolid, horizontal. Flowers bearded.*

To this ſection belong many of our garden kinds, as *I. ſuſiana*, Curt. Mag. t. 91, or Chalcedonian Iris, ſo remarkable for its large flower, elegantly pencilled with black: *I. criſtata*, Sm. Spicil. t. 13, found in America: as well as the well-known *I. variegata*, *ſambucina*, *florentina*, and *germanica*, natives of the ſouth of Europe.

* * * *Root knobby. Flowers beardleſs.*

This contains only *I. tuberoſa*, Fl. Græc. Sibth. t. 41, Curt. Mag. t. 531, known by its quadrangular leaves and ſingularly dark flower.

* * * * *Root bulbous. Flowers beardleſs.*

Here are found the pretty *I. Xiphium*, Curt. Lond. t. 686, which decorates many a cottage garden with its ſweet blue and yellow bloſſoms: *I. perſica*, Curt. Mag. t. 1, more delicately coloured: and, to ſome perſons, exquiſitely ſcented, though to others it is ſcentleſs; and *I. Siſyrinchium*, Fl. Græc. Sibth. t. 42. Redout. Liliac. t. 29. The laſt is referred by Mr. Ker to *Moræa.*

Iris, in *Gardening*, contains plants of the fibrous, tuberoſe, and bulbous-rooted, flowery, herbaceous, perennial kinds; of which the ſpecies cultivated are very numerous; but the following are ſome of the principal; the dwarf iris (I. pumila); the Chalcedonian iris (I. ſuſiana); the Florentine iris (I. florentina); the twice-flowering iris (I. biflora); the leafleſs iris (I. aphylla); the variegated iris (I. variegata); the German iris (I. germanica); the elder-ſcented iris (I. ſambucina); the brown-flowered iris (I. ſqualens); the creſted iris (I. criſtata); the trifid-petalled iris (I. tricuſpis); the bulbous-rooted iris (I. xiphium); the common yellow, or water-iris (I. pſeud-acorus); the ſtinking iris (I. fœtidiſſima); the Virginian iris (I. virginica); the various-coloured iris (I. verſicolor); the pale-yellow iris (I. ochrolinea); the ſpring iris (I. verna); the Perſian iris (I. perſica); the graſs-leaved iris (I. graminea); the ſpurious iris (I. ſpuria); the Siberian iris (I. ſibirica); the Martinico iris (I. martinicenſis); the peacock iris (I. pavonia); and the ſnake's-head iris (I. tuberoſa).

The firſt of theſe ſorts has varieties with white flowers; with ſtraw-coloured flowers; with pale-blue flowers; with bluſh-coloured flowers; with yellow variable flowers; and with blue variable flowers.

The ninth ſort has likewiſe varieties with blue ſtandards and purple falls; with pale-purple ſtandards; with white ſtandards; and with a ſmaller flower.

The eleventh ſpecies alſo varies greatly in the ſhape of the larger petals, as well as in the colours, as blue, purple, yellow, white, and ſpotted.

And the twelfth ſort furniſhes varieties with blue flowers; with violet-coloured flowers; with white flowers; with purple flowers; with yellow flowers; with blue ſtandard petals and white falls; with blue ſtandards and yellow falls; with ſtriped flowers; the broad-leaved with blue flowers; the broad-leaved purple flowered; the ſweet-ſcented blue flowered; the ſweet-ſcented purple flowered, with variegated ſweet-ſcented flowers, and the double flowered.

The nineteenth ſort, or Perſian iris, is greatly eſteemed for the beauty and extreme ſweetneſs of its flowers, as well as for its early appearance in the ſpring, being generally in perfection in February or the beginning of the following month, according to the ſtate of the ſeaſon. And Martyn notices that, "like the hyacinth and narciſſus, it will blow within doors in a water-glaſs, but ſtronger in a ſmall pot of ſand, or ſandy loam, and that a few flowers will ſcent a whole apartment."

Method of Culture.—Moſt of the ſorts may be readily increaſed by parting the roots, or ſeparating the off-ſets from the bulbs, and planting them out in the ſituations where they are to flower; the firſt ſort in the autumn, or very early in the ſpring, and the latter in the cloſe of ſummer, when the leaves decay, managing them in the ſame manner as other bulbs. As they increaſe and ſpread rapidly in their roots, they ſhould be divided and taken off every two or three years.

New varieties of the different ſorts may be raiſed from ſeed, by ſowing it in the autumn in a bed of light ſandy mould. The plants come up in the following ſpring, and in the autumn may be tranſplanted where they are to grow. They flower a year or two afterwards in this climate.

The bulbous-rooted ſorts ſucceed beſt in ſuch ſoils as are of the light, ſandy, loamy kind; but will ſucceed in any that are dry.

The laſt ſort anſwers moſt perfectly in ſuch aſpects as are towards the eaſt, the roots being prevented from going too deep in the ground.

As the ſecond ſort is liable to be injured by ſevere winters, a few ſhould be planted in pots to have protection. This ſort is well ſuited for forcing, in houſes for the purpoſe.

When planted in the open ground, it requires a rather dry ſoil and ſituation to ſucceed in a proper manner.

The Cape ſorts ſhould be retained in the dry ſtove, and be propagated and managed in the ſame manner as other bulbous-rooted plants of the ſame kind.

All the ſorts are proper for affording variety in the borders, clumps, and other parts of pleaſure-grounds; and ſome of the more tender ſorts among potted plants of ſimilar growth and habits.

Iris, in the *Materia Medica.* The *Iris florentina*, Florentine orris, or iris, is a native of Italy, and flowers in June; it was cultivated in England by Gerard in 1596, and is now conſtantly propagated by the floriſts; but the roots of the orris produced in this country have neither the odour, nor the other qualities of thoſe of the warmer climates; ſo that for medicinal uſe they are commonly imported from Leghorn. In its recent ſtate, the root is extremely acrid, and when chewed, excites a pungent heat in the mouth, of ſeveral hours' duration. When dried, this acrimony is almoſt wholly diſſipated. The taſte is ſlightly bitter, and the ſmell is agreeable, approaching to that of violets. No eſſential oil has been hitherto obtained from this root; but ſpirituous tinctures of it contain more of its virtues than watery infuſions. The freſh root is a powerful cathartic, and for this purpoſe its juice has been employed in the doſe of a dram and upwards in dropſies. It is now chiefly uſed in its dry ſtate, and ranked as a pectoral or expectorant; though there is no evidence of its expectorant powers; and therefore it is now conſidered as valuable only for the pleaſantneſs of the perfume, and the flavour which it communicates.

The *Iris pſeud-acorus*, *paluſtris*, or *paluſtris lutea*, *Acorus adulterinus*, yellow water-flag, or yellow water flower-de-luce, is common in marſhes, and on the banks of rivers, and rendered very conſpicuous by its large yellow flowers, which appear in the beginning of July. It had formerly a place in the Lond. Pharm. under the name of "Gladiolus luteus." The root has no ſmell, but an acrid ſtyptic taſte, and its juice, ſnuffed up the noſtrils, produces a burning heat in the noſe and mouth, accompanied with a copious diſcharge from theſe organs; and hence it is recommended both as an errhine and ſialagogue. This root is ſuch a powerful aſtringent, that it has been uſed inſtead of galls in the making of ink, particularly in Scotland. For this purpoſe the common people cut ſome of the roots into thin ſlices, and either boil or infuſe them in water till the liquor is highly tinged with blue; they then pour it clear off: and putting into it the blade of a knife, or any other piece of iron, they rub it hard with a rough white pebble, common there, and by degrees the liquor becomes black: they continue rubbing it till it is as deep a black as they require, and it is a tolerable good ink. (Phil. Tranſ. N° 117.) This root has alſo been uſed for the purpoſe of dyeing black; and from this quality it has been ſucceſsfully employed as a medicine for the cure of diarrhœas. When given with this intention, the root is to be well dried; for the freſh root and its juice are ſtrongly cathartic, inſomuch that eighty drops of the latter produced repeated evacuations, after jalap, gamboge, &c. had failed, and by continuing its uſe in an increaſed doſe, it cured an inveterate dropſy. Hence Bergius ſays, "virtus *recent.* hydragoga, pungens: *ſiccat.* adſtringens." The expreſſed juice is likewiſe ſaid to be an uſeful application to ſerpiginous eruptions and ſcrophulous tumours. (Woodv. Med. Bot.) The root of this plant is recommended by Brookes as a remedy for the tooth-ache.

Iris, *Rainbow*, in *Phyſiology.* The word is Greek, ιρις, ſuppoſed by ſome to be derived from ειρω, *I ſpeak*, *I tell*, as being a meteor, that is ſuppoſed to foretel, or rather to declare, rain. See Rainbow.

Iris is alſo applied to thoſe changeable colours which ſometimes appear in the glaſſes of teleſcopes, microſcopes, &c. ſo called from their ſimilitude to a rainbow. The ſame appellation is alſo given to that coloured ſpectrum, which a triangular priſmatic glaſs will project on a wall, when placed at a due angle in the ſun-beams.

Iris is alſo a name given by ſome authors to a peculiar ſpecies of ſprig cryſtal, remarkable for its giving the rainbow colours in reflection. This, however, being a property more or leſs found in all the kinds of ſprig cryſtal, and theſe much reſembling one another, it became applied to ſprig cryſtal in general; and iris, inſtead of being the name of a peculiar ſpecies, was underſtood as a ſynonymous term for common cryſtal.

Iris *Marina*, the *Sea-rainbow.* This elegant appearance is generally ſeen after a violent ſtorm, in which the ſea-water has been in vaſt emotions. The celeſtial rainbow has great advantage over the marine one in the brightneſs and variety of the colours, and in their diſtinctneſs one from the other; for in the ſea-rainbow there are ſcarcely any other colours than a duſky yellow on the part towards the ſun, and a pale green on the oppoſite ſide. The other colours are not ſo bright or diſtinct as to be well determined, but the ſea-rainbows are more frequent and more numerous than the others. It is not uncommon to ſee twenty or thirty of them at a time at noonday. Obſerv. ſur l'Aſie, p. 292.

Iris *Plants, Petrified*, in *Natural Hiſtory*. In Dr. Grew's Catalogue of the Rarities of Greſham College, p. 274, he mentions a petrified iris-root; a ſtone ſomewhat flat, but radiated from the central pith, the poliſhed end of which, when wetted, ſhewed theſe radiations very fine: this extraneous foſſil probably belonged to the coralline tribe, inſtead of being a root. In Dr. Leigh's account of the foſſil plants, found in the coal-pits at Burnley in Lancaſhire, he mentions iris: long narrow leaves, reſembling thoſe of flags, and ſo called in general, are common in coal ſtrata; theſe kinds of leaves in the grit-ſtone quarries in Derbyſhire are often called ſwords, from the reſemblance of their impreſſions in the ſtone to the ſheath of a ſword.

IRISH Sea, in *Geography*, the name of that part of the Atlantic ocean, which is between the coaſts of Ireland and Great Britain.

Irish *Terms*. See Terms.

IRKINEEVA, in *Geography*, a town of Ruſſia, in the government of Tobolſk; 160 miles E.N.E. of Eniſeiſk. N. lat. 58° 50'. E. long. 96°.

IRKUTSK, a town of Ruſſia, and capital of a government, to which it gives name, on the Angara, near the lake Baikal, the ſee of a Greek archbiſhop, and a place of conſiderable commerce; the caravans which trade to China paſſing through it. N. lat. 52° 4'. E. long. 95°.

IRKUTSKOI, a government of Ruſſia, containing all that part of Siberia which lies beyond the 107th degree of eaſt longitude; bounded on the N. by the Frozen ſea, on the E. by the N. Pacific ocean, on the S. by Chineſe Tartary, and on the W. by the governments of Kolivan and Tobolſk. It is the moſt extenſive, but leaſt populous of all the Ruſſian governments, and is divided into the four provinces of Irkutſk, Nertchinſk, Yakutſk, and Ochotſk, ſo called from the four principal towns.

IRMA-HISSAR, a town of Aſiatic Turkey, in Natolia; 40 miles S.E. of Caſtamena.

IRNEE, a town of Hindooſtan, in the circar of Mahur; 38 miles N. of Mahur.

IRNERIUS, in *Biography*, ſometimes called Wernerius, a celebrated juriſt of the twelfth century, was probably born at Bologna. He firſt taught philoſophy in that city, and acquired much diſtinction by being the firſt who opened a ſchool for lectures in the Roman law in Italy, after its interruption by the invaſions of the barbarous nations. He alſo compoſed gloſſes upon the Roman law, not only upon the Code and Inſtitutions, but upon the Digeſt. He obtained great reputation by his labours; and the name of Wernerius, in a plea of the counteſs Matilda, in 1113, ſtands before that of any other of the lawyers. The ſame circumſtance is found in the pleas of the emperor Henry IV. from the year 1116 to 1118, which proves that he attended the court of that monarch in his profeſſional capacity. In 1118 he accompanied Henry to Rome, where he was employed to perſuade the Romans to the election of the anti-pope Burdin. He died about the year 1150; and is ſaid to have introduced the degree of doctor into the univerſities. Bayle.

IRON, *Eiſen*, Germ. *Fer*, Fr. *Ferrum*, Lat. *Ferro*, Ital. *Jeren*, Swed. *Jernet*, Dan. *Vas*, Hung. *Hierro*, Span. *Jalazo*, Ruſſ. *Ferro*, Port. Σιδηρος, Gr. בַּרְזֶל (*Bharzel*, or *Varzel*), Heb. *Mars*, Alchem.

The uſe of this metal is of very high antiquity, though not ſo remote, there is reaſon to believe, as that of either gold, ſilver, or copper. The inferior brilliancy of its colour may, perhaps, in ſome degree, account for this circumſtance; as well as the greater ſkill required to obtain it from its ores, and convert it to the purpoſes of art. It is mentioned frequently in the pentateuch; and was, in the time of the celebrated writer of that hiſtory, employed for the fabrication of ſwords, knives, and various other ſharp-edged inſtruments. We may form ſome eſtimate of the value that was then attached to it, from an expreſſion in the eighth chapter of Deuteronomy, where Moſes tells the Iſraelites, in his deſcriptive eulogy of the Land of Promiſe, that it is "a land whoſe ſtones are iron, and out of whoſe hills" they may "dig braſs." A circumſtance, illuſtrative of the ſame fact, at a later date, is furniſhed about 400 years ſubſequent to that period, when Achilles propoſed a ball of iron as one of the prizes to be diſtributed to the victors at the games inſtituted in honour of Patroclus. (Ιλιαδος, Ψ.) The art of working it appears, in the courſe of a few ſucceeding centuries, to have arrived at conſiderable perfection; for, according to the information of Herodotus (Clio xxv.), a ſaucer of the metal, very curiouſly inlayed, was preſented by Alyattes, king of Lydia, to the Delphic oracle, which, he ſays, "is of ſurpriſing workmanſhip, and as worthy of obſervation as any of the offerings preſerved at Delphi." The durability of iron, and its indiſpenſible aſſiſtance in the preparation of every other metal, make it one of the moſt valuable poſſeſſions that has been bequeathed to the uſe of civilized man. "Without it," obſerves Fourcroy, "agriculture could not have exiſted, nor could the plough have rendered the earth fertile. The philoſopher, while he ſtudies the progreſs of the human underſtanding, and compares the fortune and ſtate of the different nations eſtabliſhed on various portions of the ſurface of the globe, will remark, that their iron-works ſeem, in ſome meaſure, to be proportioned to their intelligence, to the advancement of reaſon amongſt them, and the degree of perfection to which the arts have arrived. When we conſider it in this point of view, as the agent by which men, in the variety of its uſes, and the numerous wants it ſupplies, acquire enjoyments which would be unknown to them if they did not poſſeſs theſe products of their induſtry, iron muſt ſingularly contribute to extend their ideas, to multiply their knowledge, and to conduct their ſpirit towards that perfectibility, which nature has given no leſs, as the character of the human ſpecies, than as the ſource of all the advantages it can enjoy." Syſt. vol. 6.

Iron is a malleable and ductile metal, of a blueiſh-white colour; is ſuſceptible of a very high poliſh, and of the ſpecific gravity, according to the tables of Muſchenbroeck, Swedenburg, and Briſſon, of from 7.600 to 7.895, and even 8.166. It is ſoluble in moſt acids, and precipitable from its combination with them, by various re-agents, which will be hereafter pointed out. With the Pruſſic acid it forms that beautiful pigment known in commerce, and the arts, by the name of *Pruſſian blue;* and in a variety of other ways, conſtitutes the baſis of many valuable preparations. The combinations under which it is exhibited to us in nature are detailed in the following ſection.

§ 1. *Ores of Iron.*

Sp. 1. *Native iron. Gediegen-eiſen. Fer natif. Ferrum nativum.*

Its colour is ſteel-grey, paſſing to ſilver-white. Occurs only in a ramoſe form; the maſſes alluded to by Brochant and others being now conſidered of meteoric origin. Surface gliſtening. Internally it is intermediate between gliſtening and glimmering; and its luſtre metallic. Fracture hackly. It is rather ſoft, is completely malleable, and flexible without being elaſtic. Sp. gr. 7.8.

A ſpecimen from a mine near Kamſdorf, in Saxony, yielded, according to Klaproth,

Iron	92.5
Lead	6.0
Copper	1.5
	100.0

The varieties which contain nickel are meteoric.

It is found in detached maſſes, which are uſually covered with an oxyd of a browniſh colour.

The places of its occurrence are Kamſdorf and Eibenſtock, in Saxony; Oulle, near Grenoble, in France; and ſome others.

Sp. 2. *Iron Pyrites. Schwefelkies. La Pyrite Sulfureuſe. Ferrum Mineraliſatum Pyrites.*

This very abundant mineral is divided by Werner into five ſubſpecies, common, radiated, capillary, hepatic, and cellular.

Subſp. 1. *Common Pyrites.*—Colour bronze-yellow, paſſing ſometimes to gold-yellow. Occurs maſſive and diſſeminated. It is very frequently alſo cryſtallized. Its forms are the cube, either perfect or truncated, the octahedron, dodecahedron, and ſometimes, though very rarely, the icoſahedron. The cryſtals are in general ſmall; except the cube, which is middle-ſized. Their ſurface is either ſmooth or ſtreaked, and varies from glimmering to ſplendent. Internally it is ſhining or gliſtening; and its luſtre metallic. Fracture even; ſometimes conchoidal. It is hard, brittle, rather eaſily frangible, and heavy. Sp. gr. from 4.600 to 4.831.

Expoſed to the blow-pipe, it exhales a ſtrong odour of ſulphur, and burns with a blueiſh flame. It afterwards paſſes into a globule, obedient to the magnet, of a browniſh colour; and treated with glaſs of borax, communicates to it a tint of a dark dirty green. It appears to be compoſed of about 52.5 ſulphur, and 47.5 iron.

Its occurrence is almoſt univerſal, both with reference to geographic arrangement, and the mineral formations in which it is preſented.

Subſp. 2. *Radiated Pyrites.*—Colour bronze-yellow, of a paler hue than the preceding; paſſing ſometimes to braſs-yellow. Surface tarniſhed. Is found maſſive and reniform, alſo uniform, globular, and cryſtallized. The ſhape of its cryſtals is cubic, and octahedral; the latter being ſometimes truncated on the angles. The external luſtre varies between ſplendent and gliſtening. Internally it is gliſtening and glimmering. Fracture uſually radiated; ſometimes uneven and fibrous. Fragments uniform. Occurs in coarſe and large-grained diſtinct concretions, alſo lamellated and columnar. It is hard, brittle, very eaſily frangible, and heavy, but leſs ſo than the foregoing ſubſpecies. Emits a ſulphureous odour when ſtruck, or rubbed. Sp. gr. from 4.698 to 4.775.

Before the blow-pipe it exhibits the ſame appearances as common pyrites, and is conſtituted of about 54 parts of ſulphur, and 46 of iron.

It is conſiderably rarer than the preceding, and is found in veins, particularly thoſe which contain lead or ſilver.

The places of its occurrence are, amongſt others, Cornwall and Derbyſhire, in England; Arendal, in Norway; and in various diſtricts of Suabia, Saxony, and Bohemia.

Subſp. 3. *Capillary Pyrites.*—Colour bronze-yellow, inclining more or leſs to ſteel-grey. Occurs in very fine capillary cryſtals. Luſtre ſhining or gliſtening; metallic. Brittle, and in a ſmall degree flexible. The ſmallneſs of its cryſtals prevents a more particular account being given of its character.

Its chemical properties are the ſame as thoſe of common pyrites.

It is never met with but in very ſmall quantity, and is the moſt rare of all the varieties of pyritic iron. It is moſt uſually accompanied with quartz, lead-glance, or galena, and fluor and calcareous ſpar.

Is found at Annaberg, Schneeberg, and Johanngeorgenſtadt, in Saxony; at Andreaſberg, in the Hartz; and other places on the continent of Europe. The capillary pyrites, according to Klaproth's analyſis, is not an iron-ore, but nickel, mixed with a ſmall portion of cobalt and arſenic.

Subſp. 4. *Hepatic Pyrites.*—Its colour is intermediate between bronze-yellow and ſteel-grey, paſſing ſometimes entirely to the latter. On expoſure, the freſh fracture changes to a brown. It is found maſſive, and under a variety of other forms, as ſtalactitic, cellular, &c. alſo cryſtallized. The ſhape of its cryſtalline arrangement is priſmatic, pyramidal, and tabular, each with ſix ſides. Luſtre glimmering, inclining to gliſtening; metallic. Fracture even, paſſing ſometimes to uneven and imperfectly conchoidal. Fragments indeterminate, ſharp-edged. Hard, rather inclining to ſoft, brittle, eaſily frangible, and heavy.

This ſubſpecies is ſaid to contain arſenic. It decompoſes very eaſily on expoſure to air, which renders it very difficult to be retained in mineralogical collections.

It occurs only in veins, and in thoſe principally which contain red ſilver ore, galena, blende, common pyrites, and ſparry iron-ſtone. The earthy minerals that acccompany it are, for the moſt part, quartz, ſulphat of baryt, and calcareous and fluor ſpar.

It is found in Derbyſhire; at Joachimſthal in Bohemia; Annaberg and Freyberg in Saxony; and in various parts of Sweden, Norway, and Siberia.

Subſp. 5. *Cellular Pyrites.*—Colour bronze-yellow, a good deal inclining to ſteel-grey. Tarniſhes by expoſure, and then becomes of a grey tint. Occurs maſſive; but its moſt common appearance is cellular. Cells druſy on the ſurface. Luſtre gliſtening. Fracture conchoidal. Fragments ſharp-edged, indeterminate. Brittle, and in a ſlight degree flexible.

Its occurrence is in veins, where it is accompanied, according to the ſtatement of profeſſor Jamieſon, with hepatic and common pyrites, lead-glance, ſparry iron-ſtone, nickel, iron-ochre, brown-ſpar, heavy-ſpar, fluor-ſpar, and quartz.

Is found at Johanngeorgenſtadt, in the electorate of Saxony.

Sp. 3. *Magnetic Pyrites. Magnetkies. La Pyrite magnetique. Ferrum mineraliſatum magnetico-pyritaceum.*

Colour copper-red, inclining much to bronze-yellow, and even to pinchbeck-brown. Tarniſhes on expoſure, becoming then brown. Occurs maſſive and diſſeminated: has never been found under any other form. Internal luſtre gliſtening, or ſhining; metallic. Fracture uneven, and ſometimes imperfectly conchoidal: when the latter, it has a luſtre bordering on ſplendent. Fragments indeterminate, rather blunt-edged. Intermediate between hard and ſemi-hard. It is brittle, eaſily frangible, and very heavy. Is attracted by the magnet. Sp. gr. 4.516.

Treated by the blow-pipe, it emits a ſlight ſulphureous odour, and melts with great facility into a greyiſh-black globule, which is attracted by the magnet, and colours borax black. It is compoſed of 36.5 ſulphur, and 63.5 iron.

It occurs only in the claſs of rocks denominated primitive; and there only in beds. The minerals which uſually accompany it are galena, magnetic iron-ſtone, arſenical pyrites and tin ſtone; with alſo quartz, garnet, ſtrahlſtein, hornblende, &c.

Its geographic diſtribution is rather extenſive. Amongſt many other inſtances, the following may be enumerated: Moel Elion, in Caernarvonſhire, North Wales; Geyer, Breitenbrunn, &c. in Saxony; Bodenmais, in Bavaria; and in different parts of Norway and Siberia.

Sp. 4. *Magnetic Iron-ſtone. Magneteiſenſtein. Le fer magnetique. Ferrum magnes.*

Werner divides this into two ſubſpecies; namely, common magnetic iron-ſtone, and magnetic iron-ſand.

Subſp. 1.—*Magnetic Iron-ſtone.*—Colour iron-black, inclining ſometimes to perfect black, and ſometimes to ſteel-grey. Occurs maſſive, diſſeminated and cryſtallized. The form of its cryſtals is the cube, perfect or truncated; the octahedron, which is alſo ſometimes varied by truncation; the garnet dodecahedron, and the rectangular four-ſided priſm, terminated by four planes, placed on the lateral edges, as in the hyacinth. Theſe cryſtals vary much in ſize. The dodecahedrons and octahedrons have their faces ſmooth; but the planes of the four-ſided priſm are tranſverſely ſtreaked. Luſtre externally ſhining; internally varying from glimmering to ſplendent. Fracture ſmall and fine-grained, uneven, approaching ſometimes to ſmall conchoidal, and imperfect foliated. Fragments indeterminate, rather ſharp-edged. Occurs ſometimes in granular diſtinct concretions. It is ſemi-hard, paſſing to hard; brittle; when in cryſtals difficultly frangible, and heavy. Sp. gr. 4.200 to 4.939. It is attracted by the magnet; and is itſelf alſo magnetic.

Before the blow-pipe it becomes brown, and imparts a dark-green colour to borax. It is ſuppoſed to be an oxyd of iron, nearly in a ſtate of complete purity.

This ſpecies is very common in primitive mountains, eſpecially in thoſe of gneiſs and micaceous ſchiſtus. In theſe ſituations it arranges itſelf in beds; but ſometimes compoſes the entire maſs of diſtinct mountains. The fletz, or ſecondary formations, as they are termed, are not free from it. It occurs in greenſtone at Taberg; in hornblende in Smoland, and in baſalt near Eiſenach. It is uſually aſſociated with common hornblende, garnet, and granular limeſtone. Sometimes with actinote, aſbeſt, &c.; but is moſt frequently found in the vicinity of magnetic pyrites, arſenical and copper pyrites, and common pyrites.

It is found in one of the Shetland iſles; in Bohemia, Hungary, Saxony, Italy, France, Switzerland, Siberia, and South America. Is very abundant in Sweden, where it is employed for the manufacture of the iron imported to this country for the ſupply of the Sheffield market.

Subſp. 2. *Iron-ſand.*—Colour deep iron-black, which paſſes ſometimes to aſh-grey. Occurs in angular or roundiſh grains; and alſo in ſmall octahedral cryſtals. Surface rough and feebly glimmering. Internal luſtre ſhining, metallic. Fracture perfect conchoidal. Fragments indeterminate, ſharp-edged. Streak greyiſh-black. Semi-hard, brittle, eaſily frangible, and heavy. Sp. gr. 4.600. Strongly attracted by the magnet.

Its chemical characters are as the foregoing ſubſpecies.

It occurs in the beds of rivers; and alſo imbedded in the rocks of baſalt and wacke.

Is met with in the river Elbe, near Schandau, in Saxony; imbedded in floetz-trap, in Bohemia; and is found alſo at St. Domingo, Guadaloupe, in Norway, France, the Tyrol, Greenland, &c.

Sp. 5. *Iron-glance. Eiſenglanz. Le fer ſpeculaire. Ferrum mineraliſatum ſpeculare.*

This is alſo divided into two ſubſpecies; common iron glance, and micaceous iron-ore, or, as it is called by profeſſor Jameſon, iron-mica.

Subſp. 1. *Common Iron-glance.*—Colour ſteel-grey of greater or leſs intenſity, and ſometimes reddiſh. It occaſionally paſſes into iron-black. Surface very often tarniſhed, and beautifully irideſcent. Occurs maſſive, diſſeminated, and cryſtallized. The form of its cryſtals is various. The moſt common is the rhomboidal parallelopipedon; the cube, formed by the truncation of a double three-ſided pyramid, and having three triangular faces inſtead of two of its angles oppoſite, and octagonal plates bounded by linear trapeziums, ſix in number, inclined alternately to different ſides. Planes of the cryſtals ſometimes ſmooth, and ſometimes ſtreaked. Externally it varies from glimmering to ſplendent; internally from gliſtening to ſplendent; luſtre metallic. Fracture compact and foliated. The compact varieties are uneven, and ſometimes ſmall conchoidal. The foliated have a fourfold rectangular cleavage. Fragments octahedral or pyramidal; ſometimes indeterminate. Edges rather blunt. Generally unſeparated. Gives a deep cherry-red ſtreak. It is hard, opaque, brittle, more or leſs eaſily frangible, and heavy. Sp. gr. 5.0116 to 5.218. It is magnetic, but leſs ſo than the preceding ſpecies.

Before the blow-pipe it is infuſible, alone; but becomes white when heated on charcoal; and yields a dirty yellow-coloured ſcoria, with borax. Stated by Kirwan to contain from 60 to 80 *per cent.* of iron.

This ſpecies appears to be confined to primitive, and the claſs called tranſition mountains. It has never been found in thoſe of ſecondary formation. Its occurrence is in beds and veins, where it is uſually accompanied with magnetic iron-ſtone, common pyrites, compact red iron-ſtone, hornſtone, and quartz.

Sweden yields it very abundantly; as alſo does Norway. Some of the fineſt ſpecimens are from the iſle of Elba, where the ore is ſaid to have been worked for upwards of three thouſand years. It occurs in Bohemia, Saxony, Switzerland, France, England (in Lancaſhire and Cumberland), Hungary, South America, Siberia, &c.

The Engliſh ſpecimens occur in cavities in compact red iron-ſtone. The cryſtals are uſually ſmall; and the luſtre of their ſurface is particularly ſplendent.

Subſp. 2. *Iron-mica.*—Colour iron-black, paſſing ſometimes to ſteel-grey, and ſometimes to deep-red. The latter is rather the colour of it, when held under the form of thin plates, between the eye and the light. Occurs maſſive, diſſeminated, and cryſtallized. When the latter, it appears in thin tables with ſix ſides. Surface ſmooth and ſplendent. Internally it is alſo ſplendent, and its luſtre metallic. Fracture perfect curved foliated; cleavage ſimple. Fragments ſometimes indeterminate, and ſometimes tabular. The maſſive varieties occur in granular diſtinct concretions. Thin plates of it are tranſlucent. Its ſtreak is deep cherry-red. It is ſemi-hard, brittle, very eaſily frangible, and heavy. Sp. gr. 4.50 to 5.07.

Before the blow-pipe it exhibits the ſame appearances as the preceding ſubſpecies, except in communicating an olive-green tinge to borax. The proportion of iron which it yields is from 70 to 80 *per cent.*

It is excluſively confined to primitive mountains, and for the moſt part to thoſe of a newer formation. It is found, like iron-glance, in beds and veins, and is accompanied with other ores of the metal: calcareous and fluor ſpar, quartz, hornſtone, &c.

Its geographic diſtribution is rather extenſive. It occurs near Dunkeld, in Perthſhire; at Dartmoor, in Devonſhire;

in one of the Shetland iſles; in Norway, Sweden, Ruſſia, France, iſle of Elba, and many diſtricts of Germany.

Sp. 6. *Red Iron-ſtone. Roth-eiſen-ſtein. La mine de fer rouge. Ferrum ochraceum rubrum.*

Werner has divided this into four ſubſpecies, which profeſſor Jameſon, in conformity with the principles of the Wernerian nomenclature, has denominated red iron-froth, ochry-red iron-ſtone, compact red iron-ſtone, and red hematite.

Subſp. 1. *Red Iron-froth.*—Colour deep cherry-red, ſometimes blood-red and browniſh-red, and even inclining to ſteel-grey. Uſually friable. Occurs ſometimes maſſive and diſſeminated; and is compoſed of ſcaly parts which ſoil conſiderably. Luſtre between glimmering and gliſtening; ſemi-metallic. Is greaſy to the touch, and moderately heavy.

Expoſed to the blow-pipe alone, it blackens without melting, and communicates a bright green colour to borax. According to Hauy, it is conſtituted of

Iron	66.
Oxygen	28.5
Silex	4.25
Alumine	1.25
	100.

It occurs generally in veins in primitive and tranſition mountains, accompanied with other ores of iron, copper pyrites, quartz, barytic ſpar, &c.

Although a rare variety of this metal, it is found rather plentifully in the neighbourhood of Ulverſtone, Lancaſhire, and is alſo met with in Cornwall. It occurs too in Norway, the Hartz, Saxony, Sileſia, Salzburg, Hungary, and South America.

Subſp. 2. *Ochry-red Iron-ſtone, or Red Ochre.*—Colour varies between blood-red and browniſh-red. Occurs ſometimes maſſive and diſſeminated, ſometimes ſuperficial, or coating other ores of the metal, but moſt uſually friable. Luſtre faintly glimmering, or dull. Fracture earthy. Fragments indeterminate, blunt-edged. Feels meagre. Soils more or leſs ſtrongly. Is not very brittle. Eaſily frangible, and rather heavy. Sp. gr. 2.952.

It is rarely found alone; being generally accompanied with other ſpecies of iron-ore, and particularly with compact red iron-ſtone, and red hematite. It occurs in veins; and is diſtributed nearly as the two following ſubſpecies.

Subſp. 3. *Compact red Iron-ſtone.*—Colour between browniſh-red and dark ſteel-grey, paſſing ſometimes to blood-red. Occurs maſſive, diſſeminated, and in various imitative forms, as reniform, cellular, &c. It is ſometimes found cryſtallized, and appears either in cubes, or four-ſided pyramids, the latter of which are truncated on their ſummits. The cube is found both perfect and truncated. Surface of the cubes ſmooth; of the pyramids rough and dull. Internal luſtre between glimmering and dull; ſemi-metallic. Fracture for the moſt part even. It ſometimes, however, paſſes into coarſe-grained, uneven, and large conchoidal. Fragments indeterminate, rather ſharp-edged. Streak blood-red. Between hard and ſemi-hard. Somewhat brittle, and more or leſs eaſily frangible, heavy. Sp. gr. 3.423 to 3.76.

It aſſumes a darker colour before the blow-pipe; but is infuſible, even with the aſſiſtance of borax. This re-agent, however, is tinged of a yellowiſh-green by it.

Occurs in beds and veins with red hematite and the preceding ſubſpecies; and is alſo accompanied with quartz, red-jaſper, and hornſtone.

It is found very abundantly in Lancaſhire; in the Hartz, Saxony, Bohemia, Heſſia, Siberia, and France.

It is frequently ſmelted in this country; and principally in thoſe works which fabricate the variety of iron deſcribed in the ſucceeding part of this article, under the name of *forge-pig.* The richer ores, in fact, are incapable of yielding the moſt highly carbonized deſcriptions of iron; partly, perhaps, becauſe they contain too little earthy matter to afford a ſufficiently plentiful *cinder;* and partly becauſe their reduction is too immediate.

Subſp. 4. *Red Hematite.*—Colour intermediate between browniſh-red and ſteel-grey; paſſing ſometimes intirely into one or other of them, and even into blood-red. It is from the latter variety that the name of hematite (from αιμα, *ſanguis,*) is derived. Occurs maſſive and reniform; alſo ſtalactitic, globular, uniform, &c. External ſurface rough and glimmering. Internally gliſtening, paſſing into glimmering; luſtre ſemi-metallic. Fracture always fibrous. Fragments uſually wedge-ſhaped; ſometimes ſplintery and indeterminate. In angulo-granular diſtinct concretions. Streak a bright blood-red. Hard, inclining to ſemi-hard. Rather difficultly frangible. Brittle, and very heavy. Sp. gr. 4.74 to 5.005.

It exhibits the ſame chemical characters as the foregoing ſubſpecies, and yields in the large way about 60 *per cent.* of metal.

According to the recent analyſis of M. D'Aubuiſſon, who has publiſhed a very intereſting memoir in the 75th volume of the "Annales de Chimie," on the chemical conſtitution of certain iron ores which appear to have water as an eſſential ingredient, this mineral is compoſed of

Peroxyd of iron -	90
Silex - -	2
Lime - -	1
Volatile matter -	3
Loſs - -	4
	100

The ſpecific gravity of the ſpecimens here ſubmitted to examination was 4.8. Another ſpecimen, the ſpecific gravity of which was 5.0, yielded the following reſult:

Peroyxd of iron -	94
Silex - -	2
Water - -	2
Loſs - -	2
	100

Each of the above preſented a trace of manganeſe, and the latter a ſimilar evidence of lime.

Its geognoſtic ſituation is ſimilar to the laſt.

Lancaſhire yields it very plentifully, as well as the neighbouring parts of Cumberland. It is found, too, in conſiderable abundance in Saxony; and in Bohemia, France, Sileſia, the Hartz, Siberia, &c.

It is one of the moſt common varieties of iron ore, and is very frequently employed in the ſmelting furnace.

Sp. 7. *Brown Iron-ſtone. Brown Eiſenſtein. La mine de fer brune. Ferrum ochraceum brunum.*

This, like the preceding, is divided into four ſubſpecies, which have the ſame leading diſtinctions. They conſiſt of brown iron-froth, ochry-brown iron-ſtone, compact brown iron-ſtone, and brown hematite.

Subſp. 1. *Brown Iron-froth.*—Colour varying between clove-brown and ſteel-grey. Occurs maſſive, ſuperficial, and frothy. Is compoſed of ſcaly particles, which are gliſtening, and have a metallic luſtre. Fragments indeterminate, blunt-edged. Intermediate between friable and ſolid. Soils ſtrongly. Feels greaſy to the touch. Is very ſoft, light, and ſometimes even ſwimming.

It blackens before the blow-pipe without melting, and communicates a yellowiſh-green colour to borax.

It is generally found coating compact brown iron-ſtone, and brown hematite.

One of the Shetland iſlands affords it; and it occurs alſo in Saxony, the Hartz, Norway, Carinthia, Bareuth, Carniola, and Stiria.

Subſp. 2. *Ochry-brown Iron-ſtone.*—Colour yellowiſh-brown, inclining to ochre yellow. Occurs maſſive and diſſeminated. Between ſolid and friable. Fracture earthy. Internally it is dull. Fragments indeterminate, blunt-edged. Soils conſiderably. Is more or leſs coherent, and heavy.

Imparts an olive-green colour to borax.

It accompanies the other ſubſpecies; and is found in Norway, Saxony, Bohemia, Bavaria, and Salzburg.

Subſp. 3. *Compact Brown Iron-ſtone.*—Colour clove-brown of various intenſities, paſſing ſometimes to yellowiſh-brown. Occurs maſſive, diſſeminated, and in various imitative forms, as ſtalactitic, reniform, cellular, dendritic, &c. It ſometimes, alſo, appears in pſeudo-cryſtals, of which the cube, rhomb, and lens have been particularized. Madrepores and corallines, too, have it frequently for their baſe; as well as other extraneous foſſils. Internally it is dull, or very rarely glimmering. Fracture uſually even, ſometimes earthy and ſmall-grained uneven, and conchoidal. Fragments indeterminate, edges more or leſs blunt. Streak bright yellowiſh-brown, bordering on ochre-yellow. Is ſemi-hard, inclining to hard. Rather brittle. Eaſily frangible, and heavy. Sp. gr. 3.4771 to 3.551.

It darkens before the blow-pipe, in conſequence of the loſs of oxygen, and becomes magnetic. Borax receives an olive-green colour from it.

The proportion of its ingredients, as ſtated by M. D'Aubuiſſon, in the 75th volume of the "Annales de Chimie," is as follows:

	From Bergzabern.	From Vicdeſſos.	From Voighitberg.
Peroxyd of iron -	84	81	69
Peroxyd of mangaueſe	1		3
Silex - -	2	4	10
Alumine - -			3
Volatile matter -	11	12	13
Loſs - -	2	3	2
	100	100	100

The ſpecific gravity of the ſpecimen from Vicdeſſos was 3.4.

It is always accompanied with ſome of the other ſubſpecies; and frequently with quartz, calcareous and heavy ſpar, and pyrites.

Occurs in Mainland, one of the Shetland iſles; the Hartz, Saxony, Sileſia, Bohemia, Suabia, the Tyrol, France, Carinthia, &c.

Subſp. 4. *Brown Hematite.*—Its colour, internally, is clove-brown, which paſſes to yellowiſh-brown, and browniſh-black. It is exhibited under a great variety of other ſhades, as blueiſh or iron-black, pinchback-brown, bronze-yellow, and ſometimes irideſcent. Occurs rarely maſſive; uſually in ſome of the imitative forms before ſpoken of. It is ſometimes found in pſeudo-cryſtals of a pyramidal ſhape, with ſix acute-angled ſides. Surface ſometimes ſmooth, and ſometimes rough and druſy. Luſtre ſhining or gliſtening. Internally it is from glimmering to gliſtening; intermediate between ſilky and reſinous. Fracture fibrous, paſſing ſometimes to ſmall conchoidal. Fragments uſually ſplintery or wedge-ſhaped; rarely indeterminate. Occurs in diſtinct concretions. Streak yellowiſh-brown. Opaque. Semi-hard. Brittle. Very eaſily frangible, and heavy. Sp. gr. 3.789 to 3.951.

It blackens before the blow-pipe, but does not melt. With borax it enters into ebullition, and produces a dirty yellow-coloured compound.

Its conſtituent parts, according to M. D'Aubuiſſon, whoſe analyſes were generally repeated two or three times, are as below ſtated:

	From Bergzabern.	From Vicdeſſos.
Peroxyd of iron - -	79	82
Peroxyd of mangaueſe -	2	2
Silex - - -	3	1
Volatile matter - -	15	14
Loſs - - - -	1	1
	100	100

The ſpecific gravity of the former was 3.8, and of the latter 3.9. The ſpecimen from Vicdeſſos afforded a ſlight trace of alumine.

It occurs in the neweſt primitive, tranſition, and ſecondary mountains; but moſt frequently in the two latter, where it is found lining cavities in veins or beds. Its uſual attendants are black and ſparry iron-ſtone, calcareous ſpar, brown and heavy-ſpar, and ſometimes, though rarely, quartz.

It is found in Voightland, the Fichtelgebirge, Franconia, Heſſia, and Naſſau.

This ſpecies, which is ſo very abundantly diſtributed in the German ſtates, is of rare occurrence either in Sweden, Ruſſia, Norway, or England. In the former, it furniſhes materials for very extenſive iron-works; and the wrought-iron produced from it is very valuable.

Sp. 8. *Sparry iron-ſtone. Spath eiſenſtein. Le fer ſpathique. Ferrum ochraceum ſpatiforme.*

Colour yellowiſh-grey, which paſſes into yellowiſh-brown, clove-brown, and blackiſh-brown. It tarniſhes on expoſure either to the air or heat, and then becomes brown or black, and ſometimes irideſcent. Occurs maſſive, diſſeminated, and cryſtallized. Its cryſtals are either rhombs, lenſes, octahedrons, or garnet-dodecahedrons. They are ſeldom large or very ſmall; commonly middle-ſized and ſmall. Their ſurface is ſometimes ſmooth, ſometimes druſy, and a little rough. Internally it varies from ſplendent to glimmering; luſtre pearly. Fracture foliated. Cleavage triple. Fragments rhomboidal. Occurs in granular diſtinct concretions. The light-coloured varieties are tranſlucent, eſpecially on the edges: but the dark-coloured opaque. The former give a greyiſh-white ſtreak; the latter a yellowiſh-brown. It is ſemi-hard, inclining ſometimes to ſoft. Rather brittle. Eaſily frangible, and moderately heavy. Sp. gr. 3.300 to 3.810.

It blackens before the blow-pipe, and enters into ebullition with borax, to which it communicates a dirty yellow colour. It always effervesces more or leſs with acids. According to Bergmann, it is compoſed of

Oxyd of iron	38
Oxyd of manganeſe	24
Lime	19
Carbonic acid	10
Water	9
	100

but it is liable to great variation in the proportion of its ingredients. In a recent examination by Collet-Deſcotils, the following reſult was afforded :

Fragments of quartz	2.58
Red oxyd of iron	48.45
Brown oxyd of manganeſe	1.80
Lime	.52
Magneſia	1.98
Carbonic acid, water, and loſs	44.67
	100.

Annales de Chimie, t. 58.

The ſpecific gravity of the ſpecimen analyſed in this caſe was 3.693 ; and its colour was browniſh-yellow.

It occurs in primitive and ſecondary mountains; in the former, in veins; in the latter, in beds.

It is found ſparingly in Britain ; and not very abundantly in Sweden, Norway, Switzerland, Siberia, Bohemia, and Saxony. At Schmalkalden, in Heſſia, however, there is a bed from 25 to 30 fathoms thick ; and in different parts of Weſtphalia, Stiria, Carinthia, &c. it is very plentiful. A whole hill, in the province of Biſcay, is compoſed of it, which is ſaid to have been worked for ſeveral thouſand years.

It is much uſed as an ore of iron, and the metal produced from it is conſidered to be peculiarly favourable for ſteel-making ; but whether this is any thing more than a mere prejudice, ſeems greatly to be queſtioned.

Sp. 9. *Black iron-ſtone. Schwarz eiſenſtein. La mine de fer noire. Ferrum ochraceum nigrum.*

This is divided into two ſub-ſpecies ; compact black iron-ſtone, and black hematite.

Subſp. 1. *Compact Black Iron-ſtone*.—Colour between blueiſh-black, and dark ſteel-grey. Occurs maſſive, and in various imitative forms. Surface dull, or faintly glimmering. Internally it is bordering on gliſtening, and its luſtre ſemi-metallic. Fracture commonly conchoidal, ſometimes uneven. Fragments indeterminate, ſharp-edged. Streak ſhining, but unchanged. It is ſemi-hard, brittle, eaſily frangible, and heavy. Sp. gr. 4.076, according to Wiedemann.

This mineral had for a long time been claſſed as an ore of manganeſe, and was removed to the preſent genus from ſome particular diſtinctions that were pointed out by Werner, between the compact grey manganeſe ore, of which it had uſually been conſidered a variety, and the ſub-ſpecies now under examination. M. D'Aubuiſſon, however, in the courſe of his late reſearches, has ſubjected a ſpecimen of it to chemical analyſis ; and inſtead of finding iron to be its principal ingredient, has aſcertained it to be almoſt wholly compoſed of manganeſe and ſilex. This would, perhaps, be a ſufficient authority for transferring it to the latter genus again ; but as the Wernerian claſſification has been uniformly adhered to in the preſent article, it has been deemed beſt to continue its enumeration here, and accompany the account of it with the particulars of M. D'Aubuiſſon's inquiry.

The ſpecimen he examined came from Raſchau, in Saxony, and was of a blueiſh-black colour mixed with grey. It had a compact fracture, was ſemi-hard, approaching to hard, and of the ſpecific gravity of 3.6. It conſiſted of

Peroxyd of manganeſe	64
Silex	13
Volatile matter	14
Loſs (occaſioned by an accident in drying ſome carbonat of manganeſe on the filter)	9
	100

Annales de Chimie, t. 75.

Conſiderable difference is very likely to exiſt in the chemical conſtitution of this mineral, and the total abſence of iron, in the preſent caſe, may certainly be regarded as rather an extraordinary circumſtance. Indeed, Werner's judgment is much too accurate to admit the ſuppoſition, that the varieties which have come under his inſpection were deſtitute of it ; but from the very great produce of manganeſe in the above analyſis, and the general character of the ſpecies, in imparting a violet-blue colour to borax, there can be little doubt that this, if not both ſub-ſpecies of black iron-ſtone, are, properly, ores of the former metal.

Subſp. 2. *Black Hematite*.—Colour inclining more to ſteel-grey than the preceding ſub-ſpecies. Occurs maſſive and reniform. Internally it is glimmering ; luſtre ſemi-metallic. Fracture delicately fibrous, paſſing into even. Fragments wedge-ſhaped. Occurs in granular diſtinct concretions. In other reſpects agrees with the preceding.

Before the blow-pipe, both the members of this ſpecies melt with borax into a violet-blue coloured glaſs. No exact analyſis has yet been made of the black hematite ; but its chemical conſtitution is in all probability very much ſimilar to that of the former ſub-ſpecies.

Black iron-ſtone is found in primitive and fletz mountains, accompanied with brown and ſparry iron-ſtone and quartz.

It occurs at Naila, in Bareuth ; Raſchau, in Saxony ; Heſſia, the Upper Palatinate, and the Hartz.

Sp. 10. *Clay iron-ſtone. Thoneiſenſtein. Le fer argileux. Ferrum ochraceum argillaceum.*

This widely diſtributed, and highly valuable mineral, is divided into ſeven ſub-ſpecies ; reddle, columnar clay iron-ſtone, lenticular clay iron-ſtone, jaſpery clay iron-ſtone, common clay iron-ſtone, iron kidney, or kidney-ſhaped iron-ore, and pea ore, or pea-ſhaped iron-ore.

Subſp. 1. *Reddle*.—Colour light browniſh-red. Occurs only maſſive. Principal fracture ſlaty, glimmering. Croſs fracture earthy, dull. Fragments tabular, ſplintery or indeterminate. Streak lighter than the fracture ſurface, and more ſhining. Soils ſtrongly, and may be written with. It is ſoft, and very ſoft, ſectile, eaſily frangible ; ſtrongly adherent to the tongue, meagre to the touch, and moderately heavy. Sp. gr. 3.1391 to 3.931.

It decrepitates and blackens at a red heat, and, in a more elevated temperature, melts into a kind of pumice of a greeniſh-grey colour.

It moſt generally occurs in the newer clay ſlate ; and is found in Thuringia, Saxony, Sileſia, Salzburg, Heſſia, and Siberia.

It is ſcarcely uſed for any other purpoſe than drawing.

Subſp. 2. *Columnar Clay Iron-ſtone*.—Colour browniſh-red, paſſing ſometimes to cherry-red. Occurs maſſive, and in pieces which are more or leſs angular. Surface rough and dull. Internally dull, and fracture earthy. It moſt uſually occurs in columnar diſtinct concretions. Streak blood-red. It is ſoft, very eaſily frangible, brittle, meagre to the touch, adheres ſlightly to the tongue, and is moderately heavy.

It blackens before the blow-pipe, and imparts an olive-green colour to borax.

It is but rarely met with, and appears to be, in ſome inſtances, of pſeudo-volcanic origin. Its occurrence with porcelain jaſper, and other minerals which are evidently of that claſs, gives conſiderable colour to the idea; but there are caſes, as the one obſerved by Reuſs in Bohemia, where it appeared in the centre of a mountain of clay-ſlate, that are equally oppoſite in their evidence.

It is found in the iſle of Arran, at Sobruſan, Hoſchnitz, Delau, and near Prohn, in Bohemia; at Dutweiler, in Saarbrücken; and Amberg, in the Upper Palatinate.

It yields too ſmall a proportion of metal, even where the mineral is ſufficiently abundant, to be at all worked as an ore of iron.

Subſp. 3. *Lenticular Clay Iron-ſtone.*—Colour browniſh-red, varying to reddiſh and yellowiſh-brown, and greyiſh-black. Occurs maſſive. Internally it is ſtrongly glimmering, ſometimes gliſtening, and always ſemi-metallic. Fracture fine earthy, and ſometimes ſlaty. Fragments indeterminate, blunt-edged. Occurs in diſtinct concretions, which are frequently lenticular, but ſometimes granular. The ſtreak varies with the colour of the ſpecimen: generally lighter. It is uſually ſoft, ſometimes very ſoft, and ſemi-hard. Sectile, inclining to brittle; very eaſily frangible, and heavy.

Its compoſition, according to Lampadius, is

Of oxyd of iron	64.
Alumine -	23.
Silex - -	7.5
Water - -	5.
Loſs	.5
	100

The black varieties, which occur only in the canton of Berne, are ſaid to yield 90 *per cent.* of iron. The red ore, which is found very abundantly in Bohemia, affords 60 *per cent.*

It is diſtributed in tranſition and fletz mountains, and generally unmixed with other minerals.

Beſides the ſituations already noticed, it is met with in Suabia, the Netherlands, Bavaria, Franconia, and France.

It is ſmelted as an ore of iron, and the brown varieties of it, which contain from 30 to 35 *per cent.* of metal, are much valued on account of the excellent quality of the metal that is produced from them.

Subſp. 4. *Jaſpery Clay Iron-ſtone.*—Colour browniſh-red. Occurs maſſive. Internal luſtre dull, bordering on glimmering. Fracture flat conchoidal; ſometimes even. Fragments rhomboidal, alſo cubic and trapezoidal. Lighter in the ſtreak. Soft, brittle, eaſily frangible, and heavy.

It has, hitherto, been only met with in a bed which belongs to the ſecondary or fletz formation, between Vienna and Hungary.

Subſp. 5. *Common Clay Iron-ſtone.*—Colour light yellowiſh-grey, inclining to aſh-grey, and paſſing into blueiſh and ſteel-grey, yellowiſh, reddiſh, and clove-brown, brick-red, and browniſh-red. Theſe colours, particularly the lighter ones, undergo a change on expoſure to the air, generally becoming darker. Occurs maſſive, and in a variety of extraneous forms, eſpecially of ſhells and vegetables. Internally it is dull. Fracture earthy, ſometimes conchoidal and ſlaty. Fragments indeterminate, blunt-edged; ſoft; rather brittle; adheres a little to the tongue; is more or leſs eaſily frangible; meagre to the touch, and heavy. Sp. gr. from 2.936 to 3.471.

Expoſed alone before the blow-pipe it blackens, but does not melt. With borax it enters into a ſort of ebullition, and produces a glaſs of a blackiſh olive-green colour. It varies conſiderably in the proportion of its ingredients. Some ſpecimens of the mineral yield as much as 40 *per cent.* of oxyd of iron, whilſt others do not afford more than 20 *per cent.*, and many even leſs than that. The following, which will contribute to ſhew this, are the reſults of ſome analyſes by Richter and Lampadius.

Oxyd of iron	20.1	33.9	39.	42.5
Oxyd of mangan*é*ſe	1.	1.1		3.
Silex - -	19.9	23.9	5.	13.8
Alumine -	30.2	13.	40.	13.6
Magneſia -			6.	
Carbonic acid -	28.8	28.1		27.1
Water -			9.	
Sulphur -			1.	
	100	100	100	100

This ſubſpecies is a very abundant one, and occurs in beds in the ſecondary or fletz formation.

It is found very plentifully in different parts of England and Scotland; and is alſo met with in Weſtphalia, Bohemia, Sileſia, the Upper Palatinate, Poland, Ruſſia, Siberia, Italy, and Norway.

Subſp. 6. *Reniform iron ore.*—Colour yellowiſh-brown, varying in intenſity in the ſame ſpecimen. The centre is the lighteſt, and not unfrequently includes a ſmall kernel of an ochre-yellow tint. Occurs in maſſes from the ſize of a walnut to that of a man's head, which are moſt commonly imbedded in clay or ſhale. Fractured towards the ſurface, even; in the interior fine earthy. Fragments indeterminate, rather ſharp-edged. Internal luſtre dull; externally glimmering, ſemi-metallic. It is compoſed of concentric, lamellar, diſtinct concretions, incloſing a nodule, which is often looſe. Surface rough; external layers ſoft; thoſe of the centre very ſoft; brittle; eaſily frangible; adheres to the tongue; is meagre to the touch, and moderately heavy. Sp. gr. 2.574.

It does not melt before the blow-pipe, when heated alone; but enters into fuſion with borax, and communicates to it a dirty yellow colour.

Occurs in the neweſt fletz rocks, imbedded in the argillaceous ſtrata that are incumbent on coal.

It is found abundantly in Derbyſhire, and ſome of the neighbouring counties; in Scotland, Norway, Denmark, Bohemia, Sileſia, Tranſylvania, France, and Siberia.

The greateſt proportion of the iron manufactured in the midland diſtricts of England, as well as in many parts of Scotland, is obtained from the two foregoing ſubſpecies. The metal which they afford, too, is, generally ſpeaking, of the beſt quality. This is principally referable to the liberal ſupply of earthy matter in their compoſition; for, without a ſufficient production of ſcoria, or cinder, in the blaſt-furnace, the highly carbonized, and conſequently moſt valuable, varieties of iron cannot be formed. Theſe ſubjects will be more fully diſcuſſed in a ſucceeding ſection of the article.

Subſp. 7. *Piſiform iron-ſtone.*—Colour yellowiſh-brown, of different ſhades, paſſing ſometimes to blackiſh-brown. This is its internal appearance. Externally, it varies according to the nature of the ſtratum in which it is imbedded, being reddiſh, yellowiſh, and liver-brown, and even yellowiſh-grey. Occurs in ſmall ſpherical grains. Centre of the grain dull; luſtre increaſing towards the ſurface to gliſtening. Internal fracture fine earthy; externally, even. Fragments indeterminate, ſomewhat ſharp-edged. Occurs in concentric, lamellar, diſtinct concretions. Streak yellowiſh-brown. It is ſemi-hard, paſſing to ſoft. Not very brittle; eaſily frangible. Sp. gr. 5.207.

It exhibits, before the blow-pipe, the ſame appearances as the laſt ſubſpecies. Subjoined are the reſults of two analyſes of it; the former by Vauquelin, the latter by Mallinghof:

Iron	30	45
Oxygen	18	15
Alumine	31	13
Silex	15	12
Water	6	15
	100	100

This mineral is ſuppoſed by Werner to occur in the ſecond fletz lime-ſtone, and in clay-beds.

It is found in France, Switzerland, Franconia, Heſſia, Suabia, the duchy of Wirtemberg, and Dalmatia. In the latter country, it is ſaid to be uſed by the inhabitants inſtead of ſhot.

The greater part of the French iron is extracted from this ſubſpecies. It yields, in the large way, from 30 to 40 *per cent.* of metal.

Sp. 11. *Bog iron ore. Raſeneiſenſtein. Le fer limoneux. Ferrum ochraceum cæſpititium.*

Werner divides this into three ſubſpecies; moraſs ore, ſwamp ore, and meadow ore.

Subſp. 1. *Moraſs ore.*—Colour yellowiſh-brown. It is ſometimes friable, and ſometimes approaching to coherent. When the latter, it occurs maſſive, corroded, and in grains. The former varieties conſiſt of duſty particles. Luſtre dull. Fracture earthy. Fragments indeterminate, blunt-edged. Soils conſiderably. Is meagre to the touch, and light.

Subſp. 2. *Swamp ore.*—Colour dark yellowiſh-brown, ſometimes paſſing to yellowiſh-grey. Occurs corroded, veſicular, and amorphous. Luſtre dull, ſometimes ſlightly glimmering. Fracture earthy, paſſing to fine-grained, uneven. Fragments indeterminate, blunt-edged. Streak light yellowiſh-brown. Very ſoft; ſectile. Eaſily frangible, and moderately heavy. Sp. gr. 2.944.

Subſp. 3. *Meadow ore.*—Colour, when freſh broken, blackiſh-brown, paſſing ſometimes to yellowiſh-brown, and browniſh-black. Occurs maſſive, in grains, tuberoſe, perforated, and amorphous. Externally it is rough and dull. In the interior it varies from ſhining to glimmering; luſtre reſinous. Fracture conchoidal, paſſing ſometimes to ſmall-grained, uneven, and earthy. The conchoidal varieties have the brighteſt luſtre. Fragments indeterminate, blunt-edged. Streak light yellowiſh-brown. Soft; brittle. Very eaſily frangible, and heavy.

Bog-iron ore in general blackens before the blow-pipe, without melting. It enters into ebullition with borax, and produces a glaſs of a dirtyiſh yellow colour. The only member of the ſpecies that appears to have been ſubjected to analyſis is the meadow ore: and it is conſtituted, according to the information of M. D'Aubuiſſon, of

Peroxyd of iron	61
Peroxyd of manganeſe	7
Silex	6
Alumine	2
Volatile matter	19
Phoſphoric acid	2.5
Lime, ſulphur, and loſs	2.5
	100

Annales de Chimie, t. 75.

The volatile matter, which ſo conſtantly forms a part of the reſults quoted from this chemiſt, almoſt excluſively conſiſts of water; and it was with a view, indeed, of aſcertaining the proportion of this ingredient, that his analytical labours were principally commenced. He ſuppoſes it to be an eſſential conſtituent of the different minerals he has examined, and propoſes to arrange them under the claſs of *hydrats*.

The preſent ſpecies is ſmelted in ſome of the countries that afford it, and yields, in the large way, from 30 to 35 *per cent.* of metal.

It occurs in the neweſt formations, and is conceived to be continually depoſited in marſhy places, from the evaporation of the water that has held it in ſolution. The preceding ſubſpecies are products of this proceſs at different ſtages; and the order in which they are arranged is indicative of the date of their formation.

It is found in different parts of the Highlands of Scotland, the Hebrides, Orknies, and the Shetland iſlands. Poland and Pruſſia contain conſiderable quantities of it; as alſo do Brandenburg, Courland, Livonia, and Lithuania. Its occurrence is more frequent in the northern than in the ſouthern countries of Europe.

Sp. 12. *Blue iron earth. Blaue eiſenerde. Le fer terreux bleu. Ferrum ochraceum cæruleum.*

Before it has been expoſed to the air, its colour is greyiſh-white, but afterwards becomes indigo-blue of different ſhades, and ſometimes ſmalt-blue. Occurs maſſive, and diſſeminated; and is compoſed of dull, duſty particles, which are friable and cohering. Soils ſlightly. Feels meagre, and is moderately heavy.

Before the blow-pipe, it becomes of a reddiſh-brown, and afterwards melts into a brilliant black globule, which tinges borax of a deep yellow. It is readily ſoluble in acids. Bergmann had ſuppoſed it to be a native *Pruſſian-blue;* and it has received a place in many mineralogical ſyſtems, under that name, from the ſame belief: but an analytical examination of it by Klaproth ſeems to prove it to be a compound of phoſphat of iron and alumine.

It occurs in neſts in clay-beds, amongſt bog-iron ore, and incruſting turf and peat.

It is found, under the latter circumſtances, in the Shetland iſlands; it alſo appears in Iceland, Saxony, Sileſia, Swabia, Bavaria, Poland, Siberia, Ruſſia, and Sweden.

Sp. 13. *Pitchy iron ore. Eiſenpecherez. Fer phoſphaté.*

Colour pitch-black, paſſing ſometimes into blackiſh-brown, and even deep reddiſh-brown. Occurs maſſive. Surface earthy, and dull. Internally it is gliſtening; luſtre reſinous. Fracture foliated, conchoidal, and ſometimes fine-grained, uneven. Fragments indeterminate, tolerably ſharp-edged. Opaque; ſemi-hard; brittle. Not very eaſily frangible, and moderately heavy. Sp. gr. 3.956.

It melts eaſily before the blow-pipe, and forms a black enamel. According to Vauquelin, it conſiſts of

Phoſphoric acid	27
Oxyd of iron	31
Oxyd of manganeſe	42
	100

Is found near Limoges, in France.

Sp. 14. *Green iron earth. Grüne eiſenerde. Le fer terreux vert. Ferrum ochraceum viride.*

This is divided into two ſubſpecies; friable green iron earth, and coherent green iron earth.

Subſp. 1. *Friable green iron earth.*—Colour ſiſkin-green. Occurs maſſive, and diſſeminated; and conſiſts of particles which are without luſtre. Fragments indeterminate; ſoils; is ſoft, and very ſoft. Sometimes friable. Meagre to the touch. Eaſily frangible, and moderately heavy.

Subſp. 2. *Coherent green iron earth.*—Colour rather darker than the laſt ſubſpecies. Occurs maſſive, and corroded. Internally dull. Fracture fine earthy, paſſing into even, and ſometimes into ſplintery. Fragments indeterminate; ſoft. Rather brittle, and inclining to heavy.

Before the blow-pipe, it becomes firſt red, and then of a dark brown; but does not melt. It tinges borax of a yellow colour, inclining to olive-green. No exact analyſis has been made of this ſpecies; but it is ſuppoſed by Werner to have iron and phoſphoric acid for its principal ingredients.

It is a rare mineral, and has hitherto been only found at Braunſdorf and Schneiberg, in Saxony, where it occurs in veins: in the former place, accompanied with quartz and pyrites; and in the latter, with quartz and native biſmuth.

Sp. 15. *Cube-ore. Wurfelerz. Fer arſeniate.*

Colour olive-green, of different degrees of intenſity. Occurs maſſive, diſſeminated, and cryſtallized in ſmall and very ſmall cubes, which are ſometimes flattened and truncated at the angles. Planes of the cryſtals ſmooth and ſplendent. Internally it is gliſtening, and its luſtre between pearly and adamantine. Fracture imperfect foliated. Fragments indeterminate. Occurs in granular diſtinct concretions. It is tranſlucent; ſoft; brittle, and gives a ſtreak of a ſtraw-yellow colour. Sp. gr. 3.000. It appears ſometimes in the form of a reddiſh-yellow powder, which is thinly diſtributed over the ſurface.

Before the blow-pipe it ſwells up, and emits an arſenical odour; melting afterwards into a grey metallic globule, ſlightly tinged with yellow. From the analyſis of Chenevix, it appears to be compoſed of

Arſenic acid - -	31.
Oxyd of iron -	45.5
Oxyd of copper -	9.
Silex - - -	4.
Water of cryſtallization	10.5
	100

It occurs in veins, accompanied with ſome ores of copper, quartz, mica, and feldſpar.

The only places that have, hitherto, afforded it, are the mines of Carrarach and Muttrell, in Cornwall.

Until the account publiſhed of this mineral by the count de Bournon, and Mr. Chenevix, in the Philoſophical Tranſactions for 1801, it was miſtaken for an arſeniat of copper.

§ 2. *Aſſay and Analyſis.*

Since the metal contained in every ore is of ſo much greater ſpecific gravity than any other of its accompanying ingredients, it will be eaſy to form a tolerable idea of the value of an iron-ore by the weight of a given bulk.

Previouſly to working any iron-ore it ſhould be very minutely analyſed, both in the humid and dry way. By the humid proceſs we ſhall aſcertain the exact proportions of its conſtituents, without which it would be a mere work of chance to attempt to extract the iron in the metallic form.

When we are acquainted with the nature of the earthy matter in combination with the ore, we know with the greateſt certainty what ſubſtances we ought to add in the crucible, for the purpoſe of eliminating the metal. All ſuch ſubſtances are called fluxes, merely becauſe they form fuſible compounds with the earthy matter of the mineral. It is to this treatment of a ſmall quantity of the ore that we give the name of aſſaying.

The proceſs by which the component parts are aſcertained, conſiſts in ſubjecting a ſmall quantity of the ore in fine powder to the action of an acid, and ſometimes to an alkali. By this means the whole is diſſolved, and the different materials of which it is compoſed are ſeparately precipitated by different chemical re-agents. The proceſs, however, varies conſiderably with the nature of the ore to be examined.

Iron ores, as ſubjects of analyſis, are divided into three heads; namely, ſulphurets, oxyds, and ſalts.

The firſt are diſtinguiſhed by their general bronze colour, but more particularly by the ſuffocating ſmell of ſulphureous acid gas, which they afford by being heated to redneſs in the open air. The ſecond conſiſt of iron united with oxygen, and are by far the moſt common of all. Nearly the whole of the iron-ores in uſe are of this kind, containing alſo different proportions of earthy matter in their compoſition.

The third diviſion comprehends ſuch as conſiſt of the oxyd of iron combined with ſome acid, and hence are called ſalts. The principal varieties of theſe are the phoſphats, ſulphats, arſeniats, and carbonats.

The apparatus employed in the humid analyſis will be a lamp fitted up with different-ſized ſliding-bearers, a ſilver crucible, and ſmall portable furnace, with a ſand-bath, and one of water, for drying precipitates; capſules of glaſs and porcelain; precipitating glaſſes, funnels, and filtering paper. For reducing the ore to powder, a mortar of hardened ſteel will be firſt neceſſary, and afterwards one of agate, to grind it very fine. Accurate weights and ſcales will be highly requiſite, with cups of ſilver or platina.

The re-agents wanted will be ſulphuric, muriatic, and nitric acids. Pure potaſh, ſoda, and borax, in the ſolid form. Solutions of the ſame, and alſo the pure aqua ammonia. The fully ſaturated carbonats of all the alkalis, and the ſubcarbonats of the ſame. The triple pruſſiat of potaſh and iron; and, when merely uſed as a teſt, pruſſiat of lime will anſwer. The analyſt ſhould, alſo, have in his poſſeſſion powders or ſolutions of all the ſeparate ſubſtances of which the mineral is ſuppoſed to conſiſt, for the purpoſe of comparing real reſults with thoſe obtained in his experiments.

If the ore to be analyſed be a pure ſulphuret, 100 grains, or any other given weight, may be reduced to powder, obſerving to weigh it after the operation, to ſee if any of the mortar has been abraded, which, when the ore is very hard, is to be expected; and the increaſed weight muſt in that caſe be noted down.

Let this powder be boiled with nitric acid in a long narrow-beaked glaſs veſſel, which ſhould be very thin at the bottom, to avoid cracking. By this method the ſulphur of the ore will be converted into ſulphuric acid; part of the nitric acid will be decompoſed, and moſt of the remainder fly off, ſo that the reſulting fluid will principally conſiſt of the iron diſſolved in ſulphuric acid.

To this ſolution add the muriat of barytes, till a precipitation ceaſes to take place. When the precipitate has ſubſided, and the fluid is become perfectly clear, gently pour off the liquor, which is a ſolution now of iron in the muriatic acid. Let the precipitate, conſiſting of ſulphat of barytes, be repeatedly waſhed with hot diſtilled water, till the liquid gives no precipitate with nitrat of ſilver, and afterwards add the waſhings to the fluid firſt poured off. After this white powder has been dried on the ſteam-bath, which is an apparatus conſtructed for this particular uſe, let it be weighed, and for every 100 grains of the ſubſtance allow 21.3 of ſulphur. To the liquid parts which contain the oxyd of iron, add a clear ſolution of the ſub-carbonat of potaſh. Let it boil for a little time, and the oxyd of iron will ſubſide. Waſh it and dry it as above, afterwards weighing the product. The quantity of oxygen in the oxyd of iron thus obtained, may be known by the quantity of iron obtained from it in the proceſs of aſſaying, which we ſhall afterwards give. If the ore conſiſt of oxygen and iron only, it may, without any previous treatment, be referred to the dry proceſs. When, however, earthy matter is combined with it, the humid analyſis ſhould be reſorted to, which requires a different mode of proceeding to that already given.

Let 100 grains of the ore be reduced to a fine powder, as above directed, obſerving to weigh it afterwards, for the purpoſe of aſcertaining whether any of the materials of the mortar be mixed with it. The matter ſo added, if it be acquired from the agate mortar, may be deemed pure ſilex.

To this powder add 300 grains of dry potaſh, in a ſilver crucible, capable of holding about ſix or ſeven ounces. Pour to the mixture a very little water, juſt ſufficient to moiſten the whole. Apply a gentle heat in the firſt inſtance, to prevent the maſs from ſwelling too much, and gradually increaſe the temperature till the crucible is red-hot. The maſs will now be in a ſtate of fuſion more or leſs perfect, according to the quantity of ſilex contained in the ore. If, from a great proportion of alumine being preſent, the fuſion ſhould be very imperfect, more potaſh muſt be added, and the heat continued and raiſed as high as the crucible will bear. When the crucible, with its contents, are ſufficiently cooled, let both together be put into a capſule of porcelain, and nearly filled with diſtilled water. The whole ſhould then be ſet upon a ſand-bath, and boiled for ſome time, taking care to ſtir it very frequently. This will detach the matter adhering to the crucible, and if any ſilex remain unacted upon, it will be diſſolved by the potaſh.

Let the whole be now ſaturated with muriatic acid, and even added a little in exceſs; and then gently boiled till all the liquid is evaporated. During this, the mixture muſt be conſtantly ſtirred; and particularly at the time the maſs is becoming dry.

To this reſiduum let a large quantity of diſtilled water be poured. All the ſubſtances ſoluble in the acid will be now taken up. If it contain ſilex that will be left at the bottom. Let the whole be decanted into a narrow tall glaſs veſſel, to ſuffer the ſilex to ſubſide. Carefully pour off the clear liquor, and then add freſh hot diſtilled water, and continue to do ſo till the fluid does not cauſe a precipitate with nitrat of ſilver; obſerving to ſave all the waſhings which are acted upon by that teſt. The remaining water may now be evaporated from the ſilex, and the powder, being heated red-hot in a crucible of ſilver or platina, ſhould be then weighed. If it be pure, it will be of a delicate white colour, not adhering to the fingers, as is the caſe with ſome of the other earths.

The ſolution containing the remaining ſubſtances ſhould be evaporated to as ſmall a quantity as poſſible, ſo that the fluid remain liquid and clear. To this let a ſaturated ſolution of the ſubcarbonat of potaſh be added, and afterwards boiled a few minutes. By this means, the whole of the ingredients will be precipitated together, and when all of them have perfectly ſubſided, decant off the liquor, repeatedly waſhing it with hot water. The firſt decanted liquor, with the waſhings, may be thrown away. Laſtly, evaporate the remaining water, till the ſolid matter is of a pulpy conſiſtence. To this, in a capſule of good porcelain, add a ſolution of pure potaſh. The alumine will be thus diſſolved, while all the other ſubſtances will remain untouched. Let this fluid be poured off, and freſh water mingled with it, to take away all the alumine. Then, to the mixture containing the alumine, add not only as much acid as will ſaturate the potaſh, but alſo a quantity ſufficient to diſſolve the alumine, when the liquid will be quite clear. Finally, to this pour in carbonat of ammonia, till no more precipitate falls down. The precipitate, when waſhed and dried as above directed, and heated to redneſs in a ſilver crucible, may be conſidered as pure alumine.

The reſiduum from which the alumine was laſt taken is now to be diſſolved in ſulphuric acid, diluted with a large quantity of water, the acid being ſlightly in exceſs. This ſolution may contain magneſia, iron, and probably manganeſe. If lime were preſent, it will be left inſoluble at the bottom of the veſſel, in the ſtate of ſulphat of lime. The ſmall portion of this ſubſtance diſſolved by the fluid, may be precipitated by the addition of alcohol. The powder, when collected and dried at a dull red heat, muſt be weighed; allowing for every 100 parts 42 of pure lime. The ſolution from which the lime was ſeparated, muſt next be ſaturated with a ſolution of the neutral carbonat of potaſh. In a few minutes the iron will be precipitated in the ſtate of oxyd, while the magneſia and manganeſe will be diſſolved by the carbonic acid. The iron muſt be ſeparated, dried, and weighed. If with the ſolution containing the magneſia and manganeſe a ſolution of hydroſulphuret of potaſh be mingled, the latter will be precipitated in the form of a ſulphuret; and this being waſhed and heated till the ſulphur is driven off, the oxyd of manganeſe will be left in ſufficient purity.

The magneſia ſtill held in ſolution may be precipitated by adding a ſufficient quantity of pure potaſh. The product muſt be heated to redneſs, and weighed. The weights of the different ſubſtances being added together, will, if great care has been uſed, be within one or two *per cent.* of the quantity originally ſubmitted to experiment. If the deficiency be conſiderable, ſome miſtake muſt have been made, and it will be neceſſary to repeat the analyſis.

In the examination of ſalts of iron, nothing more is requiſite than to diſengage the acid with which the iron is combined. The arſeniat of iron, for example, muſt be boiled with potaſh, which will ſeparate the arſenic acid, and leave the oxyd of iron but very little acted upon. The arſenic acid may be afterwards precipitated by nitrat of lead; allowing for every 100 parts of the arſeniat of lead, when dried, 33 parts of arſenic acid.

If the ore be a pure carbonat, to 100 grains in powder, add an equal quantity of ſulphuric acid, in a glaſs veſſel which can be placed over a lamp. Heat the mixture for ſome time, ſtirring it with a glaſs rod. The carbonic acid will be thus expelled, and its quantity will be indicated by the loſs of weight ſuſtained. Care ſhould, of courſe, be taken that the heat be not too great, otherwiſe the evaporation of fluid matter may create error in the experiment. The iron may be afterwards treated as in the analyſis of the earthy ores, and its quantity aſcertained, by the methods there deſcribed. Having learned the exact proportions of the ingredients united in the ore, we may, with ſome degree of certainty, proceed to the aſſay by the crucible and fluxes. If the ore conſiſt of oxyd of iron ſimply, nothing more is neceſſary than to introduce it into a crucible with about half its weight of charcoal powder, and any ſubſtance ſuſceptible of vitrification, ſo as to keep off the air. This may be either pounded glaſs, or equal parts of lime and clay. But perhaps the beſt ſubſtance that can be employed, is the moſt fuſible part of the blaſt furnace cinder, which is the leaſt coloured with oxyd of iron. This may be employed in quantity amounting to about half the weight of the mineral to be aſſayed.

The earthy iron ore muſt be treated according to the reſult of the humid analyſis; ſuch earth being added as a flux, as will make the moſt fuſible compound with that found by analyſis to be preſent. The carbonaceous matter may be from $\frac{1}{3}$ to $\frac{1}{2}$ the weight of oxyd of iron.

The furnace beſt calculated for theſe experiments is called an aſſay furnace, and is capable of producing a great heat. See FURNACE.

The crucibles ſhould be very ſmall, not capable of holding more than three fluid ounces; and they ſhould be provided with covers turned to them in a lathe before they are burned. The aſſay may be deemed finiſhed when the whole is in a ſtate of fuſion, and the metallic button ſeparated, which, being weighed, will give the *per centage* of iron in the ore.

§ 3. *Reduction of Ores, and Manufacture of Pig-iron.*

Although iron in its pure ſtate is almoſt an infuſible ſubſtance, it is capable of aſſuming the liquid form, by being combined with other matter. With ſulphur it forms a fuſible maſs, of which we ſhall treat hereafter, It is alſo rendered fuſible at a temperature ſomething higher than that required to melt copper, by being combined with about $\frac{1}{15}$th of its weight of carbon. It is to this compound in different proportions that the name of pig-iron is given, and it is ſo denominated, becauſe it is caſt into maſſes of a ſemi-cylindrical ſhape, called *pigs*.

The fuſibility of this compound of iron and carbon, enables us to extract the metal from the ore to the greateſt advantage. It is now common, particularly in our own country, to obtain the iron in this form, previous to making it into bar, or malleable iron. Formerly caſt metal was not much in uſe, except for the manufacture of bar-iron and ſteel; while in the preſent day, a much greater proportion of it is conſumed in that ſtate than in any other; and the majority of our furnaces, too, are ſolely employed for this branch of manufacture.

The proceſs by which pig-iron is obtained from the different iron ores is called *ſmelting;* and the furnaces employed for the purpoſe are called *ſmelting*, or *blaſt furnaces*. See BLAST *furnace*, and BLOWING.

The ores of iron require different treatment in the ſmelting proceſs, according to the quantity of heterogeneous matter with which the metal is combined.

In all the ores the iron is in the ſtate of oxyd, and would at leaſt require a ſtrong heat in contact with combuſtible matter for their reduction. In moſt, the oxyd of iron is combined with a conſiderable proportion of earthy matter, and they are then denominated *iron ſtones*. Theſe may be generally divided into two claſſes; the one called argillaceous, from abounding with exceſs of alumine, or clay; and the other calcareous, from lime being their principal earthy conſtituent. The former of theſe iron-ſtones is by far the moſt abundant in this country.

But, beſides the earthy matter and oxygen in this claſs of metallic minerals, many of them contain ſulphur, which is doubtleſs combined with the iron in the ſtate of pyrites. Arſenic and mangancſe are alſo ſometimes united with them. Of the above, the arſenic and ſulphur are extricated, previouſly to ſmelting, by the proceſs called *roaſting*. For this purpoſe, the ſtone is ſtratified with refuſe pit coal, and burnt in large heaps in the open air. The heat is ſufficient to diſſipate the greateſt part of the above volatile materials, leaving behind the earth and oxyd of iron; and alſo the mangancſe, when the ore abounds with that metal.

In the proceſs of ſmelting, two things are abſolutely eſſential to the ſeparation of the iron. Firſt, the metal itſelf muſt be rendered fluid, which will then, by its great ſpecific gravity, deſcend to the loweſt parts of the furnace, and ſome other compound muſt, at the ſame time, be eliminated in a liquid form, ſo as to float upon its ſurface, and defend it from the influence of the blaſt. If the ore conſiſted of iron and oxygen alone, the carbon of the coke would combine with the oxygen; and an exceſs of carbon would alſo unite with the iron to render it liquid at that temperature; but here would be a deficiency of the fluid vitreous matter neceſſary to the defence of the iron from the oxygen of the blaſt. Hence it will be neceſſary to employ ſome ſubſtance with ſuch iron-ore, which ſhall be capable of forming a liquid ſcoria, or cinder, for the preſervation of the carburetted iron when once obtained. So far as obſervation has dictated, it would ſeem that the cinder cannot be too perfectly fluid. The principles on which the fuſibility of the cinder depends, are not ſimply confined to the materials uſed in the ſmelting of iron, but refer to all compound fuſible matter with which we are acquainted. It may be obſerved, in general, and, indeed, almoſt without exception, that the fuſibility of an alloy of two metals is fuſible at a temperature much leſs than the arithmetical mean between the fuſing points of the metals themſelves. For inſtance, an alloy of lead and tin is more fuſible than either of the metals compoſing it, and a ſimilar mixture of copper and ſilver may be uſed as a ſolder for either ſilver or copper ſeparately. This property is not leſs conſpicuous in the earths. None of them in their *pure* ſtate can be fuſed in our hotteſt furnaces; nor ſcarcely with a ſtream of oxygen gas; although certain proportions of them are, together, fuſible at the heat of a moderate air-furnace. Lime and clay, when ſeparately taken, may be conſidered as incapable of fuſion at any degree of heat, yet produced in furnaces; and ſtill, in certain proportions, they are too fuſible to be made into even bricks or crucibles. It will appear, from theſe facts, that the iron-maſter cannot pay too much attention to the ſubject of the relative fuſibility of the earths in different proportions. Moſt of the iron-ores of this country are argillaceous; that is, conſiſt, beſides oxyd of iron, of a ſmall quantity of ſilex or flint, and a large proportion of clay. Limeſtone has always been employed for ſuch ores, and, by combining with the clay and flint, as well as with a ſmall portion of the oxyd of iron, forms a ſcoria or cinder, eaſily capable of fuſion. Since, however, the proportions of theſe earths in the ore cannot be uniform, the quantity of limeſtone to be added ought to vary according to circumſtances. We may hence infer, that if the fuſibility of the cinder depends upon the particular proportions of the earths preſent, the iron-maker ought to poſſeſs a very perfect knowledge of the relative fuſibility of different combinations of theſe bodies, and being at the ſame time aware of the component parts of the ore to be reduced, he will not be at a loſs what ſhould be added in the furnace, for the purpoſe of producing the moſt fuſible cinder. But it will be proper here to obſerve, that the earths preſent, however accurate may be their proportions, will not of themſelves form a cinder of ſufficient fuſibility, without the united aid of the oxyd of iron. This fact will be very familiar to thoſe who have had experience in the uſe of fire-bricks. Clays which are free from that ingredient do not burn of a red colour; and hence the white appearance of fire-bricks is a tolerable teſt of their goodneſs. But thoſe, on the contrary, which exhibit a redneſs on being fired, are eaſily fuſed, and unfit, conſequently, to be uſed in thoſe ſituations which are expoſed to great heat. The proportions of lime, clay, and oxyd of iron, neceſſary to conſtitute the moſt fuſible compound,

pound, has not, as we have yet heard, been directly aſcertained by experiment. An inquiry, undertaken with this view, would, however, be of great importance to the ironmaſter. It might be effected in two ways; firſt, by mixing different proportions of the materials employed; and, ſecondly, by a direct analyſis of the moſt fuſible part of the blaſt-furnace cinder, and that with which the beſt and moſt carbonated iron has been produced. The cinder which fuſes at the loweſt temperature will be beſt known by its fracture after cooling. It may, in general, be deemed good in proportion to its earthineſs when ſolid, and particularly ſhould the outer cruſt appear glaſſy and tranſparent. A reaſon may be given for this appearance, by reference to ſome facts announced by ſir James Hall and Dr. Hope, in accounting for the opacity of the whin-ſtone. They found that when common flint-glaſs, which is more fuſible than the blaſt-furnace cinder, was allowed to cool ſlowly, the maſs became opaque, and put on a ſtony appearance. They hence concluded, that the whin-ſtone might have been tranſparent, and have poſſeſſed a glaſſy fracture, had it been cooled rapidly. The inference to be drawn from this will be obvious; for the more fuſible the cinder, the longer it is in cooling, and conſequently the more opaque. What ſtrengthens this idea, too, is, that the exterior of a maſs of cinder is more tranſparent, almoſt conſtantly, than the interior; and the centre of that in particular, under which the beſt iron is made, having a ſtony fracture, with a thin vitreous ſhell ſurrounding its outſide. In beginning to work any new ore of iron, the firſt ſtep is to analyſe it, both in the dry and humid way. By the firſt, we get the *per centage* of iron in the one; and by the ſecond, we become acquainted with the quality and proportions of its earthy matter. The next ſtep is to analyſe the coal to be employed, for the purpoſe of aſcertaining the quantity of carbon it contains, and alſo the nature and proportions of its earthy reſidua. Theſe facts being clearly made out, there will be nothing neceſſary but to add to theſe materials a proper mixture of ſuch ſubſtance as will make the moſt fuſible cinder. If the ore be argillaceous, or, in other words, if clay predominate, lime is to be the material employed. Indeed, ores of this deſcription are ſo very common, that lime has been thought the only ſubſtance to be uſed, under all circumſtances, for the purpoſes of a flux; and ſo completely ignorant have the ironmakers been of the philoſophy of the proceſs, that it has even been attempted to be added when the ore has already abounded with calcareous ingredients.

Keeping in view the principles we have juſt laid down, the management of the calcareous ore will be equally eaſy with the mode of working the argillaceous; ſince, in ſuch caſe, we have only to employ clay for the flux inſtead of lime. But the beſt method would, perhaps, be, if the component parts of an argillaceous and a calcareous ore were ſufficiently well known, to mix the two together in proper proportions.

Whatever may be the ſubſtance employed, whether it be limeſtone for an argillaceous ore, or clay for a calcareous ore, it ſhould be very minutely analyſed, as thoſe ſubſtances are ſcarcely ever found in a ſtate of purity. The lime ſhould, if poſſible, be the ſhell limeſtone. At all events, the magneſian ſtratum ſhould be avoided, ſince that ſubſtance tends much to leſſen the fuſibility of earthy compounds. Some ſubſtances, to which we give the name of clay, frequently conſiſt of a large proportion of ſome other earth.

Another thing to be attended to, alſo, is the ſtate of oxydation in which we find the iron-ore.

If it be highly oxydated, more of the carbonaceous matter will be required for its reduction, and in all probability a longer time; but, beſides this, a greater quantity of the oxyd of iron will combine with the earthy matter, which, although it may contribute to the fuſibility of the cinder, a large portion of the iron will be loſt. On the contrary, when the iron is in a low ſtate of oxydation, the whole of the iron may be apt to combine with the carbon, and the earthy matter may not get a ſufficient quantity of the oxyd to render it, in a proper degree, fuſible. In ſuch caſe, it would be neceſſary to add ſome oxyd of iron, which might more eaſily vitrify and enter into the compoſition of the cinder.

The coal employed in the ſmelting of iron, for the purpoſe of being coked, is commonly laid in heaps in the open air, and afterwards ſet on fire. When the combuſtion has gone on to a certain degree, the fire is checked by covering it with duſt and preventing all poſſible acceſs of air. For farther particulars, ſee Coke.

It is eſſential that the coke ſhould be harder than it can generally be made in the open air without conſiderable waſte; and we recommend, therefore, the method employed in making the cokes for melting ſteel. The coal, which is very ſoft, is piled up in ovens of the ſhape of an erect fruſtum of a cone. The air is let in at an aperture near to the bottom, which is contracted in ſize as the combuſtion becomes rapid, and ultimately cloſed. The whole maſs will at this time have acquired ſuch a degree of heat, as not only to drive off all the volatile matter, but to render the coke extremely hard. There is a conſiderable ſaving in this mode of coking, and the coke is not only more compact, but better adapted for the generality of ores of iron.

In ſmelting the argillaceous ore, the proportions of the roaſted ore, and the limeſtone, are governed entirely by the coke employed. The latter is always a fixed quantity, and the ore and limeſtone are varied according to the quality of the iron to be made and the working order of the furnace. In proportion as more or leſs of lime and ore are added to the ſtandard quantity of coke, the furnace is ſaid to carry a greater or leſs burthen.

It would be uſeleſs to give any preciſe proportions of the ore and limeſtone to a given quantity of the fuel, ſince they are found to vary with the nature of the coal in uſe; and, what is not a little remarkable, the proportions will frequently vary in two furnaces working with the ſame coal, and even in the ſame furnace at different times.

The burthen of the furnace will alſo vary with the quality of iron to be made, that is, as it is required to contain more or leſs carbon. In making the dark-grey iron called N° 1, and which contains the greateſt proportion of carbon, the burthen muſt be leſs than that required to make the leſs carburetted iron, commonly called white iron, or *forge-pig*.

To give a general idea of the proportions of the materials, we ſhall preſent in detail, the quantities uſed at a blaſt-furnace, making in general good melting iron, which is of an intermediate quality between N° 1 and the *forge-pig*. The ore is argillaceous, containing about 27 *per cent.* of iron; the coal rather ſoft, but having a good proportion of carbonaceous matter; and the limeſtone good, being of the ſhelly kind before ſpoken of. The furnace is about 45 feet high, and 12½ feet diameter in the wideſt part. It works with a bright *tuyere*, and receives from the blaſt about 2500 cubic feet of air in a minute, through a circular aperture of 2¾ inches in diameter.

The average charges of coke per *ſhift*, as it is termed, or in the ſpace of 12 hours, are 50 (each 2¾ *cwt.*), or nearly ſeven tons. The calcined ore for good melting iron is about the ſame quantity; and for forge-pig, or the leaſt carburetted variety, ſix of coke to ſeven of ore. The limeſtone unburnt, under the ſame circumſtances, is to coke as four to eleven; and, for melting metal, retains a ſimilar ratio. With the above charge per day, that is, for 12 hours, this furnace makes on the average about 40 tons of melting iron per week.

Some furnaces carry ſo little burthen as not to yield more than 13 or 14 tons weekly; whilſt others, particularly in South Wales, produce, with the ſame ſized furnace, as much as 60 and even 70 tons in an equal time. The burthen of theſe furnaces is very great, the ore to the coke being in ſome caſes as 13 to 7; and the quality of the iron is uniformly inferior. Since the cavity in the furnace is conſtantly kept full of the above materials, it may eaſily be conceived that the whole muſt be in many intermediate ſtages, from the fully melted iron to the unchanged ore. At the point where the greateſt heat is produced, which will be a little above the level of the blaſt, every thing capable of fuſion will be aſſuming the liquid form. We cannot, however, for a moment ſuppoſe, that the iron at this point is in a ſtate of oxyd, ſince it would of neceſſity be all vitrified, and enter into the compoſition of the cinder. If the iron, even in its carburetted form, were to remain long at ſo great a temperature, and within the influence of ſo much oxygen, it would firſt loſe all its carbon, and ultimately paſs into the ſtate of vitreous oxyd. As, however, the oxygen of the blaſt riſes in the furnace, it comes in contact with the carbon of the coke, and is very ſoon converted into carbonic acid gas. That point in the furnace, therefore, where the whole of the oxygen has entered into combination with carbon, may be denominated the commencement of cementation, or the point where the oxyd of iron is firſt deprived of oxygen, and ultimately ſaturated or *cemented*, as it is termed, with carbon. From this point to the top of the furnace the proceſs of cementation is going on with different degrees of rapidity, proportionate to the temperature. It is found by experiment, that if a piece of iron-ore, particularly any of the oxyds that contain but little earthy matter, be expoſed in a cloſe veſſel in contact with carbon, it will firſt loſe the whole of its oxygen, and afterwards become ſo ſaturated with carbon, as to be capable of fuſing into the beſt pig-iron. Hence it appears that the reduction of the ore, ſo far as relates to the deoxydation and carbonization of the iron, may take place at a temperature below fuſion, and without the maſs of ore changing its form. The ore expoſed to the carbonaceous matter in the cementing part of the furnace, muſt as completely undergo a ſimilar change as if it were in the cloſeſt veſſel; for the oxygen is excluded by the preſence of carbonic acid gas. When the carbonized, but yet ſolid, iron, in the form of the ore, falls below the cementing point, or perhaps ſhort of that, it begins to fuſe. The earthy matter of the ore, being in contact with lime, begins alſo to aſſume the liquid form; and whilſt the melted metal is expoſed to the oxygen of the blaſt, a ſmall portion of oxyd of iron is produced, which will enter into the compoſition of the cinder, and thus tend to increaſe its fuſibility. The liquid iron now drops into the chamber of the furnace called the *hearth*; and the liquid cinder, being of leſs ſpecific gravity, floats upon its ſurface, completely defending it from the oxygen of the blaſt. Hence we ſee that the column of the blaſt-furnace may be divided into three portions; the upper portion, or cementing part; the middle, or melting part; and the chamber, or hearth, where the metal is preſerved till it is in ſufficient quantity to be run out into pigs. The cementing portion is by far the moſt extenſive, and will vary in its extent with the ſtrength of the blaſt.

Since the combuſtion muſt be in proportion to the quantity of oxygen conſumed in a given time, the heat of the furnace will depend upon the quantity and velocity of the air blown into it to a certain extent. If the blaſt ſhould have too great a velocity, the oxygen would paſs through a greater ſpace in the furnace than is deſirable before it was diſpoſed of, and the cementing portion would be leſſened in conſequence. On the contrary, if the velocity were too little, the heat would be confined to the vicinity of the tuyere, and the cementing, as well as the melting proceſſes, would be retarded for want of heat.

When the blaſt is ſufficient to generate the neceſſary heat for melting the cinder and the metal perfectly, the extent of the cementing portion will depend upon the height of the furnace. This gives us one very ſatisfactory reaſon, why a furnace is required to be higher for the uſe of coke, than when it is heated with charcoal; ſince the carbon of the latter enters into the compoſition of the iron with much more facility than that of the former.

According to experiment, it appears that the facility with which carbon enters into combination with iron, in a cloſe veſſel, is inverſely as its aggregation or coheſion. Hence it is found, that the carbon obtained from animal ſubſtances, which is ſoft and porous, is beſt calculated to convert iron into a carburet.

It will appear from the laſt obſervation, and from what has been ſaid on the nature of coke, that the carbon employed for cementation ſhould be mechanically different from that required to generate the great and permanent heat neceſſary to the fuſion of the materials. The ore in the cementing portion ſhould, therefore, if it were practicable, be ſurrounded with coke of the ſofteſt kind, while the materials within the influence of the blaſt, and occupying the melting portion, ſhould be ſupplied with ſuch as is harder.

In making the moſt highly carbonized iron, or what is called N° 1, it ſometimes happens that a portion of the iron unites with a great exceſs of carbon, forming a ſubſtance, which, when cold, appears in bright ſhining ſcales. It is found to poſſeſs moſt of the properties of plumbago, differing from that ſubſtance only in containing leſs carbon. This carburet is no doubt in the liquid form in the furnace, and, being of much leſs ſpecific gravity than the iron, floats upon its ſurface. It is ſo much more infuſible than the metal, that before the iron enters the moulds of the pig-bed it is ſeen ſwimming at the top in the ſcaly form before mentioned.

This ſubſtance is called by the workmen *kiſh*; and whenever it appears, is a certain ſign that the furnace is working on the beſt ſort of iron. So ſurely, indeed, is it the caſe, that N° 1, or the moſt highly carburetted metal, has received the epithet of *kiſhy*, becauſe *kiſh* is the common attendant on its production.

The moſt remarkable and anomalous circumſtance preſented in the ſmelting of iron, is the difference in quantity and quality of the iron made in winter and in ſummer, when all other things are equal. It is a fact well aſcertained, that in order to make the ſame quantity and quality of iron in ſummer as in winter, the furnace will not carry ſo great a burthen, and, at the ſame time, the means of generating heat requires to be increaſed.

Various opinions have been given to explain this curious fact. Some have ſuppoſed that the proportion of the oxygen was leſs in the atmoſphere in ſummer than in winter. Others, that the exceſs of moiſture contained in the air in ſummer above that in the winter, might explain the phenomenon. Whatever may be the cauſe of this difference in the blaſt-furnace, the ſame may equally be referred to common fires, which, it is well known to every one, are much hotter in winter than in ſummer. If the Lavoiſierian doctrine of combuſtion were true, we ſhould not expect that the power of air to generate heat would vary with the temperature, ſince the ſame caloric which had contributed to dilate the oxygen in ſummer, would be given up when the oxygen combined with the carbon. Unfortunately for that doctrine, however, we find that the quantity of heat generated during the combination of oxygen, is directly as the quantity of oxygen, whatever may be its ſtate, whether ſolid, liquid, or aeriform.

It appears from general obſervation, that the difference in the quantity and quality of the iron made in winter and ſummer may be, in a great meaſure, referred to changes ariſing from variation of temperature. The average reſult of this atmoſpheric influence is different with different blaſt-furnaces, and, indeed, with the materials employed; but in general the quantity varies in winter and ſummer from $\frac{1}{5}$th to $\frac{1}{7}$th, beſides the alteration of quality, which in ſome furnaces cannot be prevented by any change in the burthen.

If the whole of this difference depend upon the temperature of the blaſt ſent into the furnace, we muſt expect to find it either in the increaſed rarity of the air, or in the preſence of moiſture, which exiſts more abundantly in the atmoſphere in ſummer than in winter; or, perhaps, it may be attributable to both theſe circumſtances.

Soon after the conſtituent parts of water were diſcovered, ſome iron-maſters attempted to produce combuſtion by blowing ſteam into the furnace. But, notwithſtanding the great proportion of oxygen exiſting in aqueous vapour, their expectations were far from being realized, and the ſcheme was given up by them under a firm conviction that it never could ſucceed.

This experiment, however, ſerved to ſhew that no more miſchief might be expected from the vapour of water in the atmoſphere, than its merely excluding a portion of oxygen. Conceiving it, therefore, to have no other influence in the furnace, we will ſubmit ſome calculations to the reader, in order to ſhew the abſolute difference in the quantity of oxygen ſent into the furnace in winter and in ſummer, and to aſcertain what ſhare of the defect may be attributed to this circumſtance, or whether the whole may not ſafely be referred to it.

We have much to regret that we are not in poſſeſſion of more experiments as to the temperature of the air ſent into the furnace at different times of the year. The mere temperature of the atmoſphere is not ſufficient for this purpoſe, ſince the air gives out much heat by compreſſion in the blowing cylinder. In a former part of this work (ſee BLAST-*furnace*), a table of ſome obſervations was given, on which, as far as they go, reliance may confidently be placed. In this table the temperature of the air was ſtated when it entered the blowing cylinder, and after it had been compreſſed into a vault, from which it paſſed into the furnace. If we take the temperature on its entrance into the furnace in winter at 50°, and in ſummer at 100°, the difference will be 50°, and the variation in the quantity of oxygen will be inverſely as the increaſed volume of the air. It is found that elaſtic fluids are augmented in bulk by one degree of Fahrenheit .00208 of the whole. Therefore, the quantity of oxygen at 50° will be to that at 100° as $1 + (100 - 50) \times .00208 : 1$; and the oxygen, conſequently, in ſummer will be .104, or little more than $\frac{1}{10}$th leſs than in winter.

The defect ariſing from the relative quantities of moiſture contained in the air in winter and ſummer will be very trifling, except where the water-regulator is employed inſtead of the air vault or common regulator. (See BLAST-*furnace.*) When the air does not come in contact with any thing moiſt after entering the blowing cylinder, in order to learn the quantity of water preſent, we have only to aſcertain the relative proportions of vapour exiſting at the reſpective temperatures of the atmoſphere in winter and ſummer. It appears from a theorem, which we have founded upon Mr. Dalton's ingenious experiments upon evaporation and the force of vapours, that the quantity of water in air at 32°, at which temperature we ſuppoſe it to enter the furnace in winter, is equal to 2.04 grains in each cubic foot. This, in weight, is $\frac{2.04}{561}$; and in bulk, vapour being to air at 32° as 274 to 561, equal to $\frac{2.04}{274}$ of the whole, or .0075. The ſummer air, which we take at 55°, contains 5.32 grains in a cubic foot; a quantity amounting in weight to $\frac{5.32}{524}$, and in bulk to $\frac{5.32}{274}$, or .019 of the whole. The difference .0115 is the deficiency of common air in ſummer, ariſing from the preſence of aqueous vapour; and makes the total variation in the quantity of oxygen between ſummer and winter equal to $.1155 = \frac{23}{200}$, or $\frac{1}{9}$th nearly.

We here conſider water as producing injury merely by diſplacing a certain proportion of oxygen, and not being prejudicial in itſelf, as is ſuppoſed by the generality of iron-maſters. The reaſon given for its bad effects does not appear intitled to much weight. The opinion commonly entertained is, that the carburetted hydrogen ſet at liberty, carries off a greater quantity of heat than the nitrogen of atmoſpheric air. An effect which, if even true, is inadequate to explain the appearances. When the air is received into a water-regulator, as is the caſe in many blaſt-furnace works, a much larger quantity of moiſture may be expected to enter the furnace, than with the ordinary apparatus. In the above calculation, if the air had been received over water, we ſhould find that its temperature in the receiving veſſel in winter and ſummer would be 50° and 100°. The vapour in the former amounts to 4.67 grains in a cubic foot: in the latter, to 18.95 grains in the ſame quantity.

Hence, air at 100° will contain leſs oxygen than that at 50°, by .055 of the whole; which is a little more than $\frac{1}{20}$th. This added to the loſs by increaſed temperature alone, will be .159, or nearly $\frac{1}{6}$th.

We may from this conclude, that the extra-quantity of moiſture admitted by uſing the water-regulator, will at any rate increaſe the difference in the amount of oxygen from $\frac{1}{9}$th to $\frac{1}{6}$th, or thereabouts; which, in all probability, will more than counter-balance the good effects ariſing from its uniform preſſure. There does not appear to be, in the preſent ſtate of our knowledge, any means of effectually remedying this evil. Some good might accrue from admitting the exterior air as cold as poſſible, and not allowing it to come in contact with water after entering the blowing-cylinder. This may be done to a certain degree, by cauſing the air to aſcend from a deep pit, by a pipe communicating with the blowing cylinder. This contrivance, however, ſhould be alaid aſide whenever the air of the atmoſphere becomes colder than the average temperature of the earth.

With regard to the defect ariſing from increaſe of volume of the air in the ſummer months, the heat cauſed by the friction of the blowing piſton will be found to contribute much to the evil. The air by this means gets an additional elaſticity, and if the ſame quantity of air be thrown into the furnace it muſt be effected by decreaſing the preſſure of the blaſt, or by increaſing the aperture of the *noſe-pipe*. If the compreſſion of the air could be effected by any means which would avoid the friction of machinery, it would no doubt be a deſideratum in the proceſs of blowing. It will appear from theſe facts, that in ſummer, when the quantity of air is deficient from increaſe of volume, and from the preſence of water, that a larger quantity of air ſhould be made to enter the furnace, partly by increaſing the velocity, and partly by uſing a *noſe-pipe* of greater diameter. If the deficiency were made up by the increaſe of preſſure only, the velocity would be too great for producing a maximum of combuſtion, where it is immediately wanted, independent of the mechanical evil it would be liable to produce. If, on the other hand, the aperture of the *noſe-pipe* were increaſed in ſummer, to make the quantity equal to that of winter, the air would enter in a ſtate of greater rarity, and the combuſtion would, from this cauſe, be of leſs intenſity. This circumſtance alone, perhaps, is ſufficient to prevent a complete remedy of the evil, and will go far to explain the difference between the fractions reſulting from calculation and experiment.

We ſhall conclude our account of this department of iron-manufacture with ſome general obſervations upon the nature and properties of pig-iron, as it is applied to different purpoſes.

When the iron has combined with its full doſe of carbon, conſtituting what is called in the trade, grey, or ſmooth-faced iron, and alſo N° 1, it is admirably fitted for making the lighter and finer ſort of caſtings, ſuch as grates and other ornamental work. It is from iron of this quality that the caſt-iron cutlery is manufactured, ſince no other would run ſufficiently fluid for articles ſo ſmall as the prongs of forks, and the bows or rings of ſciſſors. This iron, however, is not the beſt for larger caſtings where ſtrength and hardneſs are deſirable; as in large wheels, for example, beams, pillars, railways, &c. The metal employed for theſe purpoſes contains a leſſer proportion of carbon than the former, and is generally called melting-iron, or N° 2.

That ſpecies of pig-iron, however, which is combined with the ſmalleſt doſe of any, is almoſt excluſively employed for making malleable iron, and is called, for that reaſon, *forge-pig*. We have given, in the next ſection, an account of the proportion of carbon preſent in the different varieties; and it will appear from thence, that of all the combinations of iron and carbon, ſteel contains the leaſt, and grey, or N° 1, pig-iron, the moſt of any of the compounds we are yet acquainted with.

As a proof that pig-iron only requires to loſe its carbon to become malleable, we have at preſent in this country manufactures upon a large ſcale, for converting caſt metal goods, ſuch as nails, cutlery, &c. into iron perfectly malleable, without even changing the figure given to them by caſting. Nails produced in this way are ſo malleable, even when cold, as to bear the hammer, and are capable of being bent to a right angle in a *vice*.

But a ſtill ſtronger proof that this metal aſſumed the form of iron is from the great heat it will bear. The prongs of a common fork made by this proceſs can be welded together with the greateſt facility. Pig-iron, until lately, has been conſidered a much more complex body than experience has warranted. We have heard of its being ſuppoſed to contain ſilex, or, according to Mr. Davy, ſilicum, to which it owes ſome of its crude qualities. But the proceſs juſt mentioned is ſufficient to refute the aſſertion. Iron maſters, even at this day, however, will talk about oxygenated pig-iron, meaning that which is leaſt carbonated; but it muſt be clear to every one acquainted with the chemical qualities of thoſe bodies, that the preſence of carbon and oxygen in a liquid maſs is perfectly impoſſible, as they are incapable of exiſting together uncompounded at any ſuch elevated temperature. Hence we muſt regard pig-metal as a compound of iron and carbon only. Manganeſe may perhaps ſometimes be preſent in it, when particular ores are employed for ſmelting, but its union muſt be conſidered as accidental.

To make pure iron, therefore, we have, from theſe concluſions, only to extricate the carbon. This may be done, in ſmall maſſes, by ſtratifying the articles in a cloſe veſſel with ſome ſubſtance containing oxygen. The poorer iron ores, which are free from ſulphur, are uſed in powder for this purpoſe; and after the materials have been expoſed to a heat juſt ſhort of the fuſion of the metal, the air being completely excluded, the carbon will become diſſipated, and the iron left in a ſtate of purity. See CASTING and FOUNDERY.

§ 4. *Converſion of Pig-iron into malleable Iron, and Steel.*

1. *Bar, or wrought Iron.*—Iron, as obtained by the reduction of its ores in the blaſt-furnace, contains, as we have before ſtated, a certain proportion of carbon, which renders the metal unfit for the various purpoſes of forging, but conſtitutes its principal value as applicable to the uſe of the founder. To deprive it of this ingredient certain proceſſes are gone through, the object of which is, by the concurrent action of heat and air, to diſſipate the carbon under the form of an elaſtic compound. The kind of iron choſen for the converſion is that denominated by manufacturers *forge-pig*. It is the loweſt quality made for the purpoſes of art; and, in conſequence of its being combined with a ſmaller doſe of carbon than any other, which thus cauſes it to bear a leſs price in the market, is doubly preferable for the end required.

The price of *pig-iron* is almoſt excluſively determined by the quantity of carbon which is in combination with it. The varieties uſually diſtinguiſhed are N° 1, otherwiſe called *grey*, *ſmooth-faced*, or *liſey*, metal; N^os 2 and 3, and *forge-pig*. The proportion of carbonaceous matter preſent in theſe varieties is differently ſtated by different experimentaliſts. Clouet makes the higheſt proportion to amount to $\frac{1}{4}$th; but from the reſults obtained by Mr. Muſhet in combining iron *directly* with the doſes of charcoal requiſite to produce its various ſub-carburets, [illegible]th appeared to be the *maximum*. Of this, the following table, publiſhed by him in the 13th vol. of the Philoſophical Magazine, will afford the neceſſary proof.

Soft caſt ſteel	[illegible]
Common ditto	[illegible]
Same, but harder	[illegible]
Ditto, too hard for drawing	[illegible]
White caſt-iron (ſame as before called *forge pig*)	[illegible]
Mottled caſt-iron (N° 2.)	[illegible]
Black caſt-iron (N° 1.)	[illegible]

The firſt ſtep in the proceſs of decarbonization, according to the more common mode of operating, is to expoſe the iron in a furnace, called by ſome a *refinery*, but by others, to diſtinguiſh it from one hereafter to be deſcribed, a *run-out furnace*. It conſiſts of a veſſel open at the top, imbedded in ſtone or brick work, about two feet three inches long, two feet wide, and ten inches deep. This is generally, in part, conſtructed of caſt iron ; and, when ſo made, has an outer caſe about two or three inches diſtant from the inner one, which is conſtantly ſupplied with a ſtream of cold water to prevent the apparatus from melting. The iron to be decarbonized is placed in this receptacle, and kept in a continual ſtate of fuſion for three or four hours by the aid of a coke fire, which is heaped to a conſiderable height above the level of the veſſel, and extended proportionally on the hearth that ſurrounds it. The ſize of the hearth is moſtly about three yards in length, and from two to three wide, and is completely covered by the funnel of the overhanging chimney. Bellows of conſiderable ſize are employed to carry on the proceſs ; and the current of air which iſſues from them is directed immediately on the ſurface of the iron by one or more *tuyeres*. Theſe *tuyeres* are double, like the caſe, and continually cooled by the application of the ſame means. When the decarbonization is completed, the metal is let out at an opening in the ſide, which has been kept cloſe during the operation by a *ſtopping* of ſand. It flows into a groove about 18 inches wide, and ſix or ſeven feet long, conſtructed of ſtone in the floor that ſurrounds the furnace. The bottom of the veſſel is ſo placed as to be nearly on a level with the floor ; the only elevation given to it being what is merely ſufficient to let the iron run out with facility. A conſiderable quantity of vitreous oxyd is formed during the proceſs ; and the loſs in the weight of metal, which is ſtated to amount to from $\frac{1}{6}$th to $\frac{1}{7}$th, is principally referable to this circumſtance. The total quantity of carbon which the iron contains originally is not eſtimated at more than $\frac{1}{25}$ th ; and yet the approach of it to the pure ſtate, or, in technical language, to the ſtate of *bar* or *wrought iron*, after this operation, is very inconſiderable.

The cake of metal procured by theſe means is broken into lumps of a convenient ſize, and ſubjected, in a furnace of another deſcription, to a proceſs known in the art by the name of *puddling*. The furnace, which is alſo diſtinguiſhed by the ſame term, is a variety of the reverberatory ; and at the immediate point where the flame ſtrikes upon the hearth, a ſhallow concavity is worked out, in which the melted iron is expoſed. Oppoſite to it is a door, and through this the metal is kept in continual agitation, by means of a ſort of rake, for the purpoſe of exhibiting freſh ſurfaces perpetually to the influence of the air. Water is likewiſe occaſionally thrown in, which in ſome degree contributes to the decarbonization. With the loſs of carbon, the iron alſo loſes its fuſibility, and about the middle ſtage of the operation appears in the form of ſmall detached lumps, which ſcarcely ſeem to exert any affinity for each other. At length, however, by much ſtirring, and frequently preſſing them together, they cohere into a pulpy maſs ; and being gathered into pieces of a convenient ſize, are carried under rollers, where, after paſſing through four pairs, in ſucceſſion, of a gradually diminiſhing guage, they are produced into plates ſeven or eight inches wide, and three feet or more in length. Conſiderable quantities of matter are ſqueezed out in the rolling, which principally conſiſt of a vitreous kind of oxyd. This is, for the moſt part, to be referred to the action carried on in the furnace ; but ſome portion of it is, in all probability, created by the combuſtion of ſmall pieces of fluid metal, which, engaged amongſt the particles of the *puddled* maſs, are hurled through the air in a ſtate of vivid inflammation, by the compreſſive violence of the rollers. The total loſs thus ſuſtained is eſtimated at from $\frac{1}{6}$th to $\frac{1}{7}$th. The plates obtained by this treatment have a very incompact appearance ; and if attempted to be worked in the ſtate they are then preſented under, would crumble almoſt wholly into ſmall granulated lumps. To impart to them the neceſſary cloſeneſs and ſolidity, they are again heated in another kind of furnace, and beaten forcibly with a heavy hammer, which is raiſed by machinery.

Previouſly to being thus treated, they are broken up into cakes of ſmall ſize, and placed upon circular ſlabs of ſtone from 8 to 12 inches in diameter. The ſize of the cakes is in a great meaſure determined by a particular effect of the laſt pair of rollers that they are paſſed through : ribs, of a diamond ſhape, girding either one or both of them, on the whole extent of their ſurface, which leave a deep indentation on the plates, ſo as to render them eaſily frangible in that direction. The height to which theſe cakes are piled on the circular ſlab juſt ſpoken of, is generally about 12 inches ; and when ſo prepared, they are placed on the hearth of a reverberatory furnace, which differs but little in form from that employed for *puddling*, except in being flat at the bottom inſtead of concave. The furnace is denominated a *balling furnace ;* and the piles of metal, *pies* or *balls*. They are continued in this ſituation until they have arrived at a welding heat, and are then removed by large tongs under the ſtroke of the hammer. Near to the place a ſmith's forge is kept in blaſt, where long bars of iron are alſo urged to the welding point ; and, after the firſt ſtroke or two of the hammer, united to the *balled* maſſes, to afford greater convenience in turning them. The maſſes are beaten out into ingots of about three feet in length ; and the bar laſt mentioned being ſeparated, they are divided deeply by an inſtrument termed a *ſet*, to facilitate their being afterwards broken ; and the proceſs is then completed. They are in this ſtate called *blooms*, and have yet to undergo another operation, for the purpoſe of being made into bars or plates. Much loſs is ſuſtained by the laſt treatment, and principally from the ſame formation of oxyd as was noticed in the preceding caſe. The quantity thus loſt, added to the waſte occaſioned in the *bloomery*, which comes next to be deſcribed, is uſually conſidered as equal to $\frac{1}{5}$th of the metal obtained by *puddling ;* which will make the total deficiency, by all the operations, as nearly equivalent to $\frac{3}{5}$. The ingots or *blooms*, which are received from the hammer, after being broken, over a ſmall wedge-ſhaped block of iron called a *tup*, are placed in a ſpecies of reverberatory, very ſimilar to the *balling furnace,* and denominated a *blooming furnace*, or *bloomery*. They are here heated to welding, and then ſubmitted to the requiſite preſſure under rollers, which are either plain or grooved, according as the iron is wiſhed to be obtained in plates or in bars. This completes the whole of the proceſſes neceſſary for making the beſt malleable iron ; and it reſults from the obſervations which have been premiſed, that, in order to procure one ton of it, five-and-thirty hundred weight of *forge-pig* is previouſly required.

Two other modes of operating are at preſent in uſe ; one of which omits the *puddling*, and the other, that part of the foregoing proceſs that concerns the fabrication of *blooms*. In the former, iron is expoſed to the heat of a charcoal fire, in a ſpecies of furnace preciſely ſimilar to the one before deſcribed as a *refinery*, or *run-out furnace ;* and is continued in that ſituation, until the metal is thought to be ſufficiently decarbonized. It is very frequently ſtirred during the operation ; and when brought *into nature*, (to uſe the technical expreſſion,) is collected into maſſes, and removed by tongs under a large hammer, denominated, as applied to this particular uſe, a *ſtamping hammer*, where it is beaten into cakes, which are afterwards broken up, and treated in the *balling furnace* as before deſcribed. This is the old mode of working, and the iron obtained from it is by many conceived to be of very ſuperior quality. The heat produced is conſiderably inferior to that afforded by coke in the *run-out furnace;* and the iron is leſs ſurrounded by the fuel than in the caſe juſt mentioned. The preſent charcoal fire is properly a *refinery*, and not the one which is uſed merely as a preliminary to the proceſs of *puddling*. Here, the buſineſs of decarbonization is at once completed; and the reſulting metal is in the ſame ſtate of purity as that yielded from the rollers, after it has been *puddled* by the other method. *Balling* and *blooming* follow in regular ſucceſſion, and plates or bars are produced exactly as before.

According to the ſecond mode of treatment, in which *blooming* is omitted, the maſſes obtained from the *balling furnace* are reduced under the hammer into the form of ſolid, cubical blocks; and when their temperature is too much lowered to be capable of any farther working, they are again heated in a fire called a *chafery*, which is urged by a powerful pair of bellows, and ſcarcely differs from a common ſmith's forge, except in being larger, and the cokes upon it being heaped up to the unuſual height of at leaſt two feet. In this ſituation they are raiſed to the point of welding, and afterwards hammered out into ingots of a flattened ſhape. Iron bars are united to them very ſhortly after they are brought from the *balling furnace,* to afford a greater facility of management, in the ſame manner as was deſcribed in the making of *blooms;* and theſe, as before, are detached, when the ingot is ſufficiently formed. The iron produced in this way is not conſidered ſo good as that afforded by either of the other proceſſes, and is employed, for the moſt part, in the commoner ſervices of art. Repeated rolling, or hammering, is the only means of imparting the fibrous texture ſo neceſſary to good bar iron; and as this treatment is leſs frequent in the preſent mode of operating, the deficiency of value in the material obtained may very probably be referable almoſt excluſively to this circumſtance.

The above include the whole of the *important* variations that are preſented in the manufacture of bar iron. Other ſhades of diſagreement may be traced in different works; but they are of a nature too trifling and unimportant to merit any particular enumeration. The art is ſtill in its infancy; and the light of chemical ſcience, by being brought to a focus here, cannot fail to diſcloſe many improvements in the preſent modes of procedure, which will greatly abridge the expence now incident to this valuable branch of national induſtry. That the mere abſtraction of about 4 *per cent.* of carbon ſhould require a ſacrifice, in effecting it, of above 40 *per cent.* of iron, appears monſtrous beyond example: and as thoſe who are connected with the art become more ſcientific in their views, we ſhall unqueſtionably find that it will be much more economically accompliſhed.

When iron has been completely freed from carbon, and has acquired its higheſt degree of malleability by repeated hammerings, it is by far the moſt tenacious of all the metals, and is capable of being drawn into the fineſt wire.

The tenacity of iron, as well as of all the reſt of the malleable metals, varies conſiderably according to its ſoftneſs. After iron has been kept in a red heat for ſome time, and ſuffered gradually to cool, it becomes remarkably changed in point of ſoftneſs. By being hammered, drawn into wire, or rolled, it increaſes in hardneſs to a certain extent; but, at the ſame time, partly loſes its malleability. By this mechanical treatment, when cold, its ſtrength or tenacity increaſes; and it may be taken at one point, when it will require a far greater weight to break it, than if it were hammered either more or leſs.

All the experiments yet publiſhed relative to the tenacity of iron, and the other metals, are on this account very defective. The writer of this article has ſeen an iron wire, when newly annealed, break with a weight of 50 pounds; but, after being drawn through two holes of a wire-plate, bear above twice that weight, without ſuſtaining injury. Iron, when properly annealed, will bear more bending backwards and forwards before it breaks, than in any other ſtate: but the ſtrength, or that power which reſiſts a weight, exerted longitudinally to break it, is jointly as the laſt property and its hardneſs. Hence the reaſon why its ſtrength is increaſed with a certain degree of hammering. The ſpecific gravity of malleable iron, according to Briſſon, is 7.788; that of pig iron being 7.207. Iron, in a ſtate of purity, requires ſo great a heat for its fuſion, that the beſt crucibles are nearly ready to melt with it. It has, however, been fuſed, and caſt into an ingot. It is ſaid to liquify at 158° of Wedgewood. Its malleability is greatly increaſed by heat; and by raiſing it to a very high temperature, it becomes exceedingly ſoft, and may be brought ſo near to abſolute contact with another piece ſimilarly heated, that they unite firmly together. This proceſs is called *welding*. Its great affinity for oxygen, when heated to a welding point, would very ſoon reduce it to an oxyd, if it were not for the vitreous matter fuſing upon its ſurface; and it may be ſtill more completely defended, by dipping it in powdered glaſs or ſand. See *Deſcription of Plates* at the end of the article.

2. *Steel.*—This ſubſtance, which is a compound of iron and carbon, but in leſs proportion than that of pig iron, is of ſuch diſtinguiſhed importance in moſt of the arts, that no other ſubſtance could be ſubſtituted, capable of ſupplying its united properties of hardneſs, tenacity, and elaſticity. After the pig iron is totally deprived of carbon, and becomes malleable, the metal can be re-impregnated with that ſubſtance to a certain extent, without loſing much of its malleable property.

It is curious to remark, that although we have made iron of excellent quality in this country, for all the nice purpoſes to which it is capable of being applied, yet, in attempting to convert it into ſteel, we have always failed; the ſteel being red-ſhort, and otherwiſe bad. It, of late, however, has been ſo great a deſideratum to obtain ſteel from Britiſh ore, in conſequence of our want of communication with Sweden and Ruſſia, that ſeveral efforts have been lately made to bring about this deſirable object, and not altogether without ſucceſs. We may yet entertain a hope, therefore, that the time *will* arrive, when we ſhall not be dependent on other countries for this uſeful commodity.

The only ſteel at preſent, on which perfect reliance can be placed, is made from ſome of the beſt marks of Swediſh iron. The bars are ſtamped with certain letters or characters, well known to the ſteel-makers; and ſome of them have preſerved their character for making good ſteel during a long ſeries of years.

The ſize of the bars varies from 3 inches broad and $\frac{1}{2}$ inch thick, to about 2 broad by $\frac{7}{16}$ thick.

Nothing more is neceſſary to impregnate the bars of iron with carbon, by which they become ſteel, than to ſtratify them with powdered charcoal in a cloſe veſſel, called a cementing pot; expoſing the ſame to a degree of heat as little ſhort of what would fuſe the ſteel as poſſible.

The furnace in which the proceſs of cementing bar iron is performed is called a converting furnace.

The pots are made of a peculiar ſtone called fire-ſtone, from its joint property of not being liable to crack by the heat, and its little diſpoſition to enter into fuſion. It is a fine grit, and occurs abundantly in the neighbourhood of Sheffield. The interior of theſe pots is in dimenſions from 12 to 15 feet long, and from 2 feet to 30 inches ſquare. Every furnace contains two of them; and they generally hold about 5 tons of iron each. The metal is ſtratified with the charcoal duſt, in ſuch a way that each bar may be completely covered; and the laſt ſtratum, which ſhould be thicker than the reſt, is kept cloſe with a mixture of clay and ſand, ſo as to prevent the charcoal beneath it from entering into combuſtion with the outer air.

The fire is then gradually applied, and the exterior ſurface of the pots conſtantly enveloped with flame, till the whole maſs has become of the heat required. This heat is kept up for a conſiderable time, ſo that from the commencement of firing to the maximum is about ſeven days. The ſame ſpace is afterwards required to allow the maſs to cool. This rule, however, is not ſufficient to tell when the cementation is perfect. A hole is generally left in the front of the furnace, paſſing through the wall to the interior of the pot. One or two bars are laid with their ends projecting into the opening, which is looſely filled with powdered charcoal. When the proceſs is ſuppoſed to have gone on long enough, one of theſe bars is drawn out and examined.

All bar iron muſt, owing to the manner in which it is made from the pig, contain a ſmall portion of oxyd of iron, as well as ſome remains of iron not completely deprived of its carbon. The long continued heat which this proceſs requires, cannot fail to cauſe an union between the oxygen and carbon, accidentally exiſting in the bars; and we may expect, in conſequence, that an elaſtic fluid will be formed, which muſt be either carbonic acid or the carbonic oxyd; but ſince the oxyd is in the ſtate of finery cinder, we ſhould rather conceive it to be the latter; and we believe experience warrants the concluſion.

This elaſtic fluid, when the metal is ſo near the fuſing point, cauſes the ſurface of the bars to be covered with bliſters, which are a ſure ſign that the cementation is complete: and it is from the number and ſize of theſe bliſters, that the workmen know when to ceaſe adding fuel to the furnace.

Steel is made of different degrees of hardneſs, by giving it more or leſs carbon; and this is effected by keeping up the heat a longer time, ſtill having regard to the quantity and ſize of the bliſters.

The ſteel uſed for coach-ſprings contains the ſmalleſt quantity of carbon; a ſomewhat greater proportion is required for table knives, forks, carpenters' tools, and agricultural implements; and the largeſt doſe of all is wanted for files, which can ſcarcely be too hard, if the ſteel be ſufficiently malleable to work.

Steel, in the ſtate it comes from the cementing furnace, is called *bliſtered ſteel*, from the appearance we have juſt deſcribed. It is not uſed but for common purpoſes, although formerly we had no other kind. The bars of iron being formed under the forge hammer, and produced in a country not remarkable for the excellence of its machinery, the metal is found to abound with numerous ſeams and ſhells, which good workmanſhip might in a great meaſure avoid.

This evil is, however, very happily remedied, by making the bliſtered-ſteel into what is called *ſhear-ſteel*, and *caſt-ſteel*.

Shear-ſteel has derived its name from the advantage with which it has been applied in the manufacture of ſheep-ſheers. Its admirable property of welding to iron, without the other qualities it poſſeſſes being injured, renders it of great importance in all caſes where the body of the edge-tool is conſtructed of iron, and the edge merely ſteel.

From having been firſt made at Newcaſtle-upon-Tyne, it has alſo been called *Newcaſtle ſteel*. The apparatus uſed for its manufacture conſiſts of a pair of bellows, or other blowing machine, and a fire place ſimilar to that of a ſmith's hearth, but upon a larger ſcale. The hammer for drawing the bars is larger than a tilting hammer, but ſmaller than the one employed at an iron forge.

In order to make ſhear-ſteel, a number of bars of the beſt bliſtered-ſteel are laid together, and temporally faſtened. In this ſtate they are introduced into the fire, and heated to a welding temperature; after which they are firmly united by means of the hammer, and drawn. At a ſecond heat theſe maſſes are beaten down into bars about $1\frac{1}{2}$ inch broad and $\frac{3}{8}$ths of an inch thick. By this proceſs the looſe parts and ſeams of the bars are cloſed together, and the ſteel is rendered ſuſceptible of a poliſh, of which before it was not capable. But theſe are not the only advantages. The additional hammering ſo far improves its malleability, that the tenacity it enjoys is much greater, while its hardneſs is very little leſs.

This ſteel is particularly adapted for ſprings of every deſcription, and for all edge-tools requiring great tenacity rather than hardneſs.

Caſt-ſteel is entirely free from the mechanical defects which belong to bliſtered-ſteel, and even, in ſome degree, to ſhear-ſteel; ſince it conſiſts of the latter variety completely fuſed, and caſt into ingots.

The furnaces employed for this purpoſe ſhould poſſeſs all the advantages which can be given to air-furnaces, on account of the great heat requiſite for the proceſs. (See FURNACE.) The crucibles, in which the ſteel is melted, are made of Stourbridge clay, mixed with a ſmall quantity of powdered coke, which makes them leſs liable to crack in the heating or cooling; and, at the ſame time, gives to them a conſiderable degree of ſtiffneſs in the fire, when raiſed to the very great heat required. Theſe crucibles are furniſhed with covers, which are of rather more fuſible clay than the body of the veſſel, and, on that account, are ſoon partially vitrified; by which means they become cloſely luted at the time the ſteel is at a temperature ſufficiently high to be deſtroyed by the oxygen of the atmoſphere.

The fuel employed for melting ſteel, conſiſts of the hardeſt cokes, and in all caſes where long continued and high temperatures are neceſſary, cokes of this deſcription ſhould always be employed. Two advantages attend the uſe of them; for although the ſoft cokes produce a very great heat during a ſhort ſpace, yet the length of time required for melting ſteel would oblige the workman to charge the furnace too often; ſo that he would ultimately get a greater heat by the permanence of the hard coke; and the ſpecific gravity of the latter is ſo much greater than the ſoft, that the fuel is more condenſed, and hence, allowing for the difference of coheſion, will give more concentrated heat, if the ſupply of air be ſufficient.

The crucibles are of a ſize ſufficient to hold about 30lbs. of ſteel; and, in general, each will bear charging three times, or even four: ſome would remain ſound ſtill longer than that, if the fires were continued; but they are ſeldom kept in more than twelve hours in the day, and this will not allow of more than three heats. For the beſt poſſible caſt-ſteel, the bars of the beſt bliſtered-ſteel are broken into ſmall pieces, it being, on coming from the cementing furnace, ſufficiently brittle for this purpoſe. An inferior kind of caſt-ſteel is made from the ſcraps, which conſiſt of the waſte of the manufactories. The heat required to melt ſteel is very great; and inverſely as the quantity of carbon combined with it. Before caſt-ſteel making was brought to great perfection, the quantity of carbon given to it was greater, in order to effect its more eaſy fuſion. The crucibles and furnaces, however, are now ſo much improved, that the ſteel can be melted with much leſs carbon, and it is, in conſequence, ſo *kind*, to uſe a technical phraſe, as to weld with iron, and even to be capable of uniting two pieces of it together.

After the ſteel has become ſufficiently fluid, it is poured into caſt-iron moulds, which form it into ingots of an octagonal ſhape; and are about 30 inches long, each weighing about 30lbs. Formerly, the great ſecret of making caſt-ſteel was ſaid to conſiſt in uſing ſome peculiar flux. No ſubſtance, however, from what has been obſerved, can increaſe the fuſibility of the ſteel, but an additional doſe of carbon, which is improper after a certain quantity has been united with it. The only ſubſtance, therefore, which can be employed to any advantage, muſt be ſome fuſible vitreous matter, capable of floating upon the ſurface of the metal, and defending it from the contact of air.

The flux at preſent uſed, and the moſt proper for this purpoſe, is the blaſt-furnace cinder. But pounded glaſs, or any vitreous ſubſtance which fuſes a little before the metal melts, will anſwer equally well.

The ingots of caſt-ſteel, as well as the bars of bliſtered-ſteel, and ſhear-ſteel, are drawn into rods ready for forging into various articles, by a piece of machinery called a *tilt*, or *tilting-mill*. (See TILTING-MILL.) By this hammer, the caſt-ſteel can be drawn down to the ſize of $\frac{1}{4}$ inch ſquare. But in reducing ſmaller than that, it would be liable to be injured in its fabric. It is drawn into rods of ſmaller ſize by hand, for the purpoſe of making gravers, and watch-makers' tools: and for ſtill more delicate articles, it is manufactured into wire. The bliſtered-ſteel will not bear drawing to a ſmall ſize, on account of the looſeneſs of its texture.

Steel is of a mean ſpecific gravity between wrought and pig-iron; and, like the former, it increaſes its property in this reſpect by hammering. Like iron, too, it becomes ſofter on being annealed, but never becomes ſo ſoft as that metal. When of good quality, and at a certain degree of hardneſs, it is ſtronger than iron; that is, when ſtretched longitudinally by a weight; but, by ſudden bending or twiſting, it is more liable to break ſhort. In working it with the hammer, it will not bear ſo great a heat as iron; ſince the temperature iron and its combinations ſuſtain without melting, is inverſely as their doſe of carbon.

This property of bearing heat, is, however, in a ſtill leſs ratio in caſt-ſteel. This is owing to its having entirely loſt its fibrous form in the melting. Hence there is leſs danger in heating it after it has been hammered.

In welding ſteel to iron, or ſteel to ſteel, the fire ought to be very free from ſulphur, or other extraneous matter; and the heated parts of the rods ſhould be frequently ſupplied with either ſand, or ſand mixed with the ſcales which come from the hammered iron. This fuſes upon the ſurface and keeps off the air. See FORGE.

The moſt ſingular property which belongs to ſteel, is that of its hardening by being heated red-hot, and cooling rapidly. This change is greater the hotter the ſteel, and the colder the fluid into which it is plunged. (See CUTLERY.) Water, in general, is employed for this purpoſe; and ſpring-water is better than any other. If the water abound with animal or vegetable matter, the hot ſteel cools more ſlowly. This is occaſioned by a film of the matter in ſolution forming and remaining upon the ſurface, and, being a bad conductor of heat, prevents the ſteel from cooling. File-makers ſay, that the ſalt which is inevitable in their hardening water, makes the ſteel harder, and they ſometimes put ſulphuric acid into it for the ſame purpoſe.

In hardening ſteel in thin plates, ſuch as ſaws, particularly when of caſt-ſteel, quenching in water would cauſe them to crack, and make them ſo hard as not to be uſeful. They have, in conſequence, recourſe to ſome ſubſtance which is not ſo good a conductor of heat. Oil, with tallow, bees' wax, and reſin diſſolved in it, is generally employed for theſe articles. (See the article SAW.) If the ſteel be heated red-hot, it moſtly returns to its original ſtate. This, however, is ſometimes not the caſe with thin plates of caſt-ſteel. In giving various degrees of heat from the hard ſtate, it becomes more ſoft and leſs elaſtic. See CUTLERY.

This curious and valuable property which it poſſeſſes might, at firſt view, appear to be cauſed by an increaſe of denſity; but the ſpecific gravity of hardened ſteel is leſs than before it is hardened. It has been ſaid to depend upon a certain cryſtalline arrangement of its particles; but this is a mere apology for ignorance. The moſt plauſible theory we have heard of is mentioned in one of Dr. Darwin's notes to his "Botanic Garden," and was the idea of a very ingenious friend of that celebrated author. This theory was equally applied to the ſingular property poſſeſſed by the glaſs toys known by the name of *Prince Rupert's Drops*. It is as follows. When the heated ſteel or glaſs is plunged into water, the exterior ſtratum becomes ſo hard and ſolid, as not to be capable of ſhrinking; and every ſucceeding layer is to a certain degree placed in the ſame ſituation. When caloric leaves a body ſlowly, it contracts in its dimenſions, until it aſſumes ſomething near its original volume. But if any force prevent the parts from approximating, the molecules will attract each other with a power equal to the repellent energy of the caloric that cauſed the expanſion. So ſoon, however, as the outer ſtratum is broken, the whole of the others are deſtroyed in ſucceſſion. This is moſt glaringly the caſe with the glaſs drops before ſpoken of, and, to a certain extent, with unannealed glaſs, and hardened ſteel.

With reſpect to the latter, however, it is confined to large maſſes, and particularly of caſt-ſteel. The rollers employed by jewellers and others are of caſt-ſteel, and are very liable to break in the hardening, although about half the maſs in the middle is pure iron. They do not always crack at the time, but at different periods afterwards, and frequently, when no violence is applied to them, ſome have been known to fly ſix months after being finiſhed. Sometimes they break with great report, and what ſtrengthens the above opinion as to the cauſe is, that the figure of the roller is frequently changed from a round to an elliptical ſhape. For farther particulars, ſee STEEL.

§ 5. *Chemical Properties.*

When a piece of poliſhed iron is expoſed to the air, it ſoon loſes its luſtre; and if the atmoſphere be humid, it becomes covered with red ſpots called *ruſt*. When it is expoſed at 400 degrees of Fahrenheit, it changes to a yellow colour. The temperature being increaſed, the colour gradually turns to a brown, and at the heat of about 600 it becomes of a beautiful blue tint. This change of colour ariſes from the combination of oxygen;

the quantity increaſing with the temperature. If the ſurface be defended by a coating of chalk and a ſolution of glue, no change of colour takes place when the heat is applied. In the art of blueing ſteel, advantage is taken of this method to make the blue ornamental.

In a higher temperature the ſurface becomes covered with a ſcaly cruſt, which is compoſed of oxygen and iron; and in the heat of a ſmith's forge, it combines with oxygen ſo rapidly as to burn, throwing off ſparks in bright corruſcations. If ſmall iron wire be expoſed in pure oxygen gas, the end being ignited with a bit of greaſed cotton, the metal enters into brilliant combuſtion, and a globule of melted matter is formed at the end of it. The iron ſo burnt loſes all its metallic properties, by combining with the oxygen; and during this change the phenomena of burning take place. The globule is ſo brittle as to be capable of being reduced to powder, and is called the black or vitreous oxyd of iron.

Iron has ſo great an attraction for oxygen, that it decompoſes water even in the cold. When filings of that metal are mixed with water in a veſſel connected with a pneumatic apparatus, an elaſtic fluid is evolved, which is found to be hydrogen. The iron loſes its metallic luſtre, and ultimately is converted into the black oxyd before ſpoken of.

If this mixture be in a retort, and the boiling heat applied, the iron combines with the oxygen of the water with much greater rapidity; and, of courſe, a much greater quantity of hydrogen is eliminated. This method has been employed to obtain the black oxyd of iron, which was formerly called *Martial Ethiops*. Iron decompoſes water with very great rapidity, when the ſulphuric or muriatic acid is preſent. The acid takes up the oxyd as it is formed by the agency of the water, and a new ſurface is conſtantly preſented. A large quantity of hydrogen is in this proceſs diſengaged, and it is by the preſent method that this gas is procured for filling aëroſtatic machines, and for other purpoſes. If the oxyd which is taken up by the acid be precipitated by an alkali, and dried inſtantly, it will exhibit a ſimilar appearance to that obtained by the action of water alone. When firſt ſeparated it has a green appearance, which it owes to the preſence of water; and this being diſſipated by heat, it is left of a dark-grey colour. This oxyd, formed by either of the above proceſſes, is called the prot-oxyd of iron, becauſe it is combined with the *firſt* or ſmalleſt doſe of oxygen. According to Prouſt and Lavoiſier, it conſiſts of 73 of iron, and 27 of oxygen.

If the prot-oxyd of iron be expoſed to the air in a red heat for a length of time, it aſſumes a red colour, and conſtitutes the ſubſtance known in the arts by the names *crocus* and *colcothar*. This change of colour is found to have been cauſed by its combining with an additional doſe of oxygen, and the product is denominated the peroxyd, conſiſting, according to Prouſt, of 52 iron, and 48 oxygen. From the beſt chemical authorities, it appears that iron unites with oxygen only in two fixed proportions, conſtituting the prot-oxyd and the peroxyd; although it has been held by ſome that there are more varieties.

If a bar of iron be heated red-hot, and a ſtick of ſulphur applied to it, a fluid ſubſtance will drop from its end, which is found to be compounded of ſulphur and iron, and in chemiſtry is called ſulphuret of iron. The fuſion of ſulphur and iron-filings, in a crucible, gives a ſimilar product. The attraction between theſe ſubſtances is ſo great, that their union in nature is very common.

Iron-filings, mixed with ſulphur, and made into a paſte with water, in a certain time become very hot and even produce flame. The mixture is ſometimes buried under ground to produce an artificial volcano. This phenomenon, however, does not depend upon the immediate combination of the ſulphur with the iron. The water, which is a conſiderable agent, is decompoſed; the oxygen uniting with the iron to form an oxyd of iron, and with the ſulphur to form the ſulphuric acid, while the hydrogen combines with another portion of the ſulphur producing ſulphuretted hydrogen, which occaſions the flame in the experiment.

When iron-filings are heated with ſulphur, even where oxygen is not preſent, at a little ſhort of the temperature of redneſs, they combine and produce flame. We are indebted to the aſſociated Dutch chemiſts for this fact, as well as a ſimilar experiment with ſulphur and copper.

The artificial compound of ſulphur and iron, from the experiments of Prouſt, is compoſed of 62.5 ſulphur
37.5 iron
100

The native ſulphuret is found to contain a greater proportion of ſulphur. When heated in a cloſe veſſel, ſome of the ſulphur ſublimes, and may be collected in a proper apparatus. By this treatment, it is reduced to the ſtate of common ſulphuret, and loſes 20 *per cent.* of its weight. It is hence compoſed of 50.6 ſulphur
49.4 iron
100

According to ſome experiments made by Mr. Hatchett, however, theſe proportions are not regular in ſpecimens where the cryſtalline form varies. This ingenious chemiſt has found a native ſpecies agreeing in the proportion of its conſtituents with the artificial ſulphuret. It is what has been called magnetic pyrites; and is by this teſt of the magnet diſtinguiſhed from the common pyrites, which does not poſſeſs that property. It has alſo another peculiar character. If dilute ſulphuric or muriatic acid be poured upon it, a rapid action takes place, and ſulphuretted hydrogen is evolved. This is not the caſe with the ſuper-ſulphuret till it has been expoſed to heat, when it loſes its exceſs of ſulphur. The common ſulphuret of iron has been employed to make artificial magnets. Mr. Hatchett found that not only the ſulphurets, phoſphurets, and carburets, were ſeparately magnetic; but ſuſpects that certain proportions of all theſe may conſtitute a *maximum* of magnetic virtue.

It is highly probable, that the iron is the only ſubſtance poſſeſſing magnetiſm; and that the facility with which theſe compound ſubſtances become magnetic, may ariſe from the greater eaſe with which the particles of iron aſſume the peculiar arrangement on which this curious property depends. That ſome arrangement, though perhaps equally myſterious with cryſtallization, may be the cauſe of magnetiſm, there is much reaſon to believe. By mixing iron-filings with melted reſin, and incloſing them in a braſs tube, if a magnet be brought near to the tube, while the maſs is ſtill liquid, the whole, when cold, will become a magnet. During the touching of a piece of ſteel to make it magnetic, there is little doubt but that a new and peculiar diſpoſition takes place amongſt the particles, notwithſtanding the ſolid ſtate of the metal. The particles of bodies appear to be free to motion in the ſolid form. We find that iron combines with carbon, while both bodies are in that ſtate; and what is ſtill more curious, the compound aſſumes a different cryſtalline ſtructure, according to the proportions of the two bodies. Oxygen appears, in ſome inſtances, to alter the internal arrangement of ſolid bodies. If braſs, for example, were to be kept in a damp room, but more particularly where the fumes of acids are preſent, the metal, although previouſly very tenacious and ductile, becomes ſo brittle, as not to bear bending to a right angle; at the ſame time that the broken ſurfaces exhibit a cryſtalline fracture. That ſpecies of form, therefore, under which magnetiſm exiſts, may be brought about by various means. All iron inſtruments, kept in one poſition for a length of time, become magnetic; eſpecially if that poſition coincide with the magnetic meridian. We regret that ſo little is known on this intereſting ſubject; and for farther particulars refer to the article MAGNETISM.

Iron combines with ſeveral of the metals forming alloys, none of which have very ſtriking or uſeful properties. The alloy of iron and gold has been examined by Mr. Hatchett, who found that 11 parts of gold to 1 of iron formed a malleable alloy, remarkably ductile, ſo as to roll into plates, and be capable of being ſtamped into coin. The colour was of a pale yellowiſh-grey, and it was of the ſpecific gravity of 16.885. The moſt ſingular property of this alloy is its increaſe of volume by combination. Before the union, the bulk was 2799; and afterwards, 2843. The very contrary is the caſe with moſt of the other alloys of metals, and agreeably to Berthollet's doctrine of affinity, we find that the mean ſpecific gravity of bodies by experiment, is greater than the arithmetical mean, directly as the affinity of the bodies. We ſhould, therefore, in this inſtance conclude, that either the affinity of the metals is trifling, or that the above law is not general.

The alloy of pure iron with platina has not been effected from the great infuſibility of the two metals. Dr. Lewis alloyed caſt iron with platina, as well as ſteel. The ſpecific gravity of this alloy, contrary to the laſt, was greater than the arithmetical mean. It was very hard and tenacious, poſſeſſing ſome degree of ductility.

After being kept ten years, it was little tarniſhed. Iron is eaſily alloyed with ſilver. In equal parts they form a compound of conſiderable ductility, of the colour of the latter metal, but much harder; and is attracted by the magnet. The metals ſeparate, in ſome degree, when kept in fuſion; but, according to the experiments of Morveau, not completely; the ſilver retaining ſome of the iron, and the iron ſome of the ſilver, by which its quality, as a metal, is much improved. Iron is not eaſily combined with copper in large quantity. We find, however, that theſe metals are capable of uniting, and the alloy is, in ſome degree, magnetic. Indeed, in forming certain inſtruments of braſs, where the magnetic needle is employed, they are frequently defective from this circumſtance. To free copper entirely from iron, it ſhould be rediſſolved in an acid. The oxyd, after precipitation, ſhould be diſſolved in aqua ammonia, and the alkali then diſtilled from it. This being afterwards treated in a cloſe veſſel with ſome inflammable matter, the metal will be obtained pure. The alloys of tin and iron, and that of iron with zinc, may be formed by mixing clean iron-filings, or turnings, with thoſe metals while in a ſtate of fuſion. Theſe compounds are not of any uſe. Iron may be ſoldered with ſeveral of the metals. Copper, gold, and ſilver, unite to it with great facility; but require the preſence of borax to keep off the air.

The moſt permanent ſolder for iron is the carburet of the ſame metal, called N° 1, pig-iron. The pig-iron loſes ſome of its brittleneſs, and the malleable metal becomes much harder. It does not appear improbable that ſteel might be formed by uniting theſe two ſubſtances together in certain proportions.

We have next to treat of the ſalts of iron, or its combinations with acids.

Sulphat of Iron.—Sulphuric acid does not combine with iron in its metallic form; in conformity with the general law that no acid unites with a metal till the latter is previouſly oxydated. Iron is but ſlightly acted upon by this acid in the cold; but with a degree of heat far ſhort of boiling, the iron takes from it a portion of oxygen, converting it into the ſulphurous acid, which eſcapes in the form of gas. The iron, thus oxydized, combines with another portion, and forms the ſulphat of iron.

When water is added to the iron and the acid, a much more rapid action takes place. The metal ſeizes the oxygen of the water; hydrogen is evolved; and the acid unites with the oxyd forming the ſalt in queſtion. When the product obtained by this means is more than the water can diſſolve, it aſſumes the form of green cryſtals, which, when ſeparated, are the ſame with thoſe known in commerce and the arts by the names of *green vitriol* and *copperas*.

In the action of iron upon the concentrated ſulphuric acid, it appears anomalous, that the metal ſhould not be oxydized with more facility by this acid, when water is ſo rapidly decompoſed, the elements of which have ſo ſtrong an attraction for each other. It may appear equally ſtrange that the water is not decompoſed when the acid is not preſent. When it is recollected, however, that the oxyd of iron is not ſoluble in water, nor ſulphat of iron in the acid, it will appear very clear that the two ſubſtances are both eſſential to the effect; the acid promoting the decompoſition of the water by taking away the oxyd, and the water taking up the ſalt, which would be equally obſtructive to the proceſs.

This ſalt is not commonly obtained by the above proceſs. The ſulphuret of iron, above deſcribed, already conſiſts of two of its elements, namely, ſulphur and iron; the oxygen and water of cryſtallization being alone wanting to complete the ſalt under inquiry. For this purpoſe, the natural combination of it, or pyrites, is firſt roaſted, and then expoſed in large heaps under ſheds. Theſe heaps are frequently moiſtened with water, by which, together with the preſence of the air, the iron and the ſulphur become oxygenated, and cryſtals of the ſulphat begin to form. The water, which is thrown on from time to time, diſſolves the ſalt, and runs into large reſervoirs, which are alſo under ſheds, to prevent the rain falling into them. This ſolution, however, does not contain the ſalt in a fit ſtate for cryſtallization, being too highly charged with oxygen. The liquor is transferred into large boilers, and pieces of old iron put into it, which, by taking up the exceſs of oxygen, change the ſolution from a red to a green colour. When the evaporation has gone on to a certain point, the ſalt cryſtallizes, and the green cryſtals being ſeparated, are fit for ſale.

When the cryſtals are obtained from a clear ſolution, and are well defined, exhibiting tranſparent rhomboidal priſms, the ſpecific gravity of which is 1.8, the ſalt may be deemed in a ſtate of purity. It diſſolves in $\frac{3}{4}$ths its weight of boiling water, and twice its weight of water at 60°. When kept dry, it is not liable to change in the air; but if moiſtened it becomes covered with red ſpots by the abſorption of oxygen, and if it be diſſolved in water, it returns to the ſtate in which it exiſted before boiling with the metallic iron. When the cryſtals are heated, the ſalt at firſt fuſes, then aſſumes the form of white powder, by loſing its water of cryſtallization. At a red heat the acid begins to fly off; and ultimately a fine red oxyd is left behind. It is in this way the *crocus* of commerce is prepared.

According to the analyſis of Bergmann, this ſalt is compoſed of

Acid	- -	39
Protoxyd of iron	-	23
Water	- -	38
		100

According to Kirwan:

Acid	- -	26
Oxyd	- -	28
Water	- -	46
		100

It is decompoſed by the alkalies and alkaline earths; and by all the ſalts forming inſoluble compounds with ſulphuric acid.

Oxy-ſulphat of Iron.—This ſalt conſiſts of the ſulphuric acid united to the peroxyd of iron. Its ſolution in water is of a deep reddiſh-brown colour. It is inſuſceptible of cryſtallization. Hence, the green cryſtals ſeparated in making copperas are perfectly diſtinct in their nature from the ſalt which is left in the remaining liquid. When the ſulphat is expoſed in a ſtate of ſolution for a length of time, it aſſumes a red colour, and is converted into this ſalt; ſo that we never find the common ſulphat in mineral waters, but the oxy-ſulphat. This change may be more ſpeedily brought about by heating it with nitric acid. A quantity of nitrous gas is evolved, and, according to Mr. Davy, ammonia alſo; the former from the decompoſition of the acid, the latter from the decompoſition of both the acid and the water. The fluid gradually aſſumes a deep brown colour. It has a ſtrong aſtringent taſte, much reſembling the juice of ſloes. When this ſalt is formed without the addition of water, it is exceedingly heavy, and concentrated, and of a deep brown tint, approaching to blackneſs. If concentrated ſulphuric acid be poured into it ſuddenly, it loſes its brown colour, and becomes of a clear white, having the conſiſtence of thick cream. It is ſo ſoluble in water, that when evaporated ſlowly, inſtead of cryſtallizing, it aſſumes the form of ſyrup. If too much heat be applied, however, the oxyd either precipitates, or it aſſumes the form of a ſub-ſalt, and becomes inſoluble.

Since the oxy-ſulphat differs from the ſulphat in the proportion of oxygen only, ſeveral ſubſtances reconvert it into that ſalt, by abſtracting the exceſs of oxygen. If it be kept, for inſtance, for ſome time in a cloſe-ſtopped bottle with iron-filings, the metal becomes oxydized, and the whole is changed to the ſimple ſulphat.

Gay-Luſſac has lately ſhewn that the quantity of acid in any metallic ſalt is in proportion to the quantity of oxygen in the metal. (Memoires d'Arcueil, t. ii. p. 159.) Hence no additional acid is required in converting this ſalt into the ſulphat.

Tin, and ſeveral other metals, produce the ſame effect. The exceſs of oxygen may inſtantly be taken away by paſſing ſulphuretted hydrogen gas through the oxy-ſulphat. This gas reduces the oxyd exactly to a *minimum* of oxydation, to the ſtate of protoxyd; and hence the reaſon why this gas does not precipitate iron from its ſolutions.

The oxy-ſulphat may be eaſily ſeparated from the ſulphat; the former being ſoluble in alcohol, which the latter is not.

From the method required to form this oxy-ſalt, it will appear that there are ſeveral ſubſtances which may be employed to give their oxygen to the ſulphat of iron. Of theſe are the nitric and oxy-muriatic acids. And by pouring a ſolution of gold into a ſolution of this ſulphat, the oxy-ſulphat is produced, and the gold becomes metallic.

Dr. Thomſon enumerates ſeveral *triple* ſalts, formed by the ſulphuric acid with iron and other metals.

1. Sulphat of iron and copper.
2. Sulphat of iron and zinc.
3. Sulphat of iron and nickel.

The former of theſe ſometimes exiſts in the blue vitriol of commerce, which is a very great evil to colour-makers. The iron precipitates with the copper, and deſtroys the beauty of the latter. In order to aſcertain whether iron be preſent in blue vitriol, diſſolve a ſmall quantity in a wine-glaſs, and add aqua ammonia till it ſmells ſtrong of the latter. The oxyd of copper will be diſſolved, and the oxyd of iron left at the bottom. By ſtanding for ſome time, the precipitate becomes yellow and very conſpicuous. It is even ſaid that ſome of theſe ſalts have triple baſes. The two hitherto obſerved are as follows:

1. Sulphat of iron, zinc, and nickel.
2. Sulphat of iron, copper, and nickel.

Sulphite of Iron.—Berthollet has given us an account of a compound of iron with the ſulphurous acid. When iron is expoſed to the action of this acid, it becomes ſpeedily oxydized; but what is ſingular, not at the expence of the water, as is the caſe with the ſulphuric acid; but it appears that the acid is decompoſed, the oxygen uniting with the iron, while the ſulphur combines with the ſalt. Hence this ſulphat of iron is always contaminated with ſulphur. The ſulphurous acid has a leſs affinity for iron than the ſulphuric; and if the latter be added to the ſulphat, its acid is diſengaged in the form of gas.

Nitrat of Iron.—The nitric acid has very violent action upon iron, and an abundance of the red fumes of nitric oxyd are diſengaged. The ſame thing in ſome meaſure takes place with this acid, as has been remarked with regard to the ſulphuric. If it be more than a certain ſtrength the action is feeble, until a certain portion of water is added. The ſame explanation will anſwer in both inſtances. The nitric acid does not diſſolve the nitrat at firſt formed, the preſence of which interrupts the future progreſs of the operation. When the ſolution is made with much water the iron is oxydized to a *minimum*, and the ſalt formed is the proper nitrat. It is of a pale green colour. The veſſel in which this ſolution is made ſhould be kept in water as cold as poſſible, elſe it will abſorb too much oxygen, and paſs to the oxy-nitrat.

Oxy-nitrat of Iron.—When iron is acted upon by the leſs diluted acid, and with heat, the ſalt formed is the oxy-nitrat. The ſolution is of a deep brown, reſembling the oxy-ſulphat. It has a ſtrong aſtringent taſte, and turns vegetable blues red. When the ſolution is boiled the oxyd is partially precipitated; nor will it afterwards diſſolve in the nitric acid. This has furniſhed one means of ſeparating iron from other ſubſtances in the analyſis of minerals.

We are indebted to Vauquelin for a method of obtaining this ſalt in a cryſtallized ſtate. The method he recommends, is to keep the black oxyd of iron and ſtrong nitric acid together for a length of time, till the cryſtals appear. They have an acid taſte, and are deliqueſcent. The form of them is that of a four-ſided priſm.

The alkalis precipitate the oxyd of iron from this ſalt of a fine yellow colour, and yield a product which is valuable to painters.

Muriat of Iron.—The muriatic acid, like the ſulphuric and nitric, acts feebly upon iron, except it be diluted to a certain extent with water. It differs from the latter, and agrees with the former, in not being decompoſed; but merely takes up the oxyd formed by the oxygen of the water, the hydrogen being given out in the ſtate of gas. The ſolution is of a green colour; and, on evaporation, it affords cryſtals preſenting the ſame appearance. Mr. Davy has given us ſeveral uſeful facts relative to this ſalt. It was employed by him to great advantage in making ſome eudiometrical experiments. He found that a ſolution of it abſorbs a large quantity of the nitric oxyd gas, which, in this ſituation, is better fitted for abſorbing oxygen than by mixing the two gaſes together. By abſorbing this gas it aſſumes a brown colour, and acquires an aſtringent taſte. When the compound is heated, it appears that the gas is decompoſed as well as a portion of water; ſince the iron becomes more highly oxydized, and ammonia is formed. Mr. Davy recommends an infallible method of forming this ſalt, by adding muriatic acid to ſulphuret of iron. The ſulphuretted hydrogen prevents the muriat from becoming oxy-muriat, which has not the property of abſorbing the nitric oxyd. Muriat of iron is very ſoluble in water and in alcohol. It is decompoſed by the alkalis and alkaline earths, and all ſalts, the baſes of which form inſoluble compounds with muriatic acid; ſuch as ſilver and mercury.

Oxy-muriat of Iron.—The muriat of iron, like the ſulphat and nitrat, is converted into the oxy-muriat by the oxyd of iron paſſing from the ſtate of prot-oxyd to that of per-oxyd. It ſlowly undergoes this change by expoſure to the air; and rapidly, by the agency of thoſe bodies which afford oxygen with greater facility, as the nitric and oxy-muriatic acids. The ſolution is of a deep brown, but does not afford cryſtals by evaporation. It has a powerful, aſtringent taſte, and a peculiar odour. When this ſalt is diſtilled it affords oxy-muriatic acid, leaving in the retort the prot-oxyd of iron.

If the heat be applied rapidly, the ſalt ſublimes; not in the ſtate of oxy-muriat, but of muriat of iron.

There is alſo a triple ſalt formed by the muriatic acid with iron and ammonia. This may be prepared by adding iron-filings to muriat of ammonia. It may either be obtained in cryſtals by evaporation, or it may be ſublimed. In the latter ſtate it is known in medicine by the name of *Flores Martis.*

Phoſphat of Iron.—The phoſphoric acid has little action upon iron; but the acid unites with the prot-oxyd, and forms this compound.

It is prepared by adding a ſolution of ſulphat of iron to a fluid mixture of phoſphat of potaſh. The ſalt precipitates in the form of a blue powder, which is inſoluble in water, and does not loſe its colour by expoſure to the air.

The ſubſtance known by the name of native Pruſſian blue, is a phoſphat of iron; but, what is remarkable, it has little colour when dug out of the earth, becoming deeper on expoſure to the atmoſphere. A cryſtallized ſpecimen, lately brought from Brazil, has been analyſed by Vauquelin, and is compoſed of

Acid	21
Protoxyd	45
Water	34
	100

Oxy-phoſphat of Iron.—This ſalt is formed by taking advantage of ſome oxy-ſalt of iron and phoſphat that is ſoluble; as, for inſtance, by adding together the oxy-ſulphat, or oxy-muriat of iron, and the phoſphat of ſoda or of potaſh, a white powder will be precipitated, which is the oxy-phoſphat of iron.

This ſalt is inſoluble in water, but diſſolves in the muriatic or ſulphuric acids; from which it may be precipitated, unchanged, by pure ammonia.

Sub-oxy-phoſphat of Iron.—The ſalt above deſcribed is not decompoſed by the alkalis like the metallic ſalts in general. The alkali combines with a portion of the acid only, leaving the ſalt with an exceſs of baſe, which is the ſub-oxy-phoſphat of iron. This ſub-oxy-phoſphat does not diſſolve in water, or ſcarcely in acid: but it has the ſingular property of diſſolving in albumen, or the white of eggs: and if an alkali be preſent, which is the caſe with the albumen in the ſerum of blood, it aſſumes a reddiſh-brown colour, and is ſuppoſed, therefore, to be the principal colouring matter of the red blood of animals.

Fluat of Iron.—The liquid fluoric acid attacks iron, or rather takes its oxyd, which is formed by the oxygen of the water, while hydrogen gas is evolved. It has no ſtriking properties, or any which it may be important to deſcribe.

Borat of Iron.—This ſalt, being inſoluble in water, is obtained by mixing ſolutions of borat of ſoda and ſulphat of iron together. It appears in the form of a yellowiſh powder, and melts into glaſs before the blow-pipe.

If the oxy-ſulphat of iron be employed, an oxy-borat will be obtained.

Carbonat of Iron.—When iron-filings are mixed with the liquid carbonic acid, and ſuffered to remain for ſome time, the water will acquire a perceptible taſte of iron. If it be expoſed to the air, a precipitation takes place, either from the gas flying off, or from the ſalt aſſuming the ſtate of ſub-carbonat. The precipitate is of a yellow colour. This ſalt is frequently found in mineral waters, to which it gives a peculiar odour. The water, by ſtanding a little while, is not ſenſible to any of the teſts of iron; but a yellow precipitate is found at the bottom of the veſſel.

When a ſolution of neutral carbonat of potaſh is added to a ſolution of ſulphat of iron, a large quantity of iron is diſſolved by the carbonic acid, giving to the fluid a ſtrong inky taſte.

This ſalt is alſo found native in the ſolid form, of which we have already ſpoken in the mineralogical part of this article.

The common ruſt of iron, formed by expoſing iron to the air, may be proved to be a carbonat of this metal by its effervesſcence with acids. It is, no doubt, from the ſolubility of this ſalt, that iron becomes ſo periſhable by expoſure to the weather.

The ſub-carbonat of this ſpecies, according to Bergmann, is compoſed of

24	acid
76	oxyd
100	

It appears from ſome experiments of Bucholz, that the native carbonat, by heating red-hot, becomes magnetic.

Acetat of Iron.—The acetic acid, when of moderate ſtrength, added to iron-filings, cauſes the iron to be oxydated by the decompoſition of the water, while the hydrogen is ſet at liberty. The ſolution has a ſweetiſh, though inky taſte, and emits the odour of vinegar. The beſt way of forming this ſalt is by mixing acetat of lead and ſulphat of iron together. The ſulphat of lead becomes inſoluble, and the acetat of iron remains in the liquid. Mr. Davy obtained this ſalt by digeſting the ſulphuret of iron with acetic acid. It afforded to him cryſtals in ſmall priſms.

Oxy-acetat of Iron.—If the oxy-ſulphat of iron be uſed inſtead of the ſulphat with the acetat of lead, the ſulphat of lead is precipitated, and an oxy-acetat is held in ſolution of a beautiful reddiſh-brown colour. This ſalt does not afford cryſtals. It has the ſmell of vinegar; and, when in ſolution, affords an excellent teſt for arſenic. The arſenic forms an inſoluble compound with the iron, of a brilliant orange tint. The pyrolignic acid, which is an impure acetic acid, unites with iron, and yields a very cheap acetat of iron, which is uſed by dyers and calico printers as a mordant.

Succinat of Iron.—When the ſolutions of ſuccinat of potaſh or ſoda, and ſulphat of iron are mixed together, a browniſh-red inſoluble precipitate is formed, which is the ſuccinat of iron. The ſoluble ſuccinat may hence be employed to ſeparate iron from other ſubſtances.

It is compoſed of

Acid and water	61.5
Oxyd - -	38.5
	100

The *oxalat, tartarat, citrat, malat, benzoat,* and *ſuberat of iron,* are but little known. They are all, however, ſoluble in water.

Gallat of Iron.—When the gallic acid is added to any ſolution of iron, the oxyd being at a *minimum* of oxydation, a fine purple precipitate will be produced. If the acid be entirely freed from tan, the purple colour is much more conſpicuous. The pure gallic acid, therefore, is much better as a teſt for iron, than the mere infuſion of galls.

The tan may be ſeparated from this acid by means of gelatine, which does not precipitate the gallic acid. By this treatment a ſolution may be obtained colourleſs and limpid.

If the gallic acid be added to a ſalt of iron, in which the oxygen is at a *maximum,* the precipitate is a very complete black; but the oxyd ſoon ſeparates, and falls to the bottom in the form of a red powder. This property renders theſe ſalts of iron unfit for making writing ink. When the oxyd is in the ſtate of prot-oxyd, the combination is permanent; and although it is not ſo black when firſt uſed, it ſoon becomes dark by expoſure to the air. We may hence learn, that while ink is in uſe, it ſhould not be kept expoſed to air; ſince it paſſes to the ſtate of oxy-gallat, and the oxyd will fall down.

Pruſſiat of Iron.—When the triple pruſſiat of potaſh and iron is poured into a ſolution of the latter ſubſtance, the oxyd being at a *minimum* of oxydation, a white powder is precipitated, which is the pruſſiat of iron. If this powder be expoſed to the air, it changes to a blue; and in this ſtate is called the oxy-pruſſiat of iron.

Oxy-pruſſiat of Iron.—This ſalt is formed by the ſame ſoluble pruſſiat being added to the oxy-ſulphat of iron, and conſtitutes the beautiful blue pigment, known by the name of *Pruſſian blue.* It is generally, however, adulterated with alumine. See PRUSSIAN BLUE and PRUSSIC ACID.

Arſeniat of Iron.—The native arſeniat has been already deſcribed in the mineralogical part of this article. Arſeniat of potaſh, or ammonia, being added to the ſulphat of iron, an inſoluble powder precipitates, which is the artificial arſeniat of iron.

Oxy-arſeniat of Iron.—The arſeniat of iron, in common with all the other ſalts of this metal, combines with an extra doſe of oxygen, conſtituting the oxy-arſeniat. The precipitate formed by the arſenic acid and the oxy-acetat of iron is of a blueiſh-white colour.

The oxy-arſeniat of iron, from the analyſis of Chenevix, is compoſed of

Acid	42.4
Oxyd	37.2
Water	20.4
	100

Arſenite of Iron.—The arſenious acid, or the common white arſenic of commerce, forms with iron peculiar compounds, which have been but little examined. It does not take the oxyd of iron from the ſulphat, but decompoſes the acetat, forming with the protoxyd a ſubſtance of a greeniſh-yellow colour; the precipitate from the oxy-acetat being of a bright orange. If either of the acetats contain the leaſt portion of the ſulphat of iron, it prevents the precipitation of the arſenite.

Chromat of Iron.—See CHROME.

Moſt of the other acids combine with iron; but they form compounds which are but little known. Certain alkaline ſalts act upon iron, and produce triple compounds, which have not received a particular examination. When the nitrat of potaſh is fuſed in contact with that metal, the acid is decompoſed, and the iron oxydized to a *maximum.* This melted maſs, after the acid is completely diſſipated, is of a red colour. If, before it becomes deliqueſcent, which takes place from the preſence of the alkali, it be thrown into water, the alkali diſſolves a quantity of iron, forming a ſolution of a deep ſplendid purple tint. The colour remains permanent for ſome time, if the air be excluded; but, if expoſed in an open veſſel, it changes quickly to a green, and the oxyd ultimately precipitates, leaving the liquid clear and colourleſs. The precipitated oxyd is of a deep red colour.

Deſcription of Plates.

Plate I. *fig.* 1, a plan of an iron forge; *fig.* 2, an elevation of the ſame. In *fig.* 1. A is a water-wheel, which gives motion to the ſtamping hammer E; G, the mill-dam; H, the tail water courſe; I is a ſmall water-wheel, to give motion to the blowing machinery; L, *fig.* 1, is another water-wheel, which works the hammer *o*, for drawing the balls, &c. into bars; K is the mill-dam for ſupplying all the wheels.

Q, in *fig.* 1, is a refinery, technically called a *finery*; in *fig.* 2. is the elevation. It is blown by the double blowing cylinders, *e*, *e*. R, the *chafery* for heating the maſſes of iron a ſecond time after hammering; S, S, plans of balling furnaces, and ſimilar to the puddling furnace.

Plate II. *fig.* 1. is a front view of the finery, as ſeen *fig.* 2. *Plate* I.; *fig.* 2. being a ſide view. K, the hearth on which the pig-iron and charcoal is placed; G H, the chimney; *f*, the air-pipe; *g*, a cock to regulate the blaſt; *h*, a leathern pipe connecting the main-pipe with the noſe-pipe; *i*, *fig.* 3, an enlarged view of the tuyere-iron, into which the noſe-pipe *i* is inſerted, and which enters the hearth at *a*, *fig.* 1.; *m* and *n* are two iron pipes, terminating in, and forming a part of the tuyere-iron. The pipe *m* communicates with a ciſtern of water, which conveys a ſtream of cold water, for the purpoſe of keeping the tuyere-iron cool, and which is diſcharged at *n*, into the ciſtern *o*, *fig.* 4, where the whole of this apparatus is ſeen. The furnace called the *run-out furnace* is very ſimilar to the finery. The hearth of the finery is ſurrounded with caſt-metal plates, having a cavity under the bottom plate, to throw water from time to time to keep the bottom plate cool. The *run-out furnace* differs from this, in being ſurrounded on three ſides with water. This furnace, and its uſe, has already been deſcribed. The chafery is alſo ſimilar to the finery, except in the hearth being more like the ſmith's forge.

Fig. 5. exhibits tongs for taking the balls from the furnace to the hammer; and *fig.* 7. an iron ladle, employed to throw water into the puddling furnace, to oxydate the iron.

Fig. 8. the face of the ſtamping hammer, which is made to be taken out occaſionally.

Fig. 9. the face of the hammer employed for drawing out the bars: *b* is the part uſed to extend the bars in length with more expedition; the part *a* being employed for ſmoothening or finiſhing the bar.

Figs. 10. and 11. are different views of the balling furnace: *a* is the fire-grate; *b*, the hole where the fuel is admitted; *d d*, the roof made of fire-brick; *e*, the door through which the balls are admitted; and *b b*, the hearth on which the balls are laid to be heated, by the flame which is carried by the draught of the chimney G. This furnace is bound on all ſides by bars of iron, ſecured by bolts.

The puddling furnace is ſo nearly ſimilar to this, as not to require a ſeparate drawing. The hearth is more concave oppoſite the door, for the purpoſe of containing the metal which is liquid, previous to its aſſuming its malleable ſtate. The door of this furnace, for heating the balls, conſiſts of a frame of wrought iron, containing fire-bricks, to prevent the eſcape of heat. It ſhuts and opens upon the hole, by being attached to the end of a lever; its weight being counterpoiſed at the other end. See *fig.* 1. *Plate* IV. where R is the lever; *b*, the door; and *f*, the part by which it is raiſed.

The door of the puddling furnace conſiſts of a ſolid piece of caſt-iron, about 3 inches thick, having a ſmall hole through it, for the purpoſe of inſpecting the proceſs, and introducing the puddling inſtruments.

Plate III. *figs.* 1. and 7. are views of the reverberatory furnace, uſed by the caſt-iron founders, for melting large quantities of metal at once. This furnace, like the laſt, is heated with flame from its fire-place *a*, the fuel being introduced at B; *c d* is a ſloping hearth, on which the pigs or other pieces of metal are laid; *b*, the door where it is introduced; and *g*, the chimney. The melted metal runs down to the part *o*, where it is accumulated, and is let out at *f*; or a door may be opened at *e* above, and the melted metal carried out in ladles, to be poured into the moulds.

Fig. 2. is a ſection of a cupola, in which *a* is the interior of the furnace containing the metal and cokes; *e*, the tap hole; *b*, the noſe-pipe; *d*, a leathern pipe connecting the air-pipe, which comes from the blowing cylinder, with the ſame; *e*, a ſtop-cock to regulate or turn off the blaſt.

It generally conſiſts of four plates of caſt-iron, firmly bolted together; the interior being lined with fire-brick. This furnace is generally employed for the beſt kind of work, and will melt many charges in a day, according to the nature of the metal expoſed in it.

Plate IV. *figs.* 1. and 2. are two views of forge-hammer machinery, erected by the celebrated Smeaton. A is the water-wheel; H, a fly-wheel; D, wheel-work to open the ſhuttle by a little at once, for the purpoſe of adjuſting the quantity of water; F, a cog-wheel to give motion to the wheel G; at the other end, I, are a number of cogs, which lift the hammer K, *fig.* 2, by paſſing under its ſhaft, or helve, as it is ſometimes termed; L, a large beam of wood inſerted into the poſt M, and paſſing horizontally over the hammer. Into the poſts, M and N, is inſerted a piece of aſh-timber *o*, againſt which the hammer K ſtrikes in its aſcent, and by its elaſticity re-acts upon the hammer, and gives it a greater deſcending velocity than would be produced by gravity alone. Q is a number of heavy pieces of metal laid upon the beam L, to increaſe its *vis inertiæ*, and will, in conſequence, receive leſs motion from the hammer. (See Mill-Work and Water-Wheel.) The hammer here deſcribed has been much improved, ſo far as regards the ſpring at *o*.

That already mentioned in the plate is much preferred. The whole of it is made of caſt-iron, and its weight is about 35 *cwt.* It acts ſimply by its gravity; its extra force, therefore, over the common one, conſiſts in its greater quantity of matter. It is made exceedingly maſſive near the centre of motion, by which means its centre of oſcillation is thrown nearer to that point, and it conſequently deſcends with greater velocity. Although this is an advantage with reſpect to the number of ſtrokes in a given time, it is a diſadvantage in another way; ſince the centre of oſcillation is alſo the centre of percuſſion, or the point where the greateſt ſtroke is made. Could the velocity be obtained without this evil, the advantage would be material. See Tilting-Mill.

Iron, in the *Materia Medica*, is ſaid to have greater virtues than any of the other metals, which is not to be wondered at, as being the only one that is in a manner ſoluble in the human body. All the other metals, whether hard or ſoft, poiſonous or ſalutary, nay even fluid mercury itſelf, ſwallowed in their crude ſtate, paſs out of the body again unaltered; but this is not the caſe with iron, its crude filings are often taken as a medicine, and are always ſo much acted upon by their juices, as to produce conſiderable effects. It is ſo eaſily wrought upon out of the body alſo by fire, and by different menſtruums, that it becomes an aperient or aſtringent, as it is differently treated; and is, under proper management, greatly ſuperior to all other medicines in chronic caſes.

Iron or ſteel, that is, the *ferrum* or *chalybs*, may be employed indifferently, as Cullen ſuggeſts, in the preparation of the rubigo; but he thinks that, upon the whole, the preference is due to the iron in its ſoft malleable ſtate, or in that which is called "forged iron." As iron, ſays this medical writer, like all other metals, in its ſolid and entire ſtate, is not active with regard to our bodies, without being corroded or diſſolved by ſaline matters, he is of opinion, that it is rendered active only by being combined with acids. It has indeed been common to give the entire metal, brought by filing into a fine powder, and with very good effects, as a medicine. But this he does not conſider as an exception to his general rule; becauſe he is perſuaded that there is conſtantly preſent in the human ſtomach a quantity of acid capable of diſſolving iron; and as a proof of it he alleges that he never knew iron given in its metallic or ſlightly corroded ſtate, without producing a blackneſs in the ſtools, which affords a preſumption of a previous ſolution of the iron in acids. As this combination with acids is neceſſary, phyſicians and chemiſts have diverſified this combination in a variety of ways; Dr. Cullen obſerves, that he has not known a preparation of iron for the purpoſe of medicine, that has not been prepared by a combination with acids, or by bringing the iron into a ſtate that rendered it readily ſoluble by the acid of the ſtomach, and Dr. Lewis very properly remarks, that Pruſſian blue, though truly containing a quantity of iron, as it is not ſoluble in any acid, is the leaſt promiſing of all the medicinal preparations.

Its virtues internally were not unknown to the ancients; Dioſcorides attributes both an aſtringency and aperiency to it, and preſcribes it in hæmorrhages. He alſo recommends its ruſt, or *crocus martis*, in ſuppreſſions of the menſes;

though he, on the other hand, preſcribes wine or water, in which red-hot iron has been quenched, as an aſtringent in dyſenteries, diarrhœas, and weakneſſes of the ſtomach.

Iron combined with acids becomes an aſtringent ſubſtance; and hence its great medicinal virtue is cauſed by its tonic and ſtrengthening qualities; for by increaſing the tone of the veſſels, it increaſes their vigour and activity. It produces a ſlight and gentle irritation of the fibres, the effect of which is to conſtringe the ſenſible organic parts upon which it acts, and to increaſe their force and elaſticity. Iron particularly acts upon the fibres, and the veſſels of the ſtomach and inteſtines; hence it produces excellent effects in all diſeaſes which proceed from laxity and inactivity of the digeſtive organs. Such are crudities, bad digeſtion, accompanied with diarrhœa, flatulencies, flatulent colics, &c. &c. in diſeaſes which proceed from the former, as many hyſterical, hypochondriacal, melancholic affections, intermittent fevers, tertians and quartans, &c. In thoſe caſes iron quickens the circulation and raiſes the pulſe; renders the blood more florid, and as it were expands and rarefies the juices, promoting, when they are deficient, and reſtraining, when immoderate, the ſecretions that are made from the blood, as perſpiration, urine, and the uterine purgations. By the ſame corroborating power, which renders it ſerviceable in promoting deficient, and reſtraining redundant diſcharges, where the ſuppreſſion or flux ariſes from debility and relaxation, it increaſes, on the contrary, fluxes, and confirms obſtructions, when they proceed from tenſion, rigidity, or ſpaſmodic ſtrictures of the veſſels. Where either the circulation is quick, or the habit plethoric, by increaſing the velocity of the blood, and the plethoric ſymptoms, it produces heavineſs, dulneſs, vague heats and fluſhings, or kindles more dangerous fevers or inflammations, or burſts ſome of the over-diſtended ſmall veſſels. In ſome conſtitutions, where iron is proper and ſalutary, particularly in hyſterical and hypochondriacal caſes, and where the ſtomach is very weak, it is apt at firſt to occaſion great ſickneſs and perturbation: to remedy theſe inconveniences, Sydenham adviſes, to begin with very ſmall doſes, and to adminiſter it for a while at bed-time, in conjunction with a ſlight opiate. In other circumſtances, it is commonly taken in the morning and afternoon, and moderate exerciſe uſed to promote its action. In all caſes the doſe ſhould be ſmall and repeated; a grain, or half a grain of the metal diſſolved, or in a ſoluble ſtate, is generally a ſufficient doſe. Its effects are known by nidorous eructations, and by the alvine fæces being tinged of a black colour.

Stahl, and ſeveral other modern chemiſts and phyſicians, acknowledge only the tonic and ſtrengthening qualities of iron. The caſes in which iron has produced a reſolving and aperient effect are thoſe, in which the obſtructions, and the defect of ſecretions and excretions, have proceeded from weakneſs and relaxation of the fibres and of the veſſels, rather than from a craſſitude of humours, as in the chloroſis, in ſome kinds of jaundice, and other diſeaſes of the ſame ſort.

The ſame preparation, as Dr. Lewis has judiciouſly obſerved, may ſometimes exert an aperient, and ſometimes an aſtringent, power, according to the ſtate of the body to which they are applied. *E. g.* If a retention of menſes depends upon a weakneſs in the veſſels of the uterus, chalybeate medicines, by invigorating the force of the veſſels, may cure the diſeaſe, and may thereby appear to be aperient; and, on the contrary, in a menorrhagia, when the diſeaſe depends upon a laxity of the extreme veſſels of the uterus, iron exhibited, by reſtoring the tone of theſe veſſels, may ſhew an aſtringent operation. However, it is probable, that in the caſes of ſuppreſſion depending upon a conſtriction of the extremities of the veſſels of the uterus, the ſame tonic powers may not be ſo properly employed. By conſiderations of this kind, the inutility or propriety of the medicinal preparations of iron may be determined. In all caſes of active hemorrhagy they muſt be hurtful; and in caſes of hemorrhagy from external violence, Dr. Cullen would judge them to be uſeleſs, if not hurtful. In caſes of a general flaccidity, as it is frequently marked under the title of "Cachexy," and in all caſes of evacuations from laxity, whether ſanguine or ſerous, they are likely to be the moſt effectual remedies. The good effects of the preparations of iron, as Dr. Cullen apprehends, have been often miſſed by their being given in too ſmall doſes. The ſaline preparations, in large doſes, are ready to irritate the ſtomach; and for this reaſon, and ſome others, it muſt be always proper to begin with ſmall doſes, and to increaſe them by degrees; but he has often found, that no great benefit is to be obtained but when large quantities, either by the ſize of the doſes, or by the long continuance of them, have been thrown in. He ſays, that he has found the ſimple ruſt as effectual as any other preparation, and the ſtomach has borne it better than any other. He begins with a doſe of five grains, but gradually increaſes it to what the ſtomach eaſily bears. Some are ſaid to have given it to the quantity of ſix drams in one day; but he has hardly found any ſtomach that would bear the third part of that quantity without much ſickneſs. He thinks that the ſtomach bears it better by joining with it ſome aromatic.

The preparations of iron that have been in more frequent uſe, and ſome of which are at preſent continued under different names, are, 1. The crude filings reduced to an impalpable powder; this is an excellent form for adminiſtering iron in female diſorders, in which the body is weak, languid, and full of acidities; the doſe of the filings is from two or three grains to a ſcruple or more. 2. "Mars ſaccharatus," which is the filings candied with ſugar, by diſſolving two parts of fine ſugar in water, and boiling it down to a candy conſiſtence, and adding, by little and little, one part of the cleanſed filings in a kettle over a gentle fire; the veſſel being continually ſhaken, that the filings may be cruſted over with the ſugar. In order to prevent the mixture from running into lumps, a little ſtarch is previouſly mixed with the ſugar, in the proportion of a dram to a pound. 3. "Limatura Martis præparata," or "Chalybis rubigo præparata," is formed by moiſtening the filings with vinegar or water, and expoſing them to a moiſt air, or occaſionally moiſtening them afreſh, which ſoon change in great part into ruſt; this ruſt may be ſeparated from the uncorroded part, by grinding and waſhing over the fine powder with water. This is given in the ſame doſe as the crude filings.

This preparation, which was denominated "chalybis rubigo præparata" in the London Pharmacopeia of 1745, and "ferri rubigo" in that of 1787, is now called "ferri carbonas," or carbonate of iron. It is formed of ſulphate of iron, eight ounces; ſub-carbonate of ſoda, ten ounces; and a gallon of boiling water. Diſſolve the ſulphate of iron and ſub-carbonate of ſoda ſeparately, each in four pints of water; then mix the ſolutions together, and ſet by the mixture, that the precipitated powder may ſubſide; having poured off the ſupernatant liquor, waſh the carbonate of iron with hot water, and dry it upon bibulous paper in a gentle heat.

There are two oxyds of iron, both of which are combined with acids, and form different modifications of the ſame ſalt, a diſtinction that ought to be particularly regarded in medicine; they have been named, from their colour, black and red oxyds; the former, which is black, or (if formed as in the preſent inſtance, by precipitation from water) greeniſh, conſiſts of iron 73, and oxygen 27, according to Lavoiſier. It may be formed in various ways: as by expoſure of a paſte of iron-filings and water to the air; by heating together one part of red oxyd of iron, and two parts of iron-filings; and by adding a ſolution of alkali to one of green ſulphate of iron, and drying the precipitate quickly without expoſure to air; and it is kept as a ſeparate article in the Edinburgh Pharmacopeia, under the name of "Ferri oxydum nigrum purificatum." The latter, or red oxyd, conſiſts, according to Prouſt, of iron 52, oxygen 48, and in its relation to black oxyd is compoſed of 66.5 of that oxyd, and 33.5 of additional oxygen. Some chemiſts have ſuppoſed the exiſtence of other gradations of combination of iron and oxygen, but the above are all that are generally admitted, or that require particular notice; this latter is alſo kept in the Edinb. Pharmac. under the name of "oxydum ferri rubrum." Salts containing the black oxyd, on expoſure to air, paſs to the ſtate of red oxyd, by attracting oxygen from it, and in the proceſs of drying, the ſame change happens here to the oxyd in the ſub-carbonate, which, at the time of its firſt precipitation, is a black oxyd. The ſame ſubſtance, more imperfectly prepared, conſtituted the ruſt of iron (*ferri rubigo*) of the former Pharmacopeia, for which, in all the proceſſes into which it entered, this precipitate is now ſubſtituted. The red oxyd of the Edinburgh college is the old "Colcothar vitrioli," and formed by expoſure of common ſulphate of iron to a ſtrong heat, ſufficient to drive over its ſulphuric acid, when the red oxyd remains behind, as in the proceſs which was formerly in uſe for obtaining that acid. Sub-carbonate of ſoda is preferred for the precipitation to that of potaſh, on account of the greater ſolubility of the ſulphate of the former than of the latter alkali, and the conſequent facility with which it may be waſhed away. The ſalt is a ſub-carbonate, but as only one of the compounds is kept, the relation is not expreſſed. The doſe of the "ferri carbonas" is from two to ten grains.

4 "Mars ſulphuratus," prepared by mixing iron-filings with twice their weight of flower of brimſtone, and as much water as will make them into a paſte, which in a few hours ſwell up, and is then pulverized, and put into a heated crucible to deflagrate, and kept conſtantly ſtirring with an iron ſpatula, till it falls into a deep black powder: this powder urged longer in the fire, becomes red, and is called, 5. "Crocus martis aperiens et aſtringens." 6. The ſalt or vitriol of iron, "ferrum vitriolatum," called "Sal martis." This is now diſuſed. See Crocus *Martis*.

This is the "ferri ſulphas," ſulphate of iron, of the Lond. Pharm. of 1809; and is compoſed of iron and ſulphuric acid, of each by weight eight ounces, and four pints of water. The ſulphuric acid and water are mixed together in a glaſs veſſel, and the iron is added: then, after the efferveſcence has ceaſed, the ſolution is filtered through paper, and evaporated, ſo that cryſtals may form as it cools. The water is afterwards poured away, and the cryſtals are dried upon bibulous paper. Upon a large ſcale this ſalt is formed from native ſulphuret of iron (*pyrites*) by moiſtening, and expoſing it to the open air. The ſulphate of iron is afterwards diſſolved in water and cryſtallized by evaporation. Sulphuric acid will unite either with the black or red oxyd: the firſt of theſe is the ſalt here intended for internal uſe, and upon this point great ſtreſs ought to be laid; as the laſt is the ſtate in which the ſulphate of trade is uſually found, and which, for medical purpoſes, is a very diſtinct and inferior thing. Its cryſtals are tranſparent rhomboidal priſms, of a light green colour; its taſte is aſtringent and ſtrong, and it reddens vegetable blues. One part is ſoluble in two of cold, and in three-fourths of boiling water. It is inſoluble in alcohol, in which menſtruum the red ſulphate is ſoluble, and this affords a method of aſcertaining the exiſtence of the latter with the former, as alſo of ſeparating it. On expoſure to air it is gradually converted into red ſulphate: it conſiſts, according to Kirwan, of acid 26, iron 28, and water 46, parts. Heat drives off the water of cryſtallization, and the ſalt remains white: if urged farther, it drives over the acid, and leaves firſt a red ſulphate, and at laſt a red oxyd of iron. The doſe of the "ferri ſulphas" is from one to five grains. 7. "Tinctura martis in ſpiritu ſalis," P. L. 1745, "Tinctura ferri muriate," P. L. 1787, or "Tinctura ferri muriati," tincture of muriate of iron, P. L. 1809. This is formed by pouring the muriatic acid, in the proportion of a pint, upon half a pound of carbonate of iron in a glaſs veſſel, and ſhaking it occaſionally for three days: then ſetting it by, that the fæces, if there be any, may ſubſide; pouring off the ſolution, and adding three pints of rectified ſpirit. This ſalt appears to be an oxymuriate of iron, the red oxyd of iron employed becoming, on its combination with the acid, black oxyd, and giving over its ſuperabundant oxygen to the muriatic acid. This appears to be its ſtate, becauſe ſulphuric acid added to it detaches oxymuriatic acid, and heat drives over oxymuriatic acid; and in the latter inſtance, although the red oxyd was uſed for its preparation, the black oxyd remains behind. The ſalt, evaporated to dryneſs, yields an orange-coloured maſs, which is uncryſtallizable, deliqueſces on expoſure to air, and is ſoluble in alcohol. The tincture has a browniſh yellow colour, and very aſtringent taſte. 8. "Flores martiales," P. L. 1745, flowers of iron (ſee Flores), "Ens Veneris," P. L. 1720, "ferrum ammoniacale," P. L. 1787, or "ferrum ammoniatum," ammoniated iron, P. L. 1809, is compoſed by intimately mixing carbonate of iron and muriate of ammonia, of each a pound, and ſubliming by immediate expoſure to a ſtrong fire, and, laſtly, reducing the ſublimed ammoniacal iron to powder. This ſubſtance conſiſts of red muriate of iron, mixed by ſublimation with muriate of ammonia. It is orange-coloured, with a ſmell reſembling ſaffron, is deliqueſcent, and ſoluble in alcohol. The reſidue, which is deliqueſcent, conſiſts alſo of red muriate of iron, and was formerly kept under the name of "lixivium martis." The doſe is from three to fifteen grains. 9. "Tinctura florum martialium," P. L. 1745, "Tinctura martis Mynſichti," P. L. 1720. "Tinctura ferri ammoniacalis," P. L. 1787, or "Tinctura ferri ammoniati," tincture of ammoniated iron, P. L. 1809, is formed by digeſting four ounces of ammoniated iron in a pint of proof ſpirit, and then ſtraining. This is an elegant chalybeate, and may be given in doſes of a tea-ſpoonful. 10. "Ferrum tartarizatum," or tartarized iron, P. L. 1787 and 1809, called alſo "Mars ſolubilis," and "Chalybs tartarizatus," conſiſts of iron, a pound, ſupertartrate of potaſs, powdered, two pounds, and a pint of water. Rub them together, and expoſe them to the air in a broad glaſs veſſel for eight days, then dry the reſidue in a ſand bath, and reduce it to a very fine powder. Add to this powder a pint more of water, and expoſe it for eight days longer; then dry it, and reduce it to a very fine powder. This is a triple ſalt, in which the iron is firſt oxydated by being moiſtened and expoſed to air, and then combines with the ſuperabundant acid of the ſupertartate of potaſs; and it is therefore a tartrate of potaſs and iron. It may be diſſolved in water and cryſtallized. This elegant and uſeful chalybeate may be given either in a ſolid or liquid form, from five grains to a ſcruple. It has been uſually diſtinguiſhed in the ſhops by the name of its inventor, Dr. Willis. 11. "Liquor ferri alkalini," or ſolution of alkaline iron, is compoſed of 2½ drams of iron, two fluid-ounces of nitric acid, ſix fluid-ounces of diſtilled water, and ſix fluid-ounces of the ſolution of ſubcarbonate of potaſs. Having mixed the acid and water, pour them upon the iron, and when the effervеſcence has ceaſed, pour off the clear acid ſolution; add this gradually, and at intervals, to the ſolution of ſubcarbonate of potaſs, occaſionally ſhaking it, until it has aſſumed a deep brown red colour, and no farther effervеſcence takes place. Laſtly, ſet it by for ſix hours, and pour off the clear ſolution. This preparation was firſt deſcribed by Stahl, and called "tinctura martis alkalina," and it is for the firſt time introduced into the London Phamacopeia of 1809, as affording a combination of iron diſtinct from any other, and often applicable to practice. It ſeems to be a triple ſalt, formed by the union of nitric acid with red oxyd of iron, and with potaſs. Dr. Lewis has obſerved, that alkaline ſolutions of iron are ill adapted for medicinal uſe; and on that account, he ſays, they have been wholly neglected in modern practice. 12. "Vinum ferri," wine of iron, P. L. 1787 and 1809, "Vinum chalybeatum," P. L. 1745, conſiſts of two ounces of iron-filings mixed in two pints of wine. The mixture is ſet by for a month, occaſionally ſhaking it, and it is then filtered through paper. Lewis Mat. Med. Cullen Mat. Med. London Pharmac. 1809. See *Chemical Properties of* IRON, *Chalybeates*, and *Mineral*, &c. WATERS.

IRON, *Caſe-hardening of*, a proceſs by which a ſuperficial hardneſs is given to various articles made of iron. It is found by experience that pure iron is not ſuſceptible of a very fine poliſh, and that, when it is expoſed to the air, it very ſoon changes. All iron utenſils, therefore, ſuch as fire irons, and many other articles, having the appearance of poliſhed ſteel, are caſe-hardened, for the purpoſe of giving them a finer poliſh, as well as rendering their colour more permanent. The goods to be caſe-hardened ſhould be finiſhed with the exception of poliſhing, ſince, if the proceſs be well managed, the moſt delicate workmanſhip will not be injured. A box of wrought iron muſt be provided, which is perfectly ſound in every part, having a lid of the ſame metal, to fit very tight. In this box the articles are to be ſtratified with powdered carbon, that of animal ſubſtances being the beſt, for reaſons given in the article IRON, in the ſection on *Steel.* The box being perfectly filled with theſe materials, let the lid be fitted on, and luted all round with a paſte made of equal parts of pipe-clay and Calais ſand. The whole is now to be ſurrounded by bricks looſely built up, a little higher than the top of the box, leaving about four inches on each ſide for fuel. This may be done either upon a ſmith's hearth or in the open air. The moſt proper fuel is the refuſe-cokes from any fires where pit-coal is burnt. The fire being kindled, and the ſpace filled up with this fuel, the heat will be applied gradually, owing to the ſmothered combuſtion. As ſoon as the box appears of a light red heat, let it remain about half an hour, or more time if the box be large, in the ſame temperature. The lid may now be taken off, and the box inverted and its contents emptied over a ciſtern of cold water. If the box be ſuffered to cool without being opened, the goods will be perfectly white and metallic when taken out. If they are now heated red-hot, and quenched in cold water, they acquire the ſame hardneſs as if turned out of the box red-hot into the water. If the articles are very delicate, ſo as to be injured by the air in heating a ſecond time, they may be preſerved, by dipping them into a mixture of a ſaturated ſolution of ſalt (muriate of ſoda) with any vegetable matter to give it a pulpy conſiſtence. During the time of heating it red-hot, the ſalt fuſes upon the ſurface of the metal, defending it from the oxygen, ſo that after it is quenched in the water, and bruſhed, it will be perfectly clean.

The ſize of the iron box ſhould not be very large; it is better to do the work at two or three proceſſes. Charcoal is a very bad conductor of heat, and if the maſs to be heated were large, thoſe articles near the ſides would be over done, by combining with too much carbon, while thoſe in the middle would be too little carbonated.

People in the habit of caſe-hardening, have generally ſome ſecret receipt for the proceſs, on which they ſet great value. All, however, agree in uſing carbon, the only thing neceſſary: ſome add to this ſalt-petre; others ſal ammoniac, and other articles, to which they very knowingly attribute their relative ſucceſs. We can, however, aſſure the moſt ſage of theſe perſons, that if they make their box perfectly air-tight, by the rules above given, ſtratifying the articles with animal carbon alone, they will, with proper heat and time, produce the greateſt poſſible effect.

Animal carbon may be produced from moſt animal ſubſtances: among theſe are blood, hoofs, and leather. Theſe ſubſtances ſhould be preſſed into an iron pot, which can be heated red-hot, covered cloſe, with a ſmall open tube inſerted into the cover. The volatile matter that eſcapes may be ſet on fire, which will in a great meaſure deſtroy the ſmell; or a receiver may be adapted, and the crude ammonia diſtilled off. When the volatile ſubſtances have come over, the reſiduum will be fine animal carbon, which requires only to be reduced to powder.

This animal carbon is ſo fitted for combining with iron, that if it be made into a pulp with a ſaturated ſolution of ſalt, and laid upon the ſurface of iron; upon being heated red-hot, and quenched in cold water with this coating upon it, the ſurface will become hard. Any part of an iron article, not wiſhed to be *caſe-hardened*, may be prevented from undergoing the change, by covering the part with pipe-clay.

IRON *Furnace*. See BLAST-*Furnace*, and IRON, *ſupra.*

IRON, *Harping*. See HARPING.

IRON-*liquor*, in *Calico Printing* and *Dyeing*, is a ſolution of iron in the acetic acid, uſed as a mordant for certain colours. It is employed as a ſubſtitute for the ſulphat of iron, and is preferred, in thoſe proceſſes, to the laſt ſalt. The oxyd of iron, which is the eſſential ingredient, is more eaſily attracted by the ſtuff from the acetic than the ſulphuric acid, and, beſides, the texture is not ſo liable to be injured by the acetat as the ſulphat of iron. In order to make this ſubſtance cheap, the acid diſtilled from wood, called pyrolignic acid, and now found to be impure acetic acid, is uſed as a ſubſtitute for vinegar. See PYROLIGNIC *Acid*, and the laſt ſection of the article IRON.

IRON *moulds* are marks or ſtains produced on ſubſtances, particularly linen and cotton, by the oxyd of iron. The affinity of theſe vegetable ſubſtances for the oxyd of iron is ſo great, as not only to take it from the ſurface of iron, but from any acid with which it may be combined. We find, hence, that very few acids are capable of removing iron-moulds. From the well-known fact that the attraction of acids for oxyds of metals is more feeble as the latter contain more oxygen, we are enabled to account for iron-moulds being eaſier to remove, as they are more recent. The ſtain ſoon acquires an orange-red colour, by abſorbing oxygen, and is with more difficulty extracted. Various means are employed by the laundreſſes for removing ſtains of iron, the moſt general of which is the citric acid, commonly called ſalt of lemons. The muriatic acid is frequently employed by the bleachers, and it is by far the moſt rapid and effectual proceſs; but the great caution neceſſary, in ſuddenly waſhing the ſpot after the ſtain has diſappeared, leſſens its utility for domeſtic uſe. When the ſpot is dipped into the clear muriatic acid, the iron almoſt inſtantly diſappears, and it is at that inſtant the part ſhould be plunged into a quantity of clean water, and waſhed as quick as poſſible; the waſhing being continued for a conſiderable time.

In order to render the oxyd of iron more eaſily ſoluble by any acid, let the part ſtained be ſteeped for ſome time in a ſolution of ſulphuret of potaſh, or, what is more eaſily obtained, ſulphuret of lime, rinſing it afterwards in clean water. The oxyd will be deprived of ſome of its oxygen, and may be removed by almoſt any acid, when it is ſo dilute, even, as not to injure the ſtuff, however long it may remain in it.

It may be proper here to obſerve, that the tartaric and oxalic acids remove iron-moulds equally well with the citric acid.

When the ſubſtance iron-moulded is printed calico, and of a buff colour, or any other colour in which iron is employed as a mordant; it will be found that, in removing the iron-mould, the proper colour will alſo diſappear. In this caſe there is no effectual remedy.

Moſt of the iron-moulds are produced in the waſhing, for want of ſufficient caution. In thoſe utenſils in which metal is at all neceſſary, copper or zinc ſhould be employed inſtead of iron. With care, however, iron veſſels may be ſafely uſed. When they are not in uſe, the ſurface of the iron ſhould, after being made clean and dry, be ſmeared over with oil or tallow, and rubbed dry at the time they are uſed.

Iron-*moulds*, yellow lumps of earth or ſtone, found in chalk-pits about the Chiltern, in Oxfordſhire, and elſewhere, being in reality a kind of pyrites, or indigeſted iron-ore.

Iron-*ſhot*, in *Mineralogy*, is a term applied by Mr. Jameſon (Geognoſ. vol. iii. p. 47. 159.) to ſuch rocks and ſtones as are coloured or clouded by the oxyds of iron. Ferruginous is a more common name for this very common appearance in the ſtrata.

Iron-*ſick*, a *Nautical Term*, ſignifying the decay of the iron faſtenings by its corroſion with the ſea-water, by which the continuity of the parts is gnawed away by degrees, whereby the veſſel is not only rendered weak, but leaky.

Iron-*ſtone*, is that ſpecies of iron ore which abounds with a conſiderable proportion of earth, ſuch as lime, or alumine, and is the ore moſt common in this country. See Iron.

The manner of getting iron-ſtone is divided into three departments: 1. By *ſtall-work*: 2. By *bell-pits*: and 3. By *open-work*. The firſt of theſe methods is employed when the ſtone lies at a conſiderable depth. After ſinking a ſhaft to the lower part of the ſtratum, the ground is excavated in an horizontal direction, leaving at intervals certain parts ſtanding to ſupport the roof of the excavation. The ſpaces between theſe pillars are called *ſtalls*.

The *bell-pit* is employed when the iron-ſtone lies at ſome diſtance from the ſurface, and where the ground is not ſufficiently firm to admit of ſtall-work. Theſe pits, when firſt opened, are narrow, but become wider below, aſſuming the ſhape of a bell.

The third method, or the *open-work*, is made uſe of when the ſtratum containing the ſtone is nearly baſſeting, or is very near to the ſurface. The earth is firſt removed, laying the ſtratum containing the ore bare, and the ſtone is got out as from an open quarry.

The argillaceous iron ores are generally called iron-ſtones, and abound in many of the coal diſtricts. In Mr. Farey's Agricultural and Mineral Report on Derbyſhire, vol. i. p. 217, a liſt of ſeventy-five places in and near that county is given, where iron-ſtone has been dug, or where the rakes of iron-ſtone, as they are there called, have been worked.

Iron-*wood*, in *Botany*. See Sideroxylon.

Iron-*work*, in a *Ship*, denotes all the pieces of iron, of whatſoever figure or ſize, which are uſed in its conſtruction; as bolts, boom-irons, which are compoſed of two rings, nearly reſembling the figure of 8, nails, ſpikes, chains, and chain plates, block-ſtrops, cranks, braces, pintles, and goodgings.

Iron-*works*, a name given to the eſtabliſhments for the manufacture of pig-iron. (See Blast-*furnace* and Iron.) The moſt proper ſituation for iron-works is on the ſide of a hill, from which a perpendicular deſcent could be formed nearly equal to the height of the blaſt-furnace. The upper ground by this means is on a level with the mouth of the furnace, where all the materials are introduced, and is therefore the ſituation where the ore is roaſted, and the cokes prepared; the lower ground being the moſt proper for the reſt of the works.

Where ſuch local advantages do not exiſt, the materials are drawn up on an artificial inclined plane, by appropriate machinery.

Iron-*wort*, in *Botany*. See Galeopsis and Sideritis.

Iron *Iſland*, in *Geography*, a ſmall iſland in the Eaſt Indian ſea, near the coaſt of Siam. N. lat. 12° 35′. E. long. 98°.

Iron *Lough*, a lake of Ireland, in the county of Weſtmeath, through which the river Inny paſſes. It is about five miles N.W. from Mullingar.

Iron *Mountains*, a chain of American mountains, in Teneſſee, extending from the river Teneſſee to that of French Broadtown, S.W. to N.E. and conſtituting the boundary between Teneſſee and North Carolina, and reaching from near the lead mines, on the Kanhaway, through the Cherokee country, to the ſouth of Chota, and terminating near the ſource of Mobele. This chain abounds with caverns and cataracts.

IRONDEQUET, a bay on the ſouth ſide of lake Ontario.

IRONSIDE, Gilbert, in *Biography*, an Engliſh prelate, was born at Hawkſbury, in Oxfordſhire, in 1588, and educated at Trinity college, Oxford. Soon after he entered upon holy orders, he obtained the rectory of Winterburn, in Dorſetſhire. At the reſtoration he was made biſhop of Briſtol. He died in 1671. He was author of "Queſtions on the Sabbath," and a ſermon. Wood.

IRONY, derived from [illegible], *diſſimulation*, in *Oratory*, a figure in ſpeech, whereby we plainly intend ſomething very different from what our words expreſs; as when we ſeem to praiſe a perſon at a time when we evidently rally and diſcommend him.

Quintilian calls this figure *diverſiloquium*, *diſſimulation*, and *illuſion*: and obſerves that it may be known by the manner of the pronunciation, or from the nature of the perſon or the thing. The ſubjects of irony are vices and follies of all kinds: and it has thus been uſed by the moſt grave perſons on proper occaſions. Socrates uſed it ſo much as to acquire the name of [illegible], or the *droll*. It was alſo uſed by the prophet Elijah, 1 Kings, xviii. 27, by Solomon, Eccleſ. xi. 9, and by our Saviour himſelf, Mark, vii. 9.

IROQUOIS. See SIX *Nations*.

IROQUOIS, *National Muſic*. Claude Perrault, an unbeliever in the harmony or counterpoint of the ancients, tells us, in his "Phyſical Eſſays," that Louis XIV., near the end of his reign, when ſome of the Iroquois nation were brought into France, wiſhing to hear them ſing, that he might form ſome idea of their muſic, many of them ſung their wild melodies in uniſons and octaves, while others accompanied them in grunting like pigs; regularly, however, marking the meaſure by a violent jolt. And thus they attempered the acute voices by the mixture of the *grave grunts* and rhythmical pulſations of the others.

Perrault imagines, from the deſcription which Caſſiodorus gives of harmony, or ſinging together, which the ancients called *ſymphony*, that Roman harmony reſembled that of the Iroquois.

IRRADIATION, ſignifies an emanation or ſhooting out of rays, or ſubtle effluvia, from any body. See EMANATION, RAY, EFFLUVIA, and QUALITY.

IRRATIONAL NUMBERS, the ſame as *ſurd numbers*. See SURD and NUMBERS.

IRRATIONAL *Quantities*. See RATIONAL *Quantities*.

IRRATIONAL *Soul*. See SOUL.

IRREDUCIBLE CASE, in *Algebra*, is an expreſſion ariſing from the ſolution of certain equations of the third degree, which always appears under an imaginary form, notwithſtanding it is, in fact, a real quantity, but the reduction of it to a rational, or irrational finite expreſſion, has at preſent reſiſted the united efforts of many of the moſt celebrated mathematicians of Europe. Every cubic equation may be reduced to the form $x^3 + ax = b$; and then, according to the common rule,

$$x = \sqrt[3]{\frac{b}{2} + \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}} + \sqrt[3]{\frac{b}{2} - \sqrt{\frac{b^2}{4} + \frac{a^3}{27}}}.$$

See EQUATIONS.

Now, when a is negative, $\frac{a^3}{27}$ is alſo negative; and, therefore, when $\frac{b^2}{4} < \frac{a^3}{27}$, the quantity under the inferior radical, *viz.* $\sqrt{\frac{b^2}{4} - \frac{a^3}{27}}$, is imaginary; becauſe we cannot extract the ſquare root of a negative quantity; and this is what conſtitutes that which is generally called the irreducible caſe. This difficulty ſoon preſented itſelf to Cardan, after Tartalea had communicated to him his method for the ſolution of cubic equations, which rule is now commonly, though very improperly, attributed to the former. Cardan informs Tartalea, in a letter dated Auguſt 4th, 1539, that he underſtood the ſolution of the equation $x^3 + ax = b$, and alſo of $x^3 - ax = b$, when $\frac{b^2}{4} > \frac{a^3}{27}$; but when $\frac{b^2}{4} < \frac{a^3}{27}$, his attempts always failed; and he therefore begged of Tartalea to clear up his difficulty, by ſending him the ſolution of the equation $x^3 - 9x = 10$. Tartalea was himſelf perfectly aware of this difficulty, but he was by no means ſatiſfied with Cardan's conduct, whom he at that time ſuſpected to be about publiſhing as his own the rules he had taught him; and, therefore, inſtead of giving him an explicit anſwer, he writes to him in the following terms.—"M. Hieronime, I have received your letter, in which you write, that you underſtand the rule for the caſe $x^3 - ax = b$, when $\frac{b^2}{4}$ is greater than $\frac{a^3}{27}$, but when $\frac{a^3}{27}$ exceeds $\frac{b^2}{4}$, you cannot reſolve the equation; and, therefore, you requeſt me to ſend you the ſolution of the equation $x^3 - 9x = 10$. To which I reply, that you have not uſed a good method in that caſe, and that your whole proceſs is entirely falſe. As to reſolving you the equation you have ſent, I muſt ſay that I am very ſorry that I have already given you ſo much as I have done; for I have been informed by a credible perſon, that you are about to publiſh another algebraical work, and that you have been boaſting through Milan of having diſcovered ſome new rules in algebra. But take notice, that if you break your faith with me, I ſhall certainly keep my word with you, nay, I even aſſure you to do more than I promiſed." (Dr. Hutton's Mathematical Dictionary, article ALGEBRA.) Tartalea, however, notwithſtanding what he ſays in this letter, was himſelf well aware of the difficulty in queſtion, as appears from ſome of his private memoranda: and from that time to the preſent, which is near 300 years, the ſame impediment remains, notwithſtanding the repeated attempts of many very diſtinguiſhed mathematicians; in fact, there is great reaſon to ſuppoſe, independently of the failure of ſo many ingenious attempts, that the formula is inexpreſſible in any other finite form, than that under which it naturally ariſes by the ſolution. See EQUATIONS.

Notwithſtanding, however, that no analytical ſolution can be given to the caſe in queſtion, every equation of this form has three real roots, which are obtainable by other methods, ſuch as by means of a table of ſines and tangents, infinite ſeries, continued fractions, and a new method, lately publiſhed by Mr. Barlow in the Mathematical Repoſitory, which ſeems by far the readieſt and moſt accurate of any that has been at preſent diſcovered; the rationale of which is as follows;

1. Every cubic equation may be reduced to the form $x^3 \pm ax = \pm b$, by the known rules in algebra; but when the equation is in the irreducible caſe, this ambiguous form ceaſes, and the equation becomes $x^3 - ax = \pm b$; the ſolution of which, by the following method, is the ſame for either ſign of b; only when b is poſitive, the root firſt found will be poſitive, and when b is negative, the root will be negative alſo; it will, therefore, be ſufficient to conſider the caſe $x^3 - ax = b$, in which $\frac{b^2}{4} < \frac{a^3}{27}$, as we have before ſeen.

Now, every equation of the form $x^3 - ax = b$, may be transformed to another dependent equation, in which the co-efficient of the ſecond term ſhall be unity; that is, to another of the form $y^3 - y = c$. For make $x = \frac{y}{z}$, then the equation becomes $\frac{y^3}{z^3} - \frac{ay}{z} = b$; or $y^3 - az^2y = bz^3$: now take $az^2 = 1$, or $z = \sqrt{\frac{1}{a}}$; and, conſequently, $bz^3 = \frac{ba^{\frac{1}{2}}}{a^2}$; whence we have $y^3 - y = \frac{ba^{\frac{1}{2}}}{a^2}$; or putting $\frac{ba^{\frac{1}{2}}}{a^2} = c$, it becomes

$$y^3 - y = c, \text{ as required.}$$

And the value of y being found in this reduced equation, we immediately obtain that of x, in the original one, by means of the expreſſion $x = \frac{y}{z}$, or $x = y\sqrt{a}$.

Now, the original equation being by hypotheſis of the irreducible form, the transformed equation muſt neceſſarily be ſo likewiſe; and, conſequently, $\frac{c^3}{4} < \frac{1}{27}$, or $c < \frac{2\sqrt{3}}{9}$, or $c < .38491$; aſſuming this, therefore, as the maximum value of c, we find that the greateſt value of y can never exceed 1.1549, nor can the leaſt be leſs than unity; ſo that all poſſible values of y lie between the limits 1 and 1.1549; and if, therefore, we have a table containing all the values of c to thoſe of y, between the above limits, we ſhall have by inſpection the ſolution of every equation of the irreducible caſe, when converted into the form $y^3 - y = c$; and hence alſo of every irreducible equation of the form $x^3 - ax = b$, becauſe $x = y\sqrt{a}$.

The following is a table of this deſcription, the value of y being arranged in the leading column, except the laſt digit, which is found in the upper horizontal line, and the reſpective values of c are found in the other columns, being exactly the form that is uſually given to the common tables of logarithms; and the finding of any value of y, correſponding to a given value of c, is performed exactly the ſame as that of finding the natural number to a given logarithm. Thus, for example, giving $y^3 - y = .3837$ to find y: in the table the number correſponding to .38369912 is 1.1543; that is, $y = 1.1543$. It is obvious, therefore, that, from bare inſpection, the value of y may be found true to five places of figures, but theſe are extended to 8 or 9 places *true*, by taking proportional parts as in logarithms; thus, find the next greater and leſs tabular number to that propoſed; and then ſay, as the difference of theſe is to .0001; ſo is the difference between the leaſt of them and the number propoſed, to the part which is to be added unto the leaſt value of y; and this proportion may be ſafely carried to four places at leaſt, and thus the value of y will be known to eight places. This may be demonſtrated as follows: the proportional part that is thus added unto y, is always leſs than .0001, and, therefore, leſs than the $\frac{1}{10000}$dth part of y, and hence it may be ſaid to be very ſmall with regard to y. Now, I ſay, that if a and b be both very ſmall with regard to a third quantity y, that the following proportion is very nearly true; *viz.*

$$(\overline{y+a}|^3 - \overline{y+a}) - (y^3 - y) : (\overline{y+b}|^3 - \overline{y+b}|) - (y^3 - y) :: a : b;$$

for, by rejecting all thoſe powers of a and b higher than the firſt, this proportion becomes preciſely

$$(3y^2 - 1)\,a : (3y^2 - 1)\,b :: a : b;$$

and ſince, in this caſe, a and b are leſs than .0001, (or at leaſt neither of them ever exceed this,) by rejecting the ſquares and cubes of theſe quantities, we cannot have affected the fourth place of figures in the reſult, and therefore the proportion may always be depended upon to four places. And thus, the following rule may be deduced for every irreducible cubic equation, $x^3 - ax = b$; *viz.*

Find $\frac{b\sqrt{a}}{a^2}$ in the following table, and take out the correſponding value of y; then will $y\sqrt{a} = x$ be the root ſought. Let us, for inſtance, take the example propoſed by Cardan to Tartalea; namely, $x^3 - 9x = 10$, to find x.

Here $\frac{b\sqrt{a}}{a^2} = \frac{30}{81} = .37037037$.

Tab. n. .37057828, correſp. n. 1.1499|37037037 given n.
nextleſs .37028164 ——— n. 1.1498|37028164 leſs tab. n.

As 29664 : 1 :: 08873 : 2991

Therefore $y = 1.14982991$
$3 = \sqrt{a}$

and $x = 3.44948973$ as required.

Ex. 2.—Required the value of x in the equation

$$x^3 - 7x = 6.$$

Firſt $\frac{6\sqrt{7}}{7^2} = .32396954$;

Tabula n. .32398835, correſp. n. 1.1339 32396954
Next leſs .32370267, ——— n. 1.1338 32370267

As 28568 : 1 :: 26687 : 9342

Therefore the value of y is 1.13389342;

and $y\sqrt{7} = 1.13389342 \times 2.6457513 = 2.999999999$, as will be found by the operation; which anſwer is true to the 10th place, the real root being 3, as is obvious from the equation. It will be unneceſſary to give any other examples, as the ſame method is purſued in all caſes, and the ſame accuracy may be depended upon in the reſults. The reader who will trouble himſelf to compare the rule here laid down, with any other that has been before given by other writers, will ſoon be convinced of the immenſe labour that is ſaved by the following table; at the ſame time, that the number of figures in the reſult are nearly double thoſe that can be ſafely obtained by the tables of ſines and tangents.

For the method of finding the other two roots after one is obtained, ſee EQUATIONS; for the ſolution of cubic equations by the triſection of an angle, ſee Bonnycaſtle's Trigonometry; and for the method by infinite ſeries, ſee Philoſophical Tranſactions, vols. lxviii. and lxx.

IRREGOLARE, *Ital.* in *Eccleſiaſtical Muſic.* Modes are called irregular in canto fermo, when the compaſs is extended beyond its uſual limits, or its regular ſcale is in ſome unuſual manner, violated.

A cadence, or cloſe, uſed to be termed irregular when the harmony did not cloſe on the key note. (See *Diſappointed* Cadence.) But Rameau has given this title to a particular cadence of his own ſyſtem, in which the fundamental baſe riſes a 5th, or falls a 4th after the chord of the $^{6}_{5}$ to the 4th of the key. See Cadence.

IRREGULAR, ſomething that deviates from the common forms or rules.

Thus we ſay, an irregular fortification, an irregular building, &c. See Building, Fortification, Bastion, and Place.

Irregular *Figure*, in *Geometry*, is that whoſe ſides and angles are not equal. See Regular.

Irregulars, in *Grammar*, are ſuch inflexions of words as vary from the general rule, or pattern.

Irregular, among the *Caſuiſts*, is applied to a perſon who is unqualified for entering into orders, as being a baſtard, maimed, &c. or to an eccleſiaſtic, who is interdicted, ſuſpended, or cenſured, and by that means rendered incapable of holding a benefice, or diſcharging any of the ſacred functions.

Irregular *Bodies*, are ſolids not terminated by equal and ſimilar ſurfaces.

Irregular, in the *Art of Building*, is applied not only to the parts of an edifice which deviate from the proportions eſtabliſhed by antique monuments, and confirmed by architects; as when a Doric column is made nine modules high, or a Corinthian eleven; but alſo to the places and figures of buildings, where the angles and ſides are made unequal, as in moſt of the ancient caſtles; where, without any neceſſity or confinement from the ſituation, they effected ſuch irregularity.

A column is alſo ſaid to be irregular, not only when it deviates from the proportions of any of the five orders, but when its ornaments, whether in the ſhaft, or the capital, are abſurd and ill choſen.

Irregular *Leap*, in *Muſic*. See Leap.

Irregular *Temperament*, or irregular douzeaves, or ſyſtems of twelve notes in the octave, are ſuch as have more than two kinds of tempered fifths, or where the wolf, reſulting or bearing fifth, does not fall between ♯ G and ♭ E, as Mr. Farey has ſhewn in the Phil. Mag. vol. xxxvi. p. 39 and 47. The ſyſtems of lord Stanhope. M. Kirnberger, Mr. Hawke's douzeave, and many others, are irregular ſyſtems: a former diviſion of the ſyſtems of temperament uſed to be into equal and unequal, but as there could be but *one* equal temperament, ſuch a diviſion anſwered little purpoſe: the equal temperament is a regular douzeave, wherein the wolf is equal to each of the temperaments of the fifths, as ſhewn in the 6th ſcholium, in Mr. Farey's paper above referred to.

Irregular *Diatonic Intervals*, are ſuch as, when expreſſed in any notation by three very ſmall other intervals, and arranged in a table, do not increaſe pretty regularly in each of their three terms.

Irregular *Meaſures*, in *Mining*, are variable meaſures or ſtrata in thickneſs, ſometimes called *Girdles* (ſee that article); and according to Mr. William Martin (Outlines, p. 171.) include alſo ſtrata that take a different direction in their dip from that of their attendant ſtrata: in which latter caſe, we apprehend, that obſervers have moſtly overlooked ſome *fault* which ranges between the irregular ſtrata and their attendant ſtrata, and have detached and altered their poſitions, or that the ſtratula, or folia (of which this author takes no notice), that often croſs beds of ſtone oblique to their ſtrata-ſeams or way-boards, have been miſtaken for the latter, as often has happened. Numerous inſtances of variable or irregular meaſures have been noticed by Mr. Farey in his Survey of Derbyſhire and its Environs, and are particularized in his Agricultural and Mineral Report to the Board of Agriculture, vol i. p. 176. 238. 276, &c. Others have been obſerved by Mr. James Keir, in Shaw's Hiſtory of Staffordſhire; and in Mr. Weſtgarth Forſter's Treatiſe on a ſection of ſtrata. They are indeed very important geological phenomena.

IRREGULARITIES *in the Moon's Motion.* See Moon.

IRREPLEVIABILE Returnum. See Returnum.

IRREPLEVIABLE, or Irreplevisable, in *Common Law*, ſignifies what may not be replevied, or ſet at large upon ſureties.

IRRIGATION, in *Agriculture*, the art of covering meadow or graſs-lands with water, ſo as to render them more highly productive and beneficial. It may be noticed, that there are two methods of effecting improvements on lands by covering them with water; one of which is by applying it ſo as to cover the ſurface when in the ſtate of graſs or ſward; the other by communicating it to the ſoil of ſuch grounds as have been broken by means of cultivation. The firſt is the method that has been principally introduced into practice in this kingdom, and which, by a late writer, has been termed the "European practice of irrigation." But though the hiſtory of the origin of this means of improvement is involved in much difficulty, and not capable of being eaſily traced; it was probably introduced at a very early period from eaſtern countries, where the practice of covering the lands with water, in order to protect them from the injurious effects of exceſſive heat, has prevailed for ages; yet by ſome it is thought to have been brought to the attention of the farmer in this country in another way, for the benefit of natural floods, to the graſs-lands which they occaſionally overflowed, being evident, and in ſome inſtances great, the means of producing artificial floods, and of ſpreading them over lands, not liable in their natural ſituation to be overflowed, would become, of courſe, it is ſuppoſed, a deſirable object. And that as the moſt obvious effect of floods, or the overflowings of rivers and brooks on the lands over which they ſpread, is that of depoſiting their feculent particles; thereby operating as a vehicle of manure; it is likewiſe evident to common obſervation, that foul waters, as thoſe of floods, let fall their feculencies, moſt freely, in a *ſtagnant ſtate*. Further, that "it is alſo equally evident, that the ſtate of ſtagnation of the waters of floods, or a ſtate that approaches it, is cauſed by ſome obſtruction of the current below the place of ſtagnation." And that "from theſe circumſtances being ſeen, and they could not well be miſſed by any one who gave the ſubject a ſecond thought, the means of manuring lands with water, artificially, were given: in ſituations it is meant which would admit of the requiſite obſtructions" And it is further ſuggeſted, that "the bottoms, dips, or vallies, which abound, more or leſs, in every part of the kingdom, would naturally be the moſt apt ſubjects for flooding artificially with foul waters, on the principle of manuring the land with their ſediment." For on "a bank, or dam, being made acroſs the valley, below the part to be manured, the rivulet which generally accompanies a valley of this kind, eſpecially after heavy rains, the only time when flooding on this principle could be practiſed, would of courſe be obſtructed; and its waters, fouled, perhaps, with the richeſt particles.

particles of arable lands, be ſpread over the bottom of the valley, to an extent proportioned to the height of the bank, and its own flatneſs: a valve or flood-gate being fixed in the bed of the rivulet to let off the waters, when the *whole* of their foulneſſes were depoſited: thus gaining a principal advantage over natural flooding; in which the groſſer particles only are let fall; the finer, and perhaps moſt valuable eſcaping to the river, and thence to the ſea, before they be precipitated or let fall upon the land." It is conceived that on theſe principles, it is evident, ſome of the meadow-lands of the midland diſtricts have formerly been flooded; and that it is not probable, that ſo evident a method of improving meadow-lands ſhould have been confined to a particular diſtrict; but may have been common to other parts of the iſland. And it is further ſtated by the ſame writer, that the *ancient* method of meliorating graſs-lands, by the means of *ſtagnant* water, could no longer prevail, than until the ſuperior effects of running water, on ſuch lands, were diſcovered and aſcertained. And that this important diſcovery muſt have been made by *obſervation*, on the comparative effects of running and ſtanding water, in the natural and artificial flooding ſpoken of above; and muſt have been aſcertained by a long courſe of *experience:* as it is not likely that *reaſon* ſhould have had any ſhare in ſtriking out the modern method of improving graſs-lands by running water. For even now, when the reality of the improvement appears to be fully eſtabliſhed, there ſeems to be no full or ſatisfactory *theory* to account for it: though many of the effects thus produced have lately been more clearly explained and better underſtood, as will be ſeen below. The *warmth*, communicated by running water to the graſs it flows over, is one great reaſon adduced for the good effect of running water on this ſort of land. But even after this diſcovery was made, and the effect fully eſtabliſhed, it would be ſome length of time before the art arrived at its preſent high degree of perfection. As it may, in its preſent ſtate, be ſafely deemed the moſt uſeful and ſcientific operation, that has entered into the common practice of huſbandry. And the memory of the inventor, or inventors, deſerves the higheſt praiſe and admiration.

It has likewiſe been remarked, that the great degree of verdure and luxuriance which almoſt immediately ſucceeds the occaſional covering of graſs-lands with water, ſufficiently demonſtrates the power which it poſſeſſes in promoting vegetation: and that it is a means of fertility that has been employed for ages in more warm climates, with the moſt beneficial conſequences in increaſing the quantity of vegetable produce. But that although it has been long in uſe in other countries, and of late more particularly attended to in this, the principle on which it produces its effects are not yet fully explained.

In conſidering manure as the nouriſhment or food of plants, ſome of the properties of water, that may be beneficial in the vegetable economy when abſorbed or taken up by the fibrous roots of plants, have been mentioned; and there are other ways in which it may be advantageous in forwarding the growth of graſs herbage when applied over the ſurface. It is conceived that in climates where the heat is conſiderable, it may be of much utility, not only by keeping the fine fibrous roots of the graſs or other plants in a moiſt patulous ſtate, the moſt proper for the purpoſes of abſorption, but in ſuch a temperature or ſtate of heat, from the cooling effect produced by the conſtant evaporation that is taking place near the ſurface of the ground, as is the moſt ſuitable for their healthy and vigorous growth. It is probably in this way that garden plants are principally benefited by the application of water in the hot ſummer ſeaſons in our own climate; as when the waterings are not conſtantly kept up injury rather than good is moſtly experienced. But that another and more beneficial way in which graſs produce may be immediately increaſed, and the fertility of the lands more permanently improved in this country by the floating or covering them with water, is from the waters of the rivers or brooks that are turned upon them, containing, either in the ſtate of ſolution or diffuſion, a variety of different ſorts of enriching materials which they gradually and evenly depoſit upon the ſurface while they reſt upon or ſlowly flow over it. This muſt, it is imagined, be the caſe in all thoſe inſtances where the rivers or ſtreamlets either ariſe in, or in their courſe flow through or over beds of chalk, marle, or other calcareous ſtrata; as in their paſſage they become highly impregnated with the fine particles of theſe different ſubſtances. And where they are fed by the ſmall runlets which receive the waters that proceed from the higher and more elevated lands, they muſt often, eſpecially after heavy rain, be loaded with a large proportion of fine rich materials of the animal, vegetable, or other kinds, which they depoſit in a regular manner in their tardy trickling courſe over the ſurfaces of the fields below.

It would appear that waters thus impregnated produce the moſt beneficial effects, particularly when not in flood, upon the lands that are the neareſt to the ſources whence they become principally impregnated with their fertilizing principles; as when they have flowed to ſome diſtance they have, in a great meaſure, depoſited and let fall ſuch enriching ſubſtances, and are become too pure for affording advantage in the way of depoſition. It is only in the time of floods that they can produce much utility in this way at any great diſtance. It was found by an able philoſophical writer, Dr. Darwin, that the water of the Derwent, though it flows for ſeveral miles near Matlock, through calcareous ſtrata, contained no impregnation of this ſort on its reaching Derby, although the ſprings in that neighbourhood had a large proportion of it in their compoſition. And the ſame author has ingeniouſly ſuggeſted another mode in which water may prove ſerviceable in floating grounds in this climate, which is that already ſtated of protecting the graſs or other plants from the too ſevere effects of cold during the winter, or early ſpring ſeaſon. In this view it is obſerved, that the water of ſtrong ſprings, which in this country have conſtantly the temperature of forty-eight degrees of Fahrenheit's thermometer, is to be preferred to that of rivers, where it can be procured in a ſufficient proportion, as the degree of cold in theſe is in the ſame ratio with that of the atmoſphere, till it declines to the freezing point, or that of thirty-two. Though both, when ſpread out, forming a thin ſheet of ice on the ſurface of the land, are beneficial in defending the roots of the graſs plants from too intenſe degrees of cold, and of thus preſerving them in a more healthy condition; and it is added, that thoſe of ſome ſorts of graſſes are ſuppoſed even to vegetate beneath the ice, as the rein-deer moſs in Siberia moſtly vegetates beneath the ſnow, in a degree of heat of about forty, which is the medium between that of the inferior ſurface of the diſſolving ſnow, or that of thirty-two, and that of the common heat of the internal parts of the earth, which is forty-eight; and in this manner the graſs produce in this cold country be conſiderably increaſed, ſo as, under proper management, to nearly double the uſual annual quantity under other circumſtances.

In further illuſtration of theſe principles it may be obſerved, that the water iſſuing from ſprings where they abound with particles of gravel, or a ſlaty, mouldering kind of rock, containing a large proportion of calcareous earth, are known from experience to be better adapted to the purpoſe

poſe than that which ariſes from others that do not contain ſuch materials. The difference in the effects, often ſo viſibly produced, has been accounted for, from watering one field from a ſpring iſſuing out of a chalky ſoil, over thoſe which take their riſe in another, ſimilar in every reſpect and management, except that the water applied ariſes in, or flows through, a ſwamp or moraſs, compoſed chiefly of peat earth, or proceeds from ſituations known to contain none of theſe ſubſtances. However, the fact is unqueſtionably eſtabliſhed, that the water of rivers which run through comparatively level and fertile countries, is not only better than that of ſuch as have their courſes through mountainous, unproductive tracts, but ſuperior to all others, as every different ſtreamlet adds a new acceſſion of fertilizing materials, which, being diſperſed over the ſurface of the meadows, in their fine and attenuated ſtate, cannot avoid adding a conſiderable degree of improvement to the lands.

It is conceived by Mr. Marſhall, that if the art, as it now ſtands, were ſtruck out on principle, it muſt have been on that of animal circulation; to which the operation of meliorating graſs-lands with water, through the means of floats and drains, is perfectly analogous. The floats are arteries, conveying the circulating fluid to every part of the ſubject, imbuing every atom: the drains, veins, collecting the ſcattered fluid, and conveying it back to its natural channel. But that, in leſs figurative language, the floats may be conſidered as trenches, receiving, by the means of flood-gates, as occaſion requires, the water of a river, brook, or rivulet, and conveying it along the upper margin, and upon the tops of the natural or artificial ſwells of the field of improvement:—the drains, counter-trenches, ſtretching along the lower margin, and winding in the dips and hollows, to receive the waters ſpread over the ſurface by the floats.

Each ſet of trenches, whether of floats or drains, bears more or leſs reſemblance to a tree, with its trunk and branches: the branches of the floats increaſing in number, and diminiſhing in ſize, as they proceed from the river or other ſource; thoſe of the drains, on the contrary, diminiſhing in number, and increaſing in ſize, as they approach the receptacle or place at which the water is to be diſcharged. And it is further remarked, that when the water is at work, as it is properly enough termed, the entire ſurface, ſuppoſing the operation to be perfect, is covered with one continued ſheet of living *water*, purling ſlowly and evenly over every part, an inch or more deep. If the graſs be very ſhort, the water is ſeen, and has a beautiful as well as a profitable effect: if not, it ſteals, unſeen, among the herbage, or ſhews itſelf, partially: it being impoſſible, in practice, to render the ſheet throughout of an uniform depth or thickneſs, as it muſt naturally paſs off quicker in ſome ſituations than others.

From this general idea of the method of watering graſs-lands, on the modern principle, it is clearly ſhewn that a dead flat, a perfect level, is, of all others, the leaſt adapted to the practice. A perfect level, however, ſeldom occurs in nature; inequalities, ſufficiently to promote a circulation of water on the turfy ſurface, may generally be diſcovered, if judiciouſly ſought. In the midland counties, Mr. Marſhall has ſeen in the practice of a ſuperior manager a beautifully ſimple expedient practiſed, to find out the inequalities of a piece of ground nearly flat: which is that of covering it with water, and preſerving the level by the means of levelling pegs, ſtumps or piles driven down in various parts to a level with the ſurface of the water; ſo that, after the water was let off, the level ſtill remained. The parts laſt covered were, of courſe, the proper ground for the floats; the parts laſt freed for the drains; art being uſed, where wanted, to give additional advantage to the natural inequalities which may be preſent. But ſituations in general (water-formed lands excepted), abound, he thinks, ſufficiently with inequalities of ſurface: either natural, as the ſwells and hollows of lands, lying out of the way of floods, and having never been ploughed: or artificial, as thoſe which have been raiſed by the plough into ridge and furrow: in this caſe the ridges receive the floats, the furrows the drains: in that, the plummet is the guide to the floats; the water they throw out, to the drains or cuts to be formed.

The ſame writer adds, that, in the above diſtrict, he has ſeen the ſide of a hill watered with rain-water, from a road running along the top of it: the ſame trench, in this caſe, acting as float and drain, running a zig-zag along the face of the ſlope, the lower folds catching the water ſpread out by the upper; and that he has likewiſe obſerved ſeveral inſtances of ridges and furrows being watered from ſimilar ſources. In theſe caſes, whether the natural deſcent of the lands was little or great, the floats were opened upon the ridges with clods of turf cut out of the trenches, placed at diſtances proportioned to the deſcent, to check the current ſufficiently, to force the water out of the trench above, yet leaving it a ſufficient paſſage, to ſuffer it to carry down a ſupply to the parts below. He has alſo met with one or more inſtances in which ridges and furrows have been levelled at an exceſſive coſt, by paring off the turf, throwing down the ridges by hand, and replacing the turf, giving the ſurface one regular gentle deſcent; and this, notwithſtanding it is allowed by thoſe who may be ſtyled maſters in the art, that the quicker the circulation the more beneficial the effect. Upon the whole, it appears pretty evident, that the operation, though ſcientific, can ſeldom be rendered mechanical. Straight lines and plain ſurfaces can ſeldom be had, but at a great, and, frequently, an unneceſſary expence. The given ſituation of the ground ſhould be conſulted and maturely ſtudied before the work be ſet about. Every ſcite may be ſaid to require a different arrangement of trenches. Of courſe, no man ought to ſet about a work of ſo difficult a nature until he has ſtudied its principles, and made himſelf maſter of its theory; nor then, without the aſſiſtance of practice in himſelf, or others whom he can employ for the purpoſe.

It is conceived that to expatiate on the utility of watering graſs-lands would be a waſte of words. In ſituations where a ſufficient ſupply of water, of a fertilizing quality, can be commanded at all ſeaſons, it ranks indubitably among the higheſt claſs of improvements. Much, however, it is ſuppoſed, depends on the quality of the water; not on its colour or clearneſs, but the ſpecific quality of the ſuſpended particles. Waters, in their natural ſtate (not purified by diſtillation), more eſpecially ſpring waters, though perfectly tranſparent and pure to the eye, are as various in quality as ſoils, owing to earthy and other particles being ſuſpended in them imperceptibly to the eye, requiring the aid of chemiſtry to detect them; hence hard water, ſoft water, wholeſome waters, medicinal waters, &c. The effects of clear ſpring water have been found ſtrikingly evident in various caſes of this ſort of management in different places in this country.

But although very much depends on the quality of water for the purpoſe of meliorating graſs-lands, much alſo depends on the quantity; on having a ſufficient ſupply at all ſeaſons. With this there are, perhaps, few waters which might not be rendered beneficial to graſs-land, if thrown over it at proper ſeaſons, and in proper quantity. Without it, the benefit, it is poſſible, may not be adequate to the expence. The moſt obvious advantage of watering graſs lands, it is conceived, ariſes in a dry ſeaſon; and if the ſupply fail in ſuch ſeaſons, as frequently happens in many ſituations, the intention is in part fruſtrated; the winter and early ſpring waterings being in this caſe all that can be commanded for the purpoſe. This is given by way of caution; not as a diſcouragement to the practice. There are, it is well obſerved, in this iſland, ſituations innumerable, in which the advantages ariſing from the practice, properly conducted, would far exceed the expence of obtaining them; and to aſcertain them is an object of the firſt magnitude to the owners and occupiers of graſs-lands, and in many inſtances, probably in thoſe of the arable kind likewiſe.

Hence it may be ſafely concluded, that this mode of improving graſs, or other lands, where it can be had recourſe to, is of the greateſt importance, and of the moſt valuable kind; and it is probably capable of being applied in a greatly more extenſive manner than has yet been the caſe, by the perſons employed in conducting the buſineſs fully availing themſelves of the various occaſional falls of rivers, ſtreams, and, in particular ſeaſons, of canals, as in this way water may often be provided for the purpoſe of diſtributing over extenſive tracts of land that have hitherto been thought incapable of admitting of ſuch means of melioration and improvement. In other circumſtances and ſituations, by having recourſe to damming up the water, and the occaſional uſe of wooden pipes in the conveying it where neceſſary, it may be eaſily raiſed to heights ſufficient for conducting it over many elevated lands, and by ſuch means promote their vegetation and produce to a degree that cannot be eaſily calculated or conceived.

And, from what has been already done in this way, it is evident that, on heathy moors, and other mountainous tracts, it may often be applied with the proſpect of great advantage. In traverſing ſuch hills, inſtances are daily occurring of little rivulets or rills, which are inſufficient to form a regular courſe, ſpreading their waters on particular parts, and thus providing a moſt beautiful verdure; which affords ſufficient proof of what may be effected by the judicious application of water in ſuch ſituations. The ſame principles may be applied, in many ſituations, in conveying the rich liquors collected in ponds and reſervoirs about the farm yards and buildings, that are too frequently waſted by evaporation or other means, over the adjoining fields, as has been practiſed in Cheſhire by Mr. Fenna.

To this ſyſtem of improving graſs-lands, the chief objection is, the firſt expence of the work; but if it be conducted in a judicious manner, and by perſons acquainted with the buſineſs, this will ſeldom be ſo conſiderable as is commonly ſuppoſed, or form any material impediment; as the increaſe of produce, which is almoſt immediately the conſequence, will amply repay the improver. It has been objected to by ſome on the ground of cutting the land, but this is of little conſequence if additional ſupplies of food be thereby afforded for the ſupport of live ſtock, and the gradual improvement of the ſoil at the ſame time effected.

It may be ſtated that winter and ſpring are the two ſeaſons when grounds of the graſs kind are uſually irrigated or watered, as from the month of November till the beginning of March. The experience of the operator muſt, in a great meaſure, regulate this proceeding as to the length of time they ſhould remain under water. In ſome diſtricts it is the practice to allow the water to flow over the fields for ſeveral weeks together, with only the interval of a day or two occaſionally; while in others the cuſtom is to cover them alternately each other week. When froſts ſet in, the work is uſually ſuſpended; but it has been remarked, that in ſuch caſes the ſucceeding crop of graſs is leſs plentiful. As the ſpring ſeaſon advances, much leſs floating is found to be requiſite. However, in every caſe where floating is performed to advantage, the land ſhould be laid dry between every time of covering it with water.

It has been adviſed in the beginning to lay the water on in the early part of November, ſuffering it to overflow from 10 to 14 days, and then taken off; repeating the ſame proceſs in the two following months; giving in February alſo two waterings of from five to ſeven days each; and in March three, of from three to five days each, according to the ſtate of the weather, conſtantly permitting the water to continue longer upon the land in cool than warm weather; and it is likewiſe generally adviſed, that on the ſandy, gravelly, and drier kinds of lands, the water ſhould not remain ſo long at a time as in thoſe of the heavier kinds; and in the latter ſorts, Mr. Wright conſiders three weeks as long enough; but Mr. Boſwell thinks it may continue on a month, or even ſix weeks in the firſt waterings, about November, and a ſomething ſhorter time for thoſe of the former ſort of lands. Mr. Wright alſo recommends, in December and February, the land to be let dry, for the purpoſe of air for a few days, and that in February particular attention is neceſſary, not to permit the water to flow over the ground many days together, without being taken off, as there may be danger from white ſcum being formed; and by the land being left expoſed to froſt in its wet ſtate, it may be injured that way. Theſe inconveniencies, it is ſuppoſed, however, by Mr. Wright, may be avoided by taking the water off in the day, and turning it upon the lands only during the night time. But Mr. Boſwell, who has had extenſive experience in this way, does not ſeem to apprehend any danger from this circumſtance to the land.

Towards the beginning of the ſpring, as about March, and ſometimes ſooner, there is moſtly a ſufficient bite of graſs to admit the lands to be fed by ſtock. The water ſhould in this caſe be turned off for a fortnight or more, in order to give it a ſufficient degree of firmneſs before the animals are turned upon it. During the following months, it is obſerved that the graſs may be eaten cloſe, but not later; as continuing it even for a few days in May would greatly injure the hay produce which is to be obtained, both in quantity and quality. In this month, when the graſs has been fed down, the water ſhould, according to Mr. Wright, be again turned over the lands for a few days, by which they are ſo moiſtened as to produce a full crop of hay. It is not improbable but that, with leſs cloſe feeding, two crops of hay from ſuch watered lands might frequently be taken with benefit. It is remarked by this writer, that the firſt crop of hay from watered lands, when cut ſufficiently early, is equally good with that of moſt other ſorts, but that when let ſtand too long, it becomes coarſe and unfit for the purpoſe of fodder.

A late philoſophical writer has ſuggeſted, that where the flooding of lands is continued ſome time, the water ſhould only be ſuffered to trickle or flow over it gently from the higher parts, and not ſtagnate upon it; as, in the latter caſe, the graſs roots are ſoon deſtroyed in the ſpring, and that when ſuch materials begin to decay underneath the water, a white ſcum ariſes in conſequence of the air ſet at liberty by the beginning putrefaction, which has been ſuſpected as prejudicial to the graſs, but which is rather the effect than the cauſe of the miſchief, and demonſtrates that the water has remained too long in a ſtagnant ſtate upon the ground, and requires to be removed, or to have a freſh ſupply from the ſtream; but the former is probably the better practice. The neceſſity of continuing the irrigation, or watering of land, after it has been once begun in hot climates and ſeaſons, has been already ſhewn, and it is ſuggeſted that there may be injury done to the graſs plants by the ſudden application of much water under ſuch circumſtances in ſome caſes.

It is uſefully inculcated by a late writer that, before any ſerious expence is incurred in works of this kind, the nature and effects of the water that is to be employed ſhould be fully aſcertained by the eſtabliſhment of trial grounds, which, if it be proper and beneficial for the purpoſe, will be ſhewn by the ſuperiority in the growth, verdure, and general appearance of the graſs towards the latter end of March, or the beginning of the following month. The quantity of water and extent of ground that can be covered by it muſt likewiſe be jointly taken into conſideration before any improvement of this ſort can with propriety be undertaken. And in every inſtance it is adviſed that due eſtimates, and a calculation of profit, be formed on the following principles. Firſt calculating the probable advantages that may ariſe every year from hay and paſturage, and an annually increaſing ſupply of manure and dung; then taking the intereſt at ſix per centum on the eſtimated coſt of the works that may be requiſite to produce them, together with the amount of the eſtimated annual expence of labour, and neceſſary repairs.

A great number of intereſting inſtances of ſucceſsful irrigation, or application of water over lands, in the midland diſtricts, have been ſtated by the ſame author. And in this caſe, as in many others, Mr. Bakewell ſtands firſt as an improver of graſs-lands. It is ſtated that, formerly, a ſuit of meadows, lying by the banks of the Soar, received conſiderable benefit from the water of the river being ſpread over them judiciouſly in the time of floods. But now, not only theſe meadows, but near an hundred acres, he believes, of higher lands lying entirely out of the way of natural floods, are watered on the modern principle.

And it is remarked that the ingenious improver juſt noticed, like a man of experience in buſineſs, before he ſet about this great work, ſtudied the art in the principal ſcene of practice, the weſt of England, where he ſpent ſome days with the ingenious Mr. Boſwell, who, not many years ago, publiſhed a treatiſe on the ſubject. And that the great ſtroke of management in this department of his practice, which marks his genius in ſtrong characters, is that of diverting to his purpoſe a rivulet or ſmall brook, whoſe natural channel ſkirts the fartheſt boundary of his farm, falling, with a conſiderable deſcent, down a narrow valley, in which its utility, as a ſource of improvement to land, was confined. This rivulet, being turned at the higheſt place that could be commanded, and carried, in the canal manner, round the point of a ſwell, which lies between its natural bed and the farmery: by the execution of this admirable thought, not only commanding the ſkirts of the hill, as a ſeite of improvement by watering; but ſupplying, by this artificial brook, the houſe and farm-offices with water: filling, from it, a drinking-pool, for horſes and cattle; a waſh-pool, for ſheep; and converting it into a multitude of other purpoſes: acquiſitions which, Mr. Marſhall ſays, many other ſituations in the iſland are capable of affording. One of theſe purpoſes is worthy of being mentioned as deſerving the attention of the practical farmer. After endeavouring to invent a flat-bottomed boat or barge, to navigate upon this canal; for the purpoſe, moſt particularly, of conveying his turnips from the field to the cattle-ſheds; and finding it not eaſily practicable, his great mind ſtruck out, or rather caught, the beautifully ſimple idea of launching the turnips themſelves into the water; and letting them flow down ſingly with the current. "We throw them in," ſays he, "and bid them meet us at the barn's end!" in which ſituation he was then (October, 1789) contriving a reſervoir, or dry dock, for them to fall into: with a grate at the bottom, to let out the water, and retain the turnips; which will there be laid up, clean waſhed and freight-free, as a ſupply in froſty weather.

The improvements effected in this department of rural affairs, by this able improver, are, it is obſerved, not only extenſive, but highly intereſting, and are rendered the more ſtriking, by "proof pieces," (a good term for experimental patches,) left in each ſeite of improvement.

In the art of irrigating or watering graſs-lands, on the modern principle, Mr. Paget, of Ibſtock, is alſo mentioned. This improver, it is ſtated, cuts a conſiderable quantity of hay, annually, from lands which have received no other manure than water, during the laſt forty years. A ſtriking inſtance, it is ſuppoſed, that water is not merely a ſtimulus or force, as ſome men conceive it to be, but communicates ſome real nutriment to the herbage or graſs plants. In the practice of this improver, one circumſtance occurred, which ought to be mentioned by way of caution. He found that in watering an orchard with the waſhings of the ſtreet and yards of a neighbouring village (a deſirable ſpecies of water) the fruit-trees were greatly injured. A ſimilar circumſtance alſo took place in the practice of Mr. Bakewell. It is well known that ſurface water is in all circumſtances highly injurious to fruit-trees of the apple kind. Alſo, near Appleby, in Yorkſhire, Mr. Moor has executed a conſiderable work of this kind in a judicious manner, cutting a freſh channel on one ſide of the ſeite of improvement, for a rivulet which wound through its middle; in order to prevent its overflowing at an improper ſeaſon; and converting the old channel, (partially filled up) into a main float; an expedient which may be frequently practiſed with good effect, in different ſituations. The ſame ſpecies of improvement has likewiſe been carried on with much ſpirit and ſucceſs by Mr. Wilks of Meeſham; and in other inſtances the practice has not been attended with leſs ſucceſs, though under different circumſtances.

According to the agricultural ſurvey of the county of Devon, Mr. Templer, of Stover, has experienced from this method of huſbandry very conſiderable beneficial effects on a tract of marſhy land on the borders of his canal. It had formerly produced from five to ten ſhillings an acre. After having it drained and levelled, by forming conductors for the overplus water of the canal during the winter floods, and diſtributing it by well arranged ſluices, ſo as to throw the enriching particles upon the ſurface, he converted theſe marſhes into valuable, verdant meadow-land. The method that was adopted in conſtructing the diſtributing ſluices was by having a number of trunks placed at various diſtances, to each of which a plug was fitted, and when the flood ſwelled the canal above the level requiſite for navigation, the plugs were taken out, and the water immediately overflowed the ſurface of the meadow-lands, being at any time capable of being eaſily reſtrained by replacing the plugs: ſimilar ſucceſs is likewiſe aſſerted to have attended a like proceſs on lands in the upper line of the canal.

Beſides theſe, in Yorkſhire, Cheſhire, Wales, and the more northern parts of Scotland, as well as in the different diſtricts in which the practice of irrigation has been long common, various improvements have been effected by the application of water to the ſurface of graſs-lands, which will be particularly noticed under the proper head, and alſo the moſt approved methods of accompliſhing the buſineſs under different circumſtances of ſoil and ſituation. See *Watering of* LAND.

IRRITABILITY, in *Phyſiology*, denotes, in its moſt general ſenſe, the capability of being irritated or excited, or that property by which living parts are enabled to execute their functions: when thus employed, it is ſynonymous with excitability, and may be regarded as denoting the moſt characteriſtic peculiarity of living matter. It is very commonly employed, in a more limited acceptation, to expreſs the property by which muſcles are enabled to contract, either in obedience to the will, or to any mechanical or chemical ſtimuli. In either caſe, this word is to be underſtood as ſignifying merely a property of living bodies, the real nature of which is as entirely unknown to us as that of attraction or chemical affinity. All the ſpeculations which have been entertained on the ſubject of its nature, ſuppoſing it to be a peculiar ſubtle matter like thoſe (whoſe exiſtence, be it obſerved, reſts alſo on ſuppoſition) of electricity common or Voltaic, of magnetiſm or light, or conſidering it as identical with oxygen, may be diſmiſſed without any formal refutation, as they are completely gratuitous aſſumptions. See LIFE, MUSCLE, and NERVE.

IRRITATION, in *Medicine*, ſignifies a ſtate of feveriſhneſs and inquietude, in which the functions are impeded, and the ſtrength gradually impaired, ariſing either from internal or external cauſes, but principally from the former. It is ſynonymous with the *erethiſm*, ἐρεθισμὸς, of the Greek writers. Irritation is produced, in different inſtances, by extraneous ſubſtances in the cavities or organs of the body, as calculi in the bladder, kidnies, or ureters; worms in the ſtomach or inteſtines, &c.; or by chronic diſeaſe in the viſcera, ſuch as ſcirrhus of the liver, of the meſenteric glands, &c.; or ſlow inflammation in any part; or by the prevalence of any depreſſing paſſion, as grief and anxiety; or by long watching; and various other cauſes. In febrile diſeaſes, from whatever origin, a ſtate of irritation is more readily produced; *i. e.* the ſame ſtimuli which excite little effect in the ſtate of health, tend to aggravate the feveriſh ſymptoms, ſuch as external heat, ſtrong light, noiſes, muſcular or mental exertion, and the like: whence, in every fever, whether idiopathic or ſymptomatic, the removal of every ſource of irritation is an indication conſtantly to be kept in view.

IRRSUMIT, in *Geography*, a town of Eaſt Greenland. N. lat. 61° 10′. W. long. 45° 35′.

IRSOA, a ſmall iſland near the coaſt of Portugal, on the ſouth ſide of the mouth of the Minho. N. lat. 41° 50′. W. long. 8° 36′.

IRTISCH, or IRTYSH, a river of Ruſſia, which riſes in the Chineſe Soongoria, flows through the lake Norſniſan, in N. lat. 46° 30′, then enters the Ruſſian territory, and after meandering through a large tract of country, throws itſelf, in N. lat 61°, and E. long. 56′, into the Oby. In its way it takes up ſeveral ſmaller rivers, and forms ſeveral iſlands, of which ſome occaſionally diſappear, and their places are ſupplied by others; and the intervals in which it is navigable are perpetually changing. Its water in the inferior regions is whitiſh and light, ſo that it ſhould ſeem to flow over a bottom conſiſting chiefly of calcareous marle. It ſwarms with fiſh, and its ſturgeons have a peculiar delicate flavour.

IRVINE, or IREWINE, a ſea-port town and royal borough in the bailiwick of Cunningham, and county of Ayr, Scotland, is ſeated on the northern bank of the river Irvine, the eſtuary of which forms the harbour. On the ſouthern ſide of the river is a row of houſes uniformly built; and theſe, with others, are hamlets to the pariſh of Dundonald. The town appears to have been chartered at an early period; for in a grant from Alexander II., reference is made to previous charters. The magiſtracy of this town had formerly extenſive juriſdiction, but this has been abridged; but it ſtill derives an ample revenue from a large tract of land near the town. Here is a commodious harbour, which has 10 or 12 feet of water on the bar at ſpring-tides. Several veſſels, called buſſes, were formerly employed in the herring-fiſhery: at preſent the coal-trade is the chief object with the inhabitants. Above 24,000 tons have been ſhipped from this port in one year. Attached to the town is a dock-yard for ſhip-building, a large tan-yard, rope-ground, and a bleach-field. Many of the inhabitants are alſo engaged in the manufactory of carpets, muſlins, ſilks, lawns, and other articles. In the year 1800, the town contained 729 houſes, and 4584 inhabitants; though its population was eſtimated, in 1790, at 3500. The town is 61 miles W. by S. from Edinburgh. The church is deſcribed as a prominent object of beauty and intereſt in the town. Bowtree hill, in the vicinity of Irvine, is a ſeat of the honourable Mr. Hamilton; and near it is an old caſtle, belonging to the earl of Eglingtown, who has a ſeat in the neighbouring pariſh of Kilwining. In the pariſh of Irvine it is ſaid that a religious ſect called Buchannites, from the name of the founder, had its origin. Sinclair's Statiſtical Account of Scotland, vol. vii. p. 169, &c. by the Rev. James Richmond.

ISA, in *Hindu Mythology*, one of the thouſand names of Siva, the perſonification of the deſtructive or regenerative power of the deity. (See SIVA.) With the epithet *Maha*, or *great*, prefixed, Maheſa is formed, another of Siva's names. In this form, the name of his conſort or ſakti (ſee SAKTI) is Iſi. Under theſe names ſir William Jones recognizes the Oſiris and Iſis of Egypt. Iſwara ſeems but another mode of writing and pronouncing Iſa; and the deduction of Oſiris from that ſound is no ſtrained etymology, eſpecially when confirmed by many hiſtorical and characteriſtic coincidences. Iſa and Iſi are both perſonifications of the moon; for with the Hindus, that luminary is both male and female: and here we find Parvati (of whom Iſi is only another form and name) again correſponding with the Diana of the Greeks, one of whoſe names is Luna.

ISAAC, in *Scripture Biography*, the ſon of Abraham and Sarah, was born at Gerar, in the country of the Philiſtines, B.C. 1896, when his father was 100, and his mother 90 years of age. His birth was previouſly announced to Abraham, as the ſon of covenant and promiſe, in whoſe ſeed all the nations of the earth ſhould be bleſſed. His name, according to its Hebrew etymology, which denotes "he has laughed, or ſhall laugh," expreſſes the pleaſure with which his parents received the prediction of his birth, and augured the honour that awaited his poſterity. A circumſtance, however, occurred, which tended to abate their joy; and this was a divine command to offer Iſaac as a ſacrifice. (See ABRAHAM.) At the age of 40 years, Iſaac married Rebecca, the daughter of Nahor, Abraham's brother; and by her he had two twin-ſons, Eſau and Jacob. (See their articles.) This venerable patriarch, for whoſe hiſtory we refer to the book of Geneſis, ch. xviii—xxxv. died at the age of 180 years, B.C. 1716, and was buried with his parents in the cave of Machpelah.

ISAAC I. COMNENUS, in *Biography*, emperor of the Eaſt, ſon of Manuel, was the firſt of the noble family of Comneni who arrived at the imperial throne. Iſaac and his brother John were bequeathed by an affectionate father, conſcious of his own deſerts in the ſervice of his country, to the gratitude and favour of his ſovereign. The noble youths were carefully trained in the learning of the times, the arts of the palace, and the exerciſes of the camp; and had become extremely popular with the people and the army. On the elevation of Michael VI., the diſcontent of the ſoldiery was openly manifeſted. The generals, who conſidered themſelves inſulted by the election of Michael, ſecretly aſſembled in the ſanctuary of St. Sophia, and would have choſen the venerable and valiant Catacalon, if the modeſty of the veteran had not ſuggeſted the importance of birth as well as merit in the choice of a ſovereign. Upon his refuſal of the dignity, Iſaac Comnenus was approved by general conſent. Comnenus, then in Paphlagonia, ſoon learnt the deciſion of the military ſynod; and inveſted with the imperial enſigns, marched to Nice, which he took by ſurpriſe; but being encountered in the neighbourhood of that city by Michael's generals, he entirely defeated them, and proceeded to Conſtantinople. The dethroned emperor reſigned his dignity, and retired to a monaſtery; and Iſaac was ſolemnly crowned, September 1, 1057. His ſhort reign was undiſturbed by foreign enemies: he fell into a declining ſtate of health, which he took as an admonition to retire from the world. John, whom he would gladly have inveſted with the imperial purple, refuſed to accept the toil, and it was conferred upon Conſtantine Ducas; and Iſaac ended his reign of two years and three months in a monaſtery. Iſaac in a great meaſure recovered his health, and ſurvived two years his voluntary abdication. At the command of his abbot, he obſerved the rule of St. Baſil, and executed the moſt ſervile offices of the convent; but he was gratified by the frequent and reſpectful viſits of the reigning monarch, who revered in his perſon the character of a benefactor and ſaint. Gibbon. Univer. Hiſt.

Isaac II. Angelus, emperor of the Eaſt, was raiſed to that dignity by the fall of Andronicus, the laſt of the Comnenian family who reigned at Conſtantinople. The revolution which hurled him from the throne, ſaved and exalted Iſaac Angelus, who deſcended by the female line from the ſame imperial dynaſty. "The ſucceſſor of a ſecond Nero," ſays the hiſtorian, "might have found it an eaſy taſk to deſerve the eſteem and affection of his ſubjects; nevertheleſs they ſometimes had reaſon to regret the adminiſtration of Andronicus." Iſaac abandoned himſelf to frivolous amuſements and luxurious indulgences, and oppreſſed his people by the laviſh expences of his houſehold. "Iſaac," ſays Mr. Gibbon, "ſlept on the throne, and was awakened only by the ſound of pleaſure: his vacant hours were amuſed by comedians and buffoons, and even to theſe the emperor was an object of contempt: his feaſts and buildings exceeded the examples of royal luxury; the number of his eunuchs and domeſtics amounted to twenty thouſand." His generals were ſucceſsful in expelling the Sicilian invaders; but Iſaac diſgraced himſelf by the cruelty with which he treated the captives. Conſtantinople was beſieged, and the weak emperor put all his truſt in an image of the Virgin Mary, and the prayers of the monks. A revolt of the Bulgarians proved a laſting injury to the empire; and it became neceſſary to ſuffer them to eſtabliſh an independent kingdom. Iſaac drew upon himſelf various acts of hoſtility from Frederic Barbaroſſa, who was the friend and ally of the Cruſaders. At length the perfidy of his own brother Alexius was more fatal to him than foreign violence. In 1195, he ſeized upon the throne, during the abſence of Iſaac on a hunting party; and obtaining poſſeſſion of his perſon, deprived him of his ſight, and ſhut him up in a loneſome priſon. His ſon Alexius eſcaped, and engaged the weſtern powers in his behalf; who, in 1203, took Conſtantinople, and replaced Iſaac upon the throne in conjunction with his ſon. Another revolution, in 1204, effected by Alexius Ducas, deprived them of their ſeat; and the death of Iſaac very ſoon followed, or perhaps preceded, the murder of his ſon. Univer. Hiſt. Gibbon.

Isaac, Henry, a German compoſer of great renown in Italy, during the fifteenth century, under the name of Arrigo Tedeſco; by which title he is celebrated by Politian. Quadrio, tom. ii. p. 321. ſays that he was maeſtro di cappella of the church of San Giovanni, in Florence; and the firſt who, in different ballad-airs, ſet the ſongs of Lorenzo il Magnifico, in three parts, for a proceſſional maſquerade. He flouriſhed about 1475. Glareanus, in his "Dodecachordon," ſays that "Henry Iſaac chiefly cultivated the church ſtyle; and in his works may be perceived a natural force and majeſty, ſuperior, in general, to any thing that can be found in the compoſitions of our times; though his ſtyle may be ſaid to be ſomewhat rough. He was fond of long notes in ſome one of his middle parts, while the reſt of the voices were in a manner playing round it, as the wind plays when it puts the waves in motion round a rock."

ISABAD, in *Geography*, a town of Perſia, in the province of Irac; 50 miles S. of Hamadan.

ISABE, a town of Japan, in the iſland of Niphon; 50 miles N.W. of Jedo.

ISABEL, St., one of the iſlands of Solomon, in the Pacific ocean, 200 miles in circumference, S. lat. 7° 30′, about 160 leagues weſt of Lima, diſcovered by Mendana in 1567. The inhabitants are cannibals, and worſhip ſerpents, toads, and other animals. Their complexion is brown, their hair woolly, and they wear no covering but round their waiſt. They are divided into tribes, and are conſtantly at war with each other.

ISABELLA, in *Biography*, queen of Caſtile, born in 1451, was the daughter of John II. She paſſed the early part of her life in great obſcurity, and without any proſpect of a crown; but the Caſtilians having conſpired againſt her brother Henry IV., obliged him to declare Iſabella heireſs to the kingdom. In 1469 ſhe married Ferdinand king of Arragon; and upon the death of Henry in 1474, they were conjointly declared king and queen of Caſtile. They were proclaimed at Segovia, amidſt loud acclamations; and the fidelity of their new ſubjects enabled them to defeat all the deſigns of their enemies, who had declared in behalf of Joanna, the ſuppoſed daughter of Henry. Alphonſo IV. king of Portugal, eſpouſed the perſon and the cauſe of the latter, and took up arms in her defence and his own. The defeat at the battle of Toro, in 1475, was fatal to his pretenſions; and by a peace concluded in 1479, the right of Iſabella and her huſband was fully acknowledged, and Joanna retired into a monaſtery. In this ſame year, the crown of Arragon fell to Ferdinand; and from that period the kingdoms of Caſtile and Arragon were inſeparably united, compriſing the whole of Spain not poſſeſſed by the Moors. (See Ferdinand.) Religious zeal was a leading feature in her character; and the deſire of propagating the Chriſtian faith in parts of the world where it was yet unknown, was the chief motive of the encouragement ſhe gave to the projects of Columbus which eventually added ſo much to the Spaniſh monarchy. Her merits towards the church were rewarded by the title of "The Catholic," conferred by Innocent VIII. on both the royal partners, and their ſucceſſors in the Spaniſh crown. Iſabella died with the great regret of her ſubjects, in November 1504, in the 54th year of her age. Univer. Hiſt. Robertſon's Hiſt. of America.

Isabella, in *Conchyliology*, the name given by the French naturaliſts to the beautiful pale-brown voluta, ſo much eſteemed in the Dutch cabinets.

ISABELLA, in *Geography*, a ſmall iſland near the coaſt of Braſil; 25 miles S.W. from the mouth of the river St. Franciſco.—Alſo, a town on the north coaſt of the iſland Hiſpaniola, built by Chriſtopher Columbus in the year 1493. N. lat. 19° 55′. W. long. 71° 0′. Iſabella Point forms the N.E. ſide of the bay of the ſame name. Here Columbus formed the firſt Spaniſh ſettlement, naming it after his patroneſs queen Iſabella. He was driven hither by a tempeſt in the night.

ISABELLA, *St.*, a town of Braſil, in the government of St. Salvador, near the coaſt. S. lat. 11° 10′.

ISACHNE, in *Botany*, from ισος, *equal*, and αχνη, *a huſk*. Brown. Prodr. Nov. Holl. v. 1. 196. Claſs and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Eſſ. Ch. Calyx of two equal, membranous, obtuſe valves, two-flowered. Florets equal, bivalve, of a paper-like texture; the outer male, inner female. Two ſcales beneath the germen. Stigmas feathery. Seed encloſed in the hardened calyx. *Brown.*

A genus of ſmooth graſſes, growing in watery places. *Leaves* flat, their ſheaths bearded at the top. *Flowers* panicled.—They have great affinity to *Panicum*, and the aſpect of *P. coloratum*. It appears by Hermann's herbarium that his *Meneritana*, Fl. Zeyl. 24, is of this genus.

The only New Holland ſpecies given by Mr. Brown is

I. *auſtralis.* "Panicle lanceolate, ſimple. Branches and flower-ſtalks zig-zag. Stem erect." Native of Port Jackſon, New South Wales.

ISÆUS, in *Biography*, an orator of Chalcis, in Eubœa, who flouriſhed about the end of the Peloponneſian war, the fourth century before the Chriſtian era. When he came to Athens, he put himſelf under the inſtructions of the orator Lyſias, from whom he obtained the ſame purity, accuracy, conciſeneſs and perſpicuity of ſtyle, which diſtinguiſhed his maſter, with more force and vigour. He was celebrated for popular eloquence, and had the honour of being the inſtructor of Demoſthenes. It has been ſaid that he was diſſipated in early life, but that as he attained to years of maturity, he became illuſtrious by the practice of the oppoſite virtues. He lived to the time of king Philip. He was author of ſixty-four orations, of which ten only are now remaining, which are to be found among the Oratores veteres Græci. Theſe have been tranſlated by ſir William Jones, and were given to the world in 1779. There was another Greek orator of this name, who came to Rome in the firſt century of the Chriſtian era, and who is mentioned with great applauſe by Pliny the younger, who obſerves that he always ſpoke extempore, and wrote with elegance, unlaboured eaſe, and great correctneſs.

ISAGO, in *Geography*, a country of Africa, N.W. of Benin.

ISAGON, in *Geometry*, is ſometimes uſed for a figure conſiſting of equal angles.

ISAIAH, *or the Prophecy of Iſaiah*, a canonical book of the Old Teſtament. Iſaiah is the firſt of the four greater prophets; the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother, as ſome have ſaid, to Azariah, or Uzziah, king of Judah.

The firſt appointment of Iſaiah to the exerciſe of the prophetical office is ſuppoſed to have taken place in the laſt year of Uzziah's reign, or 758 B C., at which time he is ſuppoſed to have been about 25 years of age; and if he lived to the reign of Manaſſeh B C. 696, by whoſe order, according to a tradition of the Jews, he was ſawn aſunder, the duration of his office muſt have extended to 61 or 62 years. But this Jewiſh tradition is uncertain; and one of their principal rabbins (Aben Ezra, Com. in Iſ. i. 1.) ſeems rather to think that he died before Hezekiah, which opinion is received as the moſt probable. It is certain, however, that he lived at leaſt to the 15th or 16th year of Hezekiah; and this makes the leaſt poſſible term of the duration of his prophetical office, about 47 or 48 years; ſo that he propheſied in the reigns of Uzziah, Jotham, Ahaz, and Hezekiah. The time of the delivery of ſome of the prophecies is either expreſsly marked in, or eaſily deducible from, the hiſtory to which they relate; that of a few others may, with ſome probability, be inferred from expreſſions, deſcriptions, and circumſtances interwoven in the predictions themſelves. The prophecy contained in the firſt chapter ſtands ſingle and unconnected; and contains a ſevere remonſtrance againſt the corruptions prevailing among the Jews of that time; powerful exhortations to repentance; grievous threatenings to the impenitent; and gracious promiſes of better times, when the nation ſhall have been reformed by the juſt judgments of God. The expreſſion is upon the whole clear; the connection of the ſeveral parts eaſy; and in regard to the images, ſentiments, and ſtyle, it gives a beautiful example of the prophet's elegant manner of writing; though perhaps it may not be equal in theſe reſpects to many of the following prophecies. The prophecy contained in the ſecond, third, and fourth chapters, makes one continued diſcourſe. The firſt five verſes of the ſecond chapter foretel the kingdom of the Meſſiah, the converſion of the Gentiles, and their admiſſion into it. From the 6th verſe to the end of the 2d chapter, is foretold the puniſhment of the unbelieving Jews for their idolatrous practices, their ſelf-confidence and diſtruſt of God's protection; and moreover the deſtruction of idolatry, in conſequence of the eſtabliſhment of Meſſiah's kingdom. The whole third chapter, with the firſt verſe of the fourth, is a prophecy of the calamities of the Babylonian invaſion and captivity; with a particular amplification of the diſtreſs of the proud and luxurious daughter of Sion. Chapter iv. 2—6, promiſes to the remnant, which ſhall have eſcaped this ſevere purgation, a future reſtoration to the favour and protection of God. The prophecy was probably delivered in the time of Jotham, or perhaps in that of Uzziah. The 5th chapter is unconnected with that which precedes, and with that which follows it; and the ſubject of it, like that of the firſt chapter, is a general reproof of the Jews for their wickedneſs; but it exceeds that chapter in force, in ſeverity, in variety, and in elegance; and it adds a more expreſs declaration of vengeance, by the Babylonian invaſion. The viſion in the 6th chapter ſeems to contain a ſolemn deſignation of Iſaiah to the prophetical office, and it is therefore thought by moſt interpreters to be the firſt in order of his prophecies. Biſhop Lowth, however, conjectures that this may not be the caſe; becauſe Iſaiah is ſaid to have propheſied in the time of Uzziah; but as Iſaiah's prophecies are not placed in exact order of time, the 2d, 3d, 4th, and 5th chapters ſeem to be antecedent to the 1ſt chapter, and to ſuit the time of Uzziah, or the former part of Jotham's reign, whereas the 1ſt chapter can hardly be earlier than the laſt years of Jotham. Accordingly this might be a new deſignation, to introduce more ſolemnly a general declaration of the whole courſe of God's diſpenſations in regard to his people, and the fates of the nation; which are even now ſtill depending, and will not be fully accompliſhed till the final reſtoration of Iſrael. The 7th chapter begins with an hiſtorical account of the occaſion of this prophecy; and then follows a prediction of the ill ſucceſs of the deſigns of the Iſraelites and Syrians againſt Judah; and a denunciation of the calamities to be brought upon the king and people of Judah by the Aſſyrians, whom they had now hired to aſſiſt them. The 8th chapter is cloſely connected with the foregoing, and contains a confirmation of the prophecy before given of the approaching deſtruction of the kingdoms of Iſrael and Syria by the Aſſyrians, of the denunciation of the invaſion of Judah by the ſame Aſſyrians; together with a repeated general aſſurance, that all the deſigns of the enemies of God's people ſhall be in the end diſappointed and brought to nought, concluding, after admonitions and threatenings, with an illuſtrious prophecy of the manifeſtation of the Meſſiah, the tranſcendent dignity of his character, and the univerſality and eternal duration of his kingdom. This prophecy concludes at the 6th verſe of the 9th chapter. The whole paſſage from chapter ix. 7. to chapter x. 4, contains a diſtinct prophecy, and a juſt poem; remarkable for the regularity of its diſpoſition and the elegance of its plan; it is addreſſed excluſively to the kingdom of Iſrael, and the ſubject of it is a denunciation of vengeance awaiting their enemies. The 5th verſe of the 10th chapter begins with a new and diſtinct prophecy, which is continued to the end of the 12th chapter. It appears that it was delivered after the taking of Samaria by Shalmaneſer, in the 6th year of the reign of Hezekiah, and as the former part of it foretels the invaſion of Senacherib, and the deſtruction of his army, which makes the whole ſubject of this chapter, it muſt have been delivered before the 14th year of the ſame reign. Then, according to Iſaiah's uſual method, he takes occaſion, from the mention of a great temporal deliverance by the deſtruction of the Aſſyrian army, to launch out into the diſplay of the ſpiritual deliverance of God's people by the Meſſiah, to whom this prophecy relates. (See Rom. xv. 12.) The hymn in the 12th chapter ſeems, by its whole tenor, as well as by many expreſſions in it, much better calculated for the uſe of the Chriſtian church, than for the Jewiſh in any circumſtances, or at any time, that can be aſſigned; and the Jews themſelves ſeem to have applied it to the times of the Meſſiah. The 13th and 14th chapters (excluding the five laſt verſes of the latter, which belong to a quite different ſubject) contain one entire prophecy, foretelling the deſtruction of Babylon by the Medes and Perſians; delivered probably in the reign of Ahaz (ſee Vitringa, i. 380.) about 200 years before the completion of it. The former part of this prophecy, ſays biſhop Lowth, is one of the moſt beautiful examples, that can be given, of elegance of compoſition, variety of imagery, and ſublimity of ſentiment and diction in the prophetic ſtyle; and the latter part conſiſts of an ode of ſupreme and ſingular excellence. The 15th and 16th chapters, which ought not to have been ſeparated, taken together, make one entire prophecy, delivered, moſt probably, ſoon after the foregoing, in the 1ſt year of Hezekiah, and accompliſhed in his 4th year, when Shalmaneſer invaded the kingdom of Iſrael. The prophecy in the 17th chapter comprehends the kingdom of Samaria and the Iſraelites, confederated with Damaſcus and the Syrians againſt the kingdom of Judah. It was delivered probably ſoon after the prophecies of the 7th and 8th chapters, in the beginning of the reign of Ahaz, and was fulfilled by Tiglath-Pileſer's taking Damaſcus, (2 Kings, xvi. 9.) overrunning a great part of the kingdom of Iſrael, and carrying a great number of the Iſraelites alſo captives to Aſſyria; and ſtill more fully in regard to Iſrael, by the conqueſt of the kingdom, and the captivity of the people, effected a few years after by Shalmaneſer. The prophecy in the 18th chapter is in all its circumſtances obſcure and doubtful. In the 19th chapter the prophet ſeems to have had in view the conqueſt of the Perſians by Alexander, which was in fact a deliverance to Egypt, together with other preceding and collateral incidents, and the favour granted to the Jews by Alexander and the Ptolemies. The 20th chapter refers to the taking of Aſhdod or Azotus, and warns the Jews againſt depending too much on the aſſiſtance of Egypt. The ten firſt verſes of the 21ſt chapter contain a prediction of the capture of Babylon by the Medes and Perſians; the remaining prediction is obſcure. The prophecy, ending with the 14th verſe of the 22d chapter, foretels the invaſion of Jeruſalem by the Aſſyrians under Senacherib, or by the Chaldæans under Nebuchadnezzar. Vitringa thinks that the prophet had both in view; that of the Chaldæans in the firſt part, verſe 1—5, and that of the Aſſyrians in the latter part, v. 8—11. The prophecy in the 23d chapter denounceth the deſtruction of Tyre by Nebuchadnezzar. From the 13th chapter to the 23d incluſive, the fate of ſeveral cities and nations is denounced; of Babylon, of the Philiſtines, Moab, Damaſcus, Egypt, Tyre. The prophet then proceeds, in the 24th and three following chapters, to declare the judgments impending upon the people of God themſelves, for their wickedneſs and apoſtacy; and the deſolation that ſhall be brought on their whole country. The particular ſubject of the 24th chapter has been differently aſſigned by interpreters; ſome refer it to the deſolation occaſioned by the invaſion of Shalmaneſer; others to the invaſion of Nebuchadnezzar; and others to the deſtruction of the city and nation by the Romans. Vitringa is ſingular in referring it to the perſecution of Antiochus Epiphanes. Biſhop Lowth thinks it may have a view to all the three great deſolations of the country by Shalmaneſer, by Nebuchadnezzar, and by the Romans, eſpecially the laſt. The 25th chapter contains a ſong of praiſe, dictated more by the proſpect of future mercies, than by the recollection of paſt events. The ſubject of the 27th chapter ſeems to be the nature, the meaſure, and the deſign of God's dealings with his people. The prophecy in the 28th chapter, as far as the fifth verſe, relates to the Iſraelites, and manifeſtly denounces their deſtruction by Shalmaneſer. It then turns to the two tribes of Judah and Benjamin, the remnant of God's people, who were to continue a kingdom after the final captivity of the Iſraelites. It begins with a favourable prognoſtication of their affairs under Hezekiah; but ſoon changes to reproofs and threatenings, for their intemperance, diſobedience, and profaneneſs. The ſubject of the 29th and four following chapters is the invaſion of Senacherib; the great diſtreſs of the Jews while it continued; their unexpected and ſudden deliverance by God's interpoſition in their favour; the ſubſequent proſperous ſtate of the kingdom under Hezekiah; interſperſed with reproofs and threatenings, and alſo with promiſes of better times. The 34th and 35th chapters make one diſtinct prophecy; an entire, regular, and beautiful poem, conſiſting of two parts; the firſt containing a denunciation of divine vengeance againſt the enemies of the people, or church of God: the ſecond deſcribing the flouriſhing ſtate of the church of God, conſequent upon the execution of thoſe judgments. The 36th chapter contains a hiſtory of the invaſion of Senacherib, and of the miraculous deſtruction of his army, as a proper introduction to the prophecy in the 37th chapter, which is the anſwer of God to Hezekiah's prayer, which could not be well underſtood without it. The narration of the 38th and 39th chapters ſeems to be in ſome parts an abridgment of that of 2 Kings, xx. The courſe of prophecies which follow from the 40th chapter to the end of the book, and which, taken together, conſtitute the moſt elegant part of the writings of the Old Teſtament, interſperſed alſo with many paſſages of the higheſt ſublimity, was probably delivered in the latter part of the reign of Hezekiah. They are chiefly of the conſolatory kind; and therefore they are opened with the promiſe of the reſtoration of the kingdom, and the return of the people from their captivity, by the merciful interpoſition of God in their favour. The prophet, however, extends their views to the fulfilment of God's promiſes of eſtabliſhing a more glorious and an everlaſting kingdom, under the Meſſiah to be born of the tribe of Judah, and of the family of David. He connects theſe two events together, and hardly ever treats of the former without throwing in ſome intimations of the latter.

Iſaiah has been, with peculiar propriety, denominated the "evangelical prophet," on account of the number and variety of his predictions concerning the advent and character, the miniſtry and preaching, the ſufferings and death, and extenſive permanent kingdom of the Meſſiah. His predictions are, indeed, ſo explicit and determinate, as well as ſo numerous, that no one can be at a loſs in applying them to the miſſion and character of Chriſt, and the events that are cited in his hiſtory by the New Teſtament writers. The whole book of Iſaiah, ſome few paſſages excepted, which, if brought together, would not at moſt exceed the bulk of five or ſix chapters, is conſidered by biſhop Lowth as poetical (See the article *Prophetic* POETRY.) "He abounds," ſays this learned critic, "in ſuch tranſcendent excellencies, that he may be properly ſaid to afford the moſt perfect model of the prophetic poetry. He is at once elegant and ſublime, forcible and ornamented; he unites energy with copiouſneſs, and dignity with variety. In his ſentiments there is uncommon elevation and majeſty; in his imagery the utmoſt propriety, elegance, dignity, and diverſity; in his language uncommon beauty and energy; and, notwithſtanding the obſcurity of his ſubjects, a ſurpriſing degree of clearneſs and ſimplicity. To theſe we may add, there is ſuch ſweetneſs in the poetical compoſition of his ſentences, whether it proceed from art or genius, that if the Hebrew poetry at preſent is poſſeſſed of any remains of its native grace and harmony, we ſhall chiefly find them in the writings of Iſaiah: ſo that the ſaying of Ezekiel (xxviii. 12.) may moſt juſtly be applied to this prophet:

"Thou art the confirmed exemplar of meaſures,
Full of wiſdom, and perfect in beauty."

Iſaiah greatly excels, too, in all the graces of method, order, connection, and arrangement; though in aſſerting this we muſt not forget the nature of the prophetic impulſe, which bears away the mind with irreſiſtible violence, and frequently in rapid tranſitions from near to remote objects, from human to divine: we muſt alſo be careful in remarking the limits of particular predictions, ſince, as they are now extant, they are often improperly connected, without any marks of diſcrimination, which injudicious arrangement, on ſome occaſions, creates almoſt inſuperable difficulties." Biſhop Lowth has ſelected as a ſpecimen of the kind of poetry in the language of which Iſaiah delivers his prophecies, the prediction contained in the thirty-fourth and thirty-fifth chapters; and pointed out the beauties that eminently diſtinguiſh the ſimple, regular, and perfect poem, as he denominates this prophecy. The latter part of the book, commencing at the fortieth chapter, is, perhaps, ſays the ſame excellent judge, "the moſt elegant ſpecimen remaining of inſpired compoſition, and yet, in this reſpect, is attended with conſiderable difficulty. It is, in fact, a body or collection of different prophecies, nearly allied to each other as to the ſubject, which, for that reaſon, having a ſort of connection, are not to be ſeparated but with the utmoſt difficulty. The general ſubject is the reſtoration of the church. Its deliverance from captivity; the deſtruction of idolatry; the vindication of the divine power and truth; the conſolation of the Iſraelites, the divine invitation which is extended to them, their incredulity, impiety, and rejection; the calling in of the gentiles; the reſtoration of the choſen people; the glory and felicity of the church in its perfect ſtate; and the ultimate deſtruction of the wicked, are all ſet forth with a ſufficient reſpect to order and method. If we read theſe paſſages with attention, and duly regard the nature and genius of the myſtical allegory; at the ſame time remembering, that all theſe points have been frequently touched upon in other prophecies promulged at different times, we ſhall neither find any irregularity in the arrangement of the whole, nor any want of order and connection as to matter or ſentiment in the different parts. Grotius calls Iſaiah the Demoſthenes of the Hebrews, and biſhop Lowth ranks him with Homer. (See JEREMIAH.) As a commentator on this book, the learned are under great obligations to Vitringa in his excellent commentary in 2 vols. fol. Amongſt the Engliſh tranſlations, the firſt place will be allowed to biſhop Lowth for his admirable work, abounding ſo much with learned criticiſm and correct taſte, entitled "Iſaiah; a new Tranſlation, with a Preliminary Diſſertation, and Notes, critical, philological, and explanatory," firſt publiſhed in 1778, 4to. in which the author has purſued the metrical arrangement. The late Michael Dodſon, eſq. alſo publiſhed in proſe "A New Tranſlation of Iſaiah; with Notes ſupplementary to thoſe of Dr. Lowth, late Biſhop of London, and containing Remarks in many parts of his Tranſlation and Notes, by a Layman," 1790, 8vo. We have lately had a valuable tranſlation of the prophecies of Iſaiah by Dr. Stock, biſhop of Killala. See the works already cited, and Lowth's Prælectiones de Sac. Poeſ. Heb. N° xx—xxi.

ISAKLU, in *Geography*, a town of Aſiatic Turkey, in Caramania; 12 miles N.W. of Akſhehr.

ISAKOVA, a town of European Turkey, in Moldavia; 60 miles N.E. of Jaſſy.

ISAKZI, a town of European Turkey, on the Danube; 26 miles W. of Iſmail. N. lat. 45° 18'. E. long. 29° 9'.

ISAMBLUCIS, in *Natural Hiſtory*, the name of a genus of foſſils of the claſs of the *ſelenitæ*, but of the columnar, not the rhomboidal kind.

The ſelenitæ of this genus conſiſt of ſix ſides, and two obtuſe or abrupt ends; and all their ſides being very nearly of the ſame breadth, they much reſemble broken pieces of the columns of ſprig-cryſtal.

The bodies of this genus, as well as the reſt of the columnar ſelenitæ, are ſubject to a longitudinal crack, which ſometimes admitting a ſmall quantity of clay, ſhapes it into the figure of an ear of graſs. Hill's Hiſt of Foſſ. p. 121. See the article SELENITES.

ISANDORA, in *Geography*, a town of Angola, on the Coenza; 25 miles S. of Loanda.

ISANI, in *Mythology*, one of the many names of the Hindoo deity, Siva; alſo of his ſakti, or conſort Parvati: it ſeems nearly ſimilar with Iſa. (See under thoſe articles.) The Hindoos reckon eight of their principal deities, as regents or ſupporters of the eight cardinal and intermediate points of the heavens. Of theſe regents, called Maruts, or *winds*, Indra is the chief, and rules the Eaſt. (See INDRA and MARUT.) Iſani or Siva, in that form, is by ſome mythologiſts, but not by all, reckoned another, and ruler of the north-eaſt. See Moor's Hindoo Pantheon, under *Indra* in the index.

ISANTHUS, in *Botany*, ſo called by Michaux, from ισος *equal*, and *ανθος, a flower*, becauſe this plant, unlike moſt others of the claſs *Didynamia*, has a regular corolla.—Michaux Amer. v 2. 3. t. 30. Claſs and order, *Didynamia Gymnoſpermia.* Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juſſ.

Gen. Ch. *Cal.* Perianth bell-ſhaped, rather ſpreading, cloven half way down into five, nearly equal, lanceolate ſegments; the two lower ones, eſpecially after the corolla has fallen off, more cloſe than the reſt. *Cor.* nearly equal with the calyx, almoſt regular; tube ſtraightiſh, narrowly cylindrical, limb ſomewhat wheel-ſhaped, five-cleft; each ſegment oval and ſimilar, with two ſpots at the baſe. *Stam.* Filaments four, nearly equal, a little ſhorter than the corolla, perfectly erect; anthers oblique, cloven below; cells ovate, diverging nearly at a right angle. *Piſt.* Germen ſuperior, four-cleft; ſtyle the length of the ſtamens, recurved at top; ſtigmas two, recurved and much ſpreading, linear tongue-ſhaped; the lower one rather the longeſt. *Peric.* none, except the permanent, ſpreading tube of the calyx. *Seeds* four, obovate, rugged and reticulated, connected only at their baſe, filling the calyx.

Eſſ. Ch. Calyx five-cleft. Corolla nearly equal, five-cleft. Stamens erect. Anthers with divaricated lobes.

1. I. *cæruleus.* Blue Iſanthus.—Michaux Amer. v. 2. t. 30. A native of Virginia and Carolina, in a chalky ſoil. The whole plant is rather viſcid and hairy. *Root* annual. *Stem* about a foot high, erect, round, branched. *Leaves* oppoſite, on ſhort ſtalks, ovate, acuminate, ribbed or nerved, fringed. *Flowers* of a pale blue.

We are only acquainted with this plant from the deſcription and figure of Michaux. It is without doubt very nearly allied to the *Aſperifoliæ*, though we have followed that author in referring it to the claſs *Didynamia.*

ISARIA, in *Geography*, a town of Naples, in Calabria Ultra; eight miles E. of Nicaſtro.

ISARRIA, a town of Naples, in Calabria Ultra; 11 miles S. of Squillace.

ISATIS, in *Botany*, is the Ισατις of Dioſcorides, and *Iſatis* of Pliny, but its derivation is totally unknown. *Woad.* Linn. Gen. 344. Schreb. 435. Willd. Sp. Pl. v. 3. 420. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 693. Ait. Hort. Kew. v. 2. 406. Tournef. t. 100. Juſſ. 242. Lamarck Illuſtr. t. 554. Gærtn. t. 142. Claſs and order, *Tetradynamia Siliculoſa.* Nat. Ord. *Siliquoſæ*, Linn. *Cruciferæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of four, ovate, ſpreading, coloured, deciduous leaves. *Cor.* of four petals, croſs-ſhaped; petals oblong, obtuſe, ſpreading, by degrees attenuated into claws. *Stam.* Filaments ſix, ſlightly ſpreading, the length of the corolla; two of them ſhorter; anthers oblong, lateral. *Piſt.* Germen ſuperior, oblong, two-edged, compreſſed, as long as the ſhorter ſtamens; ſtyle none; ſtigma obtuſe, capitate. *Peric.* Pouch oblong, lanceolate, obtuſe, compreſſed, two-edged, of one cell, not gaping, two-valved, deciduous; the valves are boat-like, compreſſed and carinated. *Seed* ſolitary, ovate, central.

Eſſ. Ch. Pouch lanceolate, one-celled, ſingle-ſeeded, deciduous, with two boat-like valves.

1. I. *tinctoria.* Woad.—Linn. Sp. Pl. 936. Engl. Bot. t. 97. Mart. Fl. Ruſt. t. 41.—"Radical leaves crenated, ſtem-leaves arrow-ſhaped. Pouch oblong, ſmooth."—Rather a ſcarce plant in Britain, flowering in July, and found in fields. It was not originally a native of this iſland, but has become naturalized from its frequent culture for the purpoſe of dyeing blue. It is alſo a baſis for ſeveral other colours. Pliny ſays the ancient Britons ſtained their bodies with woad, but from the circumſtance of this plant having been introduced into this country from the ſhores of the Baltic, Spain, Italy, &c. Mr. Miller concludes that Weld (*Reſeda Luteola*), and not Woad, was uſed by our anceſtors for the purpoſe above related. But if the plant in queſtion can be identified with Pliny's it is undoubtedly a native. *Root* biennial. *Stem* erect, branched, furniſhed with alternate, ſomewhat ſucculent leaves; the radical ones ſtand on long foot-ſtalks, and are crenated. *Calyx* as well as the *corolla* of a yellow colour. *Seed-veſſels* dark brown. *Stem* and *leaves* occaſionally beſprinkled with a few hairs.

Linnæus enumerates three other ſpecies of *Iſatis, luſitanica, armena*, and *ægyptiaca*, the laſt of which is very properly removed by Willdenow to *Cakile* of Gærtner. Villars and Allioni mention another ſpecies under the name of *alpina.* This genus was very unaccountably placed by Linnæus in his order of *Siliquoſa*, together with *Bunias* and *Crambe*; but its near affinity to *Draba, Lepidium*, &c. in the ſhape and ſize of its pouch, ſufficiently warrant profeſſor Schreber's placing it among the *Siliculoſa.*

Isatis, in *Zoology.* See Lagopus.

ISATODES, a word uſed by Hippocrates, and ſome other of the old writers, to expreſs a greeniſh colour of the bile diſcovered in the ſtools, which reſemble the colour of the herb *iſatis*, or woad. This was eſteemed an indication of a highly depraved bile.

ISAURIA, in *Ancient Geography*, a town of Aſia Minor, near Piſidia. Its inhabitants were merely occupied in plunder, when Servilius made war upon them and conquered them. Hence he obtained the name of the "Iſaurian." Its chief town was "Iſaura," or "Iſauropolis," which were repeatedly deſtroyed and rebuilt. Under the Greek emperors, Iſauria became a conſiderable province at the expence of the neighbouring provinces. Hierocles, in his "Notitia," reckons in it 23 epiſcopal towns, and Leon-le-Sage enumerates 29.

ISBARTEH, in *Geography*, a town of Aſiatic Turkey, in Natolia, the reſidence of a Pacha; and in the fauxbourgs are four Greek churches; 92 miles S. of Kiutaja. N. lat. 37° 44′. E. long. 30° 56′.

ISBASTER, one of the ſmaller Shetland iſlands. N. lat. 60° 34′. W. long. 0° 58′.

ISCA, or Isca *Dannmoniorum*, in *Ancient Geography*, a town of Albion or England, the capital of the Dannmonii, and moſt probably Exeter.

Isca *Silurum*, the capital of the Silures, now Caerleon in Monmouthſhire. Here the ſecond legion of the Romans, which had contributed greatly to the reduction of the Silures, was placed in garriſon (as ſome antiquaries have imagined) by Julius Frontinus, to keep that people in obedience. It is certain, however, that this legion was very early and very long ſtationed at this place. Iſca Silurum was, in the time of the Romans, a city not only of great ſtrength, but alſo of great beauty and magnificence. This appears from the deſcription which is given of its ruins by Giraldus Cambrenſis, in his topography of Wales, written in the 12th century, ſoon after it had been deſtroyed and abandoned.

ISCALES, a town of Britain, in the country of the Belgæ, generally placed at Ilcheſter in Somerſetſhire.

ISCARIOTH, a place of Judea, in the tribe of Ephraim, whence Judas, who betrayed our Saviour, is ſuppoſed to have derived his ſurname.

ISCHÆMUM, in *Botany*, from ισχω, *to repreſs*, and αιμα, *blood*, becauſe it was ſuppoſed to poſſeſs the virtue of ſtopping hemorrhages from recent wounds. In this ſenſe the name was originally applied to the *Panicum ſanguinale* of Linnæus, called, for the ſame reaſon, *Sanguinaria* by ſome writers; and is now retained for a genus of graſſes, bearing ſome reſemblance to that, but the reputed virtue above-mentioned can ſcarcely be thought to have any foundation.

tion. Linn. Gen. 542. Schreb. 718. Mart. Mill. Dict. v 2. Brown. Prod. Nov. Holl. v. 1. 204. Juſſ. 30. Lamarck. Illuſtr. t. 839. Claſs and order, *Polygamia Monoecia*, or rather *Triandria Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Glume two-flowered, of two cartilaginous nearly equal valves, ſituated tranſverſely; the *outer* almoſt ovate, tumid, cloven and acute at the top, the upper part of the back flattened, ſtriated, bordered; *inner* oblong, boat-like, pointed or awned at the top, furniſhed with a longitudinal dorſal membrane below the extremity. *Florets* ſhorter than the calyx, the outer one male, inner hermaphrodite. *Cor.* (in the hermaphrodite floret) of two thin, membranous, pellucid glumes; the *outer* ſwelling, either beardleſs or awned, cloven to the inſertion of the awn, acute; *awn* long, ſlender, bent, twiſted in the lower part; *inner* glume lanceolate, acute, its margins folded together; (in the male floret) of two rather firmer, pellucid, ſomewhat coloured glumes; the *outer* oblong, ſwelling, contracted upwards, acute, beardleſs; *inner* oblong, obtuſe, concave at the back, thinner and acute at the margin: *Nectary* in each of two ſmall, ſpatulate, abrupt, notched leaves. *Stam.* Filaments three, capillary, ſhort; anthers oblong, cloven at each end. *Piſt.* (in the hermaphrodite floret) Germen oblong; ſtyles two, capillary, erect, ſhorter than the corolla; ſtigmas oblong, feathery, ſpreading, prominent. *Peric.* none, except the unchanged calyx and corolla. *Seed* (in the hermaphrodite floret) ſolitary, oblong, linear, convex at one ſide.

Eſſ. Ch. Calyx of two valves, two-flowered, placed in pairs, laterally, on a jointed ſtalk; outer valve flattened. Corolla of two valves, ſhorter than the calyx. Stigmas feathery. One floret male, or neuter.

Linnæus defines two ſpecies only, *I. muticum*, Sp. Pl. 1487, and *I. ariſtatum*, ibid. The firſt is deſtitute of awns, and is the *Tagadi* of Rheede Hort. Mal. v. 12. 91. t. 49, found in every kind of ſoil in Malabar, but not of any particular uſe, except as a graſs in general. The *root* is perennial. *Stems* about a foot high, round, ſmooth, reed-like, leafy. *Leaves* lanceolate, pointed, broad at the baſe. *Spikes* terminal, double, ſhort, cloſe, ſhining. *I. ariſtatum*, diſtinguiſhed by its awns, was gathered by Oſbeck in China, and has narrower *leaves*.

I. *rugoſum*, Saliſ. Ic. 1. t. 1. Hort. 27.—"External barren glumes tranſverſely rugoſe; one of the fertile ones, whether male or female, awned."—Found by Koenig in the borders of rice fields in the Eaſt Indies. This is very remarkable for the ſtrong wrinkles or furrows of its glumes. Linnæus was inclined to make it a new genus by the name of *Cicadaria*. Mr. Saliſbury cultivated it in his ſtove at Chapel Allerton before 1796.

Mr. Brown in his Prodromus has added ſix new ſpecies to *Iſchæmum*, and alſo juſtly refers to this genus the *Colladoa* of Cavanilles, Ic. v. 5. 37. t. 460.

ISCHENIA, Ισχενια, in *Antiquity*, anniverſary ſports celebrated at Olympia, in memory of Iſchenus, the grandſon of Mercury and Hierea; who, in a time of famine, devoted himſelf to be a ſacrifice for his country, and was honoured with a monument near the Olympian ſtadium.

ISCHIA, in *Geography*, a volcanic iſland, ſituated at the eaſtern entrance of the gulf of Naples, about 18 miles in circuit; the ſee of a biſhop, ſuffragan of that of Naples, and containing three pariſhes, and a convent of nuns. The volcanic ſubſtances of which this iſland is internally compoſed, prove, beyond the poſſibility of doubt, ſays Spallanzani, that it owes its origin to fire. The caſtle of the city of Iſchia, as it is called, is built on a rock ſurrounded by the ſea, and a little more than a quarter of a mile in circuit. The two component ſubſtances of this rock are lava and tufa. About a mile to the weſt is a torrent of lava, called the "Arſo" or burnt ground, which is the moſt recent of any in the iſland, ſince it flowed in 1302. This lava, though it flowed five centuries ago, is abſolutely ſterile; producing not a ſingle blade of graſs, and only affording, in ſome places, a few arid and uſeleſs plants of the lichen, or liverwort. On the ſurface, and for a little depth, it is light and ſpongy, and eaſily crumbles; but deeper, it becomes denſe and harder. This lava is of the hornſtone baſe, and has an earthy ground; varying in colour from that of iron to a reddiſh-black, and having incorporated in it very numerous feltſpars. M. Dolomieu ſays, that the eruption of the Arſo, though it continued two years, never produced any pumice, but only black ſcoriæ; but Spallanzani obſerves, that the hornſtone, by a violent fire, may be changed into a true pumice. Though this tranſmutation rarely happens, no part of the iſland, however, abounds ſo much with pumices as the Rotaro, a mountain ſituated between Caſamicciola and the city of Iſchia. This mountain is of a conical ſhape, and compoſed of tufa, pumices, and enamels. The extent of the pumices is more than a mile. The Rotaro is the only place in Iſchia which affords enamels. The mountain of St. Nicola, which in earlier times was called Epopeo, and which is in the centre of the iſland, was, as Spallanzani ſays, without doubt, the firſt that towered above the waves. The conſtituent ſubſtances of this mountain are of various kinds. The ſulphate of alumine (alum) was formerly extracted in Iſchia for commercial purpoſes; and the manufacture was principally carried on at Catrico, a place ſituated above Lacco, on the higher eminences of the Epopeo. But a careful obſerver has not been able recently to diſcover any remaining veſtige of this ſubſtance. Spallanzani concludes from experiments on different lavas, that this valuable ſubſtance might ſtill be obtained at Iſchia. This ingenious naturaliſt coaſted the iſland and examined various mountains that occupy the lower part of it. He began with the Vico, which is partly formed of tufa, and partly of two currents of lava, which deſcend into the ſea. The baſe of both theſe lavas is hornſtone, and they abound in feltſpars. He then proceeded to Monte Zaro, formed, towards the ſea, by a river of lava, extending a mile in length, and nearly two in breadth. The baſe of this lava is hornſtone, and it contains mica and feltſpars. From the termination of Monte Zaro to the commencement of Monte Imperatore, is a long and ample tract, almoſt entirely tufaceous, ſcattered over with fragments of pumice. The Monte Imperatore preſents different ſorts of lava, the baſe of which is hornſtone, intermixed with abundance of feltſpars. In many parts of the iſland our author found a ferruginous ſand, which not only moves the magnetic needle, but is ſtrongly attracted by the loadſtone. This iſland, our author apprehends, when it was firſt produced by conflagrations in ancient, and to us unknown, times, muſt have been of much greater extent than it is at preſent. Time has alſo produced a great alteration in the interior parts of the iſland. From the ſummit of Epopeo, a number of conical eminences may be ſeen; but their internal craters no longer exiſt; nor can be found in Iſchia inconteſtible traces of a ſingle one, ſince thoſe depths and ample cavities, thoſe reſemblances of theatres and amphitheatres, which may be every where obſerved, may be equally the effect of fire or water. The ſubſtances, our author conceives, which have furniſhed aliment to the different conflagrations of Iſchia, have had their centre in thoſe argillaceous rocks, which, by the above-mentioned eruption in 1302, ſhewed that they were not then exhauſted. See Spallanzani's Travels in the Two Sicilies, &c. vol. i.

Along the coaſt of this iſland a few pretty villages are diſperſed; and detached habitations are ſcattered over the ſurface of the whole iſland, and are to be found even at an elevation where the culture of the ſoil muſt ceaſe. The white colour of the houſes forms an agreeable contraſt with the verdure of the vines and gardens in which they are emboſomed. At the ſummit of the mountain, which forms this iſland, a hermitage, compoſed of a chapel, and three cells, has been excavated out of the volcanic rock. The cells are inhabited by as many hermits. One of them goes his round through the iſland twice a week, and brings back bread, oil, eggs, and every thing neceſſary for the ſervice of the altar. The inhabitants give him alms with joy, and recommend themſelves to his prayers. They make a pilgrimage annually to this chapel.

This iſland enjoys a propitious climate, and the ſky is ſeldom obſcured with clouds. The winters are mild, the reptiles harmleſs, and the ſprings cure various diſeaſes. The government is likewiſe mild, and the iſland is exempt from taxes. The king pays it a viſit every year, and gives portions to the indigent young females.

An hoſpital is eſtabliſhed here at the expence of a charitable ſociety at Naples. Some hundreds of ſick receive attendance and relief during the bathing-ſeaſon. Several barks are ſolely employed in removing the convaleſcents to Naples, and bringing back other patients to the hoſpital. The lame, who are cured of their infirmities, leave behind them their crutches, which they conſecrate to the Madona, or to ſome particular patron. The trees, ſhrubs, and plants which prefer volcanic ſoils, thrive ſurpriſingly in this iſland. Here and there are ſeen groves of oak and cheſnut trees; which are ſuffered to grow only 10 years. The orange, pomegranate, fig, Neapolitan medlar, and arbutus, are the moſt common trees in the gardens. Of wild ſhrubs, the myrtle and the maſtic are the moſt numerous. The inhabitants have ſomething peculiar in their language, their figure, and their dreſs. In their converſation, they ſcarcely ever uſe the word *man*, that of *Chriſtian* being ſubſtituted for it; and with them *Chriſtian* is ſynonymous with *Catholic*. In their pious expreſſions they ſeldom ſoar higher than the Mother of God. It is to our Lady they recommend you, when they leave you, and they wiſh you a *holy* night (*ſantiſſima notta.*) To her they apply when afflicted with diſeaſe. At the death of an adult they pray for the repoſe of his ſoul. The death of a child is regarded as an happy event. Religious feſtivals are with them days of rejoicing. N. lat. 40° 50′. E. long. 13° 46′.

The ſoil feeds no animals beſides aſſes and goats. The roofs of the houſes throughout the iſland are flat, and are uſed for drying fruits and other purpoſes.

ISCHIADICUS Morbus, in *Surgery*. See *Diſeaſe of* Hip-*joint*.

ISCHIAS. See *Diſeaſe of* Hip-*joint* and Sciatica.

ISCHIATIC, in *Anatomy*, an epithet applied to certain parts of the body ſituated near the iſchium; as the iſchiatic artery and nerve. See Artery and Nerve.

ISCHIATOCELE, in *Surgery*, a hernia taking place at the ſacro-iſchiatic foramen. See Hernia.

ISCHIM, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the river Iſchim, which runs into the Irtiſch, N. lat. 57° 45′. E. long. 90°; 108 miles S. of Tobolſk. N. lat. 56° 10′. E. long. 69° 14′.

ISCHIMSKOI, a town of Ruſſia, in the government of Tobolſk, at the conflux of the Iſchim and Oby; 112 miles E. of Tobolſk.

ISCHIO-CAVERNOSUS, in *Anatomy*, a name given by Winſlow and others to the erector penis muſcle. See Generation.

ISCHIOCELE, in *Surgery*, a hernia between the ſacrum and iſchium.

ISCHIO-COCCYGEUS, in *Anatomy*, a name for the coccygeus muſcle; which ſee.

ISCHIUM, one of the diviſions of the os innominatum. See Extremities.

Ischium *Os, Fractures of*, in *Surgery*. See Fracture.

ISCHNAMBLUCIS, in *Natural Hiſtory*, the name of a genus of foſſils of the claſs of the ſelenitæ, but one of thoſe which are of a columnar form, not of the common rhomboidal one.

The word is derived from the Greek, ισχνος, *thin*, αμβλυς, *blunt* or *obtuſe*, and κιων, *a column*, and expreſſes a body in form of a thin flatted column, with obtuſe ends. The bodies of this genus are of an octohedral figure, conſiſting of ſix long planes and about two broken ends. The top and baſe planes are broader than the reſt. The crack which runs through the whole length of bodies of this genus is often filled with clay, which ſpreads itſelf into the form of an ear of ſome graſſes; of this genus there are only four known ſpecies. Hill.

ISCHNOPHONIA, in *Medicine*, from ἰσχνὸς, *thin*, and φωνὴ, *the voice*, a term which ſeems to have been uſed originally to denote a certain tenuity or ſmallneſs of the voice; but the moſt common acceptation of the word is in the ſenſe of *heſitation of ſpeech*.

ISCHURIA, from ἴσχω, *I ſtop*, and οὖρον, *urine*, ſignifies an entire ſuppreſſion or retention of the urine.

The diſcharge of urine may be altogether prevented or ſuppreſſed for a time, from four different ſets of cauſes; whence Dr. Cullen has, with great judgment, arranged the forty-three varieties of *iſchuria*, deſcribed by Sauvages after Cuſſon, under four heads or ſpecies. Theſe are, 1. Iſchuria *renalis*, in which the impediment to the excretion of urine is in the *kidnies* themſelves; 2. Iſchuria *ureterica*, in which the impediment conſiſts in an obſtruction of the canal of the *ureters*, through which the urine ſhould paſs into the bladder; 3. Iſchuria *veſicalis*, in which the urine, ſecreted by the kidnies, and tranſmitted through the ureters, is retained in the *bladder* from diſeaſe in that receptacle itſelf; and, 4. Iſchuria *urethralis*, in which the impediment is occaſioned by ſome obſtruction in the canal of the *urethra*, through which the contents of the bladder are diſcharged. See Cullen. Synopſ. Noſol. Method. Claſs iv. Ord. 5. Sauvages, Claſs x. Ord. 3.

The *renal* iſchuria, in which there is little or no ſecretion of urine effected by the kidnies, is to be diſtinguiſhed by the following circumſtances: It ſupervenes upon ſome previous affection of the kidnies, and is accompanied by pain or an uneaſy ſenſe of weight in the region of the kidnies, while, at the ſame time, there is no tumour in the hypogaſtrium, or lower portion of the belly, ſuch as a diſtended bladder would occaſion, nor any deſire to make water. The iſchuria, from obſtructed *ureters*, is accompanied by ſimilar ſymptoms, except that the pain or uneaſineſs is felt in the courſe of the ureter; it is likewiſe unaccompanied by hypogaſtric tumour, or deſire to paſs urine. The moſt frequent cauſes of theſe two forms of retention of urine are inflammation of the kidnies or of the ureters, or the preſence of calculous concretions in thoſe parts; but other cauſes have been occaſionally obſerved to produce the diſeaſe, ſuch as grumous blood, impacted in the ſame parts, and purulent matter, or mucus, obſtructing the paſſages. It may be remarked, that ſome writers have confined the term *retention* of urine to the renal form of the diſeaſe, as if they would aſſert, that, when the urine was not ſecreted, it was *retained* in the blood; and they denote the other forms of the diſeaſe by the term *ſuppreſſion* of urine :—a falſe hypotheſis, but the terms may be retained as expreſſing the facts. When the retention is connected with inflammation of the kidney or ureter, its cure will depend upon the removal of that inflammatory ſtate. (See Nephritis) And when it originates from impacted calculus, it muſt be treated with the remedies reſorted to in other calculous caſes. See Nephralgia.

The two other ſpecies of iſchuria, originating from impediments to the evacuation of the bladder, by diſeaſes of that organ itſelf, or of its outlet, the urethra, are to be diſtinguiſhed, by the evident tumour of the hypogaſtrium, above the pubes, and by the frequent urging to make water, accompanied with pain in the neck of the bladder, in the one caſe, and in ſome part of the urethra in the other. The cauſes which give riſe to the *veſical* ſuppreſſion of urine, are inflammation of the neck of the bladder ; ſtone in the bladder ; ſpaſm of the ſphincter ; palſy extending to the bladder ; over-diſtention of its fibres, from retaining the urine too long ; purulent matter, mucus, or grumous blood, lodged in the neck of the bladder ; and tumours of the neighbouring parts compreſſing the neck of the bladder, ſuch as hardened fæces in the rectum, or calculous concretions, flatus, inflammation, abſceſs, or hemorrhoidal ſwellings in the ſame bowel, and alſo the gravid uterus, or other enlargements of that viſcus. The cauſes of impediment in the canal of the urethra, which occaſion ſuppreſſion of urine, are inflammation of that paſſage ; pus, mucus, or grumous blood impacted in it ; ſtricture ; tumours in the perineum ; phimoſis, &c.

The means by which theſe cauſes of ſuppreſſion of urine are chiefly to be removed, and the diſeaſe to be cured, are principally ſurgical. See *Suppreſſion of* Urine.

Ischuria, in *Surgery*. See *Retention of* Urine.

ISEFIORD, in *Geography*, a large bay or gulf of Denmark, on the N. coaſt of the iſland of Zealand ; the mouth of which lies in N. lat. 55° 59′. E. long. 11° 50′.

ISELASTICS, Iselastica, a kind of games, or combats, celebrated in the cities of Greece and Aſia, in the time of the Roman emperors.

The victors at theſe games had very conſiderable privileges conferred on them ; after the example of Auguſtus and the Athenians, who did the like to the conquerors at the Olympic, Pythian, and Iſthmian games. They were crowned on the ſpot, immediately after their victory ; had penſions allowed them ; were furniſhed with proviſion at the public coſt ; were carried home in triumph, and made to enter their cities through a breach in the walls ; whence their appellation from εισελαυνειν, *to enter*.

ISELIN, James Christopher, in *Biography*, an eminent philologiſt and divine, was born at Baſil in 1681 ; and having laid a good foundation in grammar learning, he was admitted to his academical courſe as early as the age of 13, and at 15 he diſtinguiſhed himſelf by a Latin poem on "The Paſſage of the Rhine" by the French, which obtained for him great applauſe. In 1701 he was ordained miniſter, and on that occaſion publiſhed a diſſertation on the Babylon of the Revelations, in anſwer to the biſhop of Meaux. In 1704 he accepted the chair of eloquence and hiſtory in the univerſity of Marpurg, which he occupied with great reputation for two years. In 1706 he was appointed profeſſor of hiſtory and antiquities at Baſil, and in 1711 he was made doctor in theology, and appointed to teach that ſcience. He was invited to ſettle at Paris, which he declined, and the French academy elected him to the place of honorary member, vacant by the death of Cuper. This honour was conferred upon him in return for the pains he had taken to comply with the king's requeſt of obtaining for him copies of the acts of the council held at Baſil in the fifteenth century. He died in 1737, and his memory was honoured by a great number of eulogies in Latin and German. The works of M. Iſelin conſiſt of orations, diſſertations, and detached tracts on a variety of ſubjects, philological, theological, and miſcellaneous. Moreri.

Iselin, Isaac, was born at Baſil in 1728. He received his academical education at Gottingen, where he paid great attention to juriſprudence and ſtatiſtics under the moſt able profeſſors. He undertook the taſk of reducing the juriſprudence of the Swiſs confederation into a ſyſtem, of which he publiſhed a ſpecimen in his theſis, when he obtained the degree of doctor, under the title of "Tentamen Juris publici Helvetici." When he had completed his ſtudies he went to Paris, and obtained the acquaintance and friendſhip of the moſt eminent men of letters in that capital. After his return, he applied with great diligence to the ſtudy of juriſprudence, and in 1756 he was appointed to the important office of ſecretary to the grand council of his native city. Soon after he publiſhed his firſt work, entitled the "Dream of Mankind," which has gone through many editions. He next gave the world a work, entitled "Free Thoughts on the Depopulation of my native City," in which he recommended the admiſſion of new citizens. But his moſt important work was his "Hiſtory of Mankind," in which he traces the progreſs of the human mind from a ſtate of rudeneſs to that of refinement, and ſhews in what manner nations have emerged from obſcurity, and have been completely civilized by the introduction of arts and manufactures. Iſelin was the author alſo of a periodical work, entitled "Ephemerides of Mankind." He carried on an extenſive correſpondence both in Switzerland and foreign countries, and he wrote many excellent critiques in the "Deutſhe Bibliothek," which are ſaid to be diſtinguiſhed by their acuteneſs, modeſty, and adherence to truth. He died in the year 1782, at the age of 54. Iſelin's writings abound with exalted ideas and ingenious thoughts, and diſplay great knowledge of human nature, ardent patriotiſm, and a ſtrong vigorous mind. Gen. Biog.

ISEN, in *Geography*, a town of Bavaria ; 24 miles E.N.E. of Munich.

ISENBURG, Upper, *County of*, a principality of Germany, ſituated in the Wetterau, about 30 miles long and 10 broad. The houſe of Iſenburg is divided into ſeveral branches, taking their ſurnames reſpectively from towns on the eſtate.

Isenburg, *Lower*, a county of Germany, in the circle of the Lower Rhine, formerly governed by courts of its own, as a fief of the electorate of Treves.

Isenburg, a town of Germany, giving name to the county, ſituated on the Iſer, and ſurrounded with ſharp rocks, on one of which is a caſtle built by Charlemagne ; 10 miles N. of Coblentz. N. lat. 50° 30′. E. long 7° 35′.

Isenburg, *New*, a town of Germany, in the county of Iſenburg, founded by French refugees ; 3 miles S. of Frankfort on the Maine. N. lat. 50° 3′. E. long. 8° 38′.

ISENHAGEN, a town of Weſtphalia, in the principality of Luneburg ; 24 miles E.N.E. of Zelle.

ISEO, a town of Italy, in the department of the Benaco, on a lake to which it gives name, through which the river Oglio takes its courſe : the town was anciently called "Sabino ;" 12 miles N.W. of Breſcia.

ISER, a river of the Tyroleſe, which riſes about 5 miles N. of Inſpruck, and, paſſing by Munich, Landſhut, Landau, &c. runs into the Danube, 2 miles below Deckendorf.

ISERE, a river which riſes in the Alps, about 12 miles from mount Cenis, in a mountain called "Iſeran," in the duchy of Savoy, and, after entering France, paſſes by Grenoble, &c. and joins the Rhone, about 3 miles above Valence; navigable for boats as far as Montmelian.

Isere, formerly *Graſivaudan* and *Viennois*, one of the 11 departments of the eaſtern region of France, ſo called from the river Iſere, which croſſes it; ſituated in N. lat. 45° 30′, W. of Mont Blanc: containing 452 ſquare leagues, and 441,208 inhabitants, and divided into four diſtricts, *viz.* Vienne, including 104,689 inhabitants; Tour-du-Pin, having 99,053; Grenoble, 169,623; and St. Marcellin, 67,843 inhabitants. Its number of cantons is 44, and that of communes 558. The annual contributions amount to 3,546,809 francs, and the expences charged upon it to 338,804 francs 37 cents. This department conſiſts of barren and marſhy plains, deep vallies, and high mountains partially wooded. The chief products are grain, hemp, roots, ſome good wine, and excellent paſtures. It has mines of iron, copper, lead, coal, quarries, and mineral ſprings. Its capital is Grenoble.

ISERINE, in *Mineralogy*. See Titanium.

ISERLOHN, or Lohn, in *Geography*, a town of Germany, in the county of Mark, inhabited by Lutherans, Calviniſts, and Roman Catholics, who are allowed their ſeparate worſhip. Its manufactures are conſiderable in iron, tin, ribbons, velvets, ſilks, ſtuffs, &c.; 32 miles N.E. of Cologne. N. lat. 51° 18′. E. long. 7° 40′.

ISERNIA, a town of Naples, in the Moliſe, ſituated at the foot of the Apennines, the ſee of a biſhop; 12 miles W.S.W. of Moliſe. N. lat. 41° 38′. E. long. 41° 2′.

ISERTIA, in *Botany*, was ſo named in honour of Mr. Iſert, a German botaniſt, and ſurgeon in the Daniſh ſervice, on the coaſt of Guinea.—Schreb. 234. Willd. Sp. Pl. v. 2. 240. Mart. Mill. Dict. v. 2. Vahl. Eclog. p. 2. 27. Lamarck Illuſtr. t. 259. (Guettarda; Juſſ. 207. Aubl. Guian. v. 1. 317.) Claſs and order, *Hexandria Monogynia*. Nat. Ord. *Rubiaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of one leaf, ſuperior, coloured, four or ſix-toothed, permanent. *Cor.* of one petal, funnel-ſhaped; tube long, cylindrical, ſlightly curved; limb divided into ſix, ſubovate, rather erect, villoſe ſegments. *Stam.* Filaments ſix, very ſhort, within the throat of the corolla; anthers linear, affixed to the back, erect. *Piſt.* Germen inferior, roundiſh; ſtyle thread-ſhaped, ſurrounded by a glandule at the baſe; ſtigma ſix-cleft. *Peric.* Fruit pulpy, ſomewhat globular, crowned by the calyx, ſix-celled; the caſes of the cells brittle. *Seeds* numerous, ſmall, angulated, rough.

Eſſ. Ch. Calyx ſuperior, ſix-toothed. Corolla funnel-ſhaped, ſix-cleft. Stigma ſix-cleft. Fruit ſix-celled, many-ſeeded.

1. I. *coccinea*. Willd. n. 1. (Guettarda coccinea; Aubl. Guian. v. 3. t. 123.)—Leaves lanceolate-elliptical, clothed with hoary pubeſcence, acuminate, acute at each end. Flower-ſtalks branched, bifid. A native of woods in Guiana, flowering and bearing fruit at all ſeaſons.—This *tree* riſes to the height of ten or twelve feet, is furniſhed with erect, knotty, ſquare *branches*. *Leaves* oppoſite, large, ovate, acute, green above, downy beneath, dark-coloured, with reddiſh nerves. *Stipulas* long, broad, acute, deciduous. *Flowers* racemoſe, erect, terminal; their partial-ſtalks oppoſite, furniſhed with two little ſcales. *Calyx* purpliſh. *Tube* yellow. *Fruit* red.

2. I. *parviflora*. Willd. n. 2.—"Leaves oblong, the lower ones ſomewhat heart-ſhaped at the baſe. Bunch of flowers ovate." Found in the iſland of Trinidad.—*Leaves* generally ſmooth, ſometimes rather villoſe beneath.

ISETSK, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the Iſet, which runs into the Tobol, near Yalutorovſk; 44 miles W.S.W. of Yalutorovſk.

ISGAARD, a town of Denmark, in North Jutland, ſituated on a peninſula in the Baltic; ſeven miles E.N.E. of Aarhuus.

ISGAUR, Isguriah, or *Iſkuria*, anciently called "Dioſcurias," and "Sebaſtopolis," a town of Mingrelia, on the E. coaſt of the Black ſea, with a road for ſhips, which in ſummer is tolerably good. In 1672 it was burned down by the Abhkas, who were invited by the prince of Mingrelia to aſſiſt him againſt the Turks. N. lat. 43° 18′. E. long. 40° 32′.

ISHMAELITES, in *Ancient Geography* and *Hiſtory*, the deſcendants of Iſhmael, the ſon of Abraham by Hagar, his Egyptian bond-maid. Iſhmael was born in the year B.C. 1910, and his name, founded on a circumſtance which afforded relief to his mother, when ſhe was wandering from her maſter's houſe towards Egypt, her native country, is derived from the Hebrew יִשְׁמָעֵאל, formed of שָׁמַע, *ſhhamah*, to hear, and אֵל, *el*, God, and denoting "the Lord hath hearkened!" The heavenly meſſenger who appeared to Hagar in the wilderneſs, and inſtructed her by what name to call her future ſon, predicted alſo that he and his poſterity would prove fierce and warlike, engaged in repeated hoſtilities, and yet able to maintain their independence. Hagar, deriving encouragement from this circumſtance, returned to the houſe of Abraham, and was ſoon delivered of her promiſed ſon. The father regarded Iſhmael as the heir of his wealth, till Sarah had the promiſe of her ſon Iſaac. After the birth of Iſaac, Abraham was perſuaded by his wife to diſmiſs Hagar and her ſon; and the patriarch probably provided for their ſubſiſtence in ſome diſtant ſituation, where they could not encroach on the patrimony of Iſaac. Having wandered for ſome time in the wilderneſs of Beerſheba, they proceeded farther to the wilderneſs of Paran, which bordered on Arabia, and here Iſhmael arrived at maturity, and became an expert archer, or a hunter and warrior. In proceſs of time his mother procured for him a wife out of Egypt, by whom he had twelve ſons, who eventually eſtabliſhed themſelves as the heads of ſo many diſtinct Arabian tribes. Accordingly the deſcendants of Iſhmael are mentioned in hiſtory, under the general name of Arabians and Iſhmaelites. Of Iſhmael's perſonal hiſtory, we merely learn from the ſacred writings, that he joined with his brother Iſaac in paying the laſt tribute of reſpect to the remains of their father; and that he died at the age of 137 years (B.C. 1773.) Gen. xxv. 9 18. His deſcendants, according to the ſcripture account, ſpread themſelves "from Havilah to Shur, that is before Egypt, as thou goeſt into Aſſyria." From this brief ſtatement, we may conjecture how far their territory extended; for Havilah, according to the generality of writers, was ſituated near the confluence of the Tigris and Euphrates, and Shur, on the iſthmus which ſeparates Arabia from Egypt, now called the iſthmus of Suez. From thence we may well imagine, that they ſpread themſelves on both ſides ſo far as to have taken poſſeſſion of the greateſt part of Arabia; and, indeed, Joſephus (Antiq. l. i c. 13.) does not ſcruple to ſtyle their progenitor the founder of the Arabian nation. See Arabia.

ISI, in *Hindoo Mythology*, is a name of the goddeſs Parvati, conſort of Siva, in his form of *Iſa*; which ſee.

ISIA, Ισεια, feaſts and ſacrifices anciently ſolemnized in honour of the goddeſs Iſis.

The Iſia were full of the moſt abominable impurities; and for that reaſon, thoſe who were initiated into them were obliged to take an oath of ſecrecy. They held for nine days ſucceſſively, but grew ſo ſcandalous, that the ſenate aboliſhed them at Rome, under the conſulate of Piſo and Gabinius. They were re-eſtabliſhed by Auguſtus, and the emperor Commodus himſelf aſſiſted at them, appearing among the prieſts of that goddeſs with his head ſhaven, and carrying the Anubis.

ISIAC Table is one of the moſt conſiderable monuments of antiquity, being a plate of copper or braſs, diſcovered at Rome, in 1525, and ſuppoſed by the various figures in bas relief upon it, to repreſent the feaſts of Iſis, and other Egyptian deities.

With regard to the hiſtory of this monument, we may obſerve, that the copper or braſs ground was overlaid with a black enamel, artificially intermixed with ſmall plates of ſilver. When, in the year 1525, the conſtable of Bourbon took the city of Rome, a lockſmith bought it from a ſoldier, and then ſold it to cardinal Bembo, after whoſe death it came into the hands of the duke of Mantua, and was kept in that family till it was loſt at the taking of that city by the Imperialiſts in the year 1630, nor has it been ever heard of ſince. By good fortune it had been engraved in its full proportion, and with all poſſible exactneſs, by Æneas Vico of Parma. This tablet was divided into three horizontal compartments, in each of which were different ſcenes, containing different actions. Thoſe compartments are, as it were, different cartouches, diſtinguiſhed ſometimes by ſingle ſtrokes only, but oftener by a very large faſcia, which is full of hieroglyphics, that is, of that myſterious writing, conſecrated by the ancient Egyptians to the myſteries of religion. The four ſides of the table were incloſed with a border, filled up, like the ground, with ſeveral figures of the Egyptian gods, and with a great number of hieroglyphics. There have been various opinions as to the antiquity of this monument: ſome have ſuppoſed that it was engraved long before the time when the Egyptians worſhipped the figures of men and women. Others, among whom is biſhop Warburton, apprehend, that it was made at Rome, by perſons attached to the worſhip of Iſis. Dr. Warburton conſiders it as one of the moſt modern of the Egyptian monuments, on account of the great mixture of hieroglyphic characters which it bears.

It has been alſo a queſtion, whatever may be thought of the antiquity of this tablet, whether it only repreſents the myſteries of Iſis, whoſe figure, placed in a ſort of niche, occupies the centre; or whether it contains the principal points of the Egyptian theology, ſince all their gods are here repreſented. Pignorius, Kircher, and Chifflet, have offered their various conjectures concerning the deſign and meaning of this monument. The abbé Banier (in his "Mythology, &c." vol. i. p. 567.) declares it to be his opinion, that it was a votive table, which ſome prince, or private perſon, had conſecrated to Iſis, as an acknowledgment for ſome benefit which he believed ſhe had conferred upon him. That goddeſs occupies the principal place in it, and the deſign of varying her attitudes and ſymbols, muſt have been to point out to us, in how many different modes ſhe was repreſented, as well as the different ſacrifices that were offered to her. Accordingly, three ſorts of theſe are there to be obſerved, one of animals, another of plants, and a third of libations. Perhaps the perſon who had conſecrated this table to Iſis, had offered to her all theſe ſorts of ſacrifices, either for having been cured of ſome ſevere diſeaſe, or for having been delivered from ſome great danger, to which he had been expoſed by ſea; for that goddeſs was equally invoked in diſeaſes, and when people were entering upon a long voyage; ſince the epithets of "Salutaris" and "Pelagia" were added to her name. Nothing was more common than the votive tables, conſecrated to Iſis. All the temples of this goddeſs were full of them; and works of that ſort procured a living to great numbers of painters, as we learn from Juvenal (Sat. 18.):

> "Et quam votivâ teſtantur fano tabellâ
> Plurima, Pictores quis neſcit ab Iſide paſci."

ISIACI, prieſts of the goddeſs Iſis. Dioſcorides tells us, that they bore a branch of ſea-wormwood in their hands inſtead of olive. They ſung the praiſes of the goddeſs twice a day, *viz.* at the riſing of the ſun, when they opened her temple; after which they begged alms the reſt of the day, and returning at night, repeated their oriſons, and ſhut up the temple.

Such was the life and office of the Iſiaci; they never covered their feet with any thing but the thin bark of the plant papyrus, which occaſioned Prudentius and others to ſay they went bare-footed. They wore no garments but linen, becauſe Iſis was the firſt who taught mankind the culture of this commodity. See Diodorus Siculus, and Plutarch's Iſis and Oſiris.

ISIDORE *of Peluſium*, in *Biography*, a celebrated diſciple of St. John Chryſoſtom, and diſtinguiſhed in the Greek and Roman calendars by the epithet of "Saint," was by birth an Egyptian; and flouriſhed, as the contemporary of Nonnus, and, according to Cave, about the year 412. As his name does not occur after the year 433, he probably died before the middle of the fifth century. He embraced the monaſtic life at Peluſium, and acquired, by his auſterities and indefatigable application to literary ſtudies, high reputation for ſanctity, learning, and eloquence, ſo that he was honoured by the Greeks with the appellation of "the famous." Facundus ſays, that he wrote 2000 epiſtles for the edification of the church; and Suidas aſcribes to him 3000, explanatory of the ſcriptures. Of theſe there are ſtill extant 2612, in five books; of which Moſheim ſpeaks in terms of high commendation: ſaying of them, that though they are ſhort, they are admirably written, both with reſpect to the ſolidity of the matter, and the purity and elegance of their ſtyle. He adds, that they manifeſt more piety, genius, erudition, and wiſdom, than are to be found in the voluminous productions of many other writers, and that they caſt a conſiderable degree of light upon ſeveral parts of ſcripture. Dr. Lardner, citing a diſſertation of Dr. Heumann on Iſidore of Peluſium (apud Primitias Gottingenſes, Hanover, 1738, 4to.), informs us, that this learned writer argues, that moſt of Iſidore's letters are fictitious, and not a real correſpondence; and, ſays Lardner, he ſeems to have proved what he advances. Iſidore has largely quoted all, or moſt of the canonical books of the Old Teſtament; but he very ſeldom quotes any apocryphal books. He alſo often cites the four goſpels, the acts of the apoſtles, and all St. Paul's epiſtles, except that to Philemon. He likewiſe quotes and explains paſſages of the epiſtle of James, the firſt and ſecond epiſtle of Peter, and the firſt epiſtle of John. He explains the 8th verſe of the ſecond epiſtle of John, and there is no reaſon to doubt his having received the other. He explains a paſſage of the epiſtle of Jude; and uſes ſeveral expreſſions that ſeem to have been taken from the book of Revelation: ſo that, upon the whole, his canon of ſcripture was the ſame as our's. Iſidore had a great reſpect for the ſcriptures, and often recommends the peruſal of them. The beſt edition of his works was publiſhed at Paris, in Greek and Latin, 1638, folio. Cave. Dupin. Moſheim. Lardner.

Isidore *of Seville*, was an eminent biſhop of this city in

Spain for 40 years, from the year 595 or 596 to 636. He was the ſon of Severianus, governor of Carthagena, and brother of Leander, biſhop of Seville, who had the care of his education. He preſided at a council held in Seville in 619, and at another in Toledo in 633; in which meaſures were adopted that ſerved to reform the lax ſtate of eccleſiaſtical diſcipline and manners in Spain. He was a voluminous writer, and his works are enumerated by Dupin and Lardner; and the beſt edition of them was publiſhed at Paris, in 1601, by father James du Breuil, a Benedictine monk, in folio. As a writer, he is characterized more by learning and pedantry, than by judgment, taſte, or accuracy. Moſheim reckons him among thoſe authors, who gave riſe, by their collections, to that ſpecies of divinity, which was afterwards diſtinguiſhed by the Latins under the denomination of "poſitive theology." Dupin, though he repreſents him as a prodigy of learning, and an oracle, admits that he wanted genius, and a diſcriminating judgment; and that his opinions are often falſe, and his remarks trivial, and frequently erroneous; and that his ſtyle is rather perſpicuous than eloquent or poliſhed. Iſidore received all the ſame books of the New Teſtament which we receive; and he ſpeaks of them with great reſpect, ſtating that they contain the precepts of life and the rule of faith, and that they may be profitably read by all ſorts of men. This Iſidore is ſometimes called "the younger," to diſtinguiſh him from Iſidore, biſhop of Cordova, in the fifth century, who wrote "Commentaries on the two Books of Kings," which he dedicated to Paul Oroſius, the diſciple of St. Auguſtine. Cave. Moſheim. Dupin. Lardner.

Iſidore was a man of great and extenſive learning, but particularly, it is ſaid, in geometry, muſic, and aſtrology, which, in the time of Iſidore, was another name for aſtronomy.

His book on the holy offices contains the principal points of diſcipline and eccleſiaſtical polity. He is frequently ranked among muſical writers. In his treatiſe on the divine offices, much curious information occurs concerning canto fermo, and muſic in general; but particularly its introduction into the church, the inſtitution of the four tones by St. Ambroſe, and the extenſion of that number to eight by St. Gregory. In treating of ſecular muſic, he has a ſhort chapter on each of the following ſubjects: of muſic, and its name: of its invention: its definition: of its three conſtituent parts, harmonics, rhythm, and metre: of muſical numbers: of the three-fold diviſions of muſic; 1ſt, Of the harmonical diviſion of muſic; 2dly, Of the organic or inſtrumental diviſion; 3dly, Of the rhythmical diviſion.

Theſe chapters are very ſhort, and contain little more than compreſſed definitions of muſical terms. In enumerating the ſeven liberal arts, cap. ii. he ranks them in the following manner: grammar, rhetoric, logic, arithmetic, muſic, geometry, aſtronomy. Iſidore died in the year 636, and is enrolled among the ſaints of the Romiſh calendar.

Isidore, Mercator, or Peccator, the name given to the author of a collection of canons, which for ſome time were attributed to Iſidore of Seville, is ſuppoſed to have flouriſhed towards the cloſe of the eighth century. This collection contains the pretended decretals of more than ſixty popes, which are followed by the canons of the councils which were held in Greece, Africa, France, and Spain. They are generally conſidered as ſpurious, of which there is abundant internal evidence, ariſing from the ſtyle, the incorrectneſs of their dates, and from many hiſtorical, geographical, and chronological errors. They were invented for the purpoſe of ſtrengthening the already overgrown power of the church, and to enforce the belief that the biſhop of Rome was conſtituted and appointed by Jeſus Chriſt as ſupreme legiſlator and judge of the church univerſal; and that, therefore, the biſhops derived all their authority from the Roman pontiff, nor could the councils determine any thing without his permiſſion and conſent. Though the forgery was manifeſt to every thinking perſon, yet with the great maſs of the people it produced the intended effect, and contributed to enrich and aggrandize the Roman pontiffs, and exalt them above all human authority and juriſdiction. Moreri. Moſheim.

Isidore *of Charax*, a Greek author, in the time of Ptolemy Lagus, about three centuries before the Chriſtian era, compoſed ſeveral hiſtorical works, and a deſcription of Parthia, which has been publiſhed by Heſchelius, and likewiſe at Oxford, among the collection of the leſſer geographers. It is entitled "Manſiones Parthicæ."

ISIDORO, St., in *Geography*, a town of California; 30 miles N.N.W. of Loreto.

ISIGNY, a town of France, in the department of Calvados, and chief place of a canton, in the diſtrict of Bayeux; 29 miles W.N.W. of Caen. The place contains 1829, and the canton 13,651 inhabitants, on a territory of 240 kiliometres, in 29 communes. N. lat. 49 19. W. long. 1 .—Alſo, a town of France, in the department of the Channel, and chief place of a canton, in the diſtrict of Mortain; 9 miles W. of Mortain. The place contains 358, and the canton 5708 inhabitants, on a territory of 75 kiliometres, in 11 communes.

ISIKOVA, a town of Japan, in the iſland of Niphon; 20 miles S.S.W. of Kanazava.

ISIMA, a town of France, in the department of the Dora; 19 miles E. of Aoſta.

ISIME, a town of Thibet; 25 miles E. of Harachar.

ISINDI, in *Ancient Geography*, an epiſcopal town of Aſia, in the ſecond Pamphylia.

ISINDUS, or Isinda, a town of Aſia, in Ionia.

ISINGLASS, a name given to Muſcovy talc, and to *Ichthyocolla*; which ſee. See alſo Glue.

Isinglass *Fiſh*, in *Ichthyology*. See Acipenser and Huso.

ISIS, in *Ancient Geography*, *Tchorok*, a river of Aſia, in the Colchide, which, according to Arrian, was navigable; and he places it between the mouth of the Acinaſis and that of Mogra, about 90 ſtadia from the one and the other.

Isis, in *Geography*, a name frequently given to the river Thames, before it joins the Thame at Dorcheſter; but this river is only a branch of the Thames, which riſes near Minchinhampton in Glouceſterſhire, and joins the main ſtream near Lechlade.

Isis, in *Mythology*, a goddeſs of the ancient Egyptians, worſhipped by them and many other nations.

Iſis, according to ſome, is ſynonymous with παλαια, ancient or aged, an expreſſion which, in the Egyptian theology, was appropriated to the moon, on account of her eternal birth. According to others, and particularly Jablonſki, (Pantheon Egyptiacum, vol. ii.) Iſis, in the Egyptian language, ſignified "the cauſe of abundance;" and it was applied by the Egyptian prieſts to the moon, becauſe they ſuppoſed, in conſequence of attention to the phenomena of nature, that the moon has a direct influence on the atmoſphere, the winds, and the rains; and therefore they regarded it, like the ſun (which they called Oſiris), as one of the ſources of the inundation of the Nile. Hence they were led to characterize this beneficial effect, by denominating the cauſe of it Iſis. This is ſaid to have happened 320 years after the exodus of the Iſraelites; at which period they beſtowed ſurnames on the ſun and moon, proper to fix their diſcoveries, and preſented the people with a new theology.

logy. According to Herodotus and all the ancients, Oſiris and Iſis were the two great divinities of the Egyptians, and the moſt generally worſhipped in the whole country; and, indeed, almoſt the whole mythology of thoſe ancient people is comprehended under what their prieſts fabled about them. The Greek and Latin authors extend ſtill farther this Egyptian mythology concerning Iſis and Oſiris, ſince, according to them, they comprehended all nature, and all the gods of that ancient people. According to Herodotus, the Egyptians took Iſis for Ceres, and believed that Apollo and Diana were her children, and that Latona had only been their nurſe; differing from the Greeks, who regarded her as their mother. According to the ſame author, Apollo and Orus, Diana and Bubaſtis, Ceres and Iſis, are the ſame; and hence it is, he ſays, that Æſchylus makes Diana the daughter of Ceres. Moreover, the mythologiſts aſſert, that Iſis and Oſiris included, under different names, all the gods of paganiſm; ſince, according to them, Iſis is Terra, Ceres, Juno, the Moon, Minerva, Cybele, Venus, Diana, and, in one word, all nature: and hence, as they pretend, this goddeſs was called Myrionyma, that is, who has a thouſand names. Oſiris alſo, in their opinion, is Bacchus or Dionyſius, the Sun, Serapis, Pluto, Ammon, Pan, Apis, Adonis, &c. It is difficult to aſcertain the real origin of Iſis amidſt theſe mythological fables. Some have pretended that the fable of Iſis came originally from Greece; and they have confounded that goddeſs with Io, the daughter of Inachus, king of Argos. The fable of Io is recited by Ovid in his "Metamorphoſis," (l. 38.) and this fable has been differently underſtood and explained by various authors. It is allowed that there was in Greece a princeſs named Io, the daughter of Inachus, or, as Pauſanias ſays, of Jaſus; and the Greeks took occaſion to confound Iſis and Io, in conſequence of the introduction of the worſhip of Iſis into Greece, eſpecially into the city of Argos. Inachus taught the Greeks to pay honour to Iſis, and hence they looked upon her as his daughter. Jablonſki ſays, that the Egyptians, from remote antiquity, worſhipped the moon, under her proper name of "Ioh," which, in the Egyptian language, ſignifies the moon; and that Inachus, the firſt king of Argos, carried this worſhip into Greece, nearly 300 years before the birth of Moſes. It is there, ſays Euſtathius, that a cow is the ſymbol of Io, or the moon; for in the Argian language, the moon is called Io. The Grecian fable, on the other hand, makes Io croſs the ſea from Greece, metamorphoſed into a cow, and conducts her into Egypt, where ſhe receives the name of Iſis. Accordingly, Lucian, well verſed in ancient mythology, puts theſe words into the mouth of Jupiter, "Conduct Io to the banks of the Nile, acroſs the waves of the ſea. Let her become Iſis: let her be the goddeſs of the Egyptians; let her augment the waters of the river, and let looſe the winds." As the Nile began to increaſe at the new moon which follows the ſolſtice, the Egyptian prieſts, who regarded this planet as the mother of the winds, decreed to her the honour of this phenomenon. "Iſis," ſays Servius, (Obſ. on the Æneid. l. 8.) "is the genius of the Nile. The ſiſtrum ſhe bears in her hand indicates the increaſe and the flowing of the waters; the vaſe ſhe holds in her left marks their abundance in all the canals." Temples were erected to her in the different provinces, and ſhe had altars and ſacrifices throughout the whole country. "Coptos," ſays Euſtathius, "is a city of the Thebais, where Io is adored under the name of Iſis. It is on her feſtivals that they celebrate with the ſiſtrum the increaſe of the Nile." The people, from the allegorical language of the prieſts, imagined that they owed this bounty to the tears of that divinity. The Egyptians, according to Pauſanias, were perſuaded that the tears of Iſis had the virtue to augment the Nile, and to make it riſe up into the country. Savary, in his "Letters on Egypt," ſays, that the Copts are not yet cured of this ſuperſtition.

Notwithſtanding the fabulous pretenſions of the Greeks with regard to the origin of Iſis, and their attempts to identify her with their Io, the Egyptians, according to Diodorus Siculus (l. i.) and Plutarch (De Iſ. et Oſir.) aſſert that this princeſs was born in their country; that ſhe married Oſiris, that they lived together in perfect harmony, and that they concurred in their endeavours to poliſh and civilize their ſubjects, to teach them agriculture, and ſeveral other neceſſary arts of life. Diodorus adds, that Oſiris, determining on an expedition to India for purpoſes of civilization, ſettled Iſis regent of his kingdom. (See Bacchus.) On his return to Egypt he found that his brother Typhon had formed a party againſt the government. Typhon, however, reſiſted the gentle means uſed by Oſiris for ſubduing his ambitious ſpirit, and, under a pretence of hoſpitality, confined him in a cheſt exquiſitely wrought, and threw it into the Nile. When Iſis heard of her huſband's tragical end, ſhe made diligent ſearch for the corpſe, and having found it in Phœnicia, was allured by the king of Byblos to carry it off to Egypt. Having lamented over it, ſhe at length cauſed it be interred at Abydos, a town ſituated to the weſt of the Nile. In the mean time Typhon was contriving to ſecure his new empire, but Iſis, being recovered from her diſtreſs, collected her troops, and placed them under the conduct of Orus, her ſon, who purſued the tyrant, and vanquiſhed him in two pitched battles. (See Typhon.) Iſis having died ſome time after her ſon's victory over Typhon, the Egyptians paid adoration to her with her huſband Oſiris, as to divinities; and becauſe they had applied themſelves, during their reign, to teach agriculture, the ox and the cow became their ſymbols. Feſtivals were inſtituted to their honour, in which ſeveral infamous rites were afterwards introduced. There the infamous image of the Phallus which Iſis had conſecrated, was carried in proceſſion, and it became the ſymbol of fruitfulneſs, though in its original inſtitution it had only been the mark of Iſis's paſſion for Oſiris her huſband. Diodorus Siculus has recorded the following inſcription on an ancient monument, by which Iſis was characterized. "I, Iſis, am the queen of this country. And I had Mercury for my prime miniſter. None had power to hinder the execution of my orders. I am the eldeſt daughter of Saturn, the youngeſt of the gods. I am the ſiſter and the wife of king Oſiris. I am the mother of king Orus. I am ſhe who reſides in the dog-ſtar. The city of Bubaſtis was built in honour to me. Rejoice, O Egypt, thou that haſt been to me inſtead of a nurſe, and mother." The following inſcription, according to Plutarch (De Iſ. et Oſir.) was engraved upon the pavement of Minerva's temple. "I am all that has been, that is, and that ſhall be, and none among mortals has hitherto taken off my veil."

The Egyptains, having called the moon Iſis, or the cauſe of abundance, applied this epithet to the earth, as the mother of fruits. We know, ſays Macrobius (Saturn. l. i.), that Oſiris is the ſun, and Iſis the earth. Iſis, in the Egyptian language, adds Servius, means the earth. In this point of view, ſhe has a ſtriking affinity to the Ceres of the Greeks; and this agrees with the account given of her by Herodotus (l. ii.). Plutarch informs us, that the prieſts honoured only with the name of Iſis that part of Egypt which was watered by the Nile, and in alluſion only to her fecundity: he adds, that, in the ſacred language, they termed the inundation, the marriage of Oſiris with Iſis.

Iſis is reported by Diodorus Siculus to have invented many excellent medicines; and hence, ſays he, after ſhe was received among the number of the deities, ſhe was applied to for the cure of diſtempers; and frequently indicated remedies by dreams. Galen takes notice of ſome plaſters which bear her name. Banier's Mythology, vol. i. Savary's Letters on Egypt, vol. ii. See Bubastis, Orus, Osiris, and Sothis.

Isis, in *Zoology*, a genus of Zoophytes of a ramoſe or plant-like form, the ſtem and branches of which are compoſed of ſtony articulations, longitudinally ſtriated, united by ſpongy or horny junctures, and covered, when living or in a recent ſtate, by a ſoft porous cellular fleſh or bark; and the mouths beſet with oviparous polypes. The ſpecies of this family are entirely of the marine kind, and moſtly inhabitants of the Indian ſeas.

Species.

Hippuris. Joints white with black junctures. *Iſis hippuris*, Linn. *Sertularia ramoſiſſima*, &c. Hort. Cliffort. *Iſis*, Pallas, Ellis, &c. *Hippuris ſaxea*, Cluſius. *Accabarium album*, Rumpf. *Lithophyton*, &c. Gualt.

A native of the Indian ſeas, where it is found growing to rocks, and is from ſix inches to two or three feet in height. The fleſh, when recent, is bright orange or red, the bone or ſtony part, as in the dried ſtate, whitiſh. A variety is deſcribed by Eſper under the name of Iſis elongata.

Dichotoma. Stem coralline, with ſmooth joints and decorticated junctures. Gmel. *Iſis articulata filiformis*, &c. Pallas. *Hippuris coralloides carnea capenſis*, Petiver.

This ſpecies is ſomewhat flexible, about ſix inches in height, with fleſh-coloured joints, and fleſh of a cinnabar colour, beſet with convex papillæ. It inhabits the ſeas of India and Ethiopia.

Ochracea. Stem coralline, with decorticated joints and knotty junctures. Gmel. *Lithoxylon*, &c. Hort. Cliffort. *Iſis articulata paniculato-dichotoma ramoſiſſima explanata, cortice hinc papilloſo*, Pallas. *Iſis*, &c. Soland. *Corallium rubrum indicum*, Ellis Phil. Tranſ. *Accabarium rubrum*, Rumpf. *Pſeudocorallium croceum*, Ray. *Hippuris ſaxea fulvo-rubra conſteniana*, Moriſ. *Accabaar ſeu corallodendron vulgare rubrum*, Seba.

Inhabits the ſeas of the Eaſt Indies; the colour deep-red, or ſometimes white, with the junctures browniſh-yellow; the ſtem irregularly grooved, the branches numerous, dichotomous and ſpread, the joints connected by yellow ſpongy knobs; fleſh yellow, with numerous ſtellated mouths, the habitations of polypes, each of which is furniſhed with eight claws.

Entrochia. Stem teſtaceous, round, with orbicular perforated joints and verticillated dichotomous branches. Gmel.

Stem about three quarters of an inch in thickneſs, with crowded flat orbicular joints, perforated in the centre, the perforations pentangular, with the diſk ſomewhat ſtriated from the centre, the outer bark unequal and ſurrounded with a row of tubercles: branches thin, dichotomous, continued and not jointed. Inhabits the ocean.

Asteria. Stem teſtaceous, jointed, pentagonal; the branches verticillated with a terminal dichotomous ſtar. Gmel. *Encrinus capite ſtellato ramoſo dichotomo pentagono equiſetiformi*, Ellis Phil. Tranſ. *Palma marina e Martinica*, Guettard Act. Pariſ.

Found in the ſeas about the iſland of Barbadoes. Neither this nor the ſpecies preceding, though retained under the genus Iſis, upon the authority of Gmelin, can with propriety be conſidered as appertaining to that genus, or perhaps to any other, at preſent eſtabliſhed among naturaliſts. They unqueſtionably belong to a race of creatures whoſe manners, and even ſtructure, are not at this time very clearly underſtood.

Coccinea. Stem jointed, ſlender, very red, and ſomewhat ſtriated; joints united by ſhort yellowiſh ſpongy junctures; fleſh on the outſide covered with ſmall ſcarlet prominent cells, each furniſhed with a mouth. Solander.

A diminutive kind of coral, with irregularly ſpreading branches, and which rarely exceeds the height of two or three inches. It is a native of the Indian ocean, and is ſometimes found entirely white.

ISIT, in *Geography*, a town of Ruſſia, in the government of Irkutſk, on the Lena. N. lat. 61°. E. long. 123° 50'.

ISKA, a name given by the ancients to a light kind of agaric, growing to the old ſtumps of the oak, hazel, and other trees. This being a very light kind of fuel, was uſed by the ancients in the manner of a cautery, as we have learned from the Indians to uſe moxa, or the down of mugwort leaves.

ISKARSKOIGOROD, in *Geography*, a town of Ruſſia, in the government of Toboiſk. N. lat. 60° 5'. E. long. 59° 14'.

ISKASKAMAGTI, a lake of Canada; 84 miles N.W. of Quebec. N. lat. 47° 50'. W. long. 72° 25'.

ISKIM, a river of Perſia, which runs into the Arabian ſea, N. lat. 25° 45'. E. long. 57° 9'.

ISKOLDZ, a town of Lithuania, in the palatinate of Novogrodek; 30 miles S. E. of Novogrodek.

ISKOROSE, a town of Poland, in Volhynia; 48 miles N. of Zytomiers.

ISLA, Joseph Francis de, in *Biography*, a Spaniſh Jeſuit of Madrid, who, after the deſtruction of his order, retired to Italy, and died at Bologna in 1781. He was author of a ſatire on the ignorance and vices of the monks, entitled "Hiſtoria del Fra. Gerundio de Compazas alias Zotes," which the ſupreme council of Caſtile was obliged to ſuppreſs. It has been tranſlated into Engliſh and German, and it is ſaid that ſince the time of Cervantes, no Spaniſh writer has diſplayed ſo much wit and humour. Gen. Biog.

Isla, in *Geography*, a river of Scotland, which riſes in the ſhire of Angus, and runs into the Tay, 10 miles N. of Perth.

Isla. See Ila.

ISLAM. See Mahometans.

ISLAMABAD, a town of Bengal, and capital of the province of Chittigong, ſituated on the river Chittigong, or Currumpelly, about 12 miles from the bay of Bengal. N. lat. 22° 20'. E. long. 91° 45'.—Alſo, a ſmall province of Bengal, between Goragot and Patladah.

ISLAMNAGUR, a town of Hindooſtan, in the circar of Bopal; 10 miles N.N.E. of Bopaltol.

ISLAMPOUR, a town of Hindooſtan, in the circar of Nagore; 36 miles N.E. of Didwana.—Alſo, a town of Hindooſtan, in Bahar; 28 miles S. of Patna. N. lat. 25° 8'. E. long. 85° 43'.—Alſo, a town of Hindooſtan, in Viſiapour; 15 miles S.W. of Currer.—Alſo, a town of Hindooſtan, in the circar of Jyenagur; 70 miles N.N.W. of Jyepour.

ISLAMTI, a town of Aſiatic Turkey, in Caramania; 30 miles S.S.E. of Kaiſarieh.

ISLAND, or Isle, a tract of dry land encompaſſed with water; either with the ſea, a river, or lake. In which ſenſe iſland ſtands contradiſtinguiſhed from continent, or terra firma.

Some conclude that iſlands are as ancient as the world, and it is by no means probable, that the large iſlands far remote from the continent are new, or that they either aroſe out of the ſea, or were torn from the main land. Nor is it leſs certain, that there have been new iſlands formed by the caſting up of vaſt heaps of clay, mud, ſand, &c. as that, for inſtance, of Tſongming, in the province of Nanquin, in China: or by the violence of the ſea, which has torn off large promontories from the continent, as the ancients imagined Sicily, and even Great Britain, to have been formed. It is alſo certain, that ſome have emerged above the waves, as Santorini formerly, and three other iſles near it in later times; the laſt in 1707, which roſe from the bottom of the ſea, after an earthquake, that was ſuppoſed to have looſened it from its hold.

Several naturaliſts are of opinion, that iſlands were formed at the deluge: others think they have been rent and ſeparated from the continent by violent ſtorms, inundations, and earthquakes. Theſe laſt have obſerved that the Eaſt Indies, which abound in iſlands more than any other part of the world, are likewiſe more annoyed with earthquakes, tempeſts, lightnings, volcanos, &c. than any other part.

Varenius thinks moſt of theſe opinions true in ſome inſtances, and believes that there have been iſlands produced each of theſe ways. St. Helena, Aſcenſion, and other ſteep rocky iſlands, he ſuppoſes to have become ſo, by the ſeas overflowing the neighbouring champaigns. By the heaping up huge quantities of ſand, and other terreſtrial matters, he thinks the iſlands of Zealand, Japan, &c. were formed: Sumatra and Ceylon, and moſt of the Eaſt Indian iſlands, he rather thinks, were rent off from the main land; and concludes, that the iſlands of the Archipelago were formed in the ſame way; imagining it probable, that Deucalion's flood might contribute towards it. Many iſlands in the South ſea are formed by banks of coral, the production of inſects. For an account of theſe by Alexander Dalrymple, eſq. ſee the Philoſophical Tranſactions, vol. lvii. p. 394.

The ancients had a notion, that Delos and ſome few other iſlands roſe from the bottom of the ſea; which, how fabulous ſoever it might appear, agrees very well with ſome later obſervations. Seneca takes notice, that the iſland of Theraſia roſe out of the Ægean ſea in his time, of which the mariners were eye-witneſſes. Concerning the legal occupancy and property of new iſlands, ſee ALLUVION.

Iſlands may be conſidered under ſix different heads, with a view to their ſtructure or ſubterranean geography: 1. Such as conſiſt of an unſtratified maſs, as of granite, baſalt, &c. of which ſome ſmall rocky iſlands appear to conſiſt. 2. Of mantle-ſhaped ſtrata, as M. Werner has named thoſe that ſurround a central hump or maſs, from which they dip in all directions: the projection of ſuch iſlands above the water being occaſioned by an original hump in the ſtrata. 3. They are occaſioned by hummocks, or piles of ſtrata, left when the ſurrounding ſtrata were denudated, or excavated for the bed of the ſea: England ſeems ſeparated from France by this cauſe. 4. By lifted tracts of ſtrata: it will only be practicable to diſtinguiſh this caſe from the laſt in iſlands near to others, or to a continent, in which the ſame ſtrata are found on the oppoſite coaſts, by which to obſerve, whether the iſland tract has riſen, or the intermediate part ſunk which forms the channel of ſeparation. 5. To volcanic eruptions in the bottom of the ſea: ſuch are generally of modern formation compared with the antiquity of the four preceding claſſes, and have, ſeveral of them, appeared within the periods of hiſtory; and, 6. To gravel ſand and ſilt thrown up by the waves and tide, and accumulated in height by the blowing of the ſands from the beach, until ſmall iſlands are thus raiſed permanently above the level of the ſea; ſome of them without aſſiſtance from man, but the greater part of the newly formed iſlands on the coaſts of the ocean have been gained, and are preſerved by artificial banks, from the overflowings of the high tides. In large iſlands, like England, great varieties of theſe caſes will doubtleſs be found to obtain in their ſtructure: the eaſtern ſides of the greater part of the iſlands are, perhaps, the flatteſt, and the weſtern ſides the moſt abrupt, owing to the ſtrata dipping towards the eaſt, but it is by no means true, that the weſtern ſides of iſlands and continents are always the moſt abrupt, ſince often, the ſtrata dip to the weſt, as they do and paſs under the ſea, in the coal works at Whitehaven and Workington in Cumberland.

ISLANDS, *Floating*. Hiſtories are full of accounts of floating-iſlands; but moſt of them are either falſe or founded on exaggerations. What we generally ſee of this kind is no more than the concretion of the lighter and more viſcous matter floating on the ſurface of water in cakes, and with the roots of plants, forming congeries of different ſizes, which not being fixed to the ſhore in any part, are blown about by the winds, and float on the ſurface. Theſe are generally found in lakes, where they are confined from being carried too far; and from being broken by the agitation of the water. And in proceſs of time ſome of them acquire a very conſiderable ſize. Seneca tells us of many of theſe floating iſlands in Italy; and ſome later writers have deſcribed not a few of them in other places. But however true the hiſtories of theſe might have been at the time when they were written, there remain very few proofs of their truth at this time, theſe iſlands having either diſappeared again, or having been fixed to the ſides, in ſome part, in ſuch a manner as to have made a part of the ſhore. Pliny tells us of a great iſland, which at one time ſwam about in the lake Cutilia, in the country of Reatinum, which was diſcovered to the old Romans by an oracle: and Pomponius tells us, that in Lydia there were ſeveral iſlands ſo looſe in their foundations, that every little accident ſhook and removed them. Herodotus ſpeaks alſo very largely of the lake Chemnis in Ægypt. See ABSORPTIONS *of the Earth*.

ISLANDS, *Fortunate*. See FORTUNATE.

ISLANDS, *Volcanic*. See VOLCANO.

Gryphiander has written a Latin treatiſe expreſsly on iſlands, "De Inſula."

ISLAND *Bay*, a bay on the E. coaſt of the iſland of Paraguay. N. lat. 6° 15.′ E. long. 118° 83′.

ISLANDS, *Bay of*. See BAY.

ISLANDS, *Bayona*. See BAYONA *Iſlands*.

ISLAND *Magee*, a peninſula on the eaſt coaſt of the county of Antrim, Ireland, forming one ſide of the lough, or harbour of Larne.

ISLAND, or *Iceland Cryſtal*. See CRYSTAL.

ISLAND-*Fiſh*, in the *Fiſh-trade*, a name given to the common cod-fiſh, when it has been caught and preſerved in Iceland.

ISLAS ESTOLAS, in *Geography*, a cluſter of ſmall iſlands in the Atlantic, near the coaſt of Spain. N. lat. 42° 12′. W. long. 8° 55′.

ISLAS *Medas*, three ſmall iſlands in the Mediterranean, near the coaſt of Spain. N. lat. 42° 3′. E. long. 3° 4′.

ISLAS *Oſas*, rocky iſlets in the Atlantic, near the coaſt of Spain. N. lat. 42° 17′. W. long. 8° 56′.

ISLAS *de Siſarga*, a cluſter of ſmall iſlands in the Atlantic, near the coaſt of Spain. N. lat. 43° 23′. W. long. 8° 50′.

ISLE, L', a town of France, in the department of the Tarn, and chief place of a canton, in the diſtrict of Gaillac; five miles S.W. of Gaillac. The place contains 5402, and the canton 6715 inhabitants, on a territory of 82½ kilometres, in 3 communes.—Alſo, a town of France, in the department of Vaucluſe, and chief place of a canton, in the diſtrict of Avignon. The place contains 5155, and the canton 11,099 inhabitants, on a territory of 172½ kiliometres, in 10 communes.

Isle-*Adam, L'*, a town of France, in the department of the Seine and Oiſe, and chief place of a canton, in the diſtrict of Pontoiſe, 6 miles N.N.E. of Pontoiſe. The place contains 1381, and the canton 11,965 inhabitants, on a territory of 147½ kiliometres, in 23 communes.

Isle-*Bouchard, L'*, a town of France, in the department of the Indre and Loire, and chief place of a canton, in the diſtrict of Chinon, ſurrounded by the Vienne; 9 miles E.S.E. of Chinon. The place contains 1000, and the canton 10,437 inhabitants, on a territory of 240 kiliometres, in 20 communes.

Isle-*Boudouin, L'*, or *Iſle-Bouen*, a town of France, in the department of the Vendee, ſituated on an iſland of the ſame name, about 5 miles long, on the coaſt; 9 miles N.W. of Challons.

Isle *of Cerf*, a ſmall iſland in the Engliſh channel, near the coaſt of France. N. lat. 48° 53′. W. long. 3° 25′.

Isle-*Dieu, L'*, a town of France, in the department of the Vendee, and chief place of a canton, in the diſtrict of Les Sables d'Olonne. The place contains 1049, and the canton 2053 inhabitants, on a territory of 65 kiliometres, in 2 communes.

Isle-*d'Oueſſant, L'*, a town of France, in the department of Finiſterre, and chief place of a canton, in the diſtrict of Breſt. The place contains 1645 inhabitants, on a territory of 22 kiliometres, in 1 commune.

Isle-*en-Dodan, L'*, a town of France, in the department of the Upper Garonne, and chief place of a canton, in the diſtrict of St. Gaudens; 18 miles N.N.E. of St. Gaudens. The place contains 1100, and the canton 10,832 inhabitants, on a territory of 232½ kiliometres, in 24 communes.

Isle-*Jourdain, L'*, a town of France, in the department of the Gers, and chief place of a canton, in the diſtrict of Lombés, ſituated on the Save; 7 miles E. of Auch. The place contains 4686, and the canton 11,634 inhabitants, on a territory of 262½ kiliometres, in 23 communes. N. lat. 43° 37′. E. long. 1° 10′.—Alſo, a town of France, in the department of the Vienne, and chief place of a canton, in the diſtrict of Montmorillon, 24 miles S.E. of Poitiers. The place contains 448, and the canton 7553 inhabitants, on a territory of 375 kiliometres, in 11 communes. N. lat. 46° 15′. E. long. 0° 25′.

Isle-*ſur-le-Doubs, L'*, a town of France, in the department of the Doubs, and chief place of a canton, in the diſtrict of Baume; 11 miles N.E. of Baume. The place contains 685, and the canton 7048 inhabitants, on a territory of 167½ kiliometres, in 24 communes.

Isle-*ſur-le-Serrein, L'*, a town of France, in the department of the Yonne, and chief place of a canton, in the diſtrict of Avallon. The place contains 478, and the canton 8766 inhabitants, on a territory of 250 kiliometres, in 23 communes.

Isle *des Moins*, an iſland of France, in lake Morbihan, with a tower; 5 miles S.S.W. of Vannes.

Isle *Grande*, or *La Roche*, an iſland in the South Pacific ocean, ſeen by Anthony de la Roche, in 1675. S. lat. 45°.

Isle *Royale*, an iſland on the N.W. ſide of lake Superior, within the territory of the United States, N.W. of the Ohio; about 100 miles long, and, in many places, about 40 broad. The natives ſuppoſe that this and the other iſlands on the lake are the reſidence of the Great Spirit.

Isle *Plate*, a ſmall iſland in the Engliſh channel, near the coaſt of France. N. lat. 48° 53′. W. long. 3° 24′.

Isle *of Dogs Canal*, is the name of a very wide and deep canal for the paſſage of ſhips acroſs the iſthmus called the Iſle of Dogs, in the river Thames, below London, of which an account has been given under the head of that river, in our article Canal, and a plan of the ſame will be found in our plate of *Docks*.

Isle *of Wight*, an inſulated tract of land, ſituated in the Engliſh channel, near the coaſt of Hampſhire, from which it is not more than three miles diſtant at the neareſt point, and to which county it belongs in all political and civil matters. The form of the iſland is that of an irregular lozenge; meaſuring from the eaſtern to the weſtern angle nearly twenty-three miles; and about thirteen from the northern to the ſouthern point: its ſuperficies is computed at 105,000 acres. Through the middle, in the longeſt direction, extends a range of hills, affording excellent paſture for ſheep, and commanding views over every part of the iſle, with the ocean on the ſouth ſide, and the coaſts of Hampſhire on the north. The face of the country is much diverſified; hill and dale, the ſwelling promontory and the lowly glen, appear in quick ſucceſſion to animate, and give intereſt to the proſpects. The land round the coaſt is, in ſome parts, very high, particularly on the ſouth, or back of the iſland, as it is commonly termed; here the cliffs are very ſteep, and vaſt fragments of rock, undermined by the waves, lie ſcattered along the ſhore: on the northern ſide, the ground ſlopes to the water in eaſy declivities, excepting towards the Needles, or weſtern point, where the rocks are bare, broken, and precipitous. The height of the cliffs, of which the Needles form the extreme point, is, in ſome places, ſix hundred feet above the level of the ſea, and when viewed from the diſtance of about a quarter of a mile, have a grand and almoſt ſublime and ſtupendous effect. Theſe cliffs are frequented by immenſe numbers of marine birds; as puffins, razor-bills, willcocks, gulls, cormorants, corniſh-choughs, daws, ſtarlings, and wild pigeons; ſome of which come, at ſtated times, to lay their eggs and breed; while others remain there all the year. The cliffs are in ſome places perpendicular; in others, they project and hang over, in a tremendous manner: the ſeveral ſtrata form many ſhelves; which ſerve as lodgments for the birds, where they ſit in thick rows, and diſcover themſelves by their motions and flight, though not individually viſible. Here are many caverns and deep chaſms, which ſeem to enter far into the rocks; and in ſome places, the iſſuing of ſprings forms ſmall caſcades of rippling water down to the ſea. The country people take the birds that harbour in theſe rocks, by the perilous experiment of deſcending by ropes, which are fixed to iron crows, driven into the ground: thus ſuſpended, they with ſticks beat down the birds as they fly out of their holes. A dozen birds generally yield one pound weight of ſoft feathers, for which the merchants give eight pence; the carcaſes are bought by the fiſhermen at ſixpence per dozen, for the purpoſe of baiting their crab-pots. The rocks, called the Needles, derived their name from a lofty pointed one, reſembling a needle in ſhape, which had been disjointed, with others, from the main land, by the force of the waves: this was 120 feet above the low water mark; but about forty years ago, its baſe having been excavated by the ſea, it fell, and totally diſappeared.

All the higher parts of the iſland are compoſed of an immenſe maſs of calcareous matter, of a chalky nature, incumbent on ſchiſtus, which runs under the whole iſle, and appears, at low water mark, on the coaſt near Mottiſton: this becomes ſo indurated by expoſure to the air, as to make very good whetſtones. The lime-ſtone is burnt for manure;

and in the pits where it is dug for that purpoſe, are found numerous echini, ſharks' teeth, and ammoniæ. Theſe foſſils are particularly abundant in the range of cliffs which forms the ſouthern ſhore; together with bivalve and turbinated ſhells of various deſcriptions: the cornua ammonis are of all ſizes, from one inch to eighteen inches in diameter. A ſtratum of coal diſcovers itſelf at the foot of Bimbridge cliff, and runs through the ſouthern part of the iſle, appearing again at Warden Ledge, in Freſhwater pariſh. On the north ſide of this ſtratum lies a vein of white ſand, and another of fuller's-earth; and on the ſouth ſide is a vein of red ochre.

The ſoils of the iſland are of various kinds; but the moſt prevailing is a ſtrong loamy earth, well adapted for agricultural purpoſes, and extremely fertile. The quantity of grain annually raiſed here, is computed to amount to ſeven or eight times as much as ſufficient for all the inhabitants. The medium produce of wheat, throughout the iſland, is about twenty-one buſhels per acre; of barley and oats about thirty buſhels; and of beans and peas about twenty-eight buſhels: potatoes are very productive, though not greatly in eſteem, and turnips alſo yield a rich increaſe. The meadow lands are extremely fine, and produce from one to three tons of hay per acre. The elevated tracts are moſtly appropriated to paſturing ſheep; the number annually ſhorn is about 40,000; the wool is of the fineſt quality, and in much repute; the breed in general uſe is the Dorſetſhire: about 5000 lambs are ſold annually.

The climate is extremely ſalubrious, and highly favourable to vegetation: its genial qualities, and near approximation, in mildneſs, to more ſouthern regions, may be inſtanced by the profuſion of myrtles, and by the flouriſhing ſtate of a vine-plantation at Appuldercombe. The central parts of the iſle are ſubject to frequent rains; the high range of hills proving a conſtant ſource of attraction to the vapours, and, in the winter months, involving all beneath them in gloom and humidity. The general fertility, however, is ſo little affected, and the vegetation is ſo abundant, that this iſland has often been ſtyled the "Garden of England;" an appellation, perhaps, that is partly ſuggeſted to the mind by the innumerable plants and flowers which grow every where in wild luxuriance; among them are the *ophrys apifera*, or bee-orchis; the digitalis, or fox-glove; and the crithmum maritimum, or rock-ſamphire.

The contiguity of the Portſmouth, and other dock-yards for ſhip-building, has operated to deprive the Iſle of Wight of much of its timber; and even Parkhurſt, or Cariſbrooke foreſt, which includes about 3000 acres of good land, is almoſt deſtitute of trees of any value. The woods of Swainſton are of conſiderable extent; and thoſe of Wooten and Quarr cover a ſuperficies of nearly 1100 acres: the oak and the elm are the moſt flouriſhing trees.

Great variety of fiſh is found on the coaſt, and in conſiderable abundance: thoſe of the cruſtaceous kinds are particularly numerous on the ſouthern ſhores. The lobſter and crab are of uncommon ſize, and peculiar quality; ſome of the former are often taken upwards of ſix pounds weight; the latter ſo abundant on a particular part of the coaſt, that a neighbouring village has obtained the name of Crab-Niton from this circumſtance. Cockles are in high eſtimation; the ſand-eel is alſo very plentiful.

The trade of the Iſle of Wight is flouriſhing; the harbour of Cowes is particularly convenient for ſhipping and unſhipping merchandize. The chief imports are coals, timber, deals, iron, wine, hemp, and fruits: the principal exports are wheat, flour, barley, malt, and ſalt. The chief manufactures are thoſe of ſtarch, hair-powder, and ſalt; and latterly the making of woollens, ſacking, &c. has been carried to ſome extent in the Houſe of Induſtry near Newport.

Several chalybeate ſprings have been diſcovered in different parts of the iſland; one of them, at Black Gang, under Chale cliff, is very ſtrong: about half a mile from this, at Pitland, is a ſpring, impregnated with ſulphur; and at Shankin is a ſpring, the waters of which are ſlightly tinctured with alum. Springs of clear water are very numerous, and in general extremely pure and tranſparent, from the natural percolation which they undergo through the lime-ſtone ſtrata.

The principal rivers are the Medina, the Yar, and the Wooten. The Medina, anciently called the Mede, riſes near the bottom of St. Catherine's Down, and flowing directly northward, divides the iſland into two nearly equal parts; gradually widening in its courſe, it paſſes to the eaſt of Newport, and in Cowes harbour unites its waters with the ocean. Numerous ſmaller ſtreams alſo exiſt; and various creeks and bays run up from the ſea. The two diviſions of the iſland are called the hundreds, or liberties, of Eaſt and Weſt Medina, from their relative ſituations to that river. They contain thirty pariſhes, in which are comprehended the following boroughs and towns; Brading, Newport, Newtown, and Yarmouth; the three latter of which return ſix members to parliament.

The ancient hiſtory of this iſland has been a ſubject of much controverſy with topographical writers. Whitaker, in his Hiſtory of Mancheſter, contends that it was formerly connected with the main land; and that it is the Ictis of Diodorus Siculus. At this port, according to the latter writer, the Britons ſhipped their tin for Gaul; but the original tin ſtaple of Britain was certainly the Caſſiterides, or Scilly iſlands. (See Borlaſe and Heath's Accounts of theſe Iſlands.) During the Anglo-Roman dynaſty this iſland was called *Vectis*; but it does not appear that the Romans had any ſtation or ſettlement here; though they had two or three conſiderable ſtations on the oppoſite coaſt; one at Clauſentum, near Southampton, and another at Port-cheſter. Suetonius, the firſt of the Roman authors, who notices the iſland under conſideration, ſtates, that it was ſubdued in A.D. 43 by Veſpaſian. Cerdic, a Saxon chieftain and founder of the kingdom of Weſſex, made a ſecond conqueſt of the iſle, and appointed his nephews Sterff and Withgar to govern the inhabitants. In the year 661 it was again ſubdued by Wulphure, king of Mercia, but this monarch was diſpoſſeſſed of this tract of land within the ſpace of 15 years. The Daniſh marauders afterwards viſited, and took poſſeſſion of this iſland; and preſerving a port here, they made frequent deſcents on the coaſts of Hampſhire, Dorſetſhire, and Suſſex. After the Norman conqueſt, the iſland was annexed to the crown, and was frequently granted, in truſt, to the favourites of different monarchs.

A liſt of the different noblemen who were governors, or lords of the iſland, with the conditions on which it was held, are fully narrated in ſir Richard Worſley's Hiſtory of the Iſle of Wight. The ſituation of this iſland has rendered it liable to invaſions in the time of warfare, and particularly when France has been at war with England, and many inſtances are recorded of deſcents on this coaſt. To protect the iſland, a large and ſtrong fortreſs, called Cariſbrooke caſtle, was conſtructed at an early period, and has been preſerved as a place of refuge and ſtrength even to the preſent time. Here a military governor occaſionally reſides. Other forts were conſtructed on different parts of the coaſt; but the great fortifications at Portſmouth, and at other places on the Hampſhire coaſt, ſerve to guard the iſland. The ſouthern ſhore is alſo naturally protected by rocks. The iſland contains ſeveral ſeats and villas, the principal of which is Appuldercombe park. Sir Richard Worſley's Hiſtory of the Iſle of Wight, 4to. Albin's Hiſtory, &c. 8vo. Buller's Account of the Iſland, 12mo. Windham's Picture of the Iſle of Wight.

Isle *of Wight*, a county of Virginia, on the S. ſide of James's river, W. of Norfolk county, about 40 miles long and 15 broad, containing 5313 free inhabitants, and 4029 ſlaves. In this county is a mineral ſpring, to which many perſons reſort. It is ſituated about 10 miles from Smithfield, and 12 from Suffolk.

ISLEBEIANUS Lapis, in *Natural Hiſtory*, a name given by authors to a kind of blackiſh ſlate, very heavy, not very hard, and eaſily ſplitting into thin flakes. It is dug near Iſleb, in Thuringia, whence it has its name, and is much of the nature of that ſort of black ſlate which we have common in England, lying over the coal ſtrata.

As our ſlate of this kind contains uſually leaves of fern and other plants, this foreign kind contains the impreſſions of ſeveral kinds of fiſh, ſo exactly delineated in ſhape, and with the fins, ſcales, and all other parts ſo perfect, that the ſpecies are eaſily known. All theſe impreſſions and delineations are, however, ſo flat and thin, and have taken up ſo little room in the ſtone, that they ſeem rather to have been the ſkins and exuviæ of fiſh than the whole bodies of them; but this is not wonderful when we conſider how eaſily the bodies, and even the bones of fiſhes may be diſſolved; and that theſe exuviæ are lodged in a ſubſtance which contains a vitriolic ſalt, very capable of effecting ſuch a ſolution. It is eaſy to conceive, that this and other ſuch ſalts, while in a ſtate of ſolution in water, before the concretion of the matter of this ſtone into a hard maſs, might make that water a menſtruum capable of thus diſſolving the bodies and bones of fiſhes, while the outer ſkin and ſcales being much tougher, and of a very different nature, might eſcape the effects of them. It is well known that the fins and ſcales, and other external parts of fiſh, are much more capable of bearing maceration in water than the internal ſubſtances of them; and it is eaſy to conceive that theſe, after having withſtood that power in the water, would at length ſubſide down among the muddy matter that was to form ſome of the ſtrata of this ſlate: the motion of the water would not fail to expand their ſkins, though ever ſo thin, into the true and exact ſhape of the whole fiſh; and when thus laid along upon the ſurface of the new-formed ſtratum, the next quantity of the ſame matter that ſubſided would form another ſtratum, which falling evenly upon the former, would cover it, and on the following concretion of both, the figure of the fiſh would be beautifully preſerved between two plates or flakes of a fiſſile ſtone.

It is very remarkable, that as in theſe ſlates of Iſleb preſerving fiſhes, the external parts only are preſerved, the bones and fleſh being waſted: ſo, on the other hand, in thoſe foſſile fiſhes brought from Syria, the ſkins and ſcales are wanting, and the ſkeletons are principally the part preſerved. In ſome of theſe the bones are not clean, ſmall parcels of the fleſh being found petrified among them; but this fleſh is ſtripped of the ſkin. The ſtone in which theſe Syrian fiſhes are preſerved is alſo very different from the Iſleb ſlate, being whitiſh or greyiſh, and very hard. The ſtones of this kind found on mount Libanus, where they are very common, have very fine delineations of the ſtar-fiſh complete. Woodw. Cat. Foſſ. vol. ii. p. 23, &c.

ISLEBIANS, in *Eccleſiaſtical Hiſtory*, a name given to thoſe who adopted the ſentiments of a Lutheran divine of Saxony, called John Agricola, a diſciple and companion of Luther, a native of Iſleb, whence the name; who, interpreting literally ſome of the precepts of St. Paul with regard to the Jewiſh law, declaimed againſt the law, and the neceſſity of good works. See Antinomians.

ISLEBOROUGH, in *Geography*, a townſhip of America, in Hancock county, Maine, formed by Long iſland, in the centre of Penobſcot-bay; 15 miles long, and from two to three broad: it was incorporated in 1789, contains 483 inhabitants, and is diſtant 260 miles N.E. by N. from Boſton.

ISLES *de Madame*, iſlands that lie at the S. end of Sydney, or Cape Breton iſland, on which they are dependent. The largeſt of theſe, with Cape Canſo, the E. point of Nova Scotia, forms the entrance of the gut of Canſo from the Atlantic ocean.

Isles *of Don Joſeph Galwez*, a large cluſter of iſlands in the South ſea, populous, and affording plenty of potatoes, cocoa, bananas, and other fruits. S. lat. 19° 39′. E. long. 179° 38′ from Paris.

Isles, in *Architecture*, the ſides or wings of a building.

ISLEWORTH, in *Geography*, a pariſh in the hundred of the ſame name, and county of Middleſex, England, is delightfully ſeated on the banks of the Thames, and has long been the reſidence of many perſons of rank and fortune. The pariſh conſiſts of about 2370 acres, chiefly appropriated to arable and paſture; but nearly 500 acres are uſed as gardens and nurſery-grounds. At Baberbridge, in this pariſh, are ſome large copper and braſs mills, rented by the ſociety of the mines-royal. A conſiderable china manufactory, ſome extenſive calico-grounds, and two large flour-mills are alſo within this pariſh. The chief buſineſs, or trade of the place, is derived from the gardens, which furniſh a vaſt variety of fruit and vegetables for Covent-garden market. In the year 1794, ſir Joſeph Banks obtained a correct ſtatement of the population of this pariſh: and it appeared that the number of houſes was 712; of which 43 belonged to gentlemen, 6 to farmers, 26 to publicans; the remainder conſiſted of ſhops and cottages. The inhabitants at the ſame time amounted to 4190. In the year 1800, the houſes amounted to 768, and inhabitants to 4346. The principal building in this pariſh is Sion-houſe, a ſpacious ſeat of the duke of Northumberland. The houſes occupy the ſcite of a convent of Bridgetines, founded by king Henry V. The preſent manſion was enlarged and fitted up by the late duke, who embelliſhed it with ſeveral pieces of ancient ſculpture, alſo with twelve Ionic columns, and ſixteen pilaſters of fine marble. The improvements made in the houſe, and the elegant façade, adjoining the public road near Brentford, are from deſigns by the late Mr. Adams. The gardens and pleaſure-grounds, contiguous to the Thames, were laid out by the late Mr. Brown. The duke of Marlborough and the earl of Shrewſbury have ſeats in this pariſh. Iſleworth Park was occupied by the barons' army, headed by Simon de Montford, in the year 1263. On the 4th of Auguſt, 1647, general Fairfax appointed his head-quarters at Iſleworth, and received the parliamentary commiſſioners here. Lyſons's Environs of London and Middleſex Pariſhes.

ISLINGTON, a village in Oſſulſton hundred, Middleſex, England, though formerly a ſmall place, and ſeparated from London by ſeveral intervening fields, is now connected to the northern ſuburbs of the metropolis, and indeed appears to form a part of this vaſt city. "When it is conſidered, that Iſlington is ſcarcely two miles from the centre of the original London; that it is ſeated upon the Ermin-ſtreet, of the Romans, and the ſpot where they had a military poſt; alſo, that it has, from the earlieſt period of our hiſtory, been celebrated for the richneſs of its paſtures, and the excellent produce of its dairies, there can remain little doubt that theſe circumſtances muſt have rendered it of conſiderable importance to the Londoners, as well as the garriſon there." This village has been variouſly ſpelt in old records and publications; as Iſendune, Iſendon, Iſeldon, Yſeldon, and Eyſeldon: but it appears that the preſent name has prevailed from the cloſe of the 16th century. The pariſh of Iſlington is three miles two furlongs in length, from N.W. to S.E., and two miles one furlong in breadth. It conſiſts of 3032 acres three roods, of which the chief part is appropriated to paſture. Beſides the village of Iſlington, the pariſh contains the following hamlets: Holloway, Balls-pond, Battle-bridge, the City-gardens, Kingſland-green, and great part of Newington-green. The population of this pariſh, in 1800, was returned at 10,212, occupying 1663 houſes: in 1793, the latter was only 1200, and the former 6600: whereas, in 1810, the population has increaſed to 14,000. Previous to the year 1714, the roads and highways were in ſo bad a ſtate, that in an act of parliament then paſſed, they are deſcribed to be "very ruinous and almoſt impaſſable for the ſpace of five months in the year." This furniſhes a curious illuſtration of the amazing improvements made for public accommodation within 100 years: for now foot-paſſengers are provided with good pavements, or gravel paths, and the public roads are firm, even, and generally clean. They are alſo furniſhed with lamps for winter, and watchmen and patroles are employed to protect houſes and paſſengers. From an early period, even before the time of Henry II., Iſlington has been noted as a place of recreation for the citizens of London; where wreſtling-matches, ſhooting, archery, caſting the ſtone, and other athletic paſtimes were purſued. Now the mechanics and lower claſſes frequent public-houſes, which are provided with grounds for ſkittles and Dutch-pins; places for playing at fives, cricket, and bowls. In this pariſh, to the north of White Conduit-houſe, are the traces of an encampment, which ſeveral writers have attributed to the Romans, but neither its preſent ſtate, nor any diſcoveries that have been made, juſtify this opinion. Iſlington contains ſeveral commodious, and ſome handſome houſes belonging to London merchants and tradeſmen.

For a full and circumſtantial hiſtory and deſcription of this pariſh, the reader is referred to "The Hiſtory, Topography, and Antiquities of Iſlington," by John Nelſon, 4to. 1811.

ISLIP, a poſt-town of New York, in Suffolk county, Long iſland, E. of Huntington, containing 958 inhabitants.

ISMADABS, a town of Japan, in the iſland of Niphon; 125 miles N.W. of Jedo.

ISMAELPOUR, a town of Hindooſtan, in Bahar; 38 miles S.W. of Patna.—Alſo, a town of Bengal; ſix miles E. of Boglipour.

ISMAIL, or Ismailow, a town of European Turkey, in the province of Beſſarabia, ſituated on the N. ſide of the Danube, about 33 miles from the Black ſea. The town meaſures about a mile toward the land, and half a mile by the ſide of the Danube, and was fortified by eight baſtions. The ramparts are in general 18 feet high, and in ſome places 25. The moat is from 30 to 40 feet deep, and at an intermediate diſtance between the polygons named Bender and Broek was a falſe trench. Near the town was a cavalier of ſtone-work, capable of holding ſome thouſand men. The ſide next the water was defended by ramparts and horizontal batteries. This place was taken by ſtorm, December 22, 1790, by the Ruſſians, under general Suwarrow. It is ſaid, that after the Turks had ſurrendered, the garriſon was put to death, and 30,000 men maſſacred in cold blood; the town was given up to the unreſtrained brutality of the victorious army. The booty found in the place was immenſe: 144 miles S.W. of Otchakov. N. lat. 45° 23′. E. long. 29° 45′.

ISMANING, a town of Bavaria, which gives name to a county, ſituated on the Iſer; eight miles N.N.E. of Munich.

ISMENIAS, in *Biography*, one of the moſt celebrated performers on the flute in antiquity, was a native of Thebes; and not leſs renowned for ſplendour, extravagance, and caprice, than for his ſkill in muſic. Having been taken priſoner by Atheas, king of the Scythians, he performed on the flute before this rude monarch; but though his attendants were charmed ſo much that they applauded him with rapture, the king laughed at their folly, and ſaid that he preferred the neighing of his horſe to the flute of this fine muſician.

Ælian tells us, that he was ſent ambaſſador into Perſia. Lucian, that he gave three talents, or 581*l.* 5*s.* for a flute at Corinth. Antiſthenes, not very partial to muſic, ſaid he was ſure that Iſmenias was a worthleſs fellow, by his playing ſo well on the flute. Plutarch relates the following ſtory of Iſmenias: being ſent for to accompany a ſacrifice, and having played ſome time without the appearance of any good omen in the victim, his employer became impatient, and, ſnatching the flute out of his hand, began playing in a very ridiculous manner himſelf, for which he was reprimanded by the company; but the happy omen ſoon appearing, there! ſaid he, to play acceptably to the gods, is their own gift! Iſmenias anſwered with a ſmile, "While I played, the gods were ſo delighted, that they deferred the omen, in order to hear me the longer; but they were glad to get rid of your noiſe upon any terms." Thus we ſee that neither vanity nor impiety is peculiar to modern muſicians.

The ſame author, in his life of Demetrius, informs us, that Iſmenias uſed to inſtruct his pupils by examples of excellent and execrable performance; letting them hear, immediately after each other, a good and a bad player on the flute; ſaying of the firſt, "this is the way you *ſhould* play;" and of the ſecond, "this is the way you ſhould *not* play." He is recorded by Pliny as a prodigal purchaſer of jewels, which he diſplayed with great oſtentation. Being at Cyprus, he found at a jeweller's an engraved emerald of the moſt exquiſite kind, repreſenting the princeſs Amyona, one of the daughters of Danaus, for which the jeweller aſked him five talents, with which demand Iſmenias immediately complied. But the jeweller, aſtoniſhed at his facility, and expecting that an abatement would have been required, offered, conſcientiouſly, to return two of the five talents; but the magnificent muſician refuſed to take them; ſaying, that it would for ever diminiſh the value of the gem. Upon this principle it ſeems as if the purchaſers of ſcarce books were fearful of acquiring them cheap; as their value is often more heightened by their price and margin than contents. And we are convinced that the innumerable crowds who flocked to the Pantheon in 1775, when the Agujari firſt ſung there, were not occaſioned by her merit or celebrity as a ſinger, but by her having 100*l.* a night for her performance; and who knows but that Mrs. Billington's high ſalaries may have contributed to her attractions, as well as her extraordinary talents?

ISMID, or Is Nickmid, in *Geography*, a town of Aſiatic Turkey, ſituated on a bay of the ſea of Marmora; where the Greeks and Armenians have each a church and an archbiſhop. This is ſuppoſed to have been the ancient Nicomedia,

media, the capital of Bithynia; 45 miles E.S.E. of Conſtantinople. N. lat. 40° 39′. E. long. 29° 34′.

Ismid, a town of Aſiatic Turkey, in Caramania; 24 miles E S.E. of Cogni.

ISMIL, a town of Aſiatic Turkey, in Caramania; 30 miles E. of Cogni.

ISMOKIL, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 63° 16′. E. long. 21° 20′.

ISNAGAR, or Isñajar, a town of Spain, in the province of Cordova, 10 miles S. of Lucena.

ISNARDI, in *Biography*, according to M. Laborde, "after ſinging, in his youth, on the ſtage with ſucceſs, quitted the theatre, and ſtudied compoſition and poetry. After which he publiſhed ſonnets, madrigals, and even ſhort dramas, ſet to muſic by himſelf. His works have been often reprinted." Now if Walther's dates are correct, and he gives authorities for them, Iſnardi muſt have ſung with ſucceſs on the ſtage before the lyric ſtage or operas had exiſtence; but we are unable to find a muſician of this name.

ISNARDIA, in *Botany*, was ſo named by Linnæus, in honour of M. Antoine Danti d'Iſnard, member of the Academy of Sciences, in the Memoires of which academy may be found ſeveral of his tracts on botany, publiſhed between the years 1716 and 1726.—Linn. Gen. 61. Schreb. 84. Willd. Sp. Pl. v. 1. 680. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. ed. 2. v. 1. 266. Juſſ. 333. Lamarck. Illuſtr. t. 77.—Claſs and order, *Tetrandria Monogynia*. Nat. Ord. *Calycanthemæ*, Linn. *Salicariæ*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, bell-ſhaped, permanent, divided into four, ſlightly ſpreading ſegments. *Cor.* none. *Stam.* Filaments four, ſhorter than the calyx, one placed within each ſegment of it; anthers ſimple. *Piſt.* Germen inferior; ſtyle cylindrical, longer than the ſtamens; ſtigma capitate. *Peric.* Capſule ſquare, of four cells, crowned by the calyx. *Seeds* numerous, oblong.

Eſſ. Ch. Corolla none. Calyx four-cleft. Capſule of four cells, crowned by the calyx.

Obſ. Linnæus has obſerved, in a MS. note to his own copy of the *Genera Plantarum*, that the baſe of the calyx is furniſhed with two awl-ſhaped bracteas adhering cloſely together.

1. I. *paluſtris*. Linn. Sp. Pl. 175. (Glaux major paluſtris, flore herbaceo; Bocc. Muſ. 105. t. 84. f. 2.) A native of rivers in France, Ruſſia, Jamaica, North America, &c. It flowers in July, and was firſt introduced at Kew by Dr. Fothergill, in 1776.—"In general appearance this plant greatly reſembles *Peplis Portulaca*. It is creeping and floating. *Flowers* axillary, oppoſite, ſeſſile, green."—*Leaves* obovate, wedge-ſhaped at the baſe, veined and ſmooth. *Seeds* brown.—Swartz has deſcribed a plant in his *Fl. Ind. Occ. v.* 1. 273, under the name of *Ludwigea repens*, which he ſays differs only from *Iſnardia paluſtris* in being furniſhed with petals.

ISNARI, Paolo, of Ferrara, in *Biography*, a diſciple of the celebrated muſician Manara, maeſtro di cappella of the Duomo in that city, and a voluminous compoſer of church muſic, flouriſhed in the latter end of the ſixteenth century. In 1565, he publiſhed his "Cantus Hebdomadæ Sanctæ," or Muſic for Paſſion Week: in 1568, ſix-part maſſes: in 1578, the Veſper pſalms in three parts, and three Magnificats in four parts. This laſt work was reprinted at Milan, 1590.

ISNELLO, in *Geography*, a town of Sicily, in the valley of Demona; 13 miles S. of Cefalu.

ISNIK, a town of Aſiatic Turkey, in Natolia, ſituated on a lake of the ſame name, called by the ancients Aſcanius, that abounds with fiſh, and that communicates with the ſea of Marmora. The chief article of its trade is ſilk. It is the ſee of a Greek archbiſhop, though it contains ſcarcely 300 houſes. It was anciently called "Nice," and famous for its council; 60 miles E. of Conſtantinople. N. lat. 40° 16′. E. long. 29° 50′.

ISNY, or Ysni, a town of Germany, lately imperial, ſituated in the Algau, betwixt the counties of Hoheneck and Trauchburg, and the lordſhip of Eglof. The magiſtrates and greateſt number of the citizens are Lutherans. It has often ſuffered by fire; 40 miles S. of Ulm. N. lat. 47° 45′. E. long. 9° 58′.

ISOCHRONAL, or Isochronous, is applied to ſuch vibrations of a pendulum, as are performed in equal times.

Of which kind are all the vibrations or ſwings of the ſame pendulum, whether the arcs it deſcribes be longer or ſhorter; for when it deſcribes a ſhorter arc, it moves ſo much the ſlower; and when a long one, proportionably faſter. See Pendulum.

Isochronal *Line*, is that wherein a heavy body is ſuppoſed to deſcend without any acceleration.

Leibnitz, in the Act. Erud. Lipſ. for April 1689, has a diſcourſe on the *linea iſochrona*, in which he ſhews, that a heavy body, with a degree of velocity acquired by its deſcent from any height, may deſcend from the ſame point by an infinite number of iſochronal curves, which are all of the ſame ſpecies, differing from one another only in the magnitude of their parameters; ſuch as are all the quadrato-cubical paraboloids, and conſequently ſimilar to one another. He ſhews alſo how to find a line, in which a heavy body deſcending, ſhall recede uniformly from a given point, or approach uniformly to it. See Cycloid.

ISOCHRONOUS Parcels, in *Muſic*. Mr. John Holden labours in his "Eſſay towards a rational Syſtem of Muſic," to eſtabliſh it as a principle, that "there is a certain propenſity in our mind to be ſubdividing the large numbers (of equal and equidiſtant objects) into ſmaller equal parcels: or, as it may be juſtly called, compounding the large numbers of ſeveral ſmall *factors*, and conceiving the whole by means of its parts," p. 288. "Seven, we conceive, as two threes diſjoined, and one in the middle; five becomes two twos diſjoined, and one in the middle," p. 289; and again, p. 305, "we readily conceive five by its affinity to four, and ſeven by its affinity to ſix," p. 292. "Among the iſochronous ſingle vibrations of muſical ſounds, the mind naturally ſeeks to conſtitute iſochronous compound parcels."—"The ſize or magnitude of a muſical interval is eſtimated by the *inequality* of the iſochronous parcels of vibrations of its two terms; and in proportion as their iſochronous parcels differ more from equality, the included interval becomes greater," p. 327. The above extracts ſhew the nature and uſes to which this author attempts to apply his iſochronous parcels of vibrations; in which we can ſcarcely admit him to have been more ſucceſsful, than in the application of the Grave *Harmonics* (ſee that article), or Tartinian ſounds, to accounting for the conſtitution of the muſical ſcale; the incongruous ſyſtem of intervals to which theſe fancies lead, will be ſeen in our article Holden's *Syſtem of Muſical Intervals*.

ISOCRATES, in *Biography*, a celebrated Greek rhetorician, was born at Athens about the year 436 B. C. He received a good education, but his father, being ruined by the Peloponneſian war, left him no other inheritance. He had ſtudied under Gorgias, Prodicus, and other great maſters of eloquence, but the weakneſs of his voice, and his want of a proper degree of confidence, prevented him from exerciſing the talent of ſpeaking in public. He employed himſelf, therefore, in compoſing diſcourſes in his cloſet, and in teaching the art of rhetoric. He was the inſtructor of Timotheus, ſon of Conon, whom he afterwards accompanied to ſeveral parts of Greece as his ſecretary. He had numerous ſcholars at Athens, and was amply remunerated for ſome of his writings, particularly for a diſcourſe which he addreſſed to Niocles, king of Cyprus, for which he received a ſum equal to between four and five thouſand pounds of our money. Though courted by the great, he had an ardent mind in defence of what was juſt and right. When Theramenes, proſcribed by the thirty tyrants, took refuge at the altar, he pleaded in his defence, at the hazard of ſharing his fate; and after the death of Socrates, when all his diſciples took flight, he dared appear in mourning in the public ſtreets of Athens. He paſſed a long life in peace and honour, and had reached his ninety-eighth year at the fatal battle of Cheronæa, when, unable to bear the calamity which had befallen his country, he abſtained from all ſuſtenance for four days, and expired. It was mentioned, to his praiſe, that he never, by writing or accuſation, injured a ſingle individual. A ſtatue of bronze was raiſed to his memory by Timotheus, and another by his adopted ſon Aphareus. The ſtyle of Iſocrates is pure, ſweet, and flowing: he was extremely attentive to the harmony of his periods, and he is reckoned by Cicero as the firſt who introduced into Greek proſe that melody of which it is ſuſceptible. He ſpent a deal of time in poliſhing his compoſitions; his panegyric on Athens is ſaid to have coſt him ten years labour. Twenty-one of his diſcourſes remain, which have been diſtributed into the moral, the deliberative, the panegyrical, and the agoniſtical. Moreri.

ISOETES, in *Botany*, an old name for one of the ſmaller kinds of *Sedum*, from ισος, *equal*, and ετος, *the year*, as being evergreen. It is for the ſame reaſon adopted by Linnæus for the preſent genus. Linn. It. Scan. 417. t. 419. Gen. 561. Schreb. 755. Mart. Mill. Dict. v. 2. Sm. Fl. Brit. 1144. Juſſ. 17. Lamarck Dict. v. 3. 314. Illuſtr. t. 862. (Calamaria: Dill. Muſc. 540. t. 80. f. 1.) Claſs and order, *Cryptogamia Filices*. Nat. Ord. *Filices*.

Gen. Ch. Male, *Flowers* ſolitary, within the baſe of the inner leaves. *Cal.* a heart-ſhaped, acute, ſeſſile ſcale. *Cor.* none. *Stam.* Filament none; anther roundiſh, of one cell, compreſſed, convex on one ſide, concave on the other, ſtanding on the calyx.—Female, *Flowers* ſolitary, within the baſe of the outer leaves of the ſame plant. *Cal.* as in the male. *Cor.* none. *Piſt.* Germen ovate, ſtanding on the calyx, within the leaf; ſtyle none; ſtigma . . . *Peric.* Capſule membranous, nearly ovate, concealed within the baſe of the leaf. *Seeds* numerous, angular, rough.

Eſſ. Ch. Male within the baſe of the inner leaves. Anthers ſolitary, ſtanding on the heart-ſhaped calyx. Female within the baſe of the outer leaves. Germen ſtanding on the heart-ſhaped calyx. Capſule membranous. Seeds many, angular, rough.

1. I. *lacuſtris.* Common Quillwort.—Linn. Sp. Pl. 1563. Engl. Bot. t. 1084. Bolt. Fil. 74. t. 41. (Subularia vulgaris erecta, folio rigidiſſimo; Raii Syn. 306.)—Fronds awl-ſhaped, ſemi-cylindrical, rather ſpreading. Capſules roundiſh, of two cells. Seeds granulated all over.—Found under water, about the margins of alpine lakes in various parts of Europe. In thoſe of Wales, Scotland, and Weſtmoreland, it is abundant, making a ſort of coarſe evergreen turf, much below the ſurface. The *root* is perennial, tuberous, throwing out many long ſimple fibres. *Leaves* or *fronds* numerous, tufted, ſimple, awl-ſhaped, from three to twelve inches high, rather ſpreading upwards, and often recurved, ſemi-cylindrical, ſmooth, divided internally into four longitudinal cells or tubes, with numerous tranſverſe partitions. The baſe of each leaf is ſomewhat dilated, and bordered with a membrane, the *fructification* being ſituated on the inner ſide, under the cuticle, that of the inner leaves being male, the outer female. What ſupports the anther in one flower, the germen in another, may be termed either a calyx or receptacle. The ripe *capſule* is nearly as large as a ſplit pea, browniſh, thin, and membranous; we find it divided into two cells by a tranſverſe ſtricture or partition, notwithſtanding what Schreber has mentioned to the contrary, apparently from Oeder. The *ſeeds* are numerous, ſmall, white, rough all over with minute granulations.

2. I. *ſetacea.* Slender Quillwort. Lamarck Dict. v. 3. 314.—Fronds briſtle-ſhaped, nearly round, erect.—Lamarck mentions this as very different from the former in the ſlenderneſs and ſtraightneſs of its *leaves*, which are only about 2½ inches high. The *root* alſo is entirely fibrous, not tuberous. It was found by the abbé Bonnaterre, growing three or four feet under water, in the lake of St. Andréol, on the mountains of Aubrac, in Gévaudan. We have had no other tidings of this ſpecies, but ſhould expect to find it in Britain.

3. I. *unilocularis.* Indian Quillwort.—Roxb. MSS.—Fronds ſomewhat triangular, erect. Capſules elliptical, of one cell. Seeds granulated on one ſide, triangular on the other.—Sent from the coaſt of Coromandel by Dr. Roxburgh. Koenig ſent what appears certainly to be the ſame, in a younger ſtate, to Linnæus by the name of *I. indica*, as found in ponds on a ſandy ſoil, in December. In theſe latter ſpecimens the *root* of each is a globoſe tuber. *Fronds* about ſix, erect, ſtraight, ſlender, obſcurely triangular, with a broad membranous baſe. *Fructification* too young to be diſcernible. Dr. Roxburgh's ſpecimens conſiſt of ſeparate *fronds*, larger than the former, as being more advanced, but otherwiſe exactly ſimilar, the baſe of each winged with a broad membrane, and lodging an elliptical, ſlightly compreſſed, membranous, browniſh *capſule*, from above half an inch to near an inch long, of one cell, whoſe inſide is lined with innumerable compreſſed membranous ſtalks, each bearing a beautiful white *ſeed*, convex and granulated below, triangular and ſmooth above. A ſpongy body, above the capſule, but, in our ſpecimens, disjointed from it, is lodged in the ſubſtance of the leaf, and the ſame is indicated by the figure of the firſt ſpecies in Engl. Bot. in both male and female flowers, as well as by Linnæus in his *Iter Scanicum*. Having never had an opportunity of tracing the progreſs of the fructification, we are not certain whether this be the part called ſometimes calyx, ſometimes receptacle, but if ſo, the capſule is reverſed. S.

ISOLA, in *Geography*, a town of Naples, in Calabria Ultra, the ſee of a biſhop, ſuffragan of St. Severina, from which it is diſtant S.E. 15 miles. N. lat. 39° 4'. E. long. 17° 24'.—Alſo, a town of Iſtria, ſeated on an iſthmus which extends far into the ſea, the environs of which are celebrated for wine; 7 miles S. of Capo d'Iſtria. N. lat. 45° 37'. E. long. 13° 40'.

Isola *Alta*, a town of Italy, in the department of the Mincio; 11 miles N.N.E. of Mantua.

Isola *de Dovareſi*, a town of Italy, in the department of the Upper Po, on the Oglio; 12 miles N.E. of Cremona.

Isola *Poccarizza*, a town of Italy, in the department of the Mincio; 18 miles N.E. of Mantua.

Isola *Groſſa*. See Grossa.

Isola *delle Femine*, a ſmall iſland near the W. coaſt of Sicily, which was formerly a place of baniſhment for women.

Isola *Sacra*, a ſmall iſland at the mouth of the Tiber, near Oſtia.

Isola *delle Scala*, a town of the Veroneſe; 13 miles S. of Verona.

ISOLACCIO, a town of the iſland of Corſica; 38 miles N. of Porto Vecchio.

ISOLEPIS, in *Botany*, from ισος, *equal* or *uniform*, and λεπις, a *ſcale*, a genus ſeparated from *Scirpus* by Mr. Brown, in his Prodr. Nov. Holl. v. 1. 221, on account of the want of briſtles at the baſe of the germen or ſeed, by which alone it is diſtinguiſhed; a mark, if conſtant, certainly ſufficient in ſo difficult a tribe. Twelve New Holland ſpecies are defined by this author, amongſt which are *Scirpus fluitans*, *ſupinus*, *ſetaceus*, and *capillaris* of Linnæus; *nodoſus* and *prolifer* of Rottboll; with ſix never before deſcribed.

ISOLETTA, in *Geography*, a town of Italy, in the department of the Mela; 15 miles S. of Breſcia.

ISOMERIA, formed of ισος, *equal*, and μερις, *part*, in *Algebra*, a method of freeing an equation from fractions, by reducing all the fractions to one common denominator, and then multiplying each member of the equation by that common denominator.

This amounts to the ſame with what is otherwiſe called converſion of equations. See Conversion *of Equations*.

ISONA, in *Geography*, a town of Spain, in Catalonia; 24 miles N. of Balaguer.

ISONEMA, in *Botany*, from ισος, *equal*, and νημα, *a thread* or *ſtamen*. Brown. Mem. of the Wernerian Society, v. 1. 63.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Contortæ*, Linn. *Apocineæ*, Brown.

Eſſ. Ch. Corolla ſalver-ſhaped; its mouth and tube without ſcales; limb in five deep ſegments. Stamens prominent; filaments inſerted into the mouth, ſimple at the top; anthers arrow-ſhaped, adhering to the ſtigma by their middle part. Germens two; ſtyle one, thread-ſhaped; ſtigma thick, obtuſe. No ſcales beneath the germen. Pouches . . .

The above characters are taken from a ſhrub gathered on the African coaſt, near Sierra Leone, by Smeathman, and preſerved in the Bankſian herbarium. It is hairy, apparently erect, with oppoſite *leaves*. *Panicle* terminal, oppoſitely divided, corymboſe. Leaves of the *calyx* with a double ſcale at their baſe on the inſide. Tube of the *corolla* half an inch long, cylindrical, bearded in the middle within. Brown.

ISOPERIMETRY, in *Mathematics*, is a branch of the higher geometry, which treats of the properties of iſoperimetrical figures, *viz.* of ſurfaces contained under equal perimeters; of ſolids under equal ſurfaces; curves of equal lengths, &c. Of the foregoing heads, the two firſt may be conſidered as containing the elements of the ſcience, which relate principally to the *maxima et minima* of different ſurfaces and ſolids, when bounded by figures of equal perimeters, but of a greater or leſs number of ſides, and poſited in a different order. The other part, which relates to the *maxima et minima* of curves, treats of problems of another kind, and of the moſt difficult nature which have engaged the attention, and exerciſed the talents, of many of the greateſt mathematicians of modern times; as Newton, Leibnitz, the Bernouillis, Euler, Lagrange, &c. and gave riſe to many warm and even rancorous diſputes, particularly between the brothers John and James Bernouilli, which we ſhall mention more particularly in the ſubſequent part of this article, after having given a ſlight hiſtorical ſketch and view of the more elementary parts of this intereſting branch of mathematical inquiry.

The problems in which it is required to find, among figures of the ſame or different kinds, thoſe which, within equal perimeters, ſhall comprehend the greateſt ſurfaces, and thoſe ſolids which, under equal ſurfaces, ſhall contain the greateſt volume, had long engaged the attention of mathematicians before the invention of fluxions, and different methods had been deviſed for the ſolution of them by Des Cartes, Fermat, Sluze, Hudde, and others; but theſe were all ſupplanted by the ſimplicity and generality of the new analyſis; after which time the elements of the ſcience ſeem to have been loſt ſight of by mathematicians, who were all engaged in the ſolution of the higher order of iſoperimetrical problems.

Simpſon was the firſt who condeſcended to treat of the more elementary parts of this ſcience, by giving, in his Geometry, a very intereſting chapter on the maxima and minima of geometrical quantities, and ſome of the ſimpleſt problems concerning iſoperimeters. The next who treated the ſubject in an elementary manner was Simon L'Huillier of Geneva, who, in 1782, publiſhed his treatiſe "De Relatione mutua Capacitatis et Terminorum Figurarum," &c. His principal object in the compoſition of that work was to ſupply the deficiency in this reſpect, which he found in moſt of the elementary courſes, and to determine, with regard to both the moſt uſual ſurfaces and ſolids, thoſe which poſſeſs the minimum of contour with the ſame capacity; and reciprocally, the maximum of capacity with the ſame boundary. Legendre has alſo conſidered the ſame ſubject, in his "Elemens de Géométrie;" Dr. Hutton, in his "Courſe of Mathematics;" and Dr. Horſley, in the Philoſophical Tranſactions, vol. lxxv. for 1775.

Elements of Iſoperimetry.

Proposition I.—Of all triangles that can be contained under any two given right lines, and any other line joining their extremities, that will be the greateſt that has the two given lines perpendicular to each other. *Fig.* 1. *Iſoperimetry. Plate* IX. *Geometry.*

Let A B and B D be the given lines, then will the triangle A B D, in which they are perpendicular to each other, be the greateſt: for let B C = B D, and the angle A B C either greater or leſs than the right angle A B D; and let alſo C F be drawn parallel to A B, and meeting B D in F; and join A F, A C, A C′.

Then the < B F C being a right angle, it is evident that B C, or B D, is greater than B F, and therefore the triangle A B D, being greater than the triangle A B F, is alſo greater than its equal A B C. Q. E. D.

The ſame may be otherwiſe demonſtrated, thus:—Aſſume either of the two given ſides for the baſe of the triangle; then the area being directly as the perpendicular let fall upon that ſide from the oppoſite extremity of the other given ſide, the ſurface will be the greateſt when that perpendicular is the greateſt, that is, when the other ſide is not inclined to that perpendicular, but coincides with it; hence the area is a maximum when the two given ſides are perpendicular to each other. Q. E. D.

Prop. II.

Of all triangles of the ſame baſe, and whoſe vertices fall in a right line given in poſition, the one whoſe perimeter is a minimum, is that whoſe ſides make equal angles with the given line. *Fig.* 2.

Let A B be the common baſe of a ſeries of triangles A B C, A B C′, whoſe vertices C, C′, fall in the right line L M, given in poſition; then is the triangle of leaſt perimeter, that whoſe ſides A C, B C, make equal angles with the line L M.

For, let B L be drawn from B perpendicular to L M, and produce it to D, till D M = B M, and join D A; and from the point C, where this line interſects L M, draw C B ; and alſo from any other points C', C'', aſſumed in L M, draw $C' A$, $C' B$, $C' D$; then it is obvious, that $C' D$, $C D$, $C'' D$, are reſpectively equal to $C' B$, $C B$, $C'' B$, and therefore $A C' + C' B = A C' + C' D$, and $A C + C B = A C + C D = A D$; and conſequently, ſince two ſides of a triangle are greater than the third ſide, we have $A C' + C' D > A D$, or $(A C' + C' B) > (A C + C B)$; and the ſame is true of any other point C' in the line L M; therefore $A C + C B$ is leſs than any other two lines that can be drawn from A, B, to meet in the line L M, and conſequently $A B + A C + C B$ is the triangle, having the minimum perimeter, and it has its ſides meeting L M at equal angles, as is evident, Q. E. D.

Cor.—Of all lines drawn from two given points, to meet in a line given in poſition, the ſum of thoſe two ſhall be the leaſt, that make equal angles with the given line.

Prop. III.

Of all triangles having the ſame baſe, and the ſum of the other two ſides the ſame, the iſoſceles is the greateſt. *Fig.* 3.

Let A C B be an iſoſceles triangle on the baſe A B, and A D B a triangle on the ſame baſe, having its two ſides $A D + D B = A C + C B$; then will A B C be the greateſt triangle.

Firſt draw C H perpendicular to A B, and D E F parallel to A B, interſecting C H (produced if neceſſary) in the point E ; likewiſe let A E and B E be drawn.

Now it is evident, that the angles A E F and B E D are equal, and conſequently by Prop. II. $A E + E B$ is leſs than $A D + D B$, or leſs than the equal ſum $A C + C B$; therefore the point E, and conſequently the whole triangle A E B, muſt fall within the triangle A C B, and therefore the triangle A E B, or its equal A D B, is leſs than A C B. Q. E. D.

Prop. IV.

Of all triangles ſtanding on the ſame baſe, and having the ſame vertical angle, the iſoſceles one is the greateſt. *Fig.* 4.

For ſince all triangles whoſe baſes and vertical angles are equal have their vertices in the ſame circular ſegment, it is obvious, that the iſoſceles triangle A B C is that which has the greateſt perpendicular; and ſince triangles whoſe baſes are given, are as their perpendiculars, it follows that the iſoſceles triangle, which has the greateſt perpendicular, will alſo have the greateſt ſurface. Q. E. D.

Prop. V.

Of all right lines that can be drawn through a given point, between two right lines given in poſition, but not parallel, that which is biſected by the given point forms, with the other two lines, the leaſt triangle. *Fig.* 5.

Let A B, B C be any two lines given in poſition, and D the given point ; then I ſay that the line E D F, which is biſected in the point D, makes with the two given lines A B, B C the leaſt triangle. For if E I be drawn parallel to B C, meeting G H in I, the equi-angular triangles D F H, and D E I, will be equal, becauſe $E D = F D$; and D F H will therefore be greater, or leſs, than D E G, according as B G is leſs, or greater, than B E ; in the latter caſe, let the ſpace D E B H be added to both, ſo ſhall F E B be leſs than G H B ; and if in the former caſe, D G B F be added, then will H G B be greater than F E B ; and conſequently F E B, in this caſe alſo, leſs than H G B. Q. E. D.

Cor.—If D M and D N be drawn parallel to B C and B A, the two equal triangles D E M and D F N, taken together (ſince $E M = D N = M B$), will be equal to the parallelogram D M B N ; and therefore this parallelogram is equal to half the triangle F E B, but leſs than half the triangle B G H ; whence it follows, that a parallelogram is always leſs than half the triangle in which it is inſcribed, except when the baſe of the one is half the baſe of the other, in which caſe the parallelogram is exactly equal to half the triangle, which is the maximum parallelogram that can be inſcribed in any triangle.

Scholium.—From the preceding corollary it might be demonſtrated, that the leaſt triangle that can poſſibly be deſcribed about, and the greateſt parallelogram that can be inſcribed within, any curve, concave to its axis, will be when the ſubtangent is equal to half the baſe of the triangle, or to the whole baſe of the parallelogram.

Prop. VI.

Of all right-lined figures, contained under the ſame number of ſides, and inſcribed in the ſame circle, that is the greateſt whoſe ſides are all equal. *Fig.* 6.

For, if poſſible, let ſome polygon, A B C E F, whoſe ſides C E, F E, are unequal, be the greateſt ; and let C D F be an iſoſceles triangle, deſcribed in the ſame ſegment with C E F which, being greater than C E F by Prop. IV. the whole polygon A B C D F is greater than the polygon A B C E F, whereas we have ſuppoſed the latter to be the greateſt, which is abſurd ; therefore the polygon which has all its ſides equal is the greateſt. Q. E. D.

Cor. 1.—It follows, with reference to the ſame figure, that of all right-lined figures, contained under the ſame perimeter, and of the ſame number of ſides, the greateſt is that which has all its ſides equal.

For if A B C E F be ſuppoſed the greateſt, in which the ſides C E and E F are unequal, then the triangle C E F would be greater than the triangle C D F, the ſum of the ſides in both caſes being equal ; but, ſince C D F is an iſoſceles triangle, it is greater than any other on the ſame baſe, and of equal perimeter, Prop. III. ; therefore D C and D F muſt be equal, and the ſame may be demonſtrated of any other two unequal ſides.

Cor. 2.—Hence again it follows, that of all right-lined figures, contained under the ſame number of ſides, and of equal perimeters, the greateſt is that which may be inſcribed in a circle ; the figure being a regular polygon by the foregoing corollary.

Prop. VII.

Of all rectilinear figures, in which all the ſides except one are given, the greateſt is that which may be inſcribed in a ſemicircle, whoſe diameter is that unknown ſide. *Fig.* 7.

For conceive A B C D E F to be a rectilinear figure, that is not inſcribable in a ſemicircle, and draw any two lines A D, F D, from the extremities of the ſide A F, to any angle of the figure ; then it is obvious, that the whole figure will be the greateſt when the triangle A D F is the greateſt, but this will be Prop. I. when A D F is a right angle, and in the ſame manner we find that A C F is a right angle, and ſo on ; and conſequently when the figure is inſcribed in a ſemicircle, of which the unknown ſide is the diameter, its ſurface will be the greateſt. Q. E. D.

Prop. VIII.

Of all figures, made with ſides given in number and magnitude,

nitude, that which may be inſcribed in a circle is the greateſt. *Figs.* 8. and 9.

Let $ABCDE$, &c., and $abcde$, &c. be two polygons, of which the ſides of the one are reſpectively equal to the ſides of the other; that is, $AB = ab$, $BC = bc$, $CD = cd$, &c., the firſt of which is inſcribed in a circle, but the other not inſcribable; then I ſay, that the polygon $ABCDE$, &c. that is inſcribed in a circle, is greater than the polygon $abcde$, &c. which is not ſo.

For draw the diameter EP; join AP, BP; and upon $ab = AB$ make the triangle apb equal in all reſpects to the triangle APB, and join ep. Then of the two figures $cdcbp$, and $pagfe$, one at leaſt is not by (hyp.) inſcribable in a ſemicircle, of which ep is the diameter, conſequently one at leaſt of theſe two figures is ſmaller than the correſponding part of the figure $ABCDE$, &c.; and therefore the whole of this laſt figure $ABCDEFGP$ is greater than the other whole figure $abcdefgp$; and if from each of theſe there be taken away the equal triangles APB, and apb, there will remain the polygon $ABCDE$, &c. greater than the polygon $abcde$, &c. Q. E. D.

Cor.—The magnitude of the greateſt polygon which can be contained under any number of unequal ſides, does not at all depend upon the order in which thoſe lines are connected with each other. For ſince in all caſes it muſt be inſcribable in a circle, it may always be divided into the ſame number of iſoſceles triangles, which will be reſpectively equal in all caſes.

Prop. IX.

Of all polygons circumſcribed about the ſame or equal circles, that has the greateſt ſurface which has the greateſt perimeter. For conceive radii to be drawn from the centre of the circle to each of the points of contact, then it is obvious that the area of the polygon will be equal to the rectangle of the radius into half the perimeter of the figure; therefore the area being as the perimeter, it follows that the polygon, having the greateſt perimeter, will have the greateſt area. Q. E. D.

Cor. 1.—Hence the area of any polygon circumſcribed about a circle, is to the area of the circle, as the perimeter of the former is to the circumference of the latter. Alſo, the area of different polygons circumſcribed about the ſame, or equal circles, are to each other as their perimeters.

Cor. 2.—If a circle and a polygon, circumſcribable about another circle, are iſoperimeters, they will be to each other as the radii of the circles.

Prop. X.

The circle is greater than any rectilinear figure of the ſame perimeter; and it has a perimeter leſs than any rectilinear figure of equal ſurface. *Figs.* 10. and 11.

Let the circle PQ, and the polygon $ABCDEF$, be iſoperimeters; then I ſay that the circle is greater than the polygon.

For firſt, whatever may be the number of ſides of the polygon, it will be the greateſt under the ſame perimeter when the polygon is regular, Cor. 1. Prop. VI.; and conſequently there may be a circle inſcribed within it, the area of which circle will be evidently leſs than the area of the polygon, and therefore by Cor. 1. of the preceding propoſition, the circumference of this circle will be leſs than the perimeter of the polygon, or leſs than that of the circle PQ; and conſequently, alſo, the radius of the former will be leſs than the radius of the latter. But by Cor. 2. Prop. IX. the area of the circle PQ, is to the area of the polygon, as the radius of the circle PQ is to the radius of the circle ab; and therefore the area of the former is greater than the area of the latter; that is, a circle is greater than any right-lined figure of equal perimeter.

Again, converſely, if the areas are equal, the circumference of the circles is leſs than the perimeters of the polygon.

For conceive a circle to be made whoſe circumference is equal to the perimeter of the polygon, then will this circle be greater than the polygon by what is proved above, and conſequently greater than that circle which is equal to the polygon; and therefore its circumference will alſo be greater, that is, the perimeter of the polygon will always be greater than the circumference of a circle of equal ſurface. Q. E. D.

Prop. XI.

The greateſt rectangle, that can be contained under the two parts of a line, any how divided, will be when the line is biſected.

Let AB be a line that is biſected in C, then will $AC \times CB$ be greater than $AD \times DB$, D being any other point in the line AB.

For $AC \times CB = AC^2$, but $AD \times DB = (AC - DC) \times (AC + DC) = AC^2 - DC^2$; conſequently the firſt rectangle is the greateſt. Q. E. D.

Prop. XII.

The greateſt ſolid that can be contained, under the three parts of a given line, any way taken, will be that in which the three parts are equal to each other.

For ſuppoſing the point C fixed, then the rectangle of the two parts $AD \times DC$, will be the greateſt when $AD = DC$ (by Prop. XI). In the ſame way, if any other point be ſuppoſed fixed, as D, then will the rectangle $DC \times CB$ be the greateſt when $DC = CB$, and conſequently the ſolid $AD \times DC \times CB$ will be the greateſt when theſe parts are all equal. Q. E. D.

Cor.—Hence of all parallelopipedons having the ſum of their dimenſions the ſame, the cube is that which has the greateſt capacity.

Prop. XIII.

A line being divided into two parts, the ſolid that is contained under one of thoſe parts, and the ſquare of the other, will be the greateſt when the latter part is double the former.

Let AB be divided into two parts in the point C, making $AC = 2\,CB$, then will $AC^2 \times CB$ be greater than when C is taken in any other part of the line AB.

For in whatever part of the line AB the point C be taken, the point AC may be biſected in D, and then we ſhall have $AC^2 \times CB =$ four times $AD \times DC \times CB$, but this laſt is the greateſt when $AD = DC = CB$ (Prop. XII.) therefore the former is the greateſt when $AC = 2\,CB$. Q. E. D.

Prop. XIV.

Of all priſms of equal altitudes, and whoſe baſes are alſo equal, and like, the right priſm has the ſmalleſt ſurface.

For the area of each face of the priſm is proportional to its height; and therefore the area of each face is the ſmalleſt when its height is the ſmalleſt, that is, when it is equal to the altitude of the priſm, which is evidently when the priſm is a right one. Q. E. D.

Cor.—And hence, converſely, of all priſms whoſe baſes are equal and like, and whoſe lateral ſurface is the ſame, the right priſm has the greateſt altitude and capacity.

Prop. XV.

A cylinder has a leſs ſurface than any priſm of equal baſe and altitude.

For ſince the baſes and altitudes are equal by hypotheſis, the ſurfaces will be greater or leſs, as the lateral ſurfaces are greater or leſs; but theſe will be as the perimeters of the ſolid baſes, of which that of the cylinder will be the leaſt, being a circle (by Prop. X.), and conſequently the cylinder is that which has the leaſt ſurface.

Cor. 1.—And again converſely, of all ſolids on equal baſes, and whoſe ſurfaces are alſo equal, the cylinder is that which has the greateſt capacity.

Cor. 2.—In the ſame manner (by Prop. VI. Cor. 1.) it may be demonſtrated, that of all right priſms of the ſame altitude, and whoſe baſes are equal, and of the ſame number of ſides; that has the leaſt ſurface whoſe baſe is a regular figure, and therefore when the priſm is a parallelopiped the baſe is a ſquare.

Cor. 3.—And again, of all right priſms, whoſe altitudes and ſurfaces are equal, and whoſe baſes have a given number of ſides, that which has a regular figure for its baſe is the greateſt; and therefore when the priſm is a parallelopiped the baſe is a ſquare.

Prop. XVI.

Of all right parallelopipeds, given in magnitude, that which has the ſmalleſt ſurface has all its faces equal, or is a cube: and reciprocally of all parallelopipeds of equal ſurface, the greateſt is a cube.

For by the foregoing corollaries, the right parallelopiped, having the ſmalleſt ſurface, with the ſame capacity, or the greateſt capacity with the ſame ſurface has a ſquare for its baſe: but any face whatever may be taken for the baſe: therefore in the parallelopiped, whoſe ſurface is the ſmalleſt with the ſame capacity, or whoſe capacity is the greateſt with the ſame ſurface, has neceſſarily every two of its oppoſite faces ſquares, and conſequently it is a cube. Q. E. D.

Prop. XVII.

Of all cylinders of the ſame capacity, that has the leaſt ſurface whoſe altitude is equal to the diameter of its baſe. *Figs.* 12. and 13.

Let A B C D, and *a b c d*, be two cylinders of equal capacity, and of which the firſt, A B C D, has its altitude equal to the diameter of its baſe, and the other any cylinder whoſe dimenſions are not the ſame with the firſt, then I ſay the cylinder A B C D has the leaſt ſurface.

For conceive each of theſe cylinders to be circumſcribed by a ſquare priſm, then will the capacities of theſe priſms be alſo equal; and their ſurfaces will be to each other as the ſurfaces of the cylinders that they circumſcribe, as is evident from (Cor. 1. Prop. IX.); and therefore reciprocally, the ſurfaces of the cylinders will be to each other as the ſurfaces of the priſms: but ſince theſe priſms have equal capacities, that which circumſcribes the cylinder A B C D has the leaſt ſurface, becauſe it is a cube (Prop. XVI.); and conſequently, the ſurface of that cylinder is the leaſt alſo. Q. E. D.

Cor.—In a ſimilar manner it is demonſtrated, that of all cylinders of the ſame ſurface, that has the greateſt ſolidity whoſe altitude is equal to the diameter of its baſe.

Iſoperimetrical Problems.—We have before obſerved, that the theorems relating to the ſurfaces and ſolidities of bodies, of equal perimeters, might be conſidered as forming the elements of iſoperimetry, and which, as we have ſeen, are demonſtrable from the ſimple elements of geometry; while thoſe relating to the *maxima et minima* of curves are of the higheſt order of problems; which have called into action the talents, and excited the paſſions, of ſome of the ableſt geometers of modern times, having led to a diſpute, which, for want of impartial and competent judges, remained undecided for many years, and which has ſince been termed "the war of problems," on account of the great intereſt it excited, and the determined and able manner in which each party ſupported its opinion, and conteſted that of its opponent; and as this diſpute cannot but be conſidered as one of the moſt memorable events in the hiſtory of the modern analyſis, we ſhall preſent the reader with an abſtract of it, ſo far as it relates to iſoperimetry, referring him for further information to the "Hiſtoire des Mathematiques," by Montucla, vol. iii. p. 322, and to Boſſut's "Hiſtory of Mathematics," p. 331; and alſo to an intereſting little treatiſe on this ſubject, lately publiſhed by Mr. Woodhouſe of Caius college, Cambridge.

The firſt problem which can be ſaid to relate to this claſs, was propoſed by Newton in his "Principia," which was that of the ſolid of leaſt reſiſtance. But the ſubject and doctrine did not become a matter of diſcuſſion and controverſy, till John Bernouilli required of mathematicians the determination of the curve of quickeſt deſcent, in a paper publiſhed in the Leipſic acts for June 1696, under the following form:

Problema Novum

ad cujus ſolutionem mathematici invitantur.

"Datis in plano verticali duobus punctis A et B, aſſignare mobili M, viam A M B, per quam gravitate ſua deſcendens, et moveri incipiens a puncto A, breviſſimo tempore perveniat ad altrum punctum B." *Fig.* 14.

At the firſt view of this problem, it would be imagined, that a right line, as it is the ſhorteſt path from one point to another, muſt likewiſe be the line of ſwifteſt deſcent: but the attentive geometer will not haſtily aſſert this, when he conſiders that in a concave curve deſcribed from one point to another, the moving body deſcends at firſt in a direction more approaching to a perpendicular, and conſequently acquires a greater velocity than down an inclined plane; which greater velocity is to be ſet againſt the length of the path, which may cauſe the body to arrive at the point B ſooner through the curve than down the plane. Metaphyſics alone, therefore, cannot ſolve the queſtion; in fact it requires the utmoſt accuracy of mathematical inveſtigation and calculation, the reſult of which ſhews that the path required is a cycloid reverſed, as we ſhall ſee in what follows, being at that time a new and remarkable property of this curve, which the reſearches of Huygens and Paſcal had previouſly rendered ſo celebrated. See Cycloid.

According to Boſſut, Leibnitz reſolved this problem the ſame day on which he received it, but that he and John Bernouilli agreed to keep back their ſolutions; but the fact of Leibnitz having obtained a correct ſolution ſeems to be very doubtful; at all events, at the expiration of ſix months, the time allowed, no ſolution was publiſhed, and the time was accordingly enlarged to one year, during which period the ſolutions of James Bernouilli, Newton, and the marquis de l'Hôpital appeared; Bernouilli's and Newton's were both given in the Acta. Erud. Lipſ. for May 1697, but the latter without a name, the real author of which, however, mathematicians had little trouble in divining, for as John Bernouilli obſerved on this occaſion, "ex ungue leonem."

James Bernouilli, in the courſe of his inveſtigations, had aſcended to problems on iſoperimetrical figures requiring ſtill more profound ſpeculations, and, after having reſolved them, he propoſed to mathematicians in general, at the concluſion of his ſolution of his brother's problem.

The rivalry in glory that had long divided the Bernouillis, was fully diſplayed on this occaſion. At firſt it was a little moderated by their habits of ſeeing each other, at leaſt occaſionally, and by the intervention of their common friends; but John having been appointed profeſſor of mathematics at Groningen in 1695, all private intercourſe between them ſoon ceaſed, and they no longer correſponded except through the medium of periodical publications, for the purpoſe of propoſing to each other the moſt difficult problems; and here it was that James Bernouilli, deſirous of avenging himſelf of the ingratitude of his brother, to whom he had been preceptor, challenged him by name to anſwer the following problem.

Of all iſoperimetrical curves deſcribed on the ſame common baſe B N, to find B F N, ſuch that another curve, B Z N, ſhall contain the greateſt ſpace; the ordinate of which, P Z, is in any multiplicate or ſubmultiplicate ratio of the ordinate P F, or of the arc B F. Or, as we ſhould ſay now, the ordinate of which, P Z, is any function of P F, or of the arc B F. *Fig.* 15.

To this leading propoſition, he added another more analogous to that of the line of ſwifteſt deſcent, which was, to find among all the cycloids, which a heavy body may deſcribe from a point to a line given in poſition, that cycloid which is deſcribed in the leaſt poſſible time, which propoſitions he concluded in nearly the following words. "A perſon for whom I pledge myſelf (*Prodit* NON NEMO, pro qui caveo) engages to give my brother, independently of the praiſe he will deſerve, a prize of 50 florins, on condition that within three months, he engages to reſolve theſe problems, and within a year publiſhes legitimate ſolutions of them." Adding, "if at the expiration of this time, no one ſhall have reſolved them, I will make public my ſolutions."

Theſe propoſitions, as we have before obſerved, were ſent with the ſolution of the *brachyſtochrone* (a term by which John Bernouilli's problem was deſignated); and as ſoon as he had noticed the ſolutions to this, in doing which he beſtowed great praiſe on that of Newton and de l'Hôpital, and ſome ſlight cenſure on his brother's, he undertook the ſolution of James's problems above-mentioned, and imagining that his theory of the line of ſwifteſt deſcent was alone ſufficient to ſolve them, the following expreſſions of ingenuous vanity eſcaped him. "Difficult," ſays he, "as theſe problems appear, I did not fail to apply to them the inſtant they came to my hands, and hear with what ſucceſs: inſtead of three months allowed me to found their depth, and the remainder of the year to find their ſolutions, I have employed only three minutes to examine, enter upon, and dive to the bottom of this myſtery." Theſe high ſounding phraſes were accompanied with the conſtruction he gave of the problems, and the conſequent demand of the prize, which he ſaid he ſhould give to the poor, as it coſt him ſo little trouble to gain it. But the buſineſs was by no means ſo far advanced as he ſuppoſed, as his ſolution only anſwered for particular caſes, in conſequence of his having made only two elements of the curve enter therein, while the general ſolution required three; and he therefore thus laid himſelf open to the keen reproaches of his brother, who ſoon perceived in what reſpect the ſolution was defective, and being at the ſame time perfectly ſure of his own, he publiſhed an advertiſement in 1698, in which he aſſerted that his brother's method was defective. He ſtill allowed geometricians time to find the ſolution, and if no one gave it, he pledged himſelf for three things; 1ſt. To divine with preciſion the analyſis of his brother: 2dly. Whatever it might be, to point out fallacies in it: and, 3dly. To give the true ſolution of the problem in all its parts. Adding, at the ſame time, that if any perſon was ſufficiently intereſted in the progreſs of ſcience to venture a wager upon theſe articles, that he would engage to forfeit an equal ſum if he failed in the firſt; double the ſum if he did not ſucceed in the ſecond; and triple the ſum if he did not accompliſh the third.

The ſingularity of this advertiſement, and the reputation of the writer as a geometrician, a little ſtaggered John Bernouilli's confidence in his method. He reviſed his ſolution, allowed that he had made a trifling miſtake, which he aſcribed to too great precipitancy, and ſent a new reſult, but without aſſuming a more modeſt tone, and again demanded the prize.

To theſe pretenſions, James Bernouilli laconically anſwered, "I beg my brother to reviſe his laſt ſolution anew, to examine it carefully in every point, and then to let us know whether it be all right; as he muſt be aware, that no attention can be paid to his excuſes of precipitancy after I have publiſhed my ſolution." But John Bernouilli, who was not aware of the radical defect of the method that he employed, felt an entire confidence in his laſt reſult, and ſaid in reply there was no neceſſity to reviſe what he had done, and that his time would be much better ſpent in making new diſcoveries. To this confident aſſertion James ironically anſwered, "I never believed that my brother was maſter of the true ſolution of the iſoperimetrical problem, and I doubt it now more than ever, from the difficulty he makes of the reviſion of his ſolution; if it coſt him but three minutes, as he aſſerts, "to examine, enter upon, and dive to the bottom of the whole myſtery," ſurely the reviſal could not require more: but ſuppoſe he ſpent double that time, how many new diſcoveries would he be robbed of by the ſix minutes thus employed."

To this John again replied, and the matter ſtill remained undecided; till, in 1700, James Bernouilli printed at Baſil a letter addreſſed to his brother, in which he invited him with great moderation to publiſh his method, and concluded by giving the formulæ of the problem, but without their demonſtrations. John ſoon perceived how far he differed from his brother, but not diſcovering the principle of the true ſolution, nor the defect of his own method, he at length gave it in a paper which was ſent under a ſeal to the Academy of Sciences at Paris, in the month of February 1701, on condition that it ſhould not be opened without his conſent, and after his brother had publiſhed his analyſis.

As ſoon as James Bernouilli was informed of this, he had no longer any reaſon to keep his ſolution a ſecret: he accordingly made it public, and maintained it by way of a theſis at Baſil, in March 1701, with a dedication to the four illuſtrious mathematicians, de l'Hôpital, Leibnitz, Newton, and Fatio de Duillier. He likewiſe printed it ſeparately under the following title: "Analyſis magni problematici iſoperimetrici." This was conſidered as a prodigy of ſagacity and invention; and indeed, if the time be conſidered, it will not be too much to aſſert that a more difficult problem was never reſolved. The marquis de l'Hôpital wrote to Leibnitz, that he had read it with avidity, and that he had found it very direct and accurate, which teſtimony Leibnitz tranſmitted to John Bernouilli himſelf, though he was much prejudiced in his favour, having himſelf before examined and approved of John Bernouilli's ſolution; the latter having ſubmitted it to him for his opinion.

After this publication John Bernouilli maintained a perfect ſilence, neither publiſhing his own ſolution, nor criticiſing that of his brother's. At length, in 1705, James Bernouilli died, and a ſhort time after John Bernouilli publiſhed his ſolution in the Memoires of the academy for 1706. This, however, poſſeſſed the ſame radical defect that has been before ſtated, namely, that the author had conſidered only two elements of the curve, inſtead of which it is requiſite to have three enter, or to employ an equivalent condition. In problems of the ſame kind as that of the line of ſwifteſt deſcent, where it is ſimply required to fulfil the conditions of the maximum or minimum, the applying of this condition to two elements is ſufficient to find the fluxional equation of the curve ; but when, beſide the maximum or minimum, the curve muſt poſſeſs a farther property of being iſoperimetrical to another, this new condition requires that a third element of the curve ſhall have a certain inclination with reſpect to the other two ; and every determination, founded ſimply on the firſt conſideration, will give falſe reſults ; except in thoſe caſes where a curve cannot ſatisfy one of the two conditions, without at the ſame time fulfilling the other ; and of this John Bernouilli was at length ſo convinced, that he made it the baſis of a new ſolution, more than 13 years after his brother's death, confeſſing himſelf deceived in his firſt. "J'ai donner ici," ſays he, "pour reparer cette inadvertence une nouvelle manière de reſoudre," &c. This was a tardy avowal, but it would ſtill have done him honour, had he at the ſame time acknowledged that his new ſolution was in ſubſtance the ſame as his brother's ; but given in a form which conſiderably abridged the calculation ; inſtead of which, he even in this ſeeks every occaſion to aſperſe his brother's method, and this after a lapſe of ſo many years, when, as Mr. Woodhouſe obſerves, "the recollection of his brother's kindneſs, or zeal for a brother's fame, ought to have aſſuaged and laid to ſleep all angry paſſions ;" but with regard to the ſolution itſelf, it muſt be acknowledged, conſidering the ſtate of analytical ſcience at that time, to poſſeſs very diſtinguiſhing marks of a great maſter, and fairly merits the eulogium which the author himſelf has beſtowed upon it ; that of being equally exempt from the tedіouſneſs of his brother's, and the obſcurity of Taylor's calculation, alluding here to the ſolution of the celebrated Dr. Brook Taylor, which appeared, in 1715, in his "Methodus Incrementorum." At the period at which we have now arrived, James Bernouilli had been dead ſeveral years, and the above paper was the laſt that John Bernouilli wrote on the ſubject of iſoperimetry, but the theory was purſued by many other eminent mathematicians, and introduced into ſeveral of their works. Simpſon, in his Tracts, has a chapter, entitled "An Inveſtigation of a General Rule for the Reſolution of Iſoperimetrical Problems of all Orders." He has alſo given the ſolution of ſeveral iſoperimetrical problems, in his "Doctrine of Fluxions." Maclaurin has likewiſe a chapter on the ſame ſubject in his "Treatiſe of Fluxions." To theſe may alſo be added Emerſon, Le Seur, Boſſut, and Lacroix ; each of which authors has introduced this doctrine into their reſpective works ; but the two writers who have moſt contributed in bringing to perfection the theory of iſoperimetry, are Euler and Lagrange, the former having, beſide ſeveral memoirs in the Acta Petro, a tract on this ſubject, entitled "Methodus inveniendi Lineas Curvas Proprietate Maximi Minimive gaudentes," which, with a very few exceptions, is what it was intended to be, a complete treatiſe, containing eſſentially all the requiſite methods of ſolutions, with great variety and abundance of examples and illuſtrations : there were ſtill, however, ſome defects in this work, for want of a better algorithm, or more compendious proceſs of eſtabliſhing the theorems ; and certain ſupplemental formulæ ; which defects have been finally removed by Lagrange, in his admirable and refined "Calculus of Variations ;" and a very intereſting treatiſe on the ſame ſubject has lately been publiſhed by Mr. Woodhouſe, in which are combined the hiſtory and progreſs of the ſcience, with ſuch obſervations and remarks, as ſeem moſt calculated to render it inſtructive and familiar to the Engliſh ſtudent.

Having thus given a brief ſketch of the ſucceſſive improvements that have been made in the theory of iſoperimetry, from the time of its firſt introduction by John Bernouilli, to its completion by Lagrange ; we ſhall conclude this article with the ſolution of a few problems which will illuſtrate many of the remarks that have been made in the foregoing pages, referring the reader who wiſhes for farther information to the works above quoted.

The reſearches of Euler and Lagrange have rendered the ſolution of iſoperimetrical problems extremely ſimple, but the inveſtigations by which they arrived at their formulæ of ſolution are very profound, long, and embarraſſing, which nothing leſs than the genius of theſe celebrated men would have been able to have reduced to that ſimple form at which they at length arrived, an inveſtigation of which, at leaſt of Lagrange's, will be given under the article VARIATION. In this place we ſhall barely ſtate the reſults, and ſhew their application to the ſolution of a few problems of this kind.

Let V repreſent any function of the variable quantities x and y, and let there be aſſumed

$$\dot{V} = M\dot{x} + N\dot{y} + P\dot{p} + Q\dot{q}, \text{ \&c.} \quad [A]$$

where $p = \frac{\dot{y}}{\dot{x}}$, $q = \frac{\dot{p}}{\dot{x}}$, $r = \frac{\dot{q}}{\dot{x}}$, &c.

Then the ſolution of all iſoperimetrical problems, into which no integral quantity enters, are ſolvible by the following general formula,

$$N - \frac{\dot{P}}{x} + \frac{\ddot{Q}}{\dot{x}^2} - \frac{\dddot{R}}{\dot{x}^3} + \text{\&c.} = 0 \quad [B]$$

which however, for the ſake of a more ready application, may be divided into the following caſes.

Caſe 1.—If M, Q, and all the co-efficients except N and P, in the above value of $\dot{V}$, be equal to zero, then we have $\dot{V} = N\dot{y} + P\dot{p}$; and ſince generally $N - \frac{\dot{P}}{\dot{x}} + \frac{\ddot{Q}}{\dot{x}^2} -$ &c. $= 0$, it becomes in this caſe $N - \frac{\dot{P}}{\dot{x}} = 0$; conſequently, $N\dot{y} - \frac{\dot{y}}{\dot{x}}\dot{P} = 0$; or, ſince $\frac{\dot{y}}{\dot{x}} = p$, it reduces to $N\dot{y} - p\dot{P} = 0$; whence $N\dot{y} = p\dot{P}$; and ſubſtituting this laſt value of $N\dot{y}$, we have $\dot{V} = p\dot{P} + \dot{P}p$; and taking the fluents $V = Pp + c$, c being the correction.

If M be not equal to 0, we muſt add the fluent of $M\dot{x}$; then $V = \int M\dot{x} + Pp + c$.

Caſe 2.—Let $M = 0$, $N = 0$, and all the co-efficients after Q, then $\dot{V} = P\dot{p} + Q\dot{q}$, and the general formula in this caſe becomes

$$-\frac{\dot{P}}{x} + \frac{\ddot{Q}}{\dot{x}^2} = 0;$$

whence $\dot{P} = \frac{\ddot{Q}}{\dot{x}}$, and the fluents give $P = \frac{\dot{Q}}{\dot{x}} + c$;

multiply this by $\dot{p}$, and ſince $\frac{\dot{p}}{\dot{x}} = q$, we thus obtain

$$\mathrm{P}\,\dot{p} = q\,\dot{\mathrm{Q}} + c\,\dot{p};$$

and now ſubſtituting this value of $\mathrm{P}\,\dot{p}$, in the general expreſſion for $\dot{\mathrm{V}}$, it becomes

$$\dot{\mathrm{V}} = q\,\dot{\mathrm{Q}} + \mathrm{Q}\,\dot{q} + c\,\dot{p}$$

and by taking the fluents on both ſides

$$\mathrm{V} = \mathrm{Q}\,q + c\,p + c';$$

c and c' being the corrections.

If M be not equal to o, we muſt add the fluent of $\mathrm{M}\,\dot{x}$; in which caſe

$$\mathrm{V} = \int \mathrm{M}\,\dot{x} + \mathrm{Q}\,q + c\,p + c'$$

Caſe 3.—If $\mathrm{M} = 0$, but N is not $= 0$; that is if the form be

$$\dot{\mathrm{V}} = \mathrm{N}\,\dot{y} + \dot{\mathrm{P}}\,p + \dot{\mathrm{Q}}\,q;$$

then ſince $\mathrm{N} - \frac{\dot{\mathrm{P}}}{\dot{x}} + \frac{\ddot{\mathrm{Q}}}{\dot{x}^2} = 0$,

we have by multiplying by $\dot{y} = p\,\dot{x}$, $\left(\text{becauſe } p = \frac{\dot{y}}{\dot{x}}\right)$

$$\mathrm{N}\,\dot{y} - p\,\dot{\mathrm{P}} + p\,\frac{\ddot{\mathrm{Q}}}{\dot{x}^2}\,\dot{x} = 0.$$

But $p\,\frac{\ddot{\mathrm{Q}}}{\dot{x}^2}\,\dot{x} = \left(p\,\frac{\dot{\mathrm{Q}}}{\dot{x}}\right)^{\cdot} - \dot{p}\,\frac{\dot{\mathrm{Q}}}{\dot{x}} = \left(p\,\frac{\dot{\mathrm{Q}}}{\dot{x}}\right)^{\cdot} -$ $q\,\frac{\dot{\mathrm{Q}}}{\dot{x}}\,\dot{x}$, which laſt expreſſion being ſubſtituted for $p\,\frac{\ddot{\mathrm{Q}}}{\dot{x}^2}\,\dot{x}$, gives $\mathrm{N}\,y = p\,\dot{\mathrm{P}} - \left(p\,\frac{\dot{\mathrm{Q}}}{\dot{x}}\right)^{\cdot} + q\,\frac{\dot{\mathrm{Q}}}{\dot{x}}\,\dot{x}$, whence

$$\dot{\mathrm{V}} = p\,\dot{\mathrm{P}} + \mathrm{P}\,\dot{p} - \left(p\,\frac{\dot{\mathrm{Q}}}{\dot{x}}\right)^{\cdot} + q\,\dot{\mathrm{Q}} + \mathrm{Q}\,\dot{q};$$

and taking the fluents

$$\mathrm{V} = \mathrm{P}\,p + \mathrm{Q}\,q + p\,\frac{\dot{\mathrm{Q}}}{\dot{x}} + c,$$

c being the correction, as before.

We might continue thus to deduce from the general formula other particular ones, but the foregoing are ſufficient for the ſolution of ſuch problems as the limit of our article will admit of in this place, which, for the ſake of a more ready reference, we will again repeat.

1. If the general form $\dot{\mathrm{V}} = \mathrm{M}\,\dot{x} + \mathrm{N}\,\dot{y} + \mathrm{P}\,\dot{p} + \mathrm{Q}\,\dot{q}$ &c.

becomes $\quad \dot{\mathrm{V}} = \mathrm{N}\,\dot{y} + \mathrm{P}\,\dot{p}$

then we have $\quad \mathrm{V} = \mathrm{P}\,p + c \quad [a]$

or $\quad \mathrm{V} = \int \mathrm{M}\,\dot{x} + \mathrm{P}\,p + c \quad [b]$

when M is not equal to o.

2. If the formula be $\dot{\mathrm{V}} = \mathrm{P}\,\dot{p} + \mathrm{Q}\,\dot{q}$

hen will $\quad \mathrm{V} = \mathrm{Q}\,q + c\,\mathrm{P} + c' \quad [c]$

or $\quad \mathrm{V} = \int \mathrm{M}\,\dot{x} + \mathrm{Q}\,q + c\,\mathrm{P} + c' \quad [d]$

when M is not equal to o.

3. If the formula be $\dot{\mathrm{V}} = \mathrm{N}\,\dot{y} + \mathrm{P}\,\dot{p} + \mathrm{Q}\,\dot{q}$

hen will $\quad \mathrm{V} = \mathrm{P}\,p + \mathrm{Q}\,q - p\,\frac{\dot{\mathrm{Q}}}{\dot{x}} + c \quad [e]$

To which we may alſo add the following,

4. If the formula be $\dot{\mathrm{V}} = \mathrm{P}\,\dot{p} + \mathrm{R}\,\dot{r}$,

then will $\quad \mathrm{V} = c\,p + \mathrm{R}\,r - q\,\frac{\dot{\mathrm{R}}}{\dot{x}} + c' \quad [f]$

By means of which formulæ the following problems are readily ſolved.

Problem I.

Required the relation of x and y, ſuch that the fluent of $(a\,x - y^2)\,y\,\dot{x}$, or $\int (a\,x - y^2)\,y\,\dot{x}$, ſhall be a maximum, or a minimum.

Comparing this expreſſion with $\int \mathrm{V}\,\dot{x}$, (the analytical expreſſion for the maximum or minimum property,) we ſee that $\mathrm{V} = a\,x\,y - y^3$, conſequently $\dot{\mathrm{V}} = a\,y\,\dot{x} + (a\,x - 3\,y^2)\,\dot{y}$; which compared with the general formula,

$$\dot{\mathrm{V}} = \mathrm{M}\,\dot{x} + \mathrm{N}\,\dot{y} + \text{\&c.}$$

gives $\mathrm{M} = a\,y$, and $\mathrm{N} = a\,x - 3\,y^2$, $\mathrm{P} = 0$, $\mathrm{Q} = 0$, &c.

But ſince $\mathrm{N} - \frac{\dot{\mathrm{P}}}{\dot{x}} + \text{\&c.} = 0$, this becomes

$$a\,x - 3\,y^2 = 0, \text{ or } y = \sqrt{\frac{a\,x}{3}};$$

which is the relation of x and y required.

Prob. II.

Required the ſhorteſt curve that can be drawn between two points, or between two curves.

Here, if we take z to repreſent the curve, x the abſciſs, and y the ordinate, it will be neceſſary to fulfil the following condition, namely, that $\int \dot{z}$ be a minimum.

Now by the doctrine of fluxions, $\dot{z} = \sqrt{\dot{x}^2 + \dot{y}^2} = \dot{x}\sqrt{1 + \frac{\dot{y}^2}{\dot{x}^2}} = \dot{x}\,\sqrt{1 + p^2}$; which being compared with $\int \mathrm{V}\,\dot{x}$, gives $\mathrm{V} = \sqrt{1 + p^2}$, whence by taking the fluxions on both ſides, it becomes $\dot{\mathrm{V}} = \frac{p\,\dot{p}}{\sqrt{(1 + p^2)}}$; and M, N, &c. all equal to o. Therefore comparing this with the general value of V, we have $\mathrm{P} = \frac{p}{\sqrt{(1 + p^2)}}$, and conſequently from the formula [B] we have, — flux. $\left(\frac{p}{\sqrt{(1 + p^2)}}\right) = 0$; therefore $p = a\,\sqrt{(1 + p^2)}$; and by ſquaring $p^2 = a^2 + a^2\,p^2$, or $(a^2 - 1)\,p^2 = -\,a^2$, whence

$$p = \frac{\dot{y}}{\dot{x}} = \frac{a}{\sqrt{(1 - a^2)}}; \text{ or } \dot{y}\,\sqrt{(1 - a^2)} = a\,\dot{x},$$

taking the fluents $y\,\sqrt{(1 - a^2)} = a\,x + c$, which is an equation to a right line, as it ought to be.

Prob. III.

Required the curve of quickeſt deſcent between two given points. *Fig.* 16. *Plate Iſoperimetry.*

Let A and B be the two given points, and A M B the required curve; draw P M perpendicular to A C; and put $\mathrm{A\,P} = x$, $\mathrm{P\,M} = y$, $\mathrm{A\,M} = z$: then ſince the time will be reciprocally as the ſquare root of the height, it will be required to find $\int \frac{\dot{z}}{\sqrt{y}}$, a minimum, but $\dot{z} = \sqrt{(\dot{x}^2 + \dot{y}^2)}$, whence $\int \frac{\sqrt{(\dot{x}^2 + \dot{y}^2)}}{\sqrt{y}} = \int \frac{\sqrt{\left(1 + \frac{\dot{y}^2}{\dot{x}^2}\right)}}{\sqrt{y}}\,\dot{x} =$

$\int \frac{\sqrt{(1+p^2)}}{\sqrt{y}}\,\dot{x}$, a minimum, which compared with the minimum expreſſion $\int V\,\dot{x}$, gives $V = \frac{\sqrt{(1+p^2)}}{\sqrt{y}}$; whence $\dot{V} = -\frac{\sqrt{(1+p^2)}}{2y^{\frac{3}{2}}}\,\dot{y} + \frac{p\,\dot{p}}{\sqrt{y}\,\sqrt{(1+p^2)}}$, which compared with formula [A], gives $M = 0$; $N = -\frac{\sqrt{(1+p^2)}}{2y^{\frac{3}{2}}}$; $P = \frac{p}{\sqrt{y}\cdot\sqrt{(1+p^2)}}$; $Q = 0$, &c.

Therefore, ſince by formula [a] $V = P\,p + c$; therefore in this caſe $\frac{\sqrt{(1+p^2)}}{\sqrt{y}} = \frac{p^2}{\sqrt{y}\cdot\sqrt{(1+p^2)}} + c$, whence $\frac{1}{\sqrt{y}\cdot\sqrt{(1+p^2)}} = c$; or multiplying both numerator and denominator of this fraction by $\dot{x}$, it becomes $\frac{\dot{x}}{\sqrt{y}\cdot\sqrt{(\dot{x}^2+\dot{y}^2)}} = c$, which is reducible to $\dot{x} = \frac{c\,\sqrt{y}}{\sqrt{(1-c^2y)}}\cdot\dot{y}$, an equation to a cycloid; which, therefore, is the curve required.

PROB. IV.

Required the curve which, by its revolution round its axis, generates the ſolid of leaſt reſiſtance. *Fig.* 17.

Let A B C be the required curve, which by its rotation generates the ſolid, D A C, of leaſt reſiſtance: draw P M perpendicular to A B; put A P = x, P M = y, and the arc A M = z: then we know from the principles of mechanics, that the reſiſtance $= \int \frac{y\,\dot{y}^3}{\dot{x}^2+\dot{y}^2}$, which muſt therefore be a minimum. Now this being put under the form,

$$\int \frac{y\,\frac{\dot{y}^3}{\dot{x}^3}}{1+\frac{\dot{y}^2}{\dot{x}^2}}\,\dot{x} = \int \frac{y\,p^3}{1+p^2}\,\dot{x},\ \left(\text{becauſe } p = \frac{\dot{y}}{\dot{x}}\right)$$

which being compared with the expreſſion $\int V\,\dot{x}$, gives

$$V = \frac{y\,p^3}{1+p^2};$$

the fluxion of which expreſſion being taken, gives

$$\dot{V} = \frac{p^3\,\dot{y}}{1+p^2} + \frac{(3\,y\,p^2+y\,p^4)\,\dot{p}}{(1+p^2)^2}:$$

whence $M = 0$; $N = \frac{p^3}{1+p^2}$; $P = \frac{3\,y\,p^2+y\,p^4}{(1+p^2)^2}$.

Hence by the foregoing form [a], and uſing $-c$ for a correction, we have

$$\frac{y\,p^3}{1+p^2} = \frac{3\,y\,p^2+y\,p^4}{(1+p^2)^2} - c,$$

which by reduction gives,

$c\,(1+p^2)^2 = 2\,y\,p^3$, and $y = \frac{c}{2\,p^3} + \frac{c}{p} + \frac{c\,p}{2}$;

but ſince $p = \frac{\dot{y}}{\dot{x}}$, or $p\,\dot{x} = \dot{y}$, we obtain

$$\dot{x} = -\frac{3\,c}{2\,p^5}\,\dot{p} - \frac{c}{p^3}\,\dot{p} + \frac{c}{2\,p}\,\dot{p};$$

whence, $x = \frac{3\,c}{8\,p^4} + \frac{c}{2\,p^2} + \frac{c}{2}$ hyp. log. $p + c'$;

by means of which equation, and that above, *viz.* $c\,(1+p^2)^2 = 2\,y\,p^3$, the relative values of x and y are determined.

PROB. V.

Required the brachyſtochrone, or curve of quickeſt deſcent, when the length of the curve is given.

This is an iſoperimetrical problem of the ſecond order: thoſe which we have been conſidering have only one condition enters, namely the minimum; but in the preſent problem, beſide the minimum property, the iſoperimetrical alſo enters; and we have, therefore, to find the variation of $(V - a\,u)$, inſtead of V. See Woodhouſe's Tract on Iſoperimetry, p. 122.

Here by means of the compariſon of $\int (V - a\,u)\,\dot{x}$, with the minimum condition of the problem, we obtain

$$V = \frac{\sqrt{(1+p^2)}}{\sqrt{y}},\ \text{and } u = \sqrt{(1+p^2)};$$

therefore $V - a\,u$, or $V' = \frac{\sqrt{(1+p^2)}}{\sqrt{y}} - a\,\sqrt{(1+p^2)}$,

and conſequently,

$$\dot{V}' = -\frac{1}{2\,y^{\frac{3}{2}}}\,\sqrt{(1+p^2)}\,\dot{y} + \left(\frac{1}{\sqrt{y}} - a\right) \times \frac{p\,\dot{p}}{\sqrt{(1+p^2)}}.$$

Hence we deduce, by comparing this with the general formula [A],

$$\begin{cases} N = -\frac{1}{2\,y^{\frac{3}{2}}}\,\sqrt{(1+p^2)} \\ P = \left(\frac{1}{\sqrt{y}} - a\right) \times \frac{p}{\sqrt{(1+p^2)}}. \end{cases}$$

Hence again by formula [a],

$$\sqrt{(1+p^2)}\left(\frac{1}{\sqrt{y}} - a\right) = \frac{p^2}{\sqrt{(1+p^2)}}\left(\frac{1}{\sqrt{y}} - a\right) + c,$$

or, $\left(\frac{1}{\sqrt{y}} - a\right) = c\,\sqrt{(1+p^2)}$:

whence again by reduction,

$$\dot{x} = \frac{c\,\sqrt{y}\,\dot{y}}{\sqrt{[1 - 2\,a\,\sqrt{y} + (a^2 - c^2)\,y]}}:$$

where, by taking the fluents, we have the relation between x and y, the abſciſs and ordinate of the curve.

If, inſtead of the length of the curve, the area had been given, then $\int u\,\dot{x} = \int y\,\dot{x}$, and conſequently we ſhould have,

$$V' = V - a\,u = \frac{\sqrt{(1+p^2)}}{\sqrt{y}} - a\,y;$$

in which caſe,

$$P = \frac{p}{\sqrt{y}\,\sqrt{(1+p^2)}},$$

and $\frac{\sqrt{(1+p^2)}}{\sqrt{y}} - a\,y = \frac{p^2}{\sqrt{y}\,\sqrt{(1+p^2)}} + c$:

whence again,

$$\frac{1}{\sqrt{y}\,\sqrt{(1+p^2)}} = c + a\,y;$$

which by reduction becomes,

$\dot{x} =$

$$\dot{x} = \frac{(c+ay)\sqrt{y}\cdot\dot{y}}{\sqrt{[1-y(c+ay)^2]}};$$

which expreſſion, when $c = 0$, becomes

$$\dot{x} = \frac{ay.\dot{y}}{\sqrt{(1-a^2y^2)}}:$$

whence the relative values of x and y are determined in both caſes.

Prob. VI.

Required the ſolid of leaſt reſiſtance, amongſt all the ſolids of equal capacity.

Here, the ſame as in Prob. IV., we have $V = \frac{yp^3}{1+p^2}$, and $\int u\dot{x} = \int \pi y^2 \dot{x}$, ($\pi$ being equal 3.14159, &c.) (ſee Woodhouſe's Iſoperimetry, p. 123.); therefore $V - au = V' = \frac{yp^3}{1+p^2} - ay^2$ (including π in the quantity a).

Hence $P = \frac{3yp^2+yp^4}{(1+p^2)^2}$, and by formula [$a$]

$$\frac{yp^3}{1+p^2} - ay^2 = \frac{3yp^3+yp^5}{(1+p^2)^2} - c,$$

whence, by reduction, we obtain

$$\left\{\begin{matrix}(c-ay^2)\ (1+p^2)^2 = 2yp^3, \text{ or} \\ (c-ay^2)\,d z^4 = 2y\dot{y}^3\dot{x}\end{matrix}\right\}$$

which expreſſions will furniſh the relative values of x and y.

If, inſtead of the condition of equal capacity, that of equal ſuperficies be ſubſtituted, we have

$$V - au = V' = \frac{yp^3}{1+p^2} - ay\sqrt{(1+p^2)}, \text{ and}$$

$$P = \frac{3yp^2+yp^4}{(1+p^2)^2} - \frac{ayp}{\sqrt{(1+p^2)}};$$

whence we deduce from formula [a]

$$\frac{yp^3}{1+p^2} - ay\sqrt{(1+p^2)} =$$

$$\frac{3yp^3+yp^5}{(1+p^2)^2} - \frac{ayp^2}{\sqrt{(1+p^2)}} - c,$$

which, by reduction, becomes

$$c\,(1+p^2)^2 = 2yp^3 + ay\,(1+p^2)^{\frac{3}{2}};$$

$$\text{or,}\quad c\dot{z}^4 = 2y\dot{y}^3\dot{x} + ay\dot{z}^3\dot{x}.$$

Prob. VII.

Given the length of a curve, to determine its nature, when the ſolid generated by its rotation is a maximum.

Making, as before, $\pi = 3.14159$, &c. we ſhall have

$$\int V\dot{x} = \int \pi y^2\dot{x}, \text{ and } \int u\dot{x} = \int \sqrt{(1+p^2)}\,\dot{x}.$$

Therefore V' or $V - au = \pi y^2 - a\sqrt{(1+p^2)}$;

and taking the fluxion on both ſides,

$$V' = 2\pi y\dot{y} - \frac{ap\dot{p}}{\sqrt{(1+p^2)}}:$$

comparing this expreſſion with the general one [A],

we have $P = -\frac{ap}{\sqrt{(1+p^2)}}$; and, therefore, by formula [a]

$$\pi y^2 - a\sqrt{(1+p^2)} = c - \frac{ap^2}{\sqrt{(1+p^2)}};$$

and therefore

$$\sqrt{(1+p^2)} = \frac{a}{\pi y^2 - c};$$

which, by reduction, becomes

$$p, \text{ or } \frac{\dot{y}}{\dot{x}} = \frac{\sqrt{[a^2-(\pi y^2-c)^2]}}{\pi y^2 - c}; \text{ or,}$$

$$\dot{x} = \frac{(\pi y^2 - c)}{\sqrt{[a^2-(\pi y^2-c)^2]}}\,\dot{y};$$

which, if $c = 0$, reduces to

$$\dot{x} = \frac{\pi y^2}{\sqrt{(a^2-\pi^2y^4)}}\,\dot{y}.$$

This laſt reſult agrees with Simpſon's, but it is reſtricted, becauſe c is not neceſſarily equal to 0.

Prob. VIII.

The length of a curve being given, it is required to determine its nature, when the area is a maximum.

Here, by proceeding as in the foregoing examples, we ſhall have

$$V' = \sqrt{(1+p^2)} - ay,$$

and therefore,

$$P = \frac{p}{\sqrt{(1+p^2)}};$$

and hence, by means of the formula [a],

$$\sqrt{(1+p^2)} - ay = \frac{p^2}{\sqrt{(1+p^2)}} + c.$$

Therefore,

$$\frac{1}{\sqrt{(1+p^2)}} = c + ay,$$

which, being farther reduced, becomes

$$p = \frac{\dot{y}}{\dot{x}} = \frac{\sqrt{[1-(c+ay)^2]}}{(c+ay)},$$

$$\text{or,}\quad \dot{x} = \frac{(c+ay)\,\dot{y}}{\sqrt{[1-(c+ay)^2]}},$$

the fluents of which being taken, we have

$$x = c' - \sqrt{[1-(c+ay)^2]},$$

which is an equation to a circle.

Prob. IX.

Required the curve that generates the ſolid of the leaſt ſurface, the area being given.

Here $V = 2\pi y\sqrt{(1+p^2)}$, and $u = y$; therefore V', or $V - au = 2\pi y\sqrt{(1+p^2)} - ay$,

and $V' = [2\pi\sqrt{(1+p^2)} - a]\,\dot{y} + \frac{2\pi yp}{\sqrt{(1+p^2)}}\dot{p}$;

whence, by compariſon with formula [A],

$$P = \frac{2\pi yp}{\sqrt{(1+p^2)}};$$

then, again, by formula [a], we have

$$2\pi y\sqrt{(1+p^2)} - ay = \frac{2\pi yp^2}{\sqrt{(1+p^2)}} + c,$$

which, by reduction, becomes

$$p = \frac{\dot{y}}{\dot{x}} = \frac{\sqrt{[4\pi y^2-(c+ay)^2]}}{c+ay}, \text{ or,}$$

$$\dot{x} = \frac{(c + ay)\,\dot{y}}{\sqrt{[4\pi y^2 - (c + ay)^2]}}.$$

If, inſtead of the area, the length of the curve had been given, then we ſhould have had

$$\int u\,\dot{x} = \int \dot{z} = \int \dot{x}\,\sqrt{(1 + p^2)}\ ;\ \text{and}\ u = \sqrt{(1 + p^2)}.$$

Therefore $V' = 2\pi y\,\sqrt{(1 + p^2)} - a\,\sqrt{(1 + p^2)}$, and conſequently, by formula [A],

$$P = \frac{2\pi y p - a p}{\sqrt{(1 + p^2)}};$$

whence, again, by formula [a], we have

$$(2\pi y - a)\,\sqrt{(1 + p^2)} = \frac{(2\pi y - a)\,p^2}{\sqrt{(1 + p^2)}} + c;$$

whence, by reduction,

$$\dot{x} = \frac{c\,\dot{y}}{\sqrt{[(2\pi y - a)^2 - c^2]}},$$

the fluents of which expreſſion being taken, gives

$$x = \frac{c}{2\pi}\ \text{hyp. log.}$$

$$[(2\pi y - a) + \sqrt{(2\pi y - a)^2 - c^2}] + c';$$

and therefore the required curve is the catenary.

Prob. X.

Of all iſoperimetrical curves, drawn between B and N, (*fig.* 15.) to find B F N ſuch, that B Z N ſhall contain the greateſt area, P Z being a function of P F. See the foregoing hiſtorical ſketch.

Let P F = y, and P Z a function of y = Y; then $\int V\,\dot{x}$ correſponds to $\int Y\,\dot{x}$; and $\int u\,\dot{x}$ to $\int \sqrt{(1 + p^2)}\,\dot{x}$.

Hence $V + a\,u$, or $V' = Y + a\,\sqrt{(1 + p^2)}$,

and $$\dot{V} = \frac{\dot{Y}\,\dot{y}}{\dot{y}} + \frac{a\,p\,\dot{p}}{\sqrt{(1 + p^2)}};$$

whence we have, by compariſon of formula [A],

$$P = \frac{a p}{\sqrt{(1 + p^2)}};$$

and hence, again, by form [a] is deduced

$$Y + a\,\sqrt{(1 + p^2)} = \frac{a p^2}{\sqrt{(1 + p^2)}} + c,$$

or, $$\frac{a}{\sqrt{(1 + p^2)}} = c - Y,$$ and by reduction

$$p = \frac{\dot{y}}{\dot{x}} = \frac{\sqrt{[a^2 - (c - Y)^2]}}{c - Y};$$

and conſequently,

$$\dot{x} = \frac{(c - Y)\,\dot{y}}{\sqrt{[a^2 - (c - Y)^2]}},$$

the equation of the curve.

In the equation, as it ſtands, there are two arbitrary undetermined quantities a and c. The integration of the equation would introduce a third; and to determine theſe three, we have given the two points B and N, and the length of the curve.

ISOPOGON, in *Botany*, from ισος, *equal*, and πωγων, *a beard*, becauſe the ſeeds are every where equally bearded. Brown Tr. of Linn. Soc. v. 10. 71. Prodr. Nov. Holl. v. 1. 365. Claſs and order, *Tetrandria Monogynia.* Nat. Ord. *Proteaceæ.*

Eſſ. Ch. Perianth (rather corolla) four-cleft, with a ſlender permanent tube. No ſcales under the germen. Style entirely deciduous. Stigma tapering or cylindrical. Nut ſeſſile, ſwelling, hairy all over. *Brown.*

Mr. Brown, in the places above quoted, defines 12 ſpecies of this genus, all natives of New Holland, ſuch of which as have come under the notice of other botaniſts have been confounded with the Linnæan *Protea.* They are rigid ſhrubs, with ſmooth *leaves,* which are either flat or thread-ſhaped, divided or entire. *Heads* terminal, rarely axillary. *Flowers* either very denſely imbricated in the form of a globoſe *ſtrobilus,* or faſtigiate on a flattiſh common receptacle, furniſhed with more or leſs of an involucrum, and beſet with crowded deciduous ſcales.—Examples of this genus are

I. *anethifolius.* (Protea anethifolia; Saliſb. Prodr. 48. P. acufera; Cavan. Ic. v. 6. 33. t. 549.)—Leaves once or twice pinnatifid, thread ſhaped, furrowed above: their ſegments nearly erect. Branches ſmooth. Tube of the flower downy; ſegments ſmooth, bearded at the tip.—Native of heathy ground on the eaſt coaſt of New Holland, near Port Jackſon.

I. *anemonifolius.* (Protea anemonifolia; Saliſb. Prodr. 48. Sims in Curt. Mag. t. 697. Andr. Repoſ. t. 332. P. tridactylides; Cavan. Ic. v. 6. 33. t. 548.)—Leaves once or twice three-cleft; ſegments linear, flat, rather ſpreading, ſmooth beneath. Scales of the cone ſpongy.—Found on ſtony heaths near Port Jackſon. The *flowers* are yellow.

We confeſs this genus ſeems too nearly related to Mr. Brown's *Petrophila,* with which it agrees altogether in habit, differing chiefly in the fruit of *Petrophila* being only partially hairy. To this latter belongs *Protea pulchella,* figured by Dr. Sims in Curt. Mag. t. 796.

ISOPSEPHUS, Ισοψηφος, in *Antiquity,* an appellation given to judges, who had equal juriſdiction and authority; it was likewiſe applied to a caſe where the votes were equal on both ſides. Another ſenſe is given to it, *viz.* when the letters of different words make up the ſame ſum, they were ſaid to be ισοψηφα ῥηματα; for the Greeks had no other cyphers to number with but the letters of their alphabet; ſo that α ſignified one, β two, γ three, &c. But beſide words, the ancients had likewiſe whole verſes of this kind; and it is pretended that there are ſeveral ſuch verſes in Homer. Hiſt. Acad. Inſcript. vol. iii. p. 311, ſeq.

ISOPYRUM, in *Botany,* from ισος, *equal* or *like,* and πυρος, *wheat,* a name adopted from Dioſcorides, whoſe ισοπυρον, however, is very difficult to aſcertain. He deſcribes it as having the leaf terminated by a tendril. Various plants have been taken for it by different botaniſts, amongſt others, ſurely with little probability, the *Aquilegia,* or Columbine, which we mention here becauſe it appears to have induced Linnæus to chooſe the name for the preſent genus, very much akin to *Aquilegia,* and ſtill more diſtinguiſhed for delicacy and elegance.—Linn. Gen. 282. Schreb. 378. Willd. Sp. Pl. v. 2. 1334. Mart. Mill. Dict. v. 2. Ait. Hort. Kew. v. 2. 271. Saliſb. Tr. of Linn. Soc. v. 8. 306. Juſſ. 233. Gærtn. t. 65.—Claſs and order, *Polyandria Polygynia.* Nat. Ord. *Multiſiliquæ,* Linn. *Ranunculaceæ,* Juſſ.

Gen. Ch. *Cal.* none. *Cor.* Petals five, ovate, equal, ſpreading, deciduous. Nectaries five, equal, tubular, very ſhort, inſerted into the receptacle within the petals, three-lobed at their orifice, the outer lobe largeſt. *Stam.* Filaments numerous, capillary, ſhorter than the corolla; anthers ſimple. *Piſt.* Germens ſeveral, ovate or oblong, ſuperior, ſeſſile, ſtyles ſimple, ſcarcely ſo long as the germens; ſtigmas obtuſe. *Peric.* Capſules ſeveral, ſeſſile, leguminous, oblong, of one cell and one valve, keeled at the outſide, burſting at the inner edge. *Seeds* numerous, attached in two rows to the edge of the capſule.

Eſſ. Ch. Calyx none. Petals five, deciduous. Nectaries tubular, three-cleft. Capſules ſeſſile, of one cell and one valve. Seeds numerous, marginal.

1. I. *fumarioides.* Linn. Sp. Pl. 783. (Helleborus fumariæ foliis; Ammann. Ruth. 74. t. 12.)—Stipulas awl-ſhaped. Leaflets pinnatifid. Capſules nearly cylindrical.—Native of moiſt ſhady places, near rivers, in Siberia, flowering in ſpring and ſummer. It is ſometimes cultivated in gardens, as being not only curious, but an elegant little annual plant, with the habit and glaucous hue of a *Fumaria*, to ſeveral of which genus its *leaves* bear a great reſemblance, in their pinnatifid obovate leaflets. The *flowers*, however, are totally different, reſembling a *Thalictrum*, ſmall, whitiſh, ſhort-lived, on long ſimple ſtalks. *Capſules* about ten or fifteen, ſpreading, pale green, near half an inch long, pointed with the permanent ſtyles.

2. I. *thalictroides.* Linn. Sp. Pl. 783. Jacq. Auſtr. t. 105.—Stipulas ovate. Leaflets three-cleft, dilated. Capſules ovate.—Native of ſhady rather moiſt places, in the mountains of Italy, Carniola, Auſtria, &c. flowering in April and May, and ſoon ripening its ſeed. *Root* creeping, perennial. *Stem* a ſpan high or more, naked below, ſmooth. *Leaves* ternate, leaflets more or leſs three-cleft, broadiſh, ſmooth, reſembling thoſe of an *Aquilegia*, or *Thalictrum.* *Flowers* white, with yellow ſtamens, not unlike ſome ſmall *Anemone.* *Capſules* only two or three, ovate, on a globular receptacle.

Such are the only certain ſpecies. I. *aquilegioides* of Linnæus appears to be a nonentity, its ſynonyms, as far as they can be made out, belonging to *Aquilegia viſcoſa*, which is Haller's *Iſopyrum*, n. 1190.

Mr. Saliſbury, in Tr. of Linn. Soc. v. 8. 305, has eſtabliſhed, by the name of *Coptis*, a very natural genus, though diſtinguiſhed from *Iſopyrum* chiefly by having ſtalked germens and capſules. Of this one ſpecies is *Helleborus trifolius* of Linnæus, Fl. Dan. t. 566; the other is C. *aſplenifolia* of Saliſbury, of which we have ſpecimens and a drawing from Mr. Menzies, who gathered the plant on the weſt coaſt of North America. This laſt, ſtrange to tell! appears, by ſpecimens from Thunberg, to be his *Thalictrum japonicum*, Tr. of Linn. Soc. v. 2. 337, called in Fl. Jap. 364. *Didynamiſta Salviæ ſimilis*, though nothing can be leſs ſuitable than the latter deſcription. He informs us he had never ſeen the flower, only the fruit.

ISORA, a Malabar name for ſome ſpecies of the *Helicteres* of Linnæus, and adopted by Plumier to deſignate that genus. See Helicteres.

ISOSCELES Triangle, of ισος, *equal*, and σκελος, *leg*, is a triangle which has two equal ſides. In an iſoſceles triangle, FDE (*Plate* VIII. *Geometry*, *fig.* 105.) the angles *y* and *u*, oppoſite to the equal ſides, are equal: and a line drawn from the top or vertex F, cutting the baſe into two equal parts, is perpendicular to the baſe. The ſame line alſo biſects the vertical angle of the triangle. It appears likewiſe that if the equal ſides be produced, the angles under the baſe will be equal, the ſum of thoſe above and below reſpectively being equal to two right angles. And if the vertical angles of two iſoſceles triangles be equal, the two triangles will be equiangular. Moreover, every equilateral triangle muſt be equiangular.

ISOTONIC *Scale of Muſic*, or the Equal Temperament Scale, is that in which the octave is divided into twelve equal parts; of courſe, each half note is equal $1 \div \sqrt[12]{2} = 51\Sigma + f + 4\frac{5}{12}m$, which is ſometimes called a mean ſemitone, and this, a ſyſtem of mean ſemitones. The following table ſhews ſome of the moſt uſeful particulars of this ſyſtem, *viz.*

1	2	3	4
C	.6989700	.50000	$612\Sigma + 12f + 53\ m$
B	.7240558	.52973	$561\Sigma + 11f + 48\frac{7}{12}m$
b B	.7491417	.56123	$510\Sigma + 10f + 44\frac{1}{6}m$
A	.7742275	.59460	$459\Sigma + 9f + 39\frac{3}{4}m$
※ G	.7993133	.62996	$408\Sigma + 8f + 35\frac{1}{3}m$
G	.8243992	.66742	$357\Sigma + 7f + 30\frac{11}{12}m$
※ F	.8494850	.70710	$306\Sigma + 6f + 26\frac{1}{2}m$
F	.8745708	.74915	$255\Sigma + 5f + 22\frac{1}{12}m$

D	.9498283	.89090	$102\Sigma + 2f + 8\frac{5}{6}m$
※ C	.9749142	.94387	$51\Sigma + f + 4\frac{5}{12}m$
C	.0000000	1.00000	
Notes.	Common Logarithms.	Lengths of Strings.	Farey's Notation of the Intervals.

The laſt column of this table was publiſhed in the Philoſophical Magazine, vol. xxix. p. 347; in the xxxvith vol. p. 47, ſchol. 7, the temperaments of the concords in this ſyſtem will be found, and in vol. xxxv. p. 452, the beats of all the concords. Broadwood and ſome other tuners of pianofortes pretend, it is ſaid, that they tune them to an equal temperament, but which is very much to be doubted. On the organ, it ſeems clear, as Mr. Smyth obſerves in the Phil. Mag. vol. xxxvi. p. 435, that an equal temperament never has been, and we may perhaps ſay, never will be practiſed: however many advocates this ſyſtem may have had among ſpeculative writers, among whom have been mentioned D'Alembert, Cavallo, Chladni, Couperin, Davis, Des Cartes, Emerſon, Marpurg, Merrick, Merſennus, Rameau, Ricci, &c. Mr. Farey, in propoſing what he calls his equal temperament, in the Phil. Mag. vol. xxviii. p. 65, expreſsly ſtated his object to be, to enable thoſe to tune it who might wiſh to try it, and not as recommending its adoption. See Equal Temperament.

ISPAHAN, in *Geography*, the capital city of modern Perſia, ſituated in the province of Irak, on the ſmall river Zenderud, which riſes in the mountains of Galabat, three days' journey towards the north; but Abas the Great, at a prodigious expence, pierced ſome mountains about 30 leagues from Iſpahan, and introduced another ſtream, ſo that the Zenderud was as large during the ſpring, as the Seine at Paris in the winter; for, in that ſeaſon, the ſnows on the high range of mountains melted, and very much ſwelled the river. The city is ſurrounded by walls of earth, which are ſuffered to remain in bad repair, and which are concealed by the adjoining houſes and gardens. It has eight gates, which, according to Chardin, could not be ſhut; and its ſtreets are narrow, devious, and badly paved. This writer computes its circuit, the ſuburbs included, at about 24 miles, and its inhabitants, by the loweſt eſtimate, at 600,000. But the royal ſquare, or Meidan Shah, and its grand market, the palace of the Sefi, and thoſe of the grandees, the moſques, the public bath, and other edifices, are magnificent and ſplendid. Its canals, the plantations of lofty plane trees on both ſides of the ſtreets, and the frequent waterings of them, contribute not only to its beauty, but its ſalubrity. The royal ſquare is 440 paces long, and 160 broad, and is ſurrounded with a canal built with bricks, cemented with black mortar, which in time becomes harder than free-ſtone. The royal moſque is ſituated at the S. end of this ſquare, and its portico is richly ornamented with a thouſand figures of a rich profuſion of gold and azure; the whole being alſo inlaid with enamelled ſquares, and a frieze encompaſſing it of the ſame materials. The royal palace, and the "haram," or women's apartment, are very ſplendid buildings. The former is nearly five miles in compaſs; its great portico ſtands in the royal ſquare, and is built to a great height with porphyry. By the Perſians it is regarded as ſacred. The ſuburb of Julfa, or Yulfa, was very large, and poſſeſſed by the Armenians, whoſe cemetery was near the mountains of Iſpahan, called Kou Sofa, or a mountain in the form of a terrace, and alſo Tag Ruſtan, the hill or throne of Ruſtan. This city is ſaid to be encompaſſed by 1460 villages, the inhabitants of which ſubſiſt chiefly by their manufactures of ſilk and wool. Its environs are pleaſant, and much diverſified by the vicinity of mountains. Iſpahan was taken by Timur Bec in the year 1387; when the inhabitants ranſomed their lives by the payment of a large ſum; but an inſurrection happening in the night, Timur ordered all the inhabitants to be put to the ſword; and in this maſſacre it is computed that 70,000 perſons were killed by the ſoldiers, and their heads piled in heaps on the walls of the city. In 1722, it was taken by the Afghans, under Mahmoud, after a long ſiege, which occaſioned the death of many of its inhabitants by famine. In 1727 it was recovered from the Afghans by Nadir Shah. By theſe repeated attacks, Iſpahan was greatly reduced, ſo that a Perſian merchant aſſured Mr. Hanway that not above 5000 houſes were inhabited. N. lat. 32° 24′ 34″. E. long. 51° 50′.

ISPIDA, or KING-FISHER, in *Ornithology*. See ALCEDO.

ISPIRA, in *Geography*, a town of Turkiſh Armenia; 74 miles N.E. of Erzerum.

ISQUINTIA, a town of Mexico, in the province of Guatimala; 30 miles W.N.W. of Guatimala. N. lat. 14° 32′. W. long. 93°.

ISQUITENANGO, a town of Mexico, in the province of Yucatan; 90 miles S. of Chiapa dos Eſpagnols.

ISQUITEPIC, a town of Mexico, in the province of Guaxaca; 40 miles W.N.W. of Guaxaca.

ISRAEL, in *Scripture Hiſtory*, Heb. ישראל, who prevails with God, formed of ישרה, *ſharah*, to govern, and אל, *el*, God, a name given to the patriarch Jacob by the angel who wreſtled with him at Mahanaim, or Penuel, Gen. xxxii. 1, 2. 28, 29, 30. This name was afterwards applied to the deſcendents of Jacob in general, hence called Iſraelites, as well as to Jacob himſelf, and alſo to the ten tribes who formed a kingdom diſtinct from that of Judah. Theſe tribes revolted during the reign of Rehoboam, under the conduct of Jeroboam, who became head of this new monarchy, ſtyled "the kingdom of Iſrael" in oppoſition to that of Judah. See JEWS.

ISSA, in *Ancient Geography*, a town of the iſland of Leſbos; more anciently called Himera.—Alſo, an iſland of Illyria, in the Adriatic gulf, upon the coaſt of Dalmatia, with a town of the ſame name. Strabo mentions it as a very celebrated iſland.

ISSACHAR, one of the twelve tribes of Iſrael, derived from the fifth ſon of Jacob, whoſe lot was aſſigned to him in one of the beſt parts of the land of Canaan. It was ſituated in Lower Galilee, and bounded by the Mediterranean on the W., by Zebulon on the N., by the Jordan on the E., which parted it from that of Gad, and on the S. by the half tribe of Manaſſeh. Its moſt remarkable places were mounts Carmel and Gilboah, the valley of Jezreel, and the great plain of Megiddo, called alſo the plain of Galilee, and now Saba, from a caſtle built upon it, and famed, like that of Jezreel, for the many battles fought upon it, and alſo for the abundance of corn, wine, oil, &c. which it produced.

ISSAGUNGE, in *Geography*, a town of Hindooſtan, in Oude; 35 miles N.E. of Kairabad.

ISSAPOUR, a town of Hindooſtan, in Oude; 25 miles N.E. of Lucknow.

ISSAWARRA, a town of Hindooſtan, in Oude; 15 miles S.E. of Kairabad.

ISSE HEAD, a cape of Denmark, at the northern extremity of the iſland of Samſoe. N. lat. 56° 3′. E. long. 10° 26′.

ISSEDON, or ESSEDON, in *Ancient Geography*, a town of Scythia, on the other ſide of the Imaus.—Alſo, a town of Serica, ſituated E.N.E. of the former.

ISSEDONES, or ESSEDONES, a people of Serica according to Ptolemy; but Pomponius Mela places them in the vicinity of the Palus-Mæotides; Pliny joins them to the Sauromatæ, and aſſigns them an habitation near the Colchide. Herodotus ſpeaks of Iſſidones as neighbours to the Maſſagetæ, as a numerous people, and living to the W. of the Caſpian ſea. Herodotus, who ſpeaks of the cuſtoms and religion of the Iſſidones (l. iv.), ſays, that when any one of them has loſt his father, all his relations bring him a number of cattle, whoſe carcaſſes they cut in pieces, and in the ſame manner cutting the body of the deceaſed father, they mix all the pieces of fleſh together, and ſerve them up at an entertainment, reſerving only the head of the deceaſed parent, which they ſet in gold, and uſe as an idol, to which they every year offer ſolemn ſacrifices.

ISSELBURG, in *Geography*, a town of the duchy of Cleves, on the Iſſel, containing a Lutheran and Calviniſt church; 14 miles E.N.E. of Cleves. N. lat. 51° 53′. E. long. 6° 35′.

ISSELMOND, an iſland in the river Meuſe, oppoſite to Rotterdam, with a town in it of the ſame name.

ISSELORT, a town of Holland, in Guelderland; ſituated at the ſeparation of the Rhine and Iſſel near Arnheim.

ISSELSTEIN, a town of Holland, belonging to the ſtate of Utrecht, and ſeated on the river Iſſel; it is the capital of a ſmall territory formerly belonging to William III. king of England; five miles S. of Utrecht.

ISSENBRON, a town of Bavaria, in the principality of Aichſtatt; ſix miles E.N.E. of Aichſtatt.

ISSER, a river of Algiers, which joins the Tafna, near its mouth; anciently called "Aſſanus."

ISSESUCAR, a town on the S. coaſt of the iſland of Java; 70 miles S.W. of Batavia.

ISSICUS SINUS, in *Ancient Geogrophy*, a gulf of the Mediterranean ſea, between Syria and Cilicia.

ISSIGEAC, in *Geography*, a town of France, in the department of the Dordogne, and chief place of a canton, in the diſtrict of Bergerac; nine miles S.S.E. of Bergerac. The place contains 879, and the canton 8316 inhabitants, on a territory of 210 kiliometres, in 21 communes.

ISSIN, a town of Perſia, in the province of Kerman, whither many of the inhabitants of Gomron retreat during the unhealthy ſeaſon; ſix miles N. of Gomron.

ISSINI, a kingdom of Africa, on the Ivory Coaſt, conſiſting of 12 or 13 villages. From the Rio de Suero da

Coſta to cape Apollonia, the coaſt is low and even, extending itſelf for a courſe of 12 miles eaſtward, bordered with large trees, and covered with villages, the chief of which are Boqun, Iſſini Peguena, Great Iſſini, Albiani, Tabo, and Akanimina. The firſt ſtands at a ſmall diſtance from the ſhore, near the mouth of the river Da Coſta, ſurrounded by woods and pleaſantly ſituated. Iſſini Peguena, and Great Iſſini, are both ſituated on the ſea-coaſt, at the diſtance of three or four miles, and between them is a number of villages. Three of them are conſiderable. Great Iſſini is built at the entrance of a ſmall river, which, during the dry ſeaſon, is loſt in the ſands, but diſcharges itſelf into the ſea during the rainy months. This town was pillaged and burnt by the inland Negroes in 1681; but has ſince recovered its importance by the addition of a great number of houſes and inhabitants. Where the river empties itſelf into the ſea, it forms a ſmall iſland, very commodious for building a fort; but no ſuch defence has been attempted by the Europeans. Great Iſſini is celebrated for the purity of its gold, which probably comes from the kingdom of Aſſiento, at the ſource of the Rio de Suero da Coſta, a country rich in gold, but little known to the Europeans. Eaſt of Iſſini are the little diſtricts and towns of Albiani and Tabo, the former ſix miles and the latter ten from it, both ſurrounded by high groves of palms, ſeen at a great diſtance at ſea, and much frequented by European ſhipping. A mile further eaſt, and half a mile weſt of cape Apollonia, ſtands the village Akanimina, on a riſing ground; commanding an extenſive ſea and land proſpect. The interior country between Boqun and this village, is high, rugged, and mountainous, but affording ſome fine gold, ivory, and formerly a few ſlaves. The gold duſt of theſe two places is commonly found at the depth of ſix fathoms, for two miles along the coaſt; and the Negroes mix it with pulverized copper ſo expertly, that it requires touching to diſcover the fraud.

ISSOIRE, a town of France, and principal place of a diſtrict, in the department of the Puy de Dôme, ſeated on the Couze, near the Allier; 15 miles S.W. of Clermont. The place contains 5095, and the canton 14,696 inhabitants, on a territory of 155 kiliometres, in 15 communes. N. lat. 45° 32′. E. long. 3° 19′.

ISSONG, in *Botany*, a name given by the people of Guinea to a ſpecies of plant, which they infuſe in water, and afterwards boil, and then waſh the head with it, as a cure for all kinds of the head-ach. It is a plant deſcribed by the botanical writers under the name of piſum veſicarium fructu nigro, alba macula notato, the bladder pea, with a black fruit marked with a white ſpot; and called by the people of Malabar, where it alſo grows very plentifully, *ulinga*. It is alſo found in Barbadoes and Jamaica, and is there called *parſley*. Phil. Tranſ. N° 232.

ISSOUDUN, in *Geography*, a town of France, and principal place of a diſtrict, in the department of the Indre, on the Theols; 18 miles N.E. of Chateauroux. The place contains 10,156, and the two cantons into which it is divided 23,297 inhabitants, on a territory of 662½ kiliometres, in 27 communes. This place has conſiderable manufactories. N. lat. 46° 56′ 9″. E. long. 1° 59′ 12″.

ISSUABLE Terms, in *Law*, a name applied to Hilary or Trinity terms, from the making up of the iſſues in thoſe terms.

ISSUANT, Issuing, in *Heraldry*, is underſtood of a lion, or other animal, in a coat of arms, that ſeems juſt coming out from under a chief, feſſe, a houſe, a wood, or the like; and only ſhews half his body.

It is not very eaſy to diſtinguiſh the lion iſſuant from the lion naiſſant: ſome ſay the iſſuant is that which comes out from the bottom of the chief, ſhewing his head, neck, the tip of his fore-legs and his tail, againſt the chief of the coat; whereas the naiſſant has its riſe about the middle of the field, and ſhews all his fore-part, with the tip of his tail, as if he were riſing out of the earth.

ISSUE, in *Common Law*, has divers applications, being ſometimes taken for the children begotten between a man and his wife—ſometimes for profits growing from amercements or fines—ſometimes for profits of lands and tenements—but more frequently for the point of matter depending in ſuit, whereupon the parties join, and put their cauſe to the trial of the jury.

On all theſe occaſions, iſſue has but one ſignification, which is, an effect of a cauſe preceding: as the children are the effect of the marriage between the parents; the profits growing to the king or lord, from the puniſhment of any man's offence, are the effect of his tranſgreſſion; the point referred to the trial of twelve men, is the effect of pleading or proceſs.

Iſſues concerning cauſes are of two kinds; that upon matter of fact, and that upon matter of law. An iſſue in *fact* is when the plaintiff and defendant have agreed upon a point to be tried by a jury; and iſſue in *law* is when there is a demurrer to a declaration, plea, &c. and a joinder in demurrer, which is an iſſue at law to be determined by the judges. (See Demurrer.) Iſſues in *fact* are either *general* or *ſpecial*. *General*, ſeems to be that whereby it is referred to the jury to bring in their verdict, whether or no the defendant hath done any ſuch thing as the plaintiff lays to his charge.

For example, if it be an offence againſt any ſtatute, and the defendant plead not guilty; this being put to the jury, is called the *general iſſue*.—So, if a man complains of a private wrong, which the defendant denies, and pleads no wrong, nor diſſeiſin; and this be referred to the jury; it is likewiſe the general iſſue. *Special*, is that, wherein ſpecial matters being alleged by the defendant in his offence, both parties join on this point, and ſo go to a demurrer, if it be *quæſtio juris*; or elſe to a trial by the jury, if it be *quæſtio facti*: as in aſſault and battery, where the defendant pleads that the plaintiff ſtruck firſt.

Issue, *Collateral*. See Reprieve.

Issue, *Feigned*, in *Chancery*, is uſed when a matter of fact is ſtrongly controverted, and the court directs the matter to be tried by a jury: but as no jury can be ſummoned to attend this court, the fact is uſually directed to be tried at the bar of the court of king's bench, or at the aſſizes upon a feigned iſſue. For, in order to bring it there, and have the point in diſpute, and that only, put in iſſue, an action is brought, wherein the plaintiff, by a fiction, declares that he laid a wager of 5*l.* with the defendant, that A was heir at law to B, and then avers that he is ſo, and therefore demands the 5*l.* The defendant allows the feigned wager, but avers that A is not the heir to B: and thereupon that iſſue is joined, which is directed out of chancery to be tried, and thus the verdict of the jurors at law determines the fact in the court of equity. Theſe feigned iſſues ſeem to be borrowed from the *ſponſio judicialis* of the Romans; and are alſo frequently uſed in the courts of law, by conſent of the parties, to determine ſome diſputed right without the formality of pleading, and thereby to ſave much time and expence in the deciſion of a cauſe. Blackſt. Com. book iii. p. 452.

Issues *on Sheriffs* are for neglects and defaults, by amercement and fine to the king, levied out of the iſſues and profits of their lands; and double or treble iſſues may be laid on a ſheriff.

a ſheriff for not returning writs, &c. But they muſt be taken off before they are eſtreated into the exchequer, by rule of court, on good reaſon ſhewn. Iſſues ſhall be levied on jurors, for non-appearance; though on reaſonable excuſe proved by two witneſſes, the juſtices may diſcharge the iſſues. See DISTRESS, DISTRINGAS, and PROCESS.

ISSUE denotes, in *Surgery*, an ulcer made deſignedly by the practitioner, and kept open a certain time, or even the patient's whole life, for the cure or prevention of a variety of diſeaſes. The phyſician, in his practice, has frequent occaſion to recommend the making of an iſſue, and the ſurgeon finds it a principal means of relief in ſeveral important caſes; as, for inſtance, the white-ſwelling, the diſeaſe of the hip-joint, caries of the vertebræ, &c. Many perſons are never in health, or at leaſt fancy themſelves always ill, unleſs they have an iſſue in ſome part of their body or another. Making an iſſue, indeed, is not unfrequently conſidered as an imitation of nature, who, of her own accord, often forms ulcers in various parts of the body (as is not uncommonly conjectured) for the purpoſe of diſcharging pernicious humours, whereby people are ſuppoſed to be freed from grievous diſorders, and have their health preſerved. The humoral pathologiſts were exceſſively partial to theſe notions, which, at the preſent time, will be found by every experienced practitioner to influence the maſs of mankind, and render the formation of iſſues more common than perhaps is conſiſtent with the better eſtabliſhed principles of medical ſcience. Few old ſubjects will allow a ſore of long ſtanding to be dried up, (as the expreſſion is,) without requiring the ſurgeon immediately afterwards to make an iſſue for them. When an ulcer has exiſted a great length of time, the conſtitution may poſſibly become ſo habituated to it, that the health may really ſuffer from its being healed. We have often ſeen aſthmatic complaints, and ſevere head-aches follow the cicatrization of an old ulcer; but whether they would have happened, if an iſſue had been made in time, we cannot undertake to determine poſitively, though the plan is commendable both as rational and exempt from danger. Whatever may be the ſolidity of the theories which have been offered by medical writers in regard to iſſues, the practitioner, who has his eyes open, cannot fail to ſee the benefit often derived from ſuch means; and if there be any unqueſtionable facts in medicine and ſurgery, we may confidently ſet down amongſt them the frequent poſſibility of relieving one diſeaſe by exciting another of a leſs grievous and more curable nature.

Surgeons of the preſent day have only two ways of making an iſſue; one is with a lancet, or ſcalpel; the other with cauſtic.

The place for the iſſue being fixed upon, the ſurgeon and his aſſiſtant are to pinch up a fold of the integuments, and with a lancet, or knife, make in them an inciſion of ſufficient ſize to hold a pea, or as many peas as may be thought proper. The pea or peas are then to be placed in the cut, and covered with a piece of adheſive plaſter, a compreſs and bandage. The peas firſt inſerted need not be removed for three or four days, when ſuppuration will have begun; but the iſſue is afterwards to be cleaned and dreſſed every day, and have freſh peas put into it. The preceding is the ordinary method of making ſuch iſſues as are intended to contain only one or two peas.

When the iſſue is to be larger, which is generally proper in caſes of diſeaſed vertebræ, white-ſwellings, &c. the beſt plan is to deſtroy a portion of the integuments with cauſtic. The kali purum, blended with quicklime, is moſtly preferred for this purpoſe. The ſituation and ſize of the iſſue having been determined, the ſurgeon is to take care that the cauſtic does not extend its action to the ſurrounding parts. With this view he is to take a piece of adheſive plaſter, and having cut a hole in it of the exact ſhape and ſize of the iſſue intended to be made, he is to apply it to the part. Thus the plaſter will defend the adjacent ſkin from the effects of the cauſtic, while the uncovered portion of integuments, correſponding to the hole in the plaſter, is that which is to be deſtroyed. The cauſtic is to be taken hold of with a bit of lint or tow, and its end, having been a little moiſtened with water, is to be ſteadily rubbed upon the part of the ſkin where the iſſue is to be formed. The frictions are to be continued, till the whole ſurface intended to be deſtroyed aſſumes a darkiſh corroded appearance. The cauſtic matter may now be carefully waſhed off with ſome wet tow. The plaſter is to be removed, and a linſeed poultice applied. As ſoon as the eſchar is detached, or any part of it is looſe enough to be cut away without pain or bleeding, the peas are to be inſerted and confined in their proper place with a piece of adheſive plaſter. Some uſe beans for the purpoſe; others beads, which anſwer very well, and have the advantage of ſerving for any length of time, when waſhed and cleaned every day. If the iſſue is at all of a longitudial ſhape, the peas, beans, or beads may be more eaſily kept in their places when ſtrung upon a thread.

Iſſues ought always to be made, if poſſible, in a ſituation where the peas will not be much diſturbed in the ordinary motions of the body, nor interfere with the actions of the muſcles. The interſpaces between the margins and inſertions of muſcles are deemed the moſt eligible places. Thus, iſſues in the arm are uſually made juſt at the inferior angle of the deltoid muſcle, by the ſide of the external edge of the biceps. In the lower extremities iſſues are often made at the inner ſide of the thigh, immediately above the knee, in a cavity readily felt there with the fingers. Sometimes iſſues are made upon the inſide of the leg, juſt below the knee. The nape of the neck is a common place for them. In caries of the vertebræ they are made on each ſide of the ſpinous proceſſes. In diſeaſed hips they are formed in a depreſſion juſt behind and below the trochanter major. When the nature of the caſe does not fix the ſituation of an iſſue particularly, the arm ſhould be preferred to the leg, as iſſues upon the upper extremity, eſpecially the left arm, are much leſs annoying than upon either of the lower limbs.

The great art of keeping an iſſue open for a long while, is always to maintain an equal and effectual preſſure upon the peas, by which means they will be confined in their places, and the granulations hindered from riſing. Compreſſes of paſteboard and ſheet lead will often be found highly ſerviceable.

IS-SUR-TILLE, in *Geography*, a town of France, in the department of the Côte d'Or, and chief place of a canton, in the diſtrict of Dijon; 4 miles N. of Dijon. The place contains 1598, and the canton 10,170 inhabitants, on a territory of 355 kiliometres, in 23 communes. N. lat. 47° 30′. E. long. 5° 9′.

ISSUS, in *Ancient Geography*, a town of Aſia, in Cilicia, ſituated on the ſea coaſt. This town was large, rich, and populous. It is famous for the battle fought by Alexander in the year 333 B.C. in which he defeated the Perſians, and took as priſoners the wife, mother, and daughters of Darius.

ISSY L'EVEQUE, in *Geography*, a town of France, in the department of the Saône and Loire, and chief place of a canton, in the diſtrict of Autun; 19 miles S.S.W. of Autun. The place contains 1715, and the canton 5349 inhabitants, on a territory of 220 kiliometres, in 7 communes.

ISTAD, St. a ſmall iſland in the Grecian Archipelago, near the S.E. coaſt of Argentiera.

ISTAKAR, a town of Perſia, in the province of *Farſiſtan* (which ſee), at a ſmall diſtance N. of Shiraz.

ISTAN, a town of Spain, in the province of Grenada; 6 miles S.E. of Monda.

ISTANNA, a country of Africa, E. of Benin.

ISTAPA, a town of Mexico, in the province of Culiacan; 40 miles E. of Culiacan.

ISTAPAN, a town of Mexico, in the province of Guadalajara; 15 miles N.E. of St. Miguel.

ISTECHIA, a town of the Morea, in the gulf of Coron; 7 miles S. of Scardamula.

ISTEFAN, a town of Aſiatic Turkey, in the province of Natolia; 20 miles N. of Sinob.

ISTENAZ, a town of Aſiatic Turkey, in the province of Caramania; 18 miles W. of Satalia.

ISTEPEC, a town of Mexico, in the province of Guatimala; 12 miles N. of St. Salvador.

ISTER, in *Ancient Geography*, the name which the Greeks gave to the river which we call the *Danube;* which ſee.

ISTESSO, L'Isteſso, *Ital.* in *Muſic*, the ſame ſound, air, or interval. Domenico Scarlatti, in Roſcingrave's edition of his firſt book of Leſſons, has *l'iſteſſo differente* for the ſame air, varied; and Padre Martini, for exactly the ſame thing, has *ſteſſo*, *ſteſſiſſimo*.

ISTHÆVONES, or Istævones, in *Ancient Geography*, a people of Germany, who, according to Pliny (l. iv. c. 14.), were ſituated near the Rhine, and of whom the Cimbri, in the interior of the country, formed a part.

ISTHMIA, Ισθμια, or Isthmian *Games*, *Ludi Iſthmii*, were ſolemn ſports, being one of the four ſacred games celebrated in ancient Greece.

They were called *Iſthmian*, becauſe they were celebrated in the Corinthian iſthmus, a neck of land by which Peloponneſus is joined to the continent.

Plutarch, in the life of Theſeus, tells us they were inſtituted by that hero to the honour of Neptune, in imitation of Hercules, who had before inſtituted the Olympic games to the honour of Jupiter; but Archias refers their inſtitution to the honour of Melicertes, or Palæmon, ſon of Athamas, king of Thebes, whom the Latins call Portumnus. Others ſay they were inſtituted by Niſis, ſon of Neptune; and others, by Siſyphus, brother of Athamas, king of Corinth, about 1326 years B.C. Others are of opinion that there were two diſtinct ſolemnities obſerved in the Iſthmus, one in honour of Melicertes, and another in honour of Neptune.

The moſt probable account of the origin and ſubſequent renewal of theſe games, allowing, as it may perhaps be neceſſary, for ſome mixture of fable, is as follows: Athamas, king of the Orchomenians, a people of Bœotia, having divorced his former wife, named Nephele, by whom he had two ſons, Phryxus and Hellé, and having married Ino, by whom he had alſo two ſons, Learchus and Melicertes, or Melicerta; the latter perſecuted the children of the former marriage, ſo far as to make her huſband believe that the oracle of Delphos demanded the blood of Phryxus, as the means of putting a ſtop to the famine of which ſhe herſelf was the cauſe; and the too credulous Athamas was upon the point of ſacrificing his ſon to the ſafety of his ſubjects; but upon information of his wife's whole management, he ſlew her ſon Learchus, and purſued Ino with ſuch eagerneſs, that ſhe was found to throw herſelf down with Melicerta, whom ſhe held in her arms, from the top of the rock Moluria, into the ſea. A dolphin, we are told, or rather the waves, carried Melicerta into the iſthmus of Corinth; and the Corinthians, at the perſuaſion of Siſyphus, the brother of Athamas, after having given him a ſplendid funeral, inſtituted to his honour games, which obtained the name of Iſthmian, from the place where they were celebrated for the firſt time. Theſe games, in which were exhibited the ſame trials of ſkill as in the others, and chiefly thoſe of muſic and poetry (ſee Games), having been interrupted, probably by ſome wars, were afterwards re-eſtabliſhed by Theſeus (1234 B.C.), who conſecrated them to Neptune, whoſe ſon he pretended to be, as to the god who peculiarly preſided over the iſthmus of Corinth; and they were renewed ſo regularly every five years, about the middle of the month Hecatombion, that they were not even diſcontinued after the city of Corinth had been deſtroyed and reduced to aſhes by Mummius (146 B.C.); the Sicyonians having received orders to celebrate them, notwithſtanding the public grief and deſolation. When the city was afterwards rebuilt, the new inhabitants reſumed the care of theſe games, and continued to exhibit them with great regularity. Some time after, the Romans were admitted to them, and celebrated them with ſo much pomp and apparatus, that beſides the ordinary exerciſes, a hunting match was there exhibited, in which were preſented the moſt rare animals; the city of Corinth neglecting no means by which they might pleaſe their conquerors: and their fame was ſtill increaſed, becauſe they ſerved as an era to the Corinthians, and inhabitants of the iſthmus.

Archias and others ſay, the conqueror's prize at theſe games was a crown of parſley. Plutarch and Strabo ſay it was at firſt a crown of pine; and that this was afterwards changed for one of parſley; but that at length the pine was reſumed; and to this was added a reward of 100 ſilver drachmæ, or about 3*l.* 4*s.* 7*d.* ſterling.

Theſe games were held, according to Pindar, every three years, or, according to Pliny, every five; and were ſo celebrated, and the concourſe at them was ſo great, that only the prime perſons of the moſt remarkable cities could have places in them. The Athenians had only as much room allotted them as the ſail of a ſhip, which they ſent yearly to Delos, could cover.

ISTHMUS, Ισθμος, in *Geography*, a narrow neck, or ſlip of ground, which joins two continents; or joins a peninſula to the terra firma, and ſeparates two ſeas.

The moſt celebrated iſthmuſes are that of Panama or Darien, which joins North and South America; that of Suez, which connects Aſia and Africa; that of Corinth, or Peloponneſus, in the Morea; that of Crim-Tartary, otherwiſe called Taurica Cherſoneſus; that of the peninſula Romania and Eriſſo, or the iſthmus of the Thracian Cherſoneſus, twelve furlongs broad, being that which Xerxes undertook to cut through. The ancients had ſeveral deſigns of cutting the iſthmus of Corinth, which is a rocky hillock, about ten miles over; but they were all vain, the invention of ſluices not being then known. There have been attempts, too, for cutting the iſthmus of Suez, to make a communication between the Red ſea and the Mediterranean.

Isthmus is alſo applied, by the anatomiſts, to ſeveral parts of the human body, particularly that narrow part of the throat, ſituate betwixt the two tonſils.

Alſo to the ridge that ſeparates the two noſtrils; and to the paſſage in that part of the medulla oblongata of the brain which lies between the cerebrum and cerebellum, and which reaches from the place called *anus* to the fourth ventricle. The upper part or cover of this conduit, or paſſage, which is betwixt the teſtes and the foremoſt vermicular proceſs of the cerebellum, and to which two it is tied at its two ends, and to the proceſſes which come from the cerebellum to the teſtes at its ſides, is called *valenta major;* it is of a medullary ſubſtance, and its uſe is to keep the lympha from falling out above the nerves in the baſis of the ſkull.

ISTIATZKA, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the Vagai; 68 miles S. of Tobolſk.

ISTIÆ, in *Ancient Geography*, a town of the iſland of Eubœa; ſituated in the northern part of the iſland upon a mountain, nearly oppoſite to the Pelaſgic gulf, which belonged to Theſſaly. It was anciently called Oreos, from its ſituation, ορος being a mountain. Its original inhabitants were driven from it by Pericles, and retired to the Eſtiotide, an interior country of Theſſaly; and their place was occupied by a colony of Athenians, of the tribe Heſtiæa. It is now called Orio, or Oreo.

ISTIB, in *Geography*, a town of European Turkey, in Macedonia; 72 miles N. of Saloniki. N. lat. 41° 50′. E. long. 22° 48′.

ISTILLAR, a town of European Turkey, in Macedonia; 56 miles S.E. of Saloniki.

ISTIZER, a town of Ruſſia, in the government of Tobolſk; 24 miles E.S.E. of Tobolſk.

ISTLAN, a town of Mexico, in the province of Mechoacan; 60 miles N.W. of Mechoacan.

ISTRE, a town of France, in the department of the mouths of the Rhone, and chief place of a canton, in the diſtrict of Aix; 18 miles S.E. of Arles. The place contains 2111, and the canton 5932 inhabitants, on a territory of 347½ kiliometres, in 4 communes.

ISTRIA, a peninſula of Europe, bounded every where by the ſea, except on the north, where it is joined to Carniola. This peninſula was anciently a part of Illyrium; but being conquered by the Romans, between the firſt and ſecond Punic wars, it was annexed to Italy. In the middle ages it belonged to the patriarch of Aquileia, who was inveſted with it, as a marquiſate, by the emperor Henry IV. In the year 1190 the maritime part was for the moſt part conquered by the republic of Venice, abating ſome interruptions on the part of the Auſtrians. Venetian Iſtria was divided into 4 biſhoprics and 18 diſtricts; it contained 6 large, and 12 ſmall towns, or boroughs, 200 villages, and 100,000 inhabitants, who were chiefly employed in agriculture, the production of wine and oil, the rearing of bees, the manufacture of ſilk, leather, tallow, and ſalt, and fiſhing. The grain, wine, oil, and ſalt, have been reckoned excellent, and have afforded, together with the tunny fiſh and anchovy fiſhery, profitable articles of commerce. The marble and ſtone have likewiſe ſupplied important branches of trade. But the chief wealth of Iſtria has conſiſted in its foreſts, which overſpread a great part of the country, and yield abundance, not only of fire-wood and timber for ſhip-building, but alſo of game. By the treaty of Campo Formio, in 1797, and that of Luneville, in 1801, the Venetian part of Iſtria was ceded to Auſtria. But by the treaty of Preſburg, in 1805, that part of the ſtates of the republic of Venice, which had been ceded to the emperor of Germany and Auſtria by the treaties of Campo Formio and Luneville, were united in perpetuity to the king of Italy.

ISTRUP, or Oistrup, a town of the biſhopric of Paderborn; 12 miles E. of Paderborn.

ISTUNALA, a town of South America, in the government of Tucuman; 130 miles E. of St. Miguel de Tucuman.

ISUNGO, a town near the centre of the iſland of Gilolo.

ISVORA, a town of Walachia; 12 miles E.S.E. of Brancovina.

ISURIUM, in *Ancient Geography*, a town of the iſland of Albion, or Britain, in the country of the Brigantes. It is now Aldburrow, near Boroughbridge, and probably derived its name from its ſituation on the river Ure. Although it is now a ſmall village, it ſeems to have been once the capital, of the Brigantes; being called, both in the Itinerary of Antonine and in Ravenna's, "Iſurium Brigantum." The foundations of the ramparts may ſtill be traced.

ISWARA, in *Hindoo Mythology*, one of the many names of Siva; but it is ſometimes applied, rather confuſedly, to other deities, being nearly equivalent to our lord, and ſuſceptible of equivocal application. Generally, however, it is underſtood of Siva, and ſometimes has the epithet *Maha* prefixed, giving Mäheſwàra, or the great Iſwàra. Under this form the name of his ſakti, or conſort, is Mäheſwàri.

ISWETOSTA, in *Geography*, a town of Sweden, in the province of Skonen; 8 miles N.E. of Chriſtianſtatt.

ITABIER, a town of the iſland of Borneo; 30 miles N. of Negara.

ITABOCA, a town of Brazil, in the government of Para, on the Tocantin; 90 miles S. of Canuta.

ITACAMBIM, a town of Brazil; 60 miles N. of Villa Nova del Principe.

ITACORUSSA, a town of Brazil, ſituated on the Xingis; 60 miles S.W. of Curupa.

ITAIARA, in *Ichthyology*, a name by which ſome have called a Braſilian fiſh, of the turdus kind, of great beauty, and a very delicate taſte, more uſually known by the name *juruncapeba*.

ITAKA, in *Geography*, a town of Japan, in the iſland of Niphon; 35 miles S. of Ixo.

ITALA, a town of Sicily, in the valley of Demona; 13 miles S.W. of Meſſina.

ITALAH, a town of Aſiatic Turkey, in Natolia. N. lat. 38° 43′. E. long. 28° 29′.

ITALIA, in *Ancient Geography*. See Italy.

ITALIAN, the language ſpoken in Italy.

This tongue is derived principally from the Latin, and of all the languages formed from the Latin, there is none which carries with it more viſible marks of its original than the Italian.

It is accounted one of the moſt perfect among the modern tongues. It is complained, indeed, that it has too many diminutives and ſuperlatives, or rather augmentatives; but without any great reaſon: for if thoſe words convey nothing farther to the mind than the juſt ideas of things, they are no more faulty than our pleonaſms and hyperboles.

The language correſponds to the genius of the people; they are ſlow and thoughtful; and, accordingly, their language runs heavily, though ſmoothly; and many of their words are lengthened out to a great degree. They have a great taſte for muſic; and to gratify their paſſion this way, have altered abundance of their primitive words; leaving out conſonants, taking in vowels, ſoftening and lengthening out their terminations for the ſake of the cadence.

Hence the language is rendered extremely muſical, and ſucceeds better than any other in operas, and ſome parts of poetry; but it fails in ſtrength and nervouſneſs: hence alſo a great part of its words, borrowed from the Latin, become ſo far diſguiſed, that they are not eaſily known again.

The multitude of ſovereign ſtates into which Italy is divided, has given riſe to a great number of different dialects in that language; which, however, are all good in the place where they are uſed. The Tuſcan is uſually preferred to the other dialects, and the Roman pronunciation to that of the other cities; whence the Italian proverb, "Lingua Toſcana in bocca Romana."

The Italian is generally pretty well underſtood throughout Europe, and is frequently ſpoken in Germany, Poland, and Hungary. At Conſtantinople, in Greece, and in the ports of the Levant, the Italian is uſed as commonly as the language of the country; indeed in thoſe places it is not ſpoken ſo pure as in Tuſcany, but is corrupted with many of the proper words and idioms of the place; whence it takes a new name and is called *Frank* Italian. See LANGUAGE.

ITALIAN *Coins, Meaſures, Marble, Silks.* See the ſubſtantives.

ITALIAN *School of Engraving.* Engraving, with the work of the ſcorper occaſionally intermingled with that of the graver, had been practiſed in Italy, from time immemorial, in oramenting thoſe golden and ſilver vaſes, ſalvers, chalices, and other veſſels of plate, which adorned the communion-tables of the Catholic church, and the ſide-boards of the noble and opulent, when, about the middle of the fifteenth century, Maſo, or Thomaſo, Finiguerra, a goldſmith of Florence, accidentally diſcovered the means of printing from the inciſions thus ſculptured on the metal: ſo that engraving on copper-plates, as it is now practiſed, with the view of rendering impreſſions on paper, is a ſcion from the decorative part of the art or trade of the goldſmith; but which has gradually far out-grown the parent tree.

Vaſari, in his biography of Marc Antonio, has, with great propriety, connected his account of that diſtinguiſhed engraver, with an hiſtory of the diſcovery which rendered his art ſo famous and ſo extenſively beneficial. He ſays that Finiguerra, having performed an engraving on a piece of plate, and intending to fill up the hollows with enamel; in order to try the effect of it previouſly to putting on the enamel, caſt ſome melted ſulphur upon it, and, on taking it off, perceived that the dirt (or charcoal with which he firſt tried his work) collected at the bottom of the ſtrokes, by adhering to the ſulphur, gave an impreſſion of what he had engraven. Struck with the diſcovery, he repeated the experiment, by applying moiſtened paper to his engraving inſtead of ſulphur, rolling it gently with a roller, and this experiment being attended with ſucceſs, he imparted his diſcovery to Baccio Baldini, who was alſo of Florence, by whom it was communicated to Sandro Boticelli, and perhaps alſo Antonio Pollajuolo, and Andrea Mantegna.

The baron Heinnekin, however, believes that rolling-preſs printing had previous exiſtence in Germany, and ſubſequent writers (among whom is our countryman Strutt), giving credit to the opinion of an author, who is ſo generally worthy of it as Heinnekin, have copied this belief, or repeated this aſſertion of the baron, perhaps with too little reflection.

An accidental diſcovery of this kind, which might have taken place in any country where paper was known and uſed, reflects ſo little real honour upon its birth-place, as to be unworthy of half the importance which has been induſtriouſly endeavoured to be attached to it; yet for this trivial or fancied honour, the connoiſſeurs and literati of Italy and Germany have contended; and we muſt allow, that the mind of Heinnekin appears, in this inſtance, to have been influenced by an evident bias in favour of the pretenſions of his country.

He oppoſes, however, only conjecture to the plain and ſimple fact of Vaſari, which we have related above; and though he, as well as others, have ſeduloully ſought for evidence in the dates of the earlieſt German engravings, no ſuch evidence has been found. No German print impreſſed from an engraved plate, of which the date has not been ſubſequently altered to impoſe on the credulous, has been, or can be produced, as the preſent writer believes, bearing an earlier date than 1460, the year in which, according to Vaſari, the accident happened in the workſhop of Finiguerra, which gave to Europe the means of printing from the inciſion of the graver.

Finiguerra was born at Florence ſome time about the year 1434, and died in the ſame city at an advanced age. He is reported to have ſtudied under Maſſaccio. Probably he learned drawing in the ſchool of that maſter: and Baccio Bandinelli, in one of his letters ſays, that Maſo worked with Pollajuolo and other contemporary artiſts, on the far famed metal doors of the church of St. John at Florence. About the year 1450, he engraved alſo for the church of St. John, the Paſſion of Chriſt on a ſacred vaſe of gold, in a very artiſt-like manner, though the figures were ſmall. This fact is reported in a letter from M. Gabuori to Mariette; but of his other engravings we are compelled to ſpeak with doubt.

Whether any *impreſſions* from the works of this artiſt remain to atteſt his diſcovery of printing, and corroborate the ſtatement of Vaſari, is at the beſt uncertain. Strutt has mentioned dubiouſly, "The Seven Planets;" which are really from the graver of Boticelli, and with better ſhow of reaſon, a ſmall plate of an artiſt engaged in his profeſſion, which is marked with the letter F on a ſtone, and is certainly in the very earlieſt ſtyle (for Baldini and Boticelli can ſcarcely be ſaid to have attained a ſtyle) of Italian engraving; to which the foreign writers on art have added the twenty-four following ſmall engravings, which are, for the moſt part, of the circular form. According to Huber and Roſt they were recognized as the work of Finiguerra by M. Otto, a well-known amateur of Leipſic, by M. l'Abbe Zani of Parma, and by the more celebrated baron de Stoſch, the latter of whom reſided a long time at Florence, whilſt he was forming his immenſe collection of works of art. All of theſe connoiſſeurs have admitted them into their collections as the work of Finiguerra; and Heinnekin, after attentive examination, has adjudged them to be his engraving and printing.

1. A couchant female, perhaps intended for a Venus. On a ſtreamer ſurmounting the couch, is inſcribed "Amor vuol fé, o dove fé nonne." 2. The male and female ſupporters (a young man and woman) of the arms of the Medicis, with a vaſe of flowers, &c. The female is dreſſed in the Grecian taſte, and holds two girdles. N. B. This ſeems to have been printed from the cover of a round box. 3. A half-length figure of a young man with a parroquet on his ſhoulder, playing the guitar, encircled by a border of fruit. 4. An adoleſcent cupid tied to a tree, his eyes

bandaged, and four females tormenting him. 5. The ſame ſubject, differently treated. 6. Eight ſmall ovals encloſed in a circular border of foliage. In the middle are two profiles of character, and in each of the reſt a little cupid playing on ſome muſical inſtrument. 7. A ſimilar ſubject, except that in a circle in the middle, a cavalier and lady are repreſented dancing. 8. Another circle bordered with fruit. In the middle part, a bear in a landſcape is attacked by five dogs, and at the top are two cartouches, on the ſcrolls of which the arms of the Medicis are traced with pen and ink. 9. Another circle, bordered with foliage. The ſubject a muſical party, conſiſting of a cavalier and two ladies in a garden. 10. A monſtrous viſage, the mouth of which is extended by two hands, in a circular border. 11. Contains two profiles en medallion bordered with laurel; above them are three hunting ſubjects, in one of which a dog is attacking a ſtag, whilſt a hare is eſcaping. 12. A lady careſſing a unicorn. A dog is at her feet, and her head enwreathed with flowers. 13. Judith and Holofernes, in which the heroine is habited in the antique taſte. 14. The ſame ſubject, except that Judith is here more richly dreſſed than in the former, and crowned. 15. A cavalier and lady walking in a cypreſs grove, whilſt a youth plays the tamboureen. 16. Jaſon and Medea, who appear as ſupporters to an armorial bearing. 17. Two ſupporters to a ſphere: one of whom (the man) holds a ſtreamer, on which is written "Amor vuol fé, a dove fé nonne;" the other is a female dreſſed in the antique taſte, and holding the motto "Amor non pico." 18. Another heraldic ſubject, in the midſt of which a circular ſpace is left blank for an armorial bearing. The left ſupporter is a young lady, and on the right hand is a cavalier holding a wreath of laurel; a winged cupid is fluttering above, and beneath, a dog is aſleep. 19. Another circular armorial bearing, with a male and a female ſupporter. 20. A guardian angel, with expanded wings in a pontifical habit. 21. Cupids holding wreaths of flowers and fruit; one with his eyes bandaged. 22. Bacchanals; in the midſt of which is a car drawn by cupids, ſurmounted by a trophy of gabions throwing out fire. Some of the cupids are playing on inſtruments of muſic, others bearing flambeaus. The proceſſion is led by one carrying a flag, on which is written "Purita," and cloſed by another, whoſe motto is "Al fecogedit." 23. Two women elegantly attired, ſitting in a landſcape, ſupporting a border of cornucopias. 24. Two warriors, with each a knee on the ground, ſupporting an octagonal eſcutcheon, on which is a female with her hands raiſed towards heaven. N. B. The four latter are ovals.

"An edition of the "Inferno of Dante," printed at Florence in the year 1481, has long been ſuppoſed to contain the earlieſt Italian engravings, excepting the maps to an edition of Ptolemy printed at Rome in 1478, of which the *date* is aſcertained, and to have been the firſt book ever embelliſhed with copper-plate prints, in which human figures, or other natural objects, were attempted to be repreſented. This is, however, a miſtake. The extenſive and well choſen bibliographical collection of earl Spencer contains a more perfect book, printed alſo at Florence, (by Niccolo Lorenzo della Magna,) but in the year 1477, which is four years anterior to the "Dante." Its title is "Monte Santo di Dio;" its author Antonio Bettini, biſhop of Fuligno; and of the three engravings it contains, one is much larger than the embelliſhments of Dante.

"The prints that accompany both theſe books are the joint performance of Baccio Baldini and Aleſandro Boticello, or Boticelli; and none of them diſcover much ſkill either in the deſign or execution. The ſame artiſts have alſo engraven a ſet of the Prophets, ſingle figures; and a much larger plate than had yet appeared in Italy, of which the ſubject is "The Laſt Judgment," and where the damned are repreſented in ſeparate places of torment, which reſemble ovens, each inſcribed with a particular vice or mortal ſin. But it muſt be added, that all the engravings which theſe artiſts performed in conjunction, are Gothic, vulgar, and inferior to thoſe of their German contemporaries."

Baldini was a Florentine by birth, and was brought up to the buſineſs of a goldſmith. Judging from his engraving, and his obſcurity in every other reſpect, he ſeems to have been one of thoſe men of ſlender talent, who are pretty numerous in all times and places; whoſe mere want of employment affords them leiſure to catch at, and avail themſelves of the advantages of, the inventions and diſcoveries of others. From Finiguerra he obtained his method of printing; and Boticelli furniſhing him with deſigns, he engraved, with the help of the latter, nineteen plates for the above-mentioned edition of the "Inferno of Dante." The whole of his other engravings, with which we are acquainted, have been already mentioned.

Sandro Boticelli, ſurnamed Filipipi, goldſmith, painter, deſigner, and engraver, was born at Florence in the year 1437, and died in the ſame city in 1515. Though apprenticed to a goldſmith, he ſtudied the art under Filippo Lippi the painter, and acquired ſome reputation by his pictures, but more by his drawings. His biographers ſay, that he learned engraving (probably printing by means of the roller) of Finiguerra; and beſide the deſigns for Dante's poem, and thoſe which follow, Vaſari mentions with diſtinction, as his very beſt performance with the graver, a print, entitled "Le Triomphe de la Foi de Fra Girolamo Savanarola."

"St. Jerome on his Knees, extending his right Hand toward a Crucifix;" "St. Sebaſtian with the Virgin Mary," inſcribed "O Mater Dei, memento mei.—O beate Zebaſtiano;" a ſet of twelve of "The Sybils," with each a ſcroll, and eight Italian verſes beneath; "The ſeven Planets." (N.B. It is one of them, namely, the planet Venus, which Strutt has copied, and aſcribed to Finiguerra.) "The Triumph of Paulus Emilius," inſcribed on a medallion, "Paulo Emilio Aug.;" a ſet of the "Vices" and "Paſſions," with "Innocence" and "Truth;" "The glorified Saviour riſing in Judgment, attended by the Prophets and Saints." The three latter are of ſmall folio dimenſions; and of the laſt of all we have already particularly ſpoken under the title of "The Laſt Judgment," the joint production of Boticelli and Baldini.

"Antonio Pollajuolo or Pollajuoli, who was alſo of Florence, and born ſome time about the year 1426, may with more propriety be called an artiſt. From the antique ſculpture, which was now beginning to re-appear, he ſeems to have learned attention to the anatomy of his figures: to which moſt important requiſite of hiſtorical art, Pollajuolo has the diſtinguiſhed honour of having been the firſt to attract critical attention. He has ſhewn his predilection for this ſtudy, by repreſenting the conſpirators naked in the medal which he cut to commemorate the aſſaſſination of Juliano, and the attack on Lorenzo de Medici; and alſo in a much larger engraving than had hitherto been executed, of which the ſubject is a battle, and wherein he has repreſented all the combatants naked. There is an impreſſion of this very ſcarce print in the Cracherodean collection, printed on reddiſh paper: each figure is nearly eleven inches in height; the heads have ſome faint dawnings of expreſſion; and the ſhadows are produced without croſſings, by diagonal lines, apparently done to imitate the hatchings of a pen, and in the ſame direction in which it is cuſtomary to write: but the outlines and ſhadows are dry and hard, and the forms vulgar and heavy. It is only by comparing Pollajuolo with his contemporaries and predeceſſors, that we learn to reſpect his performances; and it has even been ſaid of his moſt celebrated work, (“The Martyrdom of St. Sebaſtian,”) that it “exhibits only a group of half naked and vulgar wretches diſcharging their arrows at a miſerable fellow-creature, who, by changing places with one of his murderers, might with equal propriety become a murderer himſelf:” ſo little attention was paid even in Italy, at this early period, to character and expreſſion.” Landſeer's Lectures.

Like moſt of the contemporary artiſts of his country, Pollajuoli practiſed occaſionally the ſeveral branches of imitative art, which have ſince become diſtinct profeſſions, and was at once goldſmith, medalliſt, ſculptor in relievo, painter, and engraver with the burin. Bartolucci was his principal, or at leaſt his firſt inſtructor; but he worked with conſiderable credit, under Ghiberti, on the juſtly celebrated metal doors of the church of St. John at Florence. He alſo executed the monument of pope Sixtus IV., which originally ſtood in the chapel of that name, and has ſince been removed by the order of Urban VIII. to the church of St. Peter; and that of Innocent VIII.; which are both in bronze, and are works of great merit. The plan of the Belvidere palace has been likewiſe attributed to him.

Of the prints now extant from the graver of Pollajuoli, we know only of the following:

The above-mentioned large folio, wherein ſix men are repreſented fighting with ſwords in a foreſt; an “Holy Family,” alſo in folio; and two ſmaller prints of “The Labours of Hercules,” in one of which he is engaged with Antæus, and in the other removing a column.

An obſcure village near Mantua gave birth to the chevalier Andrea Mantegna, in the year 1451. Born in indigence, he was obliged in his early youth to tend ſheep for a ſubſiſtence; but being gifted by nature with a happy genius for the imitative arts, he employed all his leiſure in endeavouring to draw the objects around him. F. Squarcione, that obſervant protector of the fine arts, who was thence ſurnamed the Father of Painters, diſcovering the diſpoſition of our young ſhepherd for painting, took charge of his education; and conceiving for him an ardent affection, which increaſed with the increaſing merit of Mantegna, finally created him heir to his fortune.

Mantegna married the daughter of John Bellino of Venice. Correggio became his diſciple, and the duke of Mantua his warm admirer and patron: from his hands our artiſt received the honour of knighthood; and for him he painted that celebrated picture, which he afterwards engraved, and which is now in the royal palace at Hampton-Court, of the “Triumph of Julius Cæſar.”

He executed ſeveral great works for pope Innocent VIII., who invited him for that purpoſe to Rome. He painted an altar-piece for the church of St. Sophia of Padua; and ſeveral pictures for that of St. Juſtinian, particularly one which has been much admired for its colouring as well as deſign, in a chapel belonging to that church: finally, he died in the ſame city (of Padua), highly honoured and admired, in the year 1517; and a tomb, ſurmounted by his buſt, was raiſed to his memory in the church of St. Andrew.

Mantegna contributed much to the advancement of Italian engraving. “By his more intimate knowledge of the antique, and his ſuperior uſe of that knowledge, he improved the drawing, without materially altering the ſtyle of engraving of Pollajuolo, by whom he is preſumed to have been inſtructed in the new art. Indeed, as the local energies and practical perfections of painting were at this time ſo imperfectly developed, it was much more natural, and in the ſame degree more wiſe, for engraving to imitate pen and ink drawings than to imitate pictures; and the beſt of Mantegna's prints derive a peculiarity of character and of value from this circumſtance. By intermingling the appearance of the finer ſtrokes of the pen, as it worked upward, in his ſhadows he ſoftened and mellowed the ſtronger lines; ſo that the whole became a more appropriate vehicle of the obſcurity he had in view: and the exact ſimilarity of his ſtyle of engraving to his own mode of drawing ſufficiently ſhews, that to imitate pen and ink drawings was the boundary of his aim.

“A very curious pen and ink drawing from the hand of Mantegna, of which the ſubject is an attempt to reſtore an allegorical picture which Apelles painted from an event in his own life, is now in the poſſeſſion of Mr. Weſt, preſident of the Royal Academy. He engraved, from his own deſigns, ſometimes on copper, and ſometimes, as it is ſaid, upon tin. “In his engravings, as in his pictures, his contours are of a grand and decided character, ſuſtained throughout by much of what has ſince been termed the noble ſimplicity of the Roman ſchool. His prints are not few; but conſidering the early period at which they were performed, are much more extraordinary than numerous. The two “Labours of Hercules,” in the Cracherodian Collection, ought probably to be reckoned among the earlieſt of Mantegna's engravings. Like thoſe of Pollajuoli, they are printed on reddiſh paper, and are deſigned in the ſame heavy ſtyle. His “Bacchanalian Proceſſion” has ſtill ſome conſiderable remains of Gothic groſſneſs; but he has here ſhewn his talent in compoſition, and the fore-ſhortenings that occur are far better expreſſed than we have hitherto ſeen. The compoſition of his “Battle of Sea-Gods and Tritons” is wildly grand, with ſuch a mixture of the groteſque, as may ſeem not improperly to belong to a ſubject which we ſhould eſteem out of nature, or beyond the limits of the material world. The combatants in this battle are the offspring of his own fertile and vigorous fancy, generated by the ſculpture of antiquity. Beſide the tritons and ſea-monſters, here are the general forms of horſes and men; but, like the fawns and ſylvan deities of the Greeks, their natures partake of the element in which they exiſt:—at leaſt, the ſpectator is led to perceive that this intention exiſted in the mind of the artiſt, and that (in the words of Ariel's ſong) they have undergone “a ſea-change, into ſomething rich and ſtrange.” Inſtead of hair, ſea-weed decorates the human heads; and the fins and ſcales of marine animals help to conſtitute the horſes and tritons. Their weapons, too, are congenial with themſelves: they fight with fiſh and fiſh-bones, and the ſkull of ſome unknown inhabitant of the deep ſerves as a ſhield.

“The heads of the horſes, as well as thoſe of the ſea-gods, are animated by no inconſiderable portion of the ideal grandeur of the antique; the anatomical markings, the conſtant object of Mantegna's attention, are alſo ſucceſsfully ſtudied from the ſame ineſtimable ſource of information: and in the early impreſſions, the chiaroſcuro has more breadth, as well as depth, than ſeems to belong to the Italian art of this early period, and is conducted through the whole with maſterly addreſs.

“A more ſlow and ſedate magnificence moves his triumphal proceſſion of Julius Cæſar. The wild imagination which revels in his receſſes of the ocean, and his bacchanalian proceſſions, is nearly excluded from hence; it but ſerves, in the flaming of the candelabra, to gleam through “the ſpoils of nations, and the pomp of wars;” or faintly diſcovers itſelf in other ſubordinate acceſſories as the fringed ornament of ſtately grandeur.

"In his Dance of females, he has ſhewn ſo much of the graceful ſimplicity and general air of Greek ſculpture, as to give riſe to a belief that it has been copied from an antique baſſo-relievo: but till ſuch a baſſo-relievo is ſhewn, it would be unfair in us to reſign ſo much of the merit of Andrea Mantegna as this compoſition may claim. Theſe three engravings abundantly demonſtrate the wide range of his technical and inventive powers; and ſhew with what ſucceſs he could combine, or ſeparately exhibit, elegance, wildneſs, and grandeur, as occaſion admitted or required.

"Some critics have thought that Mantegna's admiration of the antique was too predominant in his works; that it too frequently engroſſed his powers; and hurried him too entirely away from that contemplation of nature, which muſt always be one of the parents of originality in art. Yet, if this enthuſiaſm be a fault, it is a fault proceeding ſo neceſſarily, and ſo immediately, from the localities of time and place, and the redundance of his merits, that it is as ſecure of pardon from the candid, as thoſe merits are of praiſe." Landſeer's Lectures.

The monogram of this celebrated engraver, reſembling that of Marc Antonio, will be found in our *Plate* I. of thoſe of the *Italian School.* The following liſt is believed to contain all his principal works, and it is not certain that he engraved any more than this liſt contains. They are of folio dimenſions, and ſome of them very large:—"The Madonna and Infant Chriſt," (copied by Strutt in his Biographical Dictionary of Engravers); "The Choice of Hercules;" "Hercules overcoming Antæus," inſcribed "Divo Herculi invicto." "The Marriage of Eneas with Lavinia;" "The Scourging of Chriſt;" "The Entombing of Chriſt," inſcribed "Humani generis Redemptor;" "The Deſcent of the Saviour to Hell;" "The Reſurrection of Jeſus Chriſt;" "Judith with the Head of Holofernes;" and two groteſque monſters fighting in the preſence of two warriors.

The following are the principal ſubjects of M. Landſeer's comments which are quoted above:—"A Bacchanalian Proceſſion," in which both fawns and ſatyrs are introduced; "A Battle between various marine Monſters;" "A Dance of Four Females;" "The Triumph of Julius Cæſar," engraven on nine plates, which, when joined, form a magnificent frieze: but it is uncommon to find a collection where the nine are complete.

Giovanni Mariæ da Breſcia, or Brixienſis, was a native of Breſcia, in the Venetian territory, and was born A.D. 1460. He was an eccleſiaſtic of the order of Carmelites, and about the beginning of the ſixteenth century, painted "The Hiſtory of Eliſha and Elijah" for the monaſtery to which he belonged. He alſo practiſed goldſmithery; but it is his engravings, which are ſomewhat numerous, that are the proper ſubject of our preſent notice.

The ſtyle of his manual execution is not always alike. In ſome of his prints it is evidently formed on that of Andrea Mantegna, the lines which form the ſhadows being laid from one corner of the plate toward the other, without any croſs hatchings, ſomewhat neater than thoſe of his great exemplar, but very inferior to him in every other reſpect. On other occaſions he employed ſecond courſes of lines, but his drawing is heavy, and his extremities not well marked: yet his prints, of which the principal are entitled as follows, are much ſought after by the curious:—"The Virgin Mary ſeated on a Bench with a Book in her right Hand, holding the Infant Chriſt;" "The Virgin ſeated upon Clouds with the Infant Chriſt; St. John Baptiſt, St. Jerome, and three Carmelite Friars below," dated 1502; "The Miracle of St. Gregory reſtoring a Boy to Life." It is a large folio of thirteen inches by nine, and is inſcribed "Opus fris io Mariæ Brixienſis, or Carmelitarum MCCCCCII." The manual part of the engraving of this plate is in a mixed ſtyle between thoſe of Mantegna and Marc Antonio. "The Hiſtory of the Emperor Trajan," wherein the artiſt has complimented the reigning pope, by introducing him at a balcony above.

Giovanni Antonio da Breſcia, the brother of the preceding artiſt, was born at Breſcia ſome time about the year 1461, and alſo became a Carmelite friar. He applied more cloſely to engraving than Giovanni Mariæ, and ſtudied the works of Mantegna with ſomewhat better ſucceſs. Yet his outline is poor, though his manual execution is ſufficiently clear and neat. We have ſubjoined a liſt of his moſt eſteemed works, of which the beſt appear to be copies from Andrea Mantegna:—"Hercules vanquiſhing the Nemean Lion," after Andrea Mantegna, inſcribed "D. Herc in victo;" two plates of "Hercules" and "Antæus," after the ſame maſter, one of them an upright 4to.; "A White Horſe," reſembling that by Albert Durer, except in the back ground, a ſmall upright; "The Scourging of Chriſt," a large upright. Of theſe the earlieſt and beſt impreſſions are dated 1503, and a ſecond edition was printed in 1509. "The Virgin and Child;" "The Holy Family, with St. Joſeph aſleep;" two plates of a "Satyr and Female," inſcribed "Victoria Auguſta," on a tablet; "A naked Female repoſing with an Infant, while a Satyr is playing on a Pipe."

Hieronymus Mocetus, or Jerome Mocetto, engraved both on metal and on wood, and was born at Verona in the year 1454. Strutt's account of him is as follows:—"The prints by this ancient maſter are by no means common. He worked with the graver only; but did not excel in the management of that inſtrument. His ſtyle of engraving bears ſome reſemblance to that of Robella. Though it is conſiderably neater and clearer, he did not draw the naked parts of the human figure correctly. The extremities eſpecially are very defective. The ſtudy of the chiaroſcuro was at this time very little attended to. We muſt not wonder, therefore, at finding the works of this artiſt totally deſtitute of effect. However, they are not without merit; though, it muſt be confeſſed, that their ſcarcity ſtamps the greateſt value on them. We have by him, "The Reſurrection of Chriſt, with Four Soldiers at the Foot of the Tomb," apparently from his own deſign; "A Sacrifice," with many figures, from an antique bas-relief; a middling-ſized plate, lengthways. Alſo ſeveral battles, with other ſubjects; which are variouſly marked, as may be ſeen in our *Plate* I. of the monograms, &c. of the *Italian School of Engravers.*

Nicoletta, or Nicolas da Modena, was a native of Modena, and ſeems to have ſtudied architecture and perſpective with more aſſiduity than ſucceſs. He is ranked as one of the earlieſt engravers of the ſchool of Lombardy; and, when we examine his works, it ſeems as if the name of engraving only had reached him; and that he had been obliged to work out his own ſyſtem. It is aſtoniſhing, at a time when ſo many engravers of conſequence were living, and had produced ſuch a variety of excellent prints, eſpecially Marc Antonio and his ſcholars, that this man, who was himſelf a painter, ſhould have been ſo much at a loſs, not only in the mechanical part of the execution of his plates, but with reſpect to the compoſitions and drawing of them alſo. If theſe rude productions have any merit to recommend them, it muſt conſiſt in the buildings and architectural ornaments, which he introduced into his deſigns, and with which he has frequently crowded them in a very abſurd manner: he worked with the graver only; and his largeſt plates ſeldom exceeded the common folio ſize. He uſually ſigned his name at length; but, in ſome few inſtances, he uſed the two monograms which we have copied in our *Plate* I. of thoſe of the *Italian School*. We have engraven by him, “The Adoration of the Shepherds,” a middling-ſized upright plate, marked with his name at length; “St. Sebaſtian,” a middling-ſized upright plate, marked with his baptiſmal name; “Nicoleto,” on a tablet; another “St. Sebaſtian,” inſcribed with his monogram; “St. Jerome;” “St. George;” “St. Martin;” “A Triton embracing a Syren;” beſide other works of leſs repute.

Benedetto Montagna, was born at Venice ſome time about the year 1458, and died at Verona in 1530. He engraved on copper, and the graver was the ſole inſtrument of his art. His engravings are dated from a very early period of the art in Italy, and it is more than poſſible that the prints of Albert Durer, which were brought to Venice as an article both of taſte and commerce, and thoſe of Marc Antonio, who had now been following the profeſſion of engraving for ſome time in that city, might induce him to take up the novel art either as a matter of profit or of curioſity. The efforts of Montagna, however, are but feeble; his outline is exceedingly defective, and his manual execution harſh and rude, though in ſome few inſtances he attempted to aſſiſt the blending of his lights and half-tints by means of ſtippling.

Benedetto engraved from his own compoſitions; and the reſemblance which ſome of his prints bear to the earlieſt and rudeſt productions of Marc Antonio, of which we ſhall preſently ſpeak, may well be thought to ſtrengthen our ſuppoſition, that from them he learned the rudiments of the art. His engravings, of which the following will probably be found the beſt, are very rare, and are generally, if not in every inſtance, marked with his name at length:—“An Holy Family,” in which the Virgin Mary appears ſeated, holding the Infant Chriſt: St. John is ſtanding beſide her naked, and St. Joſeph appears below. A view of a town, with a river and bridge over it, conſtitutes the back ground: at the top is the artiſt’s name. “The Judgment of Midas,” a ſmall upright. A naked figure ſtanding by a tree, ſomewhat larger. An elderly man and a youth; the former playing on the bag-pipes, the latter upon the violin. A landſcape, with a hamlet in view, and an old man ſeated on a bank, both ſmall uprights. Another landſcape, with three women on the foreground. A young man ſitting on a rock, paſſing a cord round a palm tree. “The Rape of Europa.” “Venus chaſtiſing Cupid.”

Strutt ſays, that Rubetta, or H. Robetta, flouriſhed in 1610. This is evidently a miſtake. The French writers on art, with much more probability, ſay that he was born at Florence in the year 1460; but the events of his life are very obſcure, and his engravings of no value but from their antiquity and rarity, for they are wretchedly executed. The ſubjects of moſt of them are devotional, and he ſometimes affixed his name at length, and at others the initial letters R.B.T.A. on a little tablet.

His moſt eſteemed engravings are, “Adam and Eve,” a ſmall upright folio; “The Adoration of the Magi,” of a nearly ſquare form; “The Reſurrection of Jeſus Chriſt,” a ſmall upright folio; and “The Golden Age,” a large upright folio.

Titian alſo etched ſome plates about this time, probably in the way of recreation, and it is ſaid, performed ſome engravings on wood. Among the former are ſeveral large landſcapes from his own compoſitions, the ſubject of the moſt remarkable of which is a paſtoral, where a ſhepherd is playing on a flute, before his flock, by the ſide of a ſtream. In another a traveller is ſleeping by moonlight. He likewiſe etched an allegorical print of Death habited in the armour of a knight.

The moſt remarkable of his wood-cuts, if theſe are really by the hand of Titian, which appears very doubtful, are, “The Marriage of St. Catherine,” a large upright, executed in a ſlight but maſterly manner, and inſcribed “Titianus Vecellius Inventor Lineavit.” “The Triumph of Faith,” repreſented by a proceſſion of patriarchs, prophets, evangeliſts, apoſtles, ſaints, martyrs, preceding and following Jeſus Chriſt: it is compoſed of from eight to ten prints, forming, when paſted together, a very long frieze, and dated 1505. “The Deſtruction of Pharaoh and his Hoſt,” a very large print lengthways, compoſed of ſix parts. This is very rough and rudely cut, and by no means equal to the “Triumph of Faith,” which is a very maſterly performance. “Sampſon betrayed by Dalilah.” “The Deluge,” a larger engraving, printed on two ſheets, of which Papillon ſays, that it is very correct and admirable; but Strutt, (who had ſeen the print) very properly obſerves, that this boaſted preciſion ſeems to make againſt its being from the graver of Titian, who would ſcarcely have beſtowed ſo much time and labour as muſt have been required to compleat it in ſo neat and regular a manner.

The famous ſatirical engraving of an old ape and two young monkies, in the attitudes of Laocoon and his ſons, which was long aſcribed to Titian, is now known to be the performance of Nicolo Vicentino. It was done to ſatirize Baccio Bandinelli, who boaſted of having executed a Laocoon, which was ſuperior to the antique.

But Strutt thinks, and with great appearance of probability, that moſt, if not all of the wood engravings aſcribed to Titian, are really the work of his younger brother Ceſare Vecelli, who alſo produced a ſet of 8vo. prints, executed in a very ſpirited and maſterly ſtyle, from the deſigns of Titian, of ancient and modern dreſſes, which was publiſhed at Venice in 1590; but perhaps there had been a former edition. The title of the edition of 1590 runs thus, “Degli Habite Antichi et Moderni di diverſe parte del mondo, Libri due fatti da Ceſare Vecellio;” and in a ſubſequent edition, publiſhed in 1664, it is more fully expreſſed as follows: “Raccolta di figure delineate dal gran Titiano, e da Ceſare Vecellio ſuo Fratello deligentemente intagliate.”

A ſingle print in chiaroſcuro, ſerves to mark the talent, in that mode of engraving, of Baldaſſare Peruzzi, an extraordinary architect, painter, engraver, and antiquary of this period. He is generally ſuppoſed to have been a native of Sienna, but Vaſari ſays, and probably with truth, that he was born at Volterra, in the year 1481. Beſide building churches and palaces at Sienna, and other parts of Italy, he embelliſhed them with his pictures; and wrote a treatiſe on the antiquities of Rome. He left behind him a commentary on Vitruvius, which Papillon informs us he intended, but that the hand of death prevented him, to have illuſtrated with engravings on wood. It is reported, but we cannot ſay on what foundation, that he was poiſoned by ſome artiſt who envied his ſuperior talents.

The print to which we have alluded is an upright folio, repreſenting Apollo, Minerva, and the Muſes, with Hercules expelling Avarice from their preſence. It appears to be engraven on three blocks; one for the outlines, another for the half-tint, and a third for the deeper ſhadows. It is executed in a bold and ſpirited ſtyle, and inſcribed “Bal. Sen,” over which letters is a five-pointed ſtar.

Domenico Campagnola was born at Padua A.D. 1482. He was the ſon of Jerome Campagnola, the ſculptor, and the diſciple of Titian. He chiefly excelled in landſcape, and has produced a conſiderable number of prints, ſome of which are etchings and others engravings on wood, executed in a bold ſtyle, but very ſlight, and incorrect in his drawing of the naked. He died at Venice in the year 1550, but lies interred in the church of St. Anthony of Padua, near the tombs of his anceſtors.

Of his etchings the following are the principal:—“The Adoration of the Magi and Kings,” a grand compoſition, in folio; “Cæſar's Tribute Money;” “Our Saviour healing the Sick;” “The Parable of Dives and Lazarus,” in large folio, etched on three plates, and marked “D.C. In Luca Bertelli,” &c.; “The Gift of Languages, or Deſcent of the Holy Ghoſt,” a large circle, inſcribed “$\frac{\text{D O}}{\text{CAP}}$ 1515;” “The Holy Family, with St. Jerome and St. John,” after Titian, a large folio, dated 1517. Two circular prints, one of which is “The Decollation of a Female Martyr;” “A Group of Warriors, attended by Fortune, ſtopping the Progreſs of the Arts and Sciences.” A landſcape, with Jupiter and Caliſto, after Titian. Another landſcape, on the fore-ground of which is a chariot drawn by two bulls; marked D. C.; a bacchanalian ſubject; a Venus, inſcribed “D.O. Camp. 1517.”

The moſt eſteemed of his letter-preſs engravings are “The Holy Family,” in a landſcape, with St. John and other ſaints. The Virgin Mother is repreſented ſuckling the Infant Chriſt; a folio print. A grand landſcape, in which is introduced St. Jerome. Another large landſcape, with a ſoldier and his family. Three children near a pedeſtal, one of whom is contemplating a dog gnawing a bone. “The Maſſacre of the Innocents;” and “The Deſtruction of Pharaoh and his Hoſt,” a large and grand work engraved on twelve blocks after Titian, and marked “Domenico del Greeche 1549.”

According to the teſtimony of the author of the Abecedario, Julio Campagnola, ſurnamed Antenoreus, was the brother of Domenico; Florent le Comte ſays, that he flouriſhed, as an engraver, from 1507 to 1517. He worked entirely with the graver, but in two very different ſtyles, one of which was his own invention.

The only two prints by Julio, with which we are acquainted, exemplify this remarkable variation in his ſtyle. The firſt is a ſmall upright of “The Rape of Ganymede;” the execution of which reſembles, in the manual, that of Marc Antonio, though the drawing is very inferior. It is inſcribed “Julio Campagnola Antenoreus fec.;” the other is ſomewhat larger, and repreſents St. John ſtanding, holding a cup and looking upwards. In this plate he has entirely departed from his former manner. The back ground is executed with round dots, made apparently with a dry point. The figure is outlined with a ſtroke deeply engraven, and finiſhed with dots, in a manner ſomewhat reſembling thoſe prints which Demarteau engraved at Paris, in imitation of red chalk. The hair and beard are expreſſed by ſtrokes. It is a very extraordinary print, and proves the antiquity of that mode of engraving, which has been erroneouſly conſidered as a modern invention; but its merit conſiſts chiefly in its ſingularity; for the drawing of the figure is ſtiff and incorrect, and there is nothing in the general effect to recommend it.

About the time now under our conſideration, there alſo aroſe in Europe another new mode of engraving, which ſucceſsfully imitated drawings waſhed with biſtre, or thoſe ancient Greek pictures which were called monochroms by the ancients. Mr. Landſeer ſays, that “the title of engraving in *chiaroſcuro*, was at that time excluſively, and therefore improperly applied to this new mode of art,” ſince chiaroſcuro, or effect of light and ſhade, is a neceſſary and elementary part of every mode of engraving that goes beyond a mere outline.

The invention of prints in *chiaroſcuro* is claimed both by the Germans and Italians. The latter aſſert that ſoon after the commencement of the ſixteenth century, Ugo da Carpi, a man of great ingenuity, diſcovered a mode of imitating ſlight drawings by the means of different blocks of wood. The Germans, on the other hand, produce ſeveral engravings by Mair, which are dated 1499, and one by Lucas Cranach, dated 1500, which are prior to the time affixed by the Italians for the invention by Da Carpi. This circumſtance, even if we ſhould ſuppoſe that the prints by Mair are the firſt attempts in this ſtyle of engraving, is ſufficient to prove the priority of the exerciſe of it in Germany. Baron Heinnekin is of opinion that the chiaroſcuros of John Ulric are ſtill more ancient than thoſe by Mair.

There is, however, a material difference between the chiaroſcuros of the old German maſters, and thoſe of the Italians. Mair and Cranach engraved the outlines and deep ſhadows upon the copper. The impreſſion taken in this ſtate was tinted over by the means of a ſingle block of wood, with thoſe parts hollowed out which were deſigned to be left quite white upon the print. On the contrary, the mode of engraving adopted by Ugo da Carpi, was to cut the outlines on one block of wood; the dark ſhadows upon a ſecond; and the light ſhadows, or half tint, upon a third. The firſt being impreſſed upon the paper, the outlines only appeared; this block being taken away, the ſecond was put in its place, their coincidence being ſecured by a mechanical contrivance, and being alſo impreſſed upon the paper, the dark ſhadows were added to the outlines, and the third block being put in the ſame place, upon the removal of the ſecond, and alſo impreſſed upon the ſame paper, made the demi-tints, and the print was completed. In ſome few inſtances, the number of blocks were increaſed, but the operation was ſtill the ſame, the print received an impreſſion from every block.

Da Carpi, who firſt practiſed this mode of art in Italy, was born at Rome in the year 1486. He ſtudied painting with his great contemporary Raphael, but appears to have poſſeſſed one of thoſe minds which, in all ages, bear hard upon rectitude, by preferring novelty to eſtabliſhed principle. He painted an altar piece for the church of St. Regard, in the execution of which he uſed no pencil, but laid on the colours immediately with his fingers; Michael Angelo being importuned for his opinion of this work, ſimply replied that “it would have been better had he uſed his pencils.”

It is probable that his paſſion for novelty led him to practiſe that new mode of engraving on wood, which is now under our notice, which alſo calling into action his acquired talents as an artiſt, enabled him to produce thoſe maſterly and ſpirited imitations of the ſketches of the great painters, from whoſe works they are taken, which he ſometimes printed in green, ſometimes in brown, and ſometimes in other colours, as his love of novelty and experiment directed.

Of theſe works, thoſe which are moſt ſought after by the curious, are as follow:—“A Sybil with Tablets and a Stylus, with an Infant Genius holding a Torch,” after Raphael, printed in green, and, according to Vaſari, the firſt work of the kind produced by Da Carpi. “Eneas eſcaping from Troy with his Father Anchiſes,” a large upright, from the ſame maſter. “The Deſcent from the Croſs,” an upright folio; “David beheading Goliah;” “The Slaughter of the Innocents;” “Jeſus preaching in the Temple;” “Elymas ſtricken with Blindneſs;” “The Death of Ananias;” “St. John in the Deſart;” “A Dead Chriſt on the Knees of his Mother;” and “Raphael converſing with his Miſtreſs;” are all after the works of this great painter.

After Parmegiano, he has engraven, a philoſopher ſeated, with a book open before him, and in the back ground, to the right, a bird, with its feathers plucked off; probably intended for Diogenes, and the cock which he plucked in ridicule of Plato's definition of man. This is a large and curious folio print, ſome of the impreſſions of which are printed in four different colours. “The Holy Virgin, with St. Sebaſtian, and St. Nicholas.” “A Satyr fathoming Water with his Flute.” All of theſe prints are of folio dimenſions.

Dominico Micarino of Sienna, ſurnamed Beccafumi, was born at Sienna, or in ſome neighbouring village, in the year 1484, and died in 1549 in the ſame city, which, by his various works in ſculpture, architecture, painting, and engraving, he greatly contributed to adorn. He was of poor parents, and like Andrea Mantegna, paſſed the early years of his life in keeping ſheep. His family name was Micarino; but ſignor Beccafumi, a diſcerning citizen of Sienna, obſerving him buſied in tracing forms upon the ſand with his crook, conceived a favourable opinion of his natural abilities, and raiſed him from obſcurity.

From this kind patron, who ſucceſſively placed our young artiſt under Antonio Vercelli, and Pietro Perugino, he took the name of Beccafumi. He travelled to Rome to compleat his ſtudies from the works of Raphael and Michael Angelo; after which he returned to Sienna, where he was employed in ſeveral works both in freſco and oil, which acquired him great applauſe, but nothing contributed more to the eſtabliſhment of his reputation than the Moſaic pavement with which he ornamented the cathedral of Sienna.

Micarino appears to have worked occaſionally in all the modes of engraving which had then been invented. He was a very good engraver on wood, and particularly excelled in chiaroſcuro, ſometimes working from his own deſigns, and at others from thoſe of Titian and other maſters. He alſo etched ſeveral plates in a very ſpirited ſtyle, and we have ſome few prints executed by him with the graver only. In theſe the hand of the maſter is very evident; the figures are drawn in a ſpirited ſtyle, and the extremities are finely marked, but, from want of ſkill in the management of the point and the graver, the mechanical part of the work has a harſh and unpleaſing appearance to an eye accuſtomed to neatneſs and preciſion.

His engravings, of which the following liſt ſpecifies the principal, are ſometimes marked with his name at length, and at others with the cypher which will be found in our *Plate* I. of thoſe of the *Italian School*.—A large folio print of “The Nativity,” after Titian, cut in wood in a very ſpirited manner. “The Holy Virgin embracing the Infant Chriſt,” printed in chiaroſcuro, in three colours, and probably from his own compoſition. Four prints executed in the ſame manner of “St. Peter,” “St. Philip,” “St. Andrew,” and “St. Jerome.” “A Philoſopher ſitting wrapt in his Mantle.” Portrait of pope Paul III. Three engravings on copper, of which the ſubjects are groups of academy figures; and ten engravings on wood of alchemical ſubjects.

The next engraver of decided talent that Italy produced was Marc Antonio Raimondi, whoſe name marks a memorable era in the hiſtory of engraving. He was born at Bologna in the year 1487 or 88, and died in the ſame city about the year 1539. Like many of his contemporaries and predeceſſors, he was brought up to the buſineſs of a goldſmith, but ſtudied drawing, in which he ſo much excelled under Franceſco Raibolini, ſurnamed Francia, from his attachment to whom, Raimondi himſelf obtained the cognomen of Francia. His earlieſt prints, as far as is known, were “The four Heroes,” and “Pyramus and Thiſbe,” the latter of which is dated in the year 1502, when he could have been only 14 or 15 years of age; theſe early works are both engraved after the deſigns of this maſter, and the letter F, which forms part of the monogram, affixed to them, may be ſuppoſed to ſtand for either Francia or fecit.

Our artiſt, however, is now generally known by his baptiſmal names, Marc Antonio. Being eager for improvement in his art, he travelled to Venice, where he firſt met with the works of the German engravers, particularly a ſet of wood cuts by Albert Durer, repreſenting “The Life and Paſſion of our Saviour.” Theſe pleaſed him ſo much, that he purchaſed them, though they coſt him nearly all the money he had brought with him; and he copied them with great exactneſs on copper. The deception, it ſeems, anſwered well to Marc Antonio; for, we are told by Vaſari, that they were frequently ſold for the originals. This circumſtance, according to the ſame author, coming at laſt to the ears of Albert Durer, he complained to the ſenate of Venice of the injury which he had ſuſtained, but all the redreſs he could obtain was, that Marc Antonio ſhould not, for the future, add the cypher or monogram of Albert Durer to any of the copies he might make from his engravings. This ſtory, if true, is not without its difficulties, and one of the moſt ſtriking is, that the copies which Marc Antonio made from the Life and Paſſion of Chriſt, by Albert Durer, have not the mark of that artiſt at all upon them, but the cypher of Marc Antonio only. Vaſari indeed might have miſtaken the life of Chriſt for the life of the Virgin, by Albert Durer, becauſe Marc Antonio copied them both with equal preciſion. The latter are much larger than the former, and have the monogram of Albert Durer repreſented in the ſame manner as upon the originals; and to theſe Marc Antonio has not put his own cypher, except upon the laſt plate; but even that has the monogram of Albert Durer alſo. Of courſe, theſe prints will much better agree with the ſtory above related, than thoſe mentioned by Vaſari.

When Marc Antonio quitted Venice, he went to Rome, where his merit ſoon recommended him to the notice of Raphael, who not only employed him to engrave a conſiderable number of his deſigns, but formed an intimate friendſhip with him, and it has been ſaid, though without ſufficient authority, that he aſſiſted him in tracing and correcting the outlines upon the plates.

The firſt plate he engraved from a drawing of Raphael's was, “Lucretia ſtabbing herſelf,” in which he ſeems to have exerted all his abilities to make it neat and delicate. Soon afterwards he executed the plate of “The Judgment of Paris,” which, though not ſo neat as the former, has more freedom and ſpirit. Raphael himſelf was ſo perfectly well pleaſed with the works of this admirable engraver, that he ſent many ſpecimens of them, as a complimentary preſent, to Albert Durer, which he thought well worthy of his acceptance.

The great reputation which Marc Antonio acquired under the patronage of Raphael, brought many young Italian artiſts to Rome, in order to ſtudy under him; and among them were the following: Agoſtino de Muſis, Marc de Ravenna, Giulio Bonaſoni, Niccolo Beatrici, and Enea Vico, who all of them became his pupils, and as his name began to be known abroad, Bartolemeo Beham, George Pens, and James Binck, with others, natives of Germany, came into Italy, and frequented his ſchool. For engraving ſome plates after the deſigns of Julio Romano, of which the ſubjects are taken from the lewd ſonnets of Aretin, he was committed to priſon by pope Clement VII., but recovered his freedom through the intereſt of Baccio Bandinelli.

After his releaſe, Marc Antonio, to manifeſt his gratitude to Bandinelli, engraved, from a picture of his, that admirable print repreſenting the Martyrdom of St. Lawrence; and ſucceeded ſo happily, correcting carefully ſeveral faults which were in the picture, that the pope, who was a great lover of the arts, upon ſeeing an impreſſion from the plate, pardoned his offence entirely, and took him under his protection. We now ſee our artiſt in the zenith of his good fortune; but his decline was ſtill more ſudden than his advancement: for the city of Rome being taken by the Spaniards, A.D. 1527, Marc Antonio loſt in the pillage all the wealth he had accumulated. He retired afterwards to Bologna, where perhaps he died; but of this there is no certain account. The laſt dated print we have by him is, "The Battle of the Lapithæ," engraved in 1539; after which time, we hear no more of him, or of his works. Malvaſia indeed affirms, that he was aſſaſſinated by a nobleman of Rome; becauſe he had, contrary to his engagement, engraved a ſecond plate of the Murder of the Innocents, after a deſign of Raphael. This deſign was certainly twice engraved by Marc Antonio, with very ſmall variations, as will be mentioned below. Baldinucci, following Malvaſia, mentions this ſtory; and adds, that Marc Antonio was married, and that his wife was alſo an engraver. But the total ſilence of Vaſari as to this circumſtance, renders it exceedingly doubtful.

The ſtyle and the principal works of ſo diſtinguiſhed an artiſt, the founder of the Roman ſchool of engraving, call for particular comment. In his fifth lecture, delivered at the Royal Inſtitution, Mr. Landſeer ſays, "The ſtyle of Marc Antonio poſſeſſes not the exteriors of oratory; but he pronounces every ſentence ſo diſtinctly, with a confidence ſo modeſt, and an emphaſis ſo true to Raphael and to nature, that thoſe who attend are convinced, without being perſuaded. To ſpeak without a metaphor, there is ſomething in his manner of employing his graver, ſomething dry, unambitious, ſevere, unattractive to the ſenſe; which, by all ſound critics, has been thought to deſerve praiſe, without deſiring it; and peculiarly appropriate to the works of a painter, who not merely does not require, but will not admit, the aid of foreign ornament.

"The Dead Chriſt of Raphael, where the exceſs of his mother's ſorrow is ſoftened, but not ſubdued, by her divine reſignation, he repeated with variations; of which the principal are, that, in the ſecond plate, the Virgin Mary appears much younger than in the firſt, and her right arm diveſted of drapery; from which circumſtance, it is known among collectors by the appellation of "The Virgin with the naked Arm." The ſecond plate is more delicately engraven, but is feeble, when compared with the maſterly vigour he has ſhewn in the firſt. The nudities are here drawn with Marc Antonio's, inſpired by Raphael's, uſual ſuperiority; but the drapery and ground are ſoftened and enriched beyond the ordinary powers of Marc Antonio's graver, and are ſo much in the improved ſtyle of his pupil, George Penz, as may incline us to ſuſpect that theſe parts have been engraven by his hand. Whether Raphael authorized or allowed Marc Antonio to ſubſtitute the younger virgin, who ſeems more like the ſiſter, for the elder, who is the mother of Chriſt, does not appear.

"In "The Virgin of the Palm," Marc Antonio diſcovers, if poſſible, a ſtill more exquiſite feeling, and of courſe produces a more perfect tranſlation, of Raphael. Chriſt is beſtowing his benediction with the ſublimity of inſpiration; and St. John receiving it with dignified and divine, though infantile, ſubmiſſion. The ſubordination of parts is juſt: the whole is perfectly graceful; and the head of the Virgin Mary, the moſt graceful part of that whole.

"Marc Antonio's powers as an engraver appear not to have declined from their acme, in his martyrdom of St. Lawrence, after Bandinelli. He not merely copied, but his long acquaintance with the works of Raphael enabled him, and his gratitude to Bandinelli, who had obtained his releaſe from priſon, diſpoſed him, to improve the drawing of his original. The print is defective, yet not more ſo than many other of his works, in chiaroſcuro: but, expreſſion of the textures of ſubſtances, and the exiſtence of reflex light, are here feebly acknowledged; the folds of the draperies are ample; the drawing of the naked excellent; and the characters of the heads far better than would ſeem to belong to the reputation of Bandinelli."

The ſeveral monograms with which Marc Antonio marked his engravings, from time to time, will be found in *Plate* I. of thoſe of the *Italian School of Engravers*; though a great number of them were publiſhed without any other mark than an intelligent eye will perceive, in the peculiar ſtyle and purity of outline of this accompliſhed artiſt.

Connoiſſeurs are extremely, and very juſtly, obſervant of the goodneſs of the impreſſions, in collecting the works of Marc Antonio; and early and well preſerved impreſſions ſell for very conſiderable ſums. Since they were firſt publiſhed, the plates have been ſucceſſively the property of Thomaſo Barlacchi, Antonio Salamanca, Antonio Lafreri, and Nicholas Van Aelſt; laſtly, they became the property of the print-dealer Roſſi, at which time, after being frequently retouched, and of courſe very much impaired, they were, as works of art, utterly worn out. Thoſe impreſſions are the earlieſt, and by far the moſt valuable, which were taken before the name of any publiſher was inſcribed on them.

Baron Heinnekin, in his "Dictionnaire des Artiſtes," printed at Leipſic, A.D. 1778, has given a complete catalogue of the works of Marc Antonio, to which the curious reader is referred, and from which we have extracted the following liſt of thoſe which are held in moſt eſteem, beginning with his portraits.

Portraits.—An artiſt wrapped in a mantle, ſeated, and in an attitude of meditation; a little table, pallete, and colours, in the back ground; ſuppoſed by Malvaſia to be the portrait of Raphael, drawn and engraven by Marc Antonio: Aretin the Poet, with a long Latin inſcription; one of the very fineſt works of the artiſt: the Emperor Charles V. in his youth; Pope Clement VII.; both en medallion: Pope Julius II. holding a bonnet: Prince Octavius Farneſe.

Subjects from Holy Writ.—"Adam and Eve," after Raphael, a very fine and rare print, the ſame which Strutt has copied and placed as the frontiſpiece to his ſecond volume of the Lives of the Engravers; "Adam and Eve expelled from the terreſtrial Paradiſe," after Michael Angelo; "Noah ſacrificing after leaving the Ark;" "The Bleſſing of Abraham;" "God appearing to Iſaac;" "The Eſcape of Joſeph from Potiphar's Wife;" "David diſcomfiting the Philiſtines, and beheading Goliah;" "David," an erect figure, with the head of Goliah, a very rare print; all after Raphael.

"The Adoration of the Shepherds," either from a deſign by Marc Antonio himſelf, or after his firſt maſter Francia; two plates of "The Murder of the Innocents," after Raphael, in the ſecond of which Marc Antonio has introduced the upper part of a ſmall yew tree, called by the Italians la Felchetta, and which does not appear in the firſt. Good impreſſions of both theſe plates are extremely rare and valuable; "An Holy Family:" from the thigh of the Virgin Mary being immoderately long, this print is diſtinguiſhed among connoiſſeurs by the name of "The Virgin of the long Thigh." Another "Holy Family," wherein the Infant Saviour repoſes on the knees of his mother,

ther, who is beſtowing her benediction on the little St. John. This is commonly known by the name of "The Virgin of the Palm." Another, called "The Virgin of the Cradle," from the circumſtance of the Infant Chriſt being repreſented in his cradle; and two plates of the "Virgin and Child;" all after Raphael.

An "Holy Family," after Michael Angelo; a very rare print of an "Holy Family," after Raphael, wherein St. John is holding a reel, and St. Elizabeth is ſpinning; another "Holy Family," in which the Infant Jeſus is receiving a fiſh from Tobit, diſtinguiſhed by the name of "The Virgin of the Fiſh," and after a very celebrated picture which Raphael painted for the church of the Dominicans at Naples, and which has ſince been in the gallery of the Eſcurial; "The Holy Virgin ſitting on the Clouds, with the Infant Chriſt," a plate which afterwards fell into the poſſeſſion of Agoſtino Carrache, who re-touched it, and added two fine heads of Cherubs; a ſet (mentioned above) of ſeventeen plates, coarſely copied from the wood-cuts by Albert Durer, of the "Life of the Virgin Mary," and marked with Durer's cypher, except the laſt, which has that of Marc Antonio. Theſe are in ſmall folio, and very rare. A ſet of thirty-ſix ſmall uprights, from Albert Durer's "Life of Chriſt," marked with the ordinary tablet of Marc Antonio.

A ſet of thirty-ſix ſmall uprights, called "The Life and Paſſion of Chriſt," copied from Durer, but marked with the tablet of Marc Antonio. A duplicate ſet of theſe are by ſome critics ſuppoſed to be the production of Wierix, or ſome other of the diſciples of Marc Antonio, and this ſet bears the cypher of Albert Durer. "Chriſt at the Entrance of the Temple, ſurrounded by his Diſciples;" "St. Mary Magdalen at the Feet of our Saviour;" "Chriſt celebrating the Paſſover;" "The Deſcent from the Croſs," in which, with the holy women, is introduced Joſeph of Arimathea. Three prints, which are known among collectors by the title of "The Virgin of Grief." In one the Holy Virgin with extended arms is lamenting over the dead body of Jeſus Chriſt. In the ſecond, of which we have ſpoken more particularly above, and which is alſo called "The Virgin with the naked Arm," the holy mother appears much younger than in the firſt, and a dead tree is omitted: in other reſpects the two compoſitions are alike. And in the third, which is alſo a dead Chriſt, his head reclines on the lap of the Virgin; mount Calvary is in the back ground, and three diſciples with Nicodemus are preſent. A glorified Chriſt with the Holy Virgin, St. John the Baptiſt, St. Paul, and St. Catherine, called "The Five Saints;" three of the cartoons, viz. "The Death of Ananias," (engraven in conjunction with Agoſtino Veneziano;) "Elymas ſtruck Blind," and "St. Paul preaching at Athens." Proofs of the latter, before the two figures were placed within the baluſtrade of the temple of Mars, are extremely rare and valuable. St. Cecilia, with the Magdalen and other ſaints, known by the name of "The Saint Cecilia with the Necklace;" "The Martyrdom of St. Felicité." A duplicate plate of this ſubject, in which the right ear of the ſaint is omitted, is more ſcarce and valuable than the former. "St. Catherine reſting on her Wheel of Martyrdom." A ſet of thirteen, of Jeſus Chriſt and the twelve apoſtles. All theſe are of folio dimenſions, and after Raphael.

"The Martyrdom of St. Laurence," a large folio, after Baccio Bandinelli, is a very fine engraving, which obtained Marc Antonio's releaſe from priſon, and recommended him to the favour of pope Clement VII. "St. George and the Dragon," either from a compoſition by Marc Antonio himſelf, or after his firſt maſter Raibolini. "St. Gregory celebrating Maſs," from Albert Durer's wood cut, entitled "The Myſtery of the Maſs."

Subjects from Profane Hiſtory and Greek Mythology— "The Rape of Helen," a grand compoſition: "Æneas retreating from the Conflagration of Troy, bearing off Anchiſes, and preceded by the young Aſcanius;" "Venus appearing to Æneas in the Diſguiſe of a Huntreſs;" (an early work of the maſter;) "The Death of Dido;" "The Death of Lucretia," inſcribed in the Greek language, "better to die than live diſhonoured," and the firſt plate engraved after Raphael by Marc Antonio; a ſubject, by ſome termed "Alexander the Great depoſiting the Poems of Homer in the Coffer of Darius," and by others "The Books of the Sybils placed in the Tomb of Numa Pompilius." A battle-piece, known among connoiſſeurs by the title of "The Battle of the Cutlaſſes," all after Raphael, and in folio.

From the ſame maſter he has engraven "The Three Angles of the Lodge of Chigi," of which the ſubjects are, 1ſt. "Jupiter careſſing Cupid;" 2d. "Mercury deſcending from Olympus," and 3d. "Cupid and the Graces." A very grand compoſition of "The Judgment of Paris;" and from Andrea Mantegna, "Mars, Venus and Cupid," of which the collector ſhould be careful to obtain thoſe impreſſions that were taken before the name of Roſſi was added as the publiſher. "Apollo leaning againſt the Shepherd Hyacinthus, and accompanied by Cupid," is either after his firſt maſter Raibolini, or from a deſign by Marc Antonio himſelf. A tablet is here ſuſpended, from a tree, on which is inſcribed the date 1506, and A.E. 19 is added, which gives the year 1487 as that of his nativity.

"The Triumph of Galatea" is a capital print, of which the beſt and rareſt impreſſions are before any letters, and thoſe with the names of Van Aelſt and Roſſi are comparatively worthleſs.

"Mount Parnaſſus" is a large and grand compoſition from the celebrated picture in the Vatican, except that Marc Antonio has very properly ſubſtituted a lyre for a violin; the inſtrument upon which Apollo is playing in the original picture. It is not improbable that Raphael himſelf, having diſcovered the anachroniſm, directed this emendation.

The above two are after Raphael. A very fine engraving of a Bacchanalian ſubject, with children bearing baſkets of grapes, and Bacchus ſeated on a tub, is alſo after Raphael, but was drawn by him from an antique bas-relief; "Bacchus and Silenus" is by ſome critics ſaid to be after Julio Romano, and "Hercules ſmothering Antæus," after Michael Angelo: but others aſcribe both theſe compoſitions to Raphael.

"The Battle of the Lapithæ," the laſt work of Marc Antonio, is of the frieze form, dated 1539, and after Julio Romano. Of "Orpheus" the deſigner is not certainly known. "Pyramus and Thiſbe" is after Raibolini. "Le quos ego," or Neptune appeaſing the Tempeſt which had diſperſed the Fleet of Æneas, is ſurrounded by a border, in which are nine ſmall compartments, containing ſubjects from the Æneid, and is after Raphael. Impreſſions of this plate, before it was retouched, are rare and very valuable. The diſagreeable hardneſs which the abdominal muſcles in the figure of Neptune have acquired in the retouching, renders them eaſily diſtinguiſhable.

The above are all of folio dimenſions. In quarto, Marc Antonio has engraven a ſet of twenty amorous and indecent ſubjects after Julio Romano, to accompany the ſonnets of Aretin, of "The Loves of the Gods and Goddeſſes," which are, as they certainly ought to be, exceedingly ſcarce, and a ſet of thirty-two, of "The Loves of Cupid and Pſyche," after Raphael, each accompanied by eight Italian verſes.

Poetic Inventions, &c.—"Le Stregozzo," the deſign of which is by ſome attributed to Raphael, and by others to Michael Angelo. Sometimes it is called, "Raphael's Dream," and probably with great truth, for though it differs from the reſt of his works, yet it differs not ſo much, but that it may be the production of his mind, and it poſſeſſes all the romantic wildneſs of a nocturnal chimera. A monſtrous carcaſs is converted into a ſort of triumphal car, in which is ſeated a ſorcereſs; it is drawn by naked men, and a youth mounted on a goat is blowing a horn. It is in very large folio, and in the later impreſſions the initials of Agoſtino Veneziano are added to the mark of Marc Antonio. "Il Morbetto," or The Plague, another large folio after Raphael, good impreſſions of which are extremely rare. Three figures from Michael Angelo's Cartoon of Piſa, dated 1510, and known among collectors by the title of "The Climbers." "Il Pito," or The Triumph of Love, an allegory, by ſome ſuppoſed to be after Andrea Mantegna. "The Emperor Trajan crowned by Victory," from a bas-relief on the arch of Conſtantine; "The Chace of a Lion," from another antique bas-relief; "The Caſſolette," a grand Bacchanalian proceſſion, of the frieze form, nineteen inches in length; "An Offering to Priapus;" the ſtatues of Apollo and Cleopatra; a bas-relief of "The Three Graces," and a dance of nine children, all after Raphael.

Agoſtino de Muſis, ſurnamed Veneziano, from the place of his nativity, and called in England Auguſtin the Venetian, was born at Venice ſome time about the year 1490. He travelled to Rome for improvement, and became one of the moſt celebrated of the numerous diſciples of Marc Antonio, with whom he ſometimes worked in conjunction. From the circumſtance of his earlieſt known engraving being dated in the year 1509, Strutt ſuppoſes that he began to ſtudy under Marc Antonio, whilſt that diſtinguiſhed maſter yet reſided at Venice. Marc of Ravenna was his fellow pupil; and Vaſari claſſes them among the very beſt of the Italian ſtudents who followed the art of engraving.

When the city of Rome was taken and ſacked by the Spaniards in the year 1527, Agoſtino retired to Florence, and applied for employ to Andrea del Sarto, who was then in high repute, but del Sarto, diſſatisfied with the dead Chriſt which he had already engraved after his deſign, refuſed to permit him to engrave any more of his pictures. Agoſtino afterwards returned to Rome, where he followed his profeſſional purſuits with great ſucceſs, and where he died ſome time about the year 1540.

He generally marked his prints with the initials A. V, which were ſometimes inſcribed on a tablet. He imitated the ſtyle of his maſter with great attention, and, as far as regards manual execution, with conſiderable ſucceſs: ſometimes, indeed, he in this reſpect excelled Marc Antonio; but in point of taſte, and in the purity and correctneſs of his outline, he fell far ſhort of that diſtinguiſhed artiſt.

Good impreſſions of the works of Veneziano are now become extremely ſcarce, and a compleat ſet is hardly to be obtained; among them will be found a few, wherein he has expreſſed the fleſh entirely by means of ſtippling, in a manner which, being imitated by Boulanger, grew by degrees into what is now termed the *chalk* manner of engraving. The following liſt is believed to contain the deſcription or titles of his beſt performances.

Portraits of Charles V. after Titian, ſuperſcribed with ſixteen Italian verſes; another of the ſame emperor, inſcribed "Progenei divum quintus ſic, &c. Æt. ſua XXVI.;" a profile of pope Paul III. in a leathern cap; the ſame, wearing the papal crown, dated MDXXXVI.; all in folio. Ferdinand king of the Romans, in 4to. Francis I., of France, dated 1536; a profile of the emperor Soliman, dated 1535; Barbaroſſa holding a turban; all in folio.

Subjects from Sacred Hiſtory.—"The Creation," a folio plate, engraved partly by Agoſtino and partly by Marc of Ravenna, and inſcribed "Exc. Deus enim Omnia," &c. "Abraham offering up Iſaac;" "The Benediction of Iſaac," dated 1522; the ſame ſubject, with ſome trifling variations, dated 1524; "The Paſſage of the Red Sea," engraved in conjunction with Mark of Ravenna; "The Fall of Manna," a plate which preſumptively was begun by Marc Antonio, and finiſhed by Veneziano, all after Raphael and of folio dimenſions. "Samſon bound by the Philiſtines," a circular print, nine inches in diameter, is ſuppoſed to be from a compoſition by Veneziano himſelf.

"The Queen of Sheba viſiting Solomon," after Raphael, has been attributed to the graver of Marc Antonio, but is by Agoſtino and Marc in conjunction, and one of their early performances. It is of the folio ſize.

A ſet of the four evangeliſts, in 4to. is after Julio Romano. "The Annunciation" is after Raphael, and engraven by the friends and fellow ſtudents Agoſtino and Marc; "The Nativity" is after Julio Romano; and both are of folio dimenſions.

"St. John the Baptiſt in the Deſert," of anonymous invention, dated 1532; perhaps deſigned by the engraver himſelf. "The Maſſacre of the Innocents," a rare engraving, is copied from the celebrated print of Marc Antonio; "The Laſt Supper," in folio, after Albert Durer; the ſame ſubject in ſmaller folio, attributed to Raphael; "Chriſt bearing the Croſs," in folio, after Raphael, dated 1519; "The dead Chriſt," after Andrea del Sarto, a folio print, with which, as mentioned in our biography, the painter was ſo diſſatisfied, as to refuſe Veneziano the liberty of engraving from his works during his own lifetime. Another dead Chriſt, in ſmall quarto, after Albert Durer, a very rare print; "The Archangel Michael," in folio, after Raphael; "The Holy Family," in ſmall folio, marked only with the initials of our artiſt, and probably from his own compoſition; another "Holy Family," after Francia, dated 1516; "The Holy Virgin and Child, ſitting on a Pedeſtal," ſix friars and a nun are preſent, and above are two angels, holding a tablet with an Ecce Homo, in folio; "The Crucifixion," with ſix figures of ſaints and angels receiving the blood of the Saviour, dated 1528, and alſo in folio; "St. Jerome," after Raphael, in quarto; "St. Margaret kneeling, and putting a Demon of the Serpent Form to Flight, by means of the Mirror of Truth," an early performance of Agoſtino, engraved before he frequented the ſchool of Marc Antonio.

Subjects from Greek Mythology and Hiſtory.—"Iphigenia en Tauride," an anonymous plate, in quarto; "Diogenes lying on his Cloak near the Margin of a River," a ſmall engraving after Baccio Bandinelli; "The Loves of Alexander and Roxana," an anonymous plate, in folio, the deſign of which Vaſari attributes to Raphael; "Tarquin offering Violence to Lucretia," in 4to. after the ſame maſter; a very fine copy of Marc Antonio's print of Lucretia, in quarto, with Latin verſes beneath. "Camillus redeeming the Tribute impoſed on Rome by the Gauls," and a naked figure of Cleopatra, both in ſmall folio, and after Bandinelli; a ſmall figure of Mars, after Raphael; "Vulcan preſenting Venus with Arrows," dated 1530, and "Venus ſeated on a Dolphin," both in folio, and after Raphael; "The Aſſembly of the Gods," engraved by Agoſtino and Marc of Ravenna; attached to which, by the ſame artiſt, is "The Marriage of Cupid and Pſyche," both after Raphael. From the ſame painter, are "Leda careſſed by the Swan," in 4to.; "The Fall of Phaeton," in folio; and "Apollo and Daphne" in quarto; the latter of which is by ſome falſely attributed to the graver of Marc Antonio.

"The Diſpute between the Muſes and Pierides," an anonymous plate, in large folio, attributed by Vaſari to the pencil of Roſſo, and by the French to that of Perin del Vaga: this plate was afterwards re-touched and re-publiſhed in 1553, by Eneas Vico; "The Metamorphoſe of Neptune into a Horſe," in 8vo., after Julio Romano, dated 1516; "A Bacchanalian Triumph," in 4to., after Raphael, or, according to Mariette, after Raphael del Colle; "The Entrance of Orpheus into Inferno," a ſmall engraving, after Julio Romano, dated 1525; "The Infant Hercules deſtroying the Serpents," in ſmall folio, after the ſame maſter; "The Death of Antæus," in ſmall folio, after Michael Angelo, wherein Earth is perſonified as an old woman, dated 1533; "Hercules killing the Nemean Lion," a ſmall print after Raphael, dated 1528, and a frieze of conſiderable length, of which Mariette attributes the invention to Bandinelli, and of which the ſubject is a female figure on Olympus, blowing a trumpet, in preſence of the aſſembled deities.

Allegoric Inventions, &c.—"An old Man ſeated on a Bank, with a Cottage in the back Ground," one of the few plates wherein Agoſtino has ſtippled the fleſh with the graver. Providence: on a tablet held by two angels is inſcribed "Cauſar. Cognitio:" this is a ſmall folio, and after Marc Antonio; "The Cumæn Sybil," after Raphael, in 4to., and dated 1516; "The Cemetery," in large folio, after Bandinelli. This is the print ſometimes called "The Skeletons of Baccio," wherein Death is repreſented tearing a book in preſence of various other ſkeletons; "The Battle of Charles the Raſh," a ſmall folio, dated 1518; "The Climbers," being part of Michael Angelo's Cartoon of Piſa, in large folio; "The Academy of Baccio Bandinelli," alſo in large folio; "A Combat between Five Warriors," alſo ſaid to be from the celebrated Cartoon of Piſa, in 4to.: "The Three Marys (veiled figures), on their Way to the Sepulchre," in folio, an anonymous deſign, but attributed by Huber to Michael Angelo; another from Michael Angelo's Cartoon of Piſa, in 4to., a very rare print; "A Shepherd careſſing a Shepherdeſs," in folio, after Raphael; "An aged Philoſopher meaſuring a Diſk," after Dominic Campagnola. A very rare print in 4to., after Raphael, of "A Female reſting her Right Hand on a Vaſe;" "A Dance of Fawns and Bacchantes," of the frieze form, dated 1518, after an antique bas relief, but by ſome aſcribed to Primaticcio. A ſet of ſixteen plates of bronze and marble vaſes, from the antique, in ſmall folio, inſcribed "Sic Romæ Antiqui Sculptores," &c. Another ſet of thirty-ſix, in 4to., of groteſque ſubjects, after Raphael, ſome of which only are marked with the cypher of Agoſtino; the reſt are by other pupils of Marc Antonio. A ſet of forty-eight buſtos, in 4to. "The Arch of Conſtantine," in a circle, dated 1517.

Marco Ravignano, commonly known by the name of Marc of Ravenna, was born at Ravenna in the year 1496. He ſtudied at Rome, and became the pupil of Marc Antonio, and co-diſciple and friend of Agoſtino of Venice.

As long as Raphael lived, *i. e.* till the year 1520, our two engravers worked together, after which each began to engrave on his own account, and to mark his prints with his own peculiar cypher.

Mark died at Rome about the middle of the 16th century. Strutt ſays of him that he "imitated the bolder ſtyle of engraving which was adopted by his maſter, with great accuracy; but when he attempted to follow him in his neateſt manner, he was not equally ſucceſsful. He handled the graver with more freedom than his fellow ſcholar de Muſis, who, however, ſurpaſſed him in neatneſs and preciſion.

Ravenna drew well, as his beſt prints ſufficiently teſtify; though not with that purity of outline which diſtinguiſhes the works of his maſter; neither are the extremities of his figures marked with equal correctneſs or judgment. His works, however, are juſtly held in eſtimation by the curious.

The uſual mark adopted by this artiſt is a cypher, compoſed of an R and an S joined together, which has been the occaſion of ſeveral miſtakes, not only with reſpect to his works, but with reſpect to himſelf; and has led ſeveral authors to ſuppoſe that there were two Ravennas, the one named Marco, and the other Silveſtro; and they have been confirmed in this opinion by the declaration of Vaſari, who tells us, that Marco da Ravignano, for ſo he writes the name, marked his plates with an M and an R, which, in ſome few inſtances, he certainly did. Thoſe, who do not ſuppoſe there were two Ravennas, have imagined that theſe two letters were deſigned for Raphael Sanzio, and placed upon the plate to denote that it was taken from a deſign by that maſter. This opinion, however, is eaſily confuted; for the ſame mark is found on "The Slaughter of the Innocents," after Baccio Bandinelli, and of courſe cannot, by any means, refer to Raphael. It certainly ſhould be read *Ravenna* or *Ravignano, ſculpſit*. He ſometimes marked his engravings with a ſingle R, without the S, and at others, as will be found in our *Plate* I. of the Monograms, &c. of the *Italian School*.

Of the engravings of Ravignano, the following are thoſe which are held in moſt requeſt, beginning with the

Sacred Subjects.—A ſet of twelve, of the frieze proportions, from Bible hiſtory, after Raphael; "The Slaughter of the Innocents," a large folio plate, after Bandinelli. A duplicate plate of the ſame ſubject, differently cyphered, and without the name of the painter; "The Transfiguration," marked with an R on the bole of a tree, under which a diſciple is ſeated; "The Laſt Supper," marked R, and from the ſame original as that by Marc Antonio; and "The Virgin of the long Thigh," varied from that by Marc Antonio, by the introduction of a ſmall keg, all in folio, and after Raphael; "The Holy Family," after Polidore, in folio. A ſet of thirteen, of the Saviour and Apoſtles, in 4to., after Raphael, and diſtinguiſhable from thoſe of Marc Antonio, by the cypher of Ravenna; "The Victory of St. Michael," in ſmall folio, after Raphael; "The Cemetery, or Memorial of Death," in folio, after Bandinelli, but differing ſo widely from that by Agoſtino de Muſis, both in particulars and the general compoſition, as to warrant an opinion that it is engraved from another deſign.

Profane Subjects.—"The Rape of Helen," and "Alexander depoſiting the Works of Homer in the Coffer of Darius," both in folio, and after Raphael. A pair in folio, of "The Interview between Scipio and Hannibal," and "Scipio's Victory over the latter," after Julio Romano. A ſmall anonymous print of an armed Jupiter, the deſign of which is attributed to Salviati; "Venus quitting Juno and Ceres," a ſmall folio, from the fable of Pſyche; "The Triumph of Galatea," in large folio, marked with an R;

and "Jupiter and Antiope," in ſmall 4to., all after Raphael; "Euridice in Inferno," engraved in the taſte of Marc Antonio, apparently after Julio Romano; "A Nymph and Triton," in 4to., anonymous, but after Raphael; "Polyphemus, attended by Cupid, purſuing Galatea;" "The Triumph of Galatea," and "Apollo as a Shepherd guarding the Flocks of Admetus," all in 4to., and after the deſigns of Raphael. A ſet of three prints, called "The Nymphs of Marc Antonio:" the firſt, accompanied by Cupid, is drawn by two marine monſters, the ſecond is watched by a ſatyr, and the third is drawing a thorn from her foot, all after Raphael; "The Birth of Venus," in folio; "Cupid mounted on a Dolphin," in 4to.; "Vulcan forging Arrows for Cupid," in 4to., all after the ſame painter; "A drunken Silenus, ſupported by two Bacchantes," an anonymous print, in 4to.; "A Satyr holding a Nymph in his Arms," anonymous alſo, but ſuppoſed to be after Julio Romano; and "A Combat between a Satyr and a Goat," of anonymous deſign, both in 4to.; "The Combat between Entellus and Daret," in folio, after Raphael; "Orpheus," in 4to.; "Poeſy," a duplicate plate, or copy from that by Marc Antonio, of the ſame ſubject, in 4to., dated 1542; "Infant Bacchanals," from Julio Romano, in folio. An emblematical ſubject, in which are repreſented a lion, a fox, and a dragon, with the word "Ergo," an oval print.

Antique Bas Reliefs, Statues, &c.—A ſacrifice from the antique, in 4to. The ſame ſubject reverſed. A bas-relief, from the arch of Conſtantine, in folio. An antique frieze with architectural decorations: the ſubject is three cupids, or genii, two of whom hold ſhells, and the other a trident. The original is preſerved in Ravenna, the native city of our artiſt, in the church of St. Vital, with the inſcription "Opus hoc antiquum repertur Ravennæ in aed divi vitalis MDXVIII." A battle piece, in folio. A female conducting a lion towards a funeral pile. Notwithſtanding that this print is inſcribed with the cypher of Marc of Ravenna, it is ſo much in the ſtyle of Marc Antonio, that ſome connoiſſeurs attribute it to his graver. A ſet of four bas-reliefs from the Trajan column, in ſmall folio, and in a ſlight unfiniſhed manner. The antique group of the Laocoon, a large upright folio, and exhibiting the only inſtance which has come to our knowledge, where the artiſt has inſcribed his name nearly at length, omitting only the letter A in Marcus. Another engraving of this group, in folio, marked with the ordinary cypher of our artiſt, and inſcribed on the baſe "Prout in II. deneidos P.V. Maronis." It is ſuppoſed by many that Raphael made the drawing for the latter print: both of them are rare and remarkable, as ſhewing the exact ſtate of this wonderful monument of art at the time when it was diſcovered.

The remainder of Ravignano's engravings from the antique are, the equeſtrian ſtatue of Marcus Aurelius, in folio, inſcribed "Sic Romæ aca ſculp. ante Portum Eccl. &c." The three Graces. A naked female drawing a thorn from her foot, called "The Venus of the Rabbit." Two females with a caſſolette or cenſer, after Raphael. Statue of a man ſitting, inſcribed "Roma in Capitoli," all in 4to. Mutilated ſtatue of an emperor, marked with the large R, a ſmall folio plate.

Julio Bonaſoni, or Bonaſone, was a native of Bologna, and for that reaſon is ſometimes called Bologneſe: he was born in the year 1498, and died at Rome in 1564. He ſtudied the rudiments of art under Laurent Sabatini, a Bologneſe painter, but afterwards became the diſciple of Marc Antonio. He worked from the pictures of Raphael, Julio Romano, and other great maſters, and occaſionally from his own deſigns. Excepting one or two ſubjects, in which he called in the aſſiſtance of the point (which, however, he never well underſtood the uſe of), his plates are executed entirely with the graver, in a manner though much varied from that of his tutor, yet evidently founded upon it. It is neither ſo firm, nor ſo clear and maſterly. His drawing is often heavy, and the extremities of his figures frequently neglected. The folds of his draperies are ſeldom well expreſſed, and the back-grounds to his prints, eſpecially his landſcapes, are extremely flat and ſtiff. However, with all theſe faults, which are not always equally conſpicuous, his beſt prints are not without their merit; and though not equal to thoſe of his maſter, are held in no ſmall degree of eſtimation by the generality of collectors. One thing in particular is remarkable in them, namely, the attempt which he has made of preſerving the maſſes, and a breadth of light and ſhadow, as well upon the groups of figures, as upon the figures ſeparately.

Mariette has written a catalogue raiſonée of 190 ſelect engravings by this maſter; and Mr. Cumberland a ſmall book, wherein he beſtows on Bonaſoni much more praiſe than he deſerves.

Bonaſoni ſometimes affixed to his prints his name at length, ſometimes he contracted it, but not always in the ſame manner; and ſometimes he employed the monogram, which will be found in our *Plate* I. of thoſe of the *Italian Engravers*. The moſt eſteemed of his engravings are thoſe which follow.

The *Portraits* of Pope Marcelle II. in 4to., anonymous; and very rare; Philippus Hiſpaniarum Princeps, Caroli V. filius," in large 4to.; Cardinal Bembo, aged 77, after Titian; Raphael d'Urbino; Michael Angelo Buonarotti, aged 72, in a circle; Franciſcus Flori of Antwerp, a Belgic painter; Johannes Bernardinus Bonifacius; and Niccolo Ardinghello, Cardinalis, annum agens XLIII.

Sacred Subjects.—"The Creation of Eve," after Michael Angelo; "Adam and Eve in Paradiſe:" they are ſitting in an arbour embracing each other; and "Adam and Eve after the Fall:" Adam is here digging the earth; Eve is ſpinning; and two children are preſent. Theſe are in ſmall folio, and from compoſitions by Bonaſoni himſelf; "Adam and Eve driven out of Paradiſe," a ſmall folio, after Amico Aſpertini; "Joſeph ſold to the Iſhmaelites;" and "The Cup found in Benjamin's Sack," both after Raphael; "The Fall of Manna and Moſes ſtriking the Rock;" on the ſame plate, after Parmegiano; all in ſmall folio; "Judith leaving the Tent of Holofernes," a large folio print, after M. Angelo; "The Nativity," deſigned by the engraver, in 4to. Another of the ſame ſubject, in folio, from a grand compoſition by Julio Romano; "The Adoration of the Shepherds," in folio, of anonymous invention, but attributed by Malvaſia to Parmegiano; "The Holy Family," a folio print, after Julio Romano; another "Holy Family," where St. Joſeph is ſeated on an aſs, deſigned by Bonaſoni; "A dead Chriſt," after Raphael; "The Entombing of Chriſt," after Titian; "The Reſurrection," deſigned by Bonaſoni himſelf; "St. Peter placed at the Head of the Church," after Raphael; "St. John and St. Peter healing the Sick," after Perino del Vaga; "St. Paul preaching to the People," an oval, after Perino del Vaga, all in ſmall folio. A large folio upright plate, arched at the top, of "The Laſt Judgment," after Michael Angelo, inſcribed "Julius Bonaſonius Bonon, propria Michaelis Angeli pictura quæ eſt in Vaticano, nigro lapillo excepit in æſque incidit;" "Jeſſe, David, and Solomon," in folio, from the celebrated picture in the Siſtine chapel, by the ſame maſter; "St. Joachim and St. Ann preſenting Mary their Daughter to the High Prieſt," after Parmegiano; "Chriſt meeting St. Peter at the Gates of Rome," after Raphael; "The Virgin and Child," after Parmegiano; "St. Cecilia," after Raphael; "St. George," after Julio Romano;" "The Emperor Auguſtus, and the Sybil," after Parmegiano, all in ſmall folio. In 4to. a ſet of twenty-nine prints, from "The Life and Paſſion of Jeſus Chriſt;" and in 8vo. a ſet of thirteen, from "The Life of the Holy Virgin."

Profane Subjects.—"Achilles dragging the Corſe of Hector at his Chariot Wheels;" after Primaticcio; "The taking of Troy," after the ſame painter, a large folio, engraved on two plates; "The Diſperſion of the Fleet of Eneas," after an anonymous, but very indifferent deſign; "Alexander and Bucephalus," in folio, from a compoſition by Bonaſoni; "Cimon nouriſhed by his Daughter," of the frieze form, after Polidore; "A Combat of Cavalry," being the firſt idea of Raphael for his battle of Attila; "Scipio wounded and retiring from the Combat," from a deſign by Bonaſoni; "The myſterious Saturn with his Three Sons," after Julio Romano. A ſet of twenty-two ſmall engravings, deſigned by Bonaſoni, of the loves, diſdains, and jealouſies of Juno; "The Rape of Europa," after Raphael, in large folio; "Mars and Venus," in folio, after Primaticcio; "Vulcan diſcovering the Amours of Mars and Venus," in 4to., of anonymous invention; "Venus attired by the Graces," in 4to., after Raphael; "The Birth of Adonis;" "The Triumph of Cupid and Pſyche;" and "Phœbus in his Car, attended by the Hours, with Time walking on Crutches before them, and a Man and Woman waking from Sleep," are all in ſmall folio, and from compoſitions by the engraver himſelf; "The Deſtruction of the Children of Niobe," after Perino del Vaga, dated 1541; "The Fall of Phaeton," in large 4to., after M. Angelo, and a group of three females, after the ſame maſter, in folio.

From Antique Sculpture and Architecture, &c.—Small buſtos of Jupiter, Juno, Latona, Bellona, and Minerva, five plates; "Hercules and Dejanira;" "A Satyr and Nymph; "The youthful Olympus holding a Flute;" "The Flight of Medea," a bas-relief; a ditto repreſenting "A Female and Two Children ſeated;" "The Loves of the Centaurs," with groteſque foliage, all in 4to.; "The Temple of Jupiter and that of Neptune," both in folio; and a conſiderable number of book-plates, the ſubjects of many of which are from the amours of the heathen deities.

Jean Baptiſta Franco, was born at Venice in 1498, and died in the ſame city, A.D. 1561. He learnt the principles of deſign in his native country; but travelled to Rome to perfect himſelf by ſtudying the works of Michael Angelo. According to Vaſari, he made a drawing after the famous Laſt Judgment of that maſter, which paſſed in his time for a chef-d'œuvre. Franco had an excellent taſte in deſign, and perfect knowledge of anatomy. He excelled greatly in the correctneſs of his contours, and the learned manner in which he indicated the play of the muſcles. But as a painter he was deficient: he knew very little of compoſition; or colouring, his pictures were therefore without harmony, and hard. He felt their imperfections, and quitting painting, applied himſelf to drawing and engraving. Of whom he learnt the art of engraving we are ignorant: it has been ſaid he was of the ſchool of Marc Antonio; but the mechanical part of his engraving bears more reſemblance to that of Julius Bonaſoni. He uſed the graver, and probably that inſtrument alone, notwithſtanding that many of his prints appear as if done with the point. His taſte was free, and he worked in a grand ſtyle; his figures were generally well proportioned, and his attitudes various and well contraſted; his heads were often ſmall, but always well deſigned and characteriſtic; and the other extremities were rendered with the hand of a maſter.

Franco generally marked his prints B. F. V. F. that is to ſay, Baptiſta Franco Venetus Fecit; and his beſt engravings are as follow:—"Abraham receiving Melchiſedec;" "The Sacrifice of Abraham;" and "Moſes ſtriking the Rock;" all in ſmall folio. "The Iſraelites receiving Manna in the Deſert;" in large folio. "The captive Kings brought before Solomon;" ditto. "The Adoration of the Shepherds;" "The Virgin ſitting at the Foot of a Rock, careſſing the Infant Jeſus, and in the back ground the little St. John;" "St. John the Baptiſt lying on the Earth;" all in ſmall folio. "St. Jerome holding a Death's Head;" a large folio print. "Jeſus Diſputing in the Temple with the Doctors of the Law;" "The Diſciples laying the Body of Chriſt in the Tomb;" large folio. "Simon the Magician, practiſing his Impoſtures before the Apoſtles;" "A Cyclop in his Forge, with Cupid at his Side;" "Hercules bending his Bow againſt the Centaur Neſſus;" "Two Leopards, two Lions, a Wild Goat, and a Griffin," from the antique; "The Donation to the Roman Church, by the Emperor Conſtantine," after Raphael; "A Bacchanal," a grand compoſition, from Julio Romano; "Triumph of Bacchus," a grand compoſition, all in large folio; "The Deluge," in ſmall folio.

Jacques Franco was born at Venice ſome time about the year 1560; and probably of the ſame family as Baptiſta. His taſte in engraving bore much reſemblance to that of Auguſtin Carrache, of whom he was the contemporary. He was a good deſigner, and marked his heads and other extremities very well: among the number of his productions, the following are the moſt eſteemed:—Part of the 4to. engravings for the edition of Taſſo's Jeruſalem, which was publiſhed at Genoa in 1590, after the deſigns of Bernardo Caſtelli; the reſt are done by Auguſtino Carrache; a collection of portraits of great men, publiſhed in 1626, dated 1596; "The Crucifixion," a ſmall piece, marked Giacomo Francho fec.; "St. Jerome," ditto; "Hercules between Vice and Virtue," from an antique bas-relief; beſides many other plates after Baptiſta Franco.

Nicholas Beatrice, Beatrici, or Beatrizet, was a native of Thionville in Lorrain, but ſtudied engraving in Italy, and chiefly at Rome. He was born ſome time about the commencement of the ſixteenth century, and continued practiſing his art at Rome till the year 1562, about which time he probably died. Whether he became the diſciple of Marc Antonio, or of Agoſtino of Venice, is not certainly known: Strutt thinks he ſtudied under the former. A ſedulous contemplation and imitation of Marc Antonio's excellent print of "Neptune calming the Tempeſt," after Raphael, certainly contributed to the formation of what little he poſſeſſed that might be called ſtyle in his art. Yet it is much more the merits of Michael Angelo, Raphael, and the other great maſters after whom he engraved, than his own, which makes his prints deſirable. for he neither drew accurately, nor had attained any conſiderable powers in handling his graver; and his knowledge of chiaroſcuro was but very ſuperficial.

The opinion which was held by many collectors, that Beatrice was the author of the engravings which are marked with a ſmall die, inſcribed with the letter B. ſeems at length to be juſtly abandoned. They are the performances of a ſuperior artiſt, and perhaps of Bartholomew Beham The marks which do belong to him will be found in our *Plate* I. of the monograms of the *Italian School of Engravers.*

The prints by this artiſt which are moſt ſought after, are thoſe which follow, beginning with his

Portraits.—Pius III. with a Latin inſcription; Paul III.; Paul IV. dated in 1558; Pius V.; Henry II. of France, dated 1558; another of the ſame monarch, with acceſſories, dated 1556; Hippolito Gonzague; Don Juan of Auſtria, in an oval, with the battle of Lepante in a cartouche, and other accompaniments; a ſet of medallions of the kings of Poland. All the above are of folio dimenſions.

Subjects from Sacred Hiſtory.—"The Death of Abel," in 4to.; "Joſeph interpreting the Dreams of his Brethren," in folio, after Raphael, one of the beſt of Beatrice's engravings; "Abigail meeting David," a ſmall folio, of which critics have diſputed, without ſettling whether the deſign is by M. Angelo, Bandinelli, or Julio Romano; "The Nativity of the Virgin Mary," after Bandinelli; "The Annunciation," after M. Angelo; "The Adoration of the Magi," after Parmegiano; "The Holy Family," after Jerome Mutien;" "The Good Samaritan," after M. Angelo; "Jeſus Chriſt on the Mount of Olives," after Titian; "The Crucifixion," after Mucianus Brixianus; "The Virgin in Grief," after M. Angelo; "The Deſcent from the Croſs," after N. Circignani; "The Aſcenſion," after Raphael; "The Converſion of St. Paul," after M. Angelo; "St. Michael's Victory over the Devil," after Raphael, all in folio; "The Holy Virgin diſtributing Roſaries," a large oval print; "The Adoration of the Holy Croſs," (an altar piece in large folio); "The Prophet Jeremiah," from M. Angelo's picture in the Siſtine Chapel; "St. Jerome," after Titian; "St. Elizabeth, of Hungary, healing the Sick," after Mucieno, all in large folio; and "The Laſt Judgment," a very large print engraved on ſeveral plates; from the far famed picture of M. Angelo.

Subjects from Profane Hiſtory, &c.—"The Sacrifice of Iphigenia," after del Vaga, or Salviati; "The Rape of Ganymede," after Michael Angelo; "The Fall of Phaeton," after the ſame maſter: Strutt ſpeaks highly of this engraving, but ſays it was not originally the work of Beatrice; "A Bacchanalian Piece," after Michael Angelo; "The Dream of Human Life," after the ſame maſter; a very ſingular allegorical print, exhibiting the influence of the paſſions, and ſaid, by ſome, to be compoſed and painted by Michael Angelo, from a viſion which he really experienced; "The Archers," from the ſame maſter; "Vertumnus and Pomona," from Jacobo Fiorentino;" "The Combat of Reaſon and Love," after Bac. Bandinelli, called here Bradin; "Combat of five Men againſt five ferocious Beaſts; two Lions, a Bear, a Bull, and a Wild Boar," anonymous, marked 1532, attributed to Julio Romano; "Battle of the Amazons," after a grand bas-relief on a ſepulchral urn in the Capitol, a large piece, on two plates; "The Battle of the Dacians," from the Arch of Conſtantine, inſcribed "Tabula marmorea Pugnæ Daciæ, &c.; "The Emperor Trajan in a triumphal Car;" "The Pantheon of Agrippa;" "The Temple of Fortune," from a drawing by Raphael; all in folio; "The Grand Circus," a large print engraved on two plates; "Front of the Farneſe Palace," after Michael Angelo; "The Statue of Moſes," from Michael Angelo; "Equeſtrian Statue of Marcus Aurelius," engraved in 1558; a ſtanding figure of Chriſt, after Michael Angelo; "Statue of the Philoſopher Anaximenes reading," ſince retouched, and re-named "St Paul;" "The Caſtle of St. Angelo;" "Siege and taking of Theonville," a bird's-eye view, dated 1558. Moſt of the above are of large folio dimenſions.

The foregoing artiſts worked with the graver only, but the art of etching had now travelled from Germany to Italy, and Leo Daris, otherwiſe called Leon Daven, or Louis d'Aveſne, who was the countryman and contemporary of Beatrice, is believed to have been among the very firſt who practiſed it in Italy. He was born ſome time about the year 1500: ſtudied at Florence and at Rome, and returned to France, perhaps to Lorrain, or ſtill more probably, to Fontainbleau, with Primaticcio, after whoſe compoſitions his principal works are for the moſt part engraved.

His ſtyle is ſingular, and though not inimitable, has not often been imitated. His plates are chiefly etched in rather a coarſe but ſpirited manner, in ſhort hatchings; his lights are kept broad and clear, but his ſhadows want degradation, his outlines are ſtiff and hard, and his heads, hands, and feet, are not correctly drawn. The following liſt will probably be found to contain his beſt engravings:—"Venus blinding Cupid," deſigned by the engraver, in 4to. A pair, of "Jeſus Chriſt," and "The Holy Virgin," each ſurrounded by a glory and heavenly hoſt, after Primaticcio; from whoſe pictures Daris alſo engraved, an "Holy Family;" "The victorious Saviour;" "Alexander and Bucephalus," an oval; "The Marriage of Alexander and Roxana;" "Cleopatra ſtanding under a Tent, holding the Aſp in her Hand, and reſting the other on a Vaſe;" "The Continence of Scipio; "The Rape of Europa;" "Danae in the Shower of Gold," an oval; "Jupiter preſſing the Clouds to cauſe Rain on the Earth;" "Venus bathing," a grand compoſition, where there is in the back ground an old woman bringing refreſhments, in a ſculptured border; "Venus entering with Mars into a Tub;" on the foreground are cupids playing with the arms of Mars, and two women with vaſes; "The Forges of Vulcan;" "The Rape of Proſerpine;" "The Chace of a Stag;" "The Repoſe of Diana after the Chace;" (ſhe is lying by the ſide of her game with a dog under her arm); marked Fontainbleau; "Hercules undreſſing to enter the Bath with Omphale," ditto; "Hercules in the Arms of Omphale, ſurpriſed by Fawns, with Flambeaus;" "Cadmus preparing to combat the Dragon;" "The Maſquerade;" "The Elephant and the Caravan," all in folio, and after the pictures of Primaticcio.

After Roſſo, our artiſt has engraven "Francis I. of France ſurrounded by his Court;" the ſame monarch entering the Temple of Glory; "Venus and Adonis;" and "The Diſpute between Neptune and Minerva."—After Lucas Penni, "The Trojan Horſe;" "Jupiter ſeated on his Throne;" "Pſyche approaching the Dragon-guarded Fountain;" and "Parnaſſus with Apollo and the Muſes."—After Julio Romano, "The Combat for the Body of Patroclus;" after Parmegiano, "Circe and Ulyſſes," and a battle, after an antique bas-relief, all in folio.

Lucas Penni was born at Florence ſome time about the beginning of the ſixteenth century, and was the brother of Giovanni Franceſco Penni, ſurnamed Il Fattore. He frequented the ſchool of Raphael, and ſtudied a conſiderable time under Perino del Vaga. He poſſeſſed conſiderable merit as an hiſtorical painter, and George Ghiſi of Mantua has engraven from ſeveral of his pictures. After viſiting Genoa and Lucca, he travelled to England, where he was employed by Henry VIII.; he afterwards went to France, and practiſed the fine arts for a while at Fontainbleau. On his return to Italy he applied himſelf to etching and engraving, and we have ſeveral meritorious prints from his hand; he ſometimes worked from his own deſign, but oftener from Roſſo and Primaticcio. His mark was uſually compoſed of an L and an R joined together, or ſeparate; for he choſe to add the word Romanus, or the Roman, to his name, or the initials of it; but it is neceſſary to caution the young collector, with reſpect to theſe marks, all of which will be found in our *Plate* II. of monograms of the *Italian Engravers*, becauſe they were uſed by other maſters greatly inferior in point of abilities to Penni, and to ſtate that his engravings are not only executed in a very ſpirited ſtyle, but alſo accurately drawn. He chiefly etched, but at times worked with the graver only.

The following is a liſt of his principal works:—"Two Satyrs giving Wine to Bacchus;" "Leda drawing Arrows from Cupid's Quiver;" "Suſannah at the Bath ſurpriſed by the Elders," all of which are from Roſſo: but the four following are from Primaticcio; "Abraham ſacrificing Iſaac;" "The Marriage of St. Catherine;" "Jupiter metamorphoſing Caliſto into a Bear;" and "Penelope at work with her Women," all of which plates are of folio dimenſions.

At the ſame period with Penni lived Franciſco Marcolini, of Forli, an ingenious engraver on wood, who engraved, printed, and publiſhed a volume, entitled "Giardino de Penſieri," ornamented with wood cuts after Joſ. Salviati. The ſubjects are emblematical and ſatirical, and are executed with conſiderable delicacy for that mode of engraving. Marcolini was alſo an architect of no mean talent.

Another engraver on wood, Giovanni Niccolo Roſſiliani, or Vicentino, alſo lived at this period, he was of Venice; of mediocre talent; engraved a few ſubjects after Raphael, and "The Entry of Henry III. into Venice."

Battiſta Vicentino, ſo called like Roſſiliani, from his birth-place, has been ſometimes miſtaken for him. According to Vaſari, he was born at Venice in the year 1500, and engraved, in conjunction with Baptiſt del Moro, fifty ſubjects of landſcapes and ancient edifices, in a firm and agreeable ſtyle; theſe are chiefly of folio dimenſions, and among them are Monte Quirinalis, the Coliſeum, &c. &c.

The Ghiſi of Mantua, each of whom was ſucceſſively termed the Mantuano, were a numerous family of artiſts. Jean Baptiſte, the patriarch of this Mantuan race, was born at the commencement of the ſixteenth century, and, according to Vaſari, was the diſciple of Julio Romano, and he was occaſionally painter, ſtatuary, architect, and engraver. In the latter art he worked with the graver only, and his ſtyle bears reſemblance to that of Marc Antonio, when mingled with the work of his pupil Penz, as in the celebrated print of "Neptune rebuking the Winds," where the lines of the ſhadows are gradually blended into ſtippled light. Baptiſta underſtood the human figure, but his drawing is mannered, and his effects deficient in harmony.

His uſual mark will be found in our *Plate* I. of monograms of the *Italian School*, and his principal engravings are: a large folio, of which the ſubject is a "Naval Combat," from a compoſition by himſelf, dated 1538; ſome heads of warriors, helmeted, in 4to.; "The Holy Virgin ſuckling the Infant Chriſt," in 4to. dated 1539; "David beheading Goliah," in folio, dated 1540; "A Warrior eloping with a Female," probably the Rape of Helen, 1539; "A River God," after Lucas Penni, in 4to.; "Mars, Venus, and Cupid," in folio; "The Conflagration of Troy," a capital print from his own deſign, of large folio dimenſions.

Georgio Ghiſi was born at Mantua A.D. 1524. He was the nephew, or, as others ſay, the ſon of Jean Baptiſte, whom we have mentioned above, and appears to have learned from him the rudiments of engraving, though in the progreſs of his ſtudies he much improved the ſtyle of his predeceſſor.

Georgio was eminently ſucceſsful in the technical and anatomical parts of the art: in particular he ſtudied the extremities of the human figure with much attention; and expreſſed the knitting of the joints and turns of the limbs with conſiderable accuracy. The knees of his figures eſpecially, he frequently drew in a manner which has been juſtly admired. There is, indeed, a ſameneſs of ſtyle in the drawing and marking of his figures, which has made it ſuſpected that he always drew from the ſame individual model, and thus obtruded a manner of his own, inſtead of rendering the forms of the great painters after whom he worked in all their variety. This may be the reaſon why he has ſucceeded ſo indifferently in working from Michael Angelo; whoſe forms he to a certain degree caricatured: the ſwellings of the muſcles being too powerfully expreſſed, the lights became divided, the maſſes confuſed, and the neceſſary degrees of roundneſs impaired in the effect. Theſe faults may be but too obviouſly ſeen in "The Laſt Judgment," engraved after that celebrated maſter, where the dorſal and abdominal muſcles, as well as thoſe of the limbs, are marked in a heavy, affected, and unpleaſing manner.

Such defects as theſe, however, which do not always predominate in the works of Georgio, are often more than counterbalanced by the degrees of truth and beauty which are found in them.

Indifferent impreſſions of his prints are by no means rare, but ſuch as are finely printed and well preſerved appear but ſeldom, yet without ſeeing them, it is impoſſible to form an adequate idea of the merits of this engraver. His monograms will be found in our *Plate* I. of thoſe of the *Italian School*: and the following are among his moſt juſtly valued performances.

"The Myſtery of the Trinity," from his own compoſition; "The Prophets and Sybils" of Michael Angelo; a ſet of ſix upright folios from the pictures in the Siſtine chapel; "The Laſt Judgment" of Michael Angelo, a very large upright, arched at the top, engraved on ten or eleven plates. The portrait of pope Julius II. after Raphael; and from the ſame maſter, "A Holy Family;" "The School of Athens," very large, and "The Diſpute of the Sacrament."

His print of "The Dream of Raphael" is of doubtful original, for while ſome call it by this name, others term it "Michael Angelo's Melancholy." It is of large folio dimenſions, dated in 1561, and repreſents an aged philoſopher contemplating a ſhipwrecked veſſel, while a nymph advances towards him: in the back-ground are ſtrange and fantaſtic appearances. Baſan ſays that Raphael had no hand in it, yet the words "Raphaelis urbinatus inventum," are affixed to it, and the ſtyle of compoſition and deſign appear to juſtify the inſcription.

Of a long 4to. ſize are, a female ſitting in a boat, to whom an old man is bringing a new-born infant, of anonymous invention; and a winged female holding a globe. The remainder are in folio, *viz.* an allegorical print, in compliment to the birth of the prince of the houſe of Gonzague, after Julio Romano: "Cupid and Pſyche crowned by Hymen," and "The Birth of Memnon," both from the ſame maſter; the latter one of the fineſt engravings from the hand of Mantuano; "Cephalus and Procris," from the ſame; "The Interview between Scipio and Hannibal, previous to the Battle of Zama;" "Regulus reviled by the Carthaginians," and "Regulus encloſed in the Caſk," all after the ſame maſter: "Venus at the Forge of Vulcan," is after Perin del Vaga; "Mars and Venus," after Raphael del Reggio; "Diana and Endymion," after Lucas Penni; "The Adoration of the Shepherds" is very large, and engraved on two plates, after Angelo Bronzini; "The Laſt Supper," after L. Lombart: "Hercules vanquiſhing the Hydra of Lerna," after Bertano Mantuano;

tuano; and after the ſame maſter, "The Judgment of Paris," "The Grecian Heroes before Troy," "The Deſtruction of Troy," and "The Cemetery," ſometimes called "The Reſurrection of dry Bones," a fine ſpecimen of the artiſt's ability, wherein ſkeletons, tombs, and emaciated figures form a grand compoſition.

Adam Ghiſi, alſo known by the cognomen of Mantuano, was a younger brother of George, and engraved much in the ſame ſtyle, though he was certainly ſomewhat inferior to his elder brother, both in correctneſs of outline, and the ability with which he handled the graver. The cypher with which he ſometimes marked his engravings, will be found in our *Plate* I. of thoſe of the *Italian School*, and among his beſt works are the following:—"Nativita de Noſtra Signore," after Julio Romano, which is thus treated: In the heavens is the Deity ſurrounded by the heavenly hoſt; lower in the compoſition is the Holy Ghoſt, ſurrounded by a radiance, and on the earth is the Holy Virgin and Child, and St. Joſeph; "The Preſentation in the Temple," after Nicolas Martinelli; a group from the marble of Michael Angelo, called "The Virgin of Pity," of which the ſubject is a dead Chriſt laying acroſs the knees of his afflicted mother. Collectors ſhould be careful to note, that in the early impreſſions, as the plate came from the hands of Adam Ghiſi, the back ground is blank, but it has ſince been re-touched, and a landſcape background added by Ant. Lefreri, who, however, has affixed his own name to the print. The above are all of large folio dimenſions.

In 4to. our artiſt has produced, "Mars preparing for Battle," and "Diana preparing for the Chace," either after Julio Romano, or from deſigns by himſelf; "Angelica and Medora;" "Diana and Endymion;" "Hercules and Ioli;" "The Choice of Hercules;" "Two Cupids conducting a Car with a river-God;" and "Two Cupids riding on Dolphins," both of the oval form; and "The God Pan playing on the Syrinx, with Venus and Cupid liſtening."

Diana Ghiſi, of Mantua, was ſiſter to the two preceding. The year of her birth has not been recorded. She was a woman of conſiderable ingenuity, and probably learned drawing and engraving from her brother George, whoſe ſtyle ſhe ſucceſsfully imitated. She employed no monogram or cypher, but marked her engravings, of which the following are the principal, with the name of Diana, ſometimes without any addition:—"A Converſation Party of three Figures," and "The Holy Family," both of anonymous invention, and perhaps done from compoſitions by herſelf; another "Holy Family," in a landſcape ornamented with ruined edifices, after Correggio, in large folio, dated 1577; another "Holy Family," after Raphael, where the little St. John is preſenting a ſcroll to the Infant Saviour, while St. Joſeph, in the back ground, repoſes on the baſe of a column, in folio; "The Virgin Mary careſſing the Infant Chriſt," after F. Salviati, in ſmall folio; "The Holy Virgin and Child ſitting on Clouds, and attended by the Archangels Gabriel, Michael, and Raphael:" this plate is probably engraved from her own compoſition, and the earlier impreſſions are without the inſcription "Regina Angelorum:" it is in large folio; "The Inſtitution of the Papacy, or St. Peter appointed Head of the Church," after Raphael; "The Woman taken in Adultery," after Julio Romano; "The Heroiſm of Horatio Cocles," after the ſame maſter, all in large folio; "The Continence of Scipio," in ſmall folio; and "The Birth of Caſtor and Pollux," which latter is perhaps the very beſt of Diana's engravings, are alſo after Julio Romano.

We ſhall add to this liſt but one more, namely, "The grand Feſtival of the Gods," after the ſame great painter, done from the celebrated picture in the palace del T. at Mantua. It is a very large production, which Diana, from a motive of convenience, has engraven on three plates.

Of Domenico del Barbiere, better known by the name of Fiorentino, we ſhall ſay but little; for, as an engraver, he merits not much, though he painted in ſtucco, under the ſuperintendence of Roſſo, with conſiderable ability. He was born at Florence in the year 1506, or thereabouts; and travelling to Fountainbleau in the year 1544, worked with credit from the deſigns of Primaticcio and Roſſo. His engravings, which are executed in a ſtiff and incorrect manner, are ſometimes marked with his name at length, with the occaſional addition of Fiorentino, and at others with the cypher which will be found in our *Plate* II. of the monogram, &c. of the *Italian Engravers*.

Beſides ſeveral plates of groups, and ſometimes ſingle figures, from the Laſt Judgment of Michael Angelo, he engraved a "Repoſo," in which the holy family are attended by angels, in large folio; "A dead Chriſt," from Salviati; and an antique Banquet, from Primaticcio; both in ſmall folio; "Mars and Venus," from Roſſo, in 4to.; and "An Angel, or Figure of Fame, ſtanding on a Globe holding two Trumpets," in folio.

We have now to ſpeak of that extraordinary artiſt, Franceſco Mazzuoli of Parma, more commonly known by his cognomen Parmegiano. He was born A.D. 1505, and died, at Caſtel Maggiore, at the early age of 35; yet in that ſhort life very high degrees of excellence were attained in the art of painting and etching, notwithſtanding that no inconſiderable portion of it was fruitleſsly ſpent in alchemical purſuits.

For an account of his merit as a painter, ſee MAZZUOLI. He acquired the firſt rudiments of art under the tuition of his two uncles at Parma, and at the age of 16 ſurpriſed the partiality of relationſhip, and even aſtoniſhed the exiſting taſte of that part of Italy, by the production of a picture of "St. John baptizing the Saviour in the River Jordan;" but the fame of Raphael and Michael Angelo ſoon attracted him from his native city to Rome, where he remained till Rome itſelf was ſacked, ſtudying with ardour from the works of thoſe great artiſts, yet at times retarded, in no trifling degree, by his unfortunate predilection for alchemy.

It has been ſtated by ſome writers, and is generally believed, that Parmegiano (if not the inventor of etching) was the firſt Italian who ſucceſsfully practiſed that art. Strutt ſays of him, with great juſtice, that "in the etchings of this great maſter we diſcover the hand of the artiſt, working out a ſyſtem, as it were, from his own imagination, and ſtriving to produce the forms he wanted to expreſs. We ſee the difficulty he laboured under; and cannot doubt, from the examination of the mechanical part of the execution of his works, that he had no inſtruction. It appears to be ſomething entirely new to him without the knowledge of any thing better. We know that he certainly was not the firſt inventor of etching, becauſe it was practiſed in Germany before he was of age to attempt it; yet it appears as if he had been unacquainted with the prior diſcovery, or only knew of it imperfectly by report; and in the latter caſe he might have been nearly as much at a loſs as in the former. The ſpirit and genius which appear through the clouds are ſuch as juſtly render his etchings exceedingly valuable; and on this account they have been often copied, and ſometimes indifferently. The mechanical part of them is ſcratched in with the point, often badly corroded with the aquafortis, and re-touched with the graver, without the leaſt appearance of knowledge as an engraver. But looking beyond theſe defects to the ſweet characters of the heads, to the elegant turns of the figures, and to the beauty and ſimplicity of the compoſition of theſe rude ſketches, what is wanting in the excellency of the mechanical part of the art, is abundantly ſupplied to the judicious eye, in the fire and animation of the maſter. The copies are always better than the originals, with reſpect to the regularity of the workmanſhip; but even the beſt of them are exceedingly defective in ſtyle and ſpirit, ſo that they are eaſily diſtinguiſhed upon compariſon. Good impreſſions of the originals are very rare; ſuch, I mean, as are not re-touched. From the foulneſs of the copper upon which he engraved, and the little ſkill he had in managing the aquafortis, his etchings are ſeldom clear or perfect in their appearance, though ſome indeed are greatly ſuperior to others in this reſpect; and thoſe perhaps he executed in the latter part of his life.

"It is alſo ſaid that he engraved many prints on wooden blocks in chiaroſcuro; but it is much more likely, as Baſan juſtly obſerves, that he was only the deſigner and director of theſe works, and that they were executed by Ugo da Carpi, Andrea Andreani, and other maſters."

The alarms of war, much more the diſtreſs and horrors of a ſiege, are deſtructive to the purſuits of an artiſt. When Rome was taken by the Spaniards, Parmegiano retired to Bologna, whither misfortune purſued him. Many of his deſigns, etchings, and chiaroſcuro blocks, were here ſtolen from him by an engraver, whom he retained in his ſervice, and whom Huber calls by the name of Antonio de Trente, and De Piles, Antonio Frontana. They were afterwards recovered, or recovered in part; but whether by legal proceſs, or the remorſe of Antonio, has not been explained. Poor Parmegiano was for a time almoſt diſtracted by the event, which, with a debt due to the church, and other misfortunes, drove him from Bologna to Caſtel Maggiore, where he ſoon after died of a fever.

The moſt important of the prints from the hand of this great maſter, are, "Moſes and the Burning Buſh," a ſmall plate, and apparently one of his firſt attempts in etching; "Joſeph ſolicited by the Wife of Potiphar," and "Judith with the Head of Holofernes," both in ſmall 4to.; an antique ſacrifice; a ſet of thirteen ſmall uprights, of Chriſt and the twelve apoſtles; "The Virgin Mary receiving Inſpiration from the Holy Spirit;" "The Adoration of the Shepherds," a ſmall upright; "The Marriage of St. Catherine," in ſmall 4to.; "A Holy Family," where the Virgin is ſeated, and the Saviour is lying in a cradle; another "Holy Family," where St. John is preſenting a baſket of flowers to the Infant Chriſt, in folio; another "Holy Family," in larger folio, where a biſhop and a ſaint are introduced; a very rare print, done with the graver, marked "Franc. Parm. fecit," and of folio dimenſions, of which the ſubject is alſo an "Holy Family;" "The Entombing of Chriſt," a ſmall upright folio, which Guido has copied of the ſame ſize; "The Reſurrection of Chriſt," in 4to.; "A Shepherd leaning on his Crook;" "A Mother inſtructing her four Daughters;" a back figure of a man with a woman ſeated by his ſide; all from his own compoſitions.

After Raphael, he has etched the celebrated cartoon of "St. Peter and St. John healing the lame Man," in ſmall folio; of which Strutt ſays, that it is one of Parmegiano's fineſt and moſt determined etchings, adding, "we ſee he has mixed his own ſweet manner with that of Raphael, in the treatment of the heads, and it ſeems to me to loſe nothing by the alteration."

We conclude our liſt of his etchings with thoſe of "Penelope engaged with her Women at Embroidery;" "Diogenes buſied with mathematical Diagrams at the entrance of his Tub;" and a ſmall folio of the "Adoration of the Magi," in chiaroſcuro.

Antonio de Trente was born at Trentin A.D. [illegible]. He ſtudied under Parmegiano, though but three years older than himſelf, and became a painter of ſome merit, and an excellent engraver in *chiaroſcuro*, which latter art he is preſumed to have learned from Ugo da Carpi. His ſtyle of engraving is by no means elaborate, and his extremities are often neglected, yet his prints are valued by connoiſſeurs. Reſpecting the robbery of his maſter, of which Huber has accuſed him, though we have thought it right to mention the report, we ſhall not very ſtrenuouſly inſiſt on the fact. Authors agree that the plates and blocks were reſtored after a time, and differ in the name of the robber; under ſuch circumſtances it would ſurely be unfair to brand with cyclopedian notoriety the memory of Antonio de Trente.

His moſt remarkable prints are, "The Virgin Mary embracing the Infant Chriſt," from Beccafumi; another "Virgin and Child," from Andrea del Sarto; "The Tiburtinian Sybil, pointing out the Saviour to the Emperor Auguſtus;" (which latter was printed in green ink,) after Parmegiano; a man holding a lyre; a back view of a man leaning againſt a bank, with a female head at ſome little diſtance; "Circe receiving the Companions of Ulyſſes," of the octagon form; "Pſyche ſaluted with divine Honours," of the ſame octagonal ſhape; all of folio dimenſions, and after Parmegiano; "The Martyrdom of St. Peter and St. Paul," a ſtill larger print after the ſame maſter, is particularly mentioned by Vaſari, in his life of Marc Antonio.

Nicolas Vicentino, known under the name of Boldrini, an engraver on wood, was born at Vienna ſome time about the year 1510. Of this ancient engraver there is very little known, but it is ſuppoſed he was a pupil of Titian, from whoſe deſigns he commonly worked. There is a large upright print by him, repreſenting Venus naked, ſitting on a bank with Cupid, and a ſquirrel appears behind on the branch of a tree; the figures, back-ground, &c. are executed in a bold, free ſtyle, chiefly with a ſingle ſtroke; but there is ſome croſs hatching in the deep ſhadows. It is marked Titianus inv. Nicolas Baldrinus Vincentinus inciabat, 1566. The following are among his beſt engravings, which are very rare:—A portrait of Jean Baron de Schwarzenberg, ſurrounded with a border of warlike implements, after Albert Durer, in folio; "The Adoration of the Kings," after Titian, marked with the cypher of Boldrini;" another large print of "St Jerome at Devotion at the Foot of a Rock," in a landſcape; "Saint Sebaſtian and St. Catherine," with four other ſaints, of a large ſize: both this and the laſt are from Titian; a large print repreſenting a mountainous landſcape, with animals, a female leading a cow, and a young man carrying a large tub; another large print of an old ape between two young ones, entwined with a ſerpent, intended as a ſatire on the boaſt of Baccio Bandinelli, that his Laocoon ſurpaſſed the antique. This wood cut has been attributed to Titian by ſome authors, and to Boldrini by others.

To Antonio Salamanca, who was born at Rome in the year 1500, have been attributed a whole length portrait of Bandinelli; "God creating the Animal World," after Raphael, both in large folio, with ſome other works, which are marked with one or other of the three monograms, which will be found in our ſecond plate of thoſe of the *Italian School*; yet Strutt doubts whether he was the author or only the publiſher of theſe engravings.

Giovanni Giacomo del Caraglio, or Caralius, ſurnamed

Jacobus Veronenſis, was born at Verona in the year 1512, and died at an advanced age at Parma. Caraglio went to Rome to ſtudy under Marc Antonio Raimondi, whoſe ſtyle he imitated with great ſucceſs, and he occupies a diſtinguiſhed rank among the engravers of Italy. He was a very clever deſigner, and poſſeſſed great knowledge in drawing the human figure, eſpecially the heads, which are in general very characteriſtic and expreſſive, but his draperies are not ſo well drawn; the folds are not broad enough, and not ſufficiently varied; and moſt of his prints are defective in the management of the chiaroſcuro. Caraglio was alſo very ſkilful in engraving gems, and executed ſome medals which added to his reputation.

Sigiſmond I. king of Poland, being informed of the merit he poſſeſſed, invited him to his court, where he lived to a happy old age, rich in royal favour, and ſurrounded by his friends and pupils. He commonly marked his prints with his name, and occaſionally with a cypher, which will be found in our ſecond plate of monograms of the *Italian Engravers*. The following are among his beſt works; "The Virgin ſitting with the Infant Jeſus under an Orange Tree," marked Jacobus Veronenſis; in 4to.; another quarto plate of "St. Anne, and other Saints, with the Virgin kneeling, holding the Infant Chriſt," marked as the former. A large folio print of "A Holy family," from the famous picture by Raphael, done for Francis I. ſince well known by the fine engraving of Edelinck. This one is without names, but there are proofs with the name of Caralius; another "Holy Family," after Raphael, repreſenting the Virgin holding the Infant Jeſus on a cradle, and careſſing St. John, who is preſented by St. Elizabeth, in folio.

F. de Poilly has engraven this ſubject with the inſcription "Deliciæ meæ eſſe." "The Marriage of the Virgin," from Parmegiano, in large folio. "The Annunciation of the Virgin," marked "Titiani figurarum ad Coſareni exemplar. Jac. Caraglio," in large folio. "The Supplication of Tantalus," after the ſame maſter, in large folio; "The Rape of Ganymede," after Michael Angelo: this plate is attributed to Caraglio, but it is without his name, in 4to.; a print in 4to. of an anatomical figure holding a ſkull in its hand, ſitting on a ſerpent, from P. Roſſi del.; "Hercules receiving the Arrows of the Centaur Neſſus," likewiſe from Roſſi, in large quarto; "Hercules killing the Robber Cacus," after the ſame, in large quarto; a large ſquare folio print, repreſenting a number of young men and women cultivating a garden, in the middle of which is a ſtatue of Priapus, after the ſame painter; a ſet of twenty prints in 4to. repreſenting the ſtatues of the heathen deities, with their attributes, in niches, from Roſſi. Profeſſor Chriſt ſays of theſe, that "the figures or ſtatues of the heathen deities, which appeared under his name, are not by him; I find theſe ancient plates come originally from James Binck." But here he is certainly miſtaken; thoſe by Caralius are dated 1526; and the copies by Binck 1530; which is four years poſterior to the firſt publication of them.

"The Loves of the Gods," in twenty ſmall upright plates from Perin del Vaga; a large folio plate of "The Conteſt between the Muſes and the Pierides;" "The Death of Meleager," and "The Creation of the Univerſe," both after Perin del Vaga, in large folio.

Jean Baptiſte d'Angelo del Moro, ſurnamed Torbido, was born at Verona in the year 1512. In his youth he frequented the ſchool of Titian, but afterwards became the diſciple of Franceſco Torbido, called Il Moro; whom he inherited both in his name and fortune. Del Moro was both painter and engraver, and in the former art was eſteemed a good colouriſt; his etchings are ſlight but ſpirited, and he drew the extremities of the figure in a very maſterly ſtyle. Among his works, we find fifty very fine landſcapes which he engraved in conjunction with Baptiſta Vicentino, of whom we have before ſpoken, and alſo the following; "The Nativity," after Parmegiano, in folio; "The Virgin bathing the Infant Jeſus, with the little St. John," in folio; "A Holy Family," wherein angels are miniſtering to the Holy Virgin and Child, an anonymous compoſition, but certainly after Raphael, in folio; another "Holy Family," from Raphael, in large folio; a battle piece, in large folio; "The Martyrdom of St. Catherine," from Bernadino Campi of Cremona; another large folio print, repreſenting a ſhepherd, with his crook, accompanied by his dog, and viſited by an angel; without names. There is a very grand compoſition by Julius del Moro, brother to the preceding artiſt, preſerved in the ſaloon, of the grand counſel at Venice, entitled "Papa Aleſſandro terzo che dona al Doge li ſtandardi e trombe nella Chieſa di S. Giovanni."

Marc d'Angelo del Moro was the ſon of Jean Baptiſta, and was born at the ſame place, in the year 1531. He ſtudied under, and was not inferior to, his father, either in painting or engraving. We are acquainted with thirty of his engravings, which are executed with conſiderable ability, among which are the following:—"The Nativity, or the Adoration of the Shepherds;" "A Holy Family;" "The Adoration of the Kings;" and "The Baptiſm of our Saviour;" all of large folio dimenſions. This artiſt died at Rome at an early period of life.

Æneas Vico, or Vicus, or Vighi, was born at Parma A.D. 1512. It has been ſuppoſed that he learned the principles of deſign of Julio Romano; and that, hearing of the great reputation which Marc Antonio had acquired at Rome by his engravings, he went to that city, and became his diſciple. He was a man of talent, though inferior to his maſter; neither his chiaroſcuro nor his manual execution are commendable; and in the latter a certain impatience of temper is but too obvious; yet he underſtood the human figure very well, and, when he pleaſed, could draw correctly. But in many of his productions the extremities are hard and heavy, and the proportions neglected. His engravings are neither ſo neat nor ſo clear as thoſe by Marc Antonio. Indeed he ſucceeded beſt when he attempted a more open ſtyle; a good ſpecimen of which is, a female figure, with her right arm extended, over which appears an owl flying in the air, from Parmegiano; it is a half ſheet print, dated 1548.

Vico ſometimes engraved on wood, and it appears that his ſmall works done in this ſtyle are ranged among his firſt productions. Of this number is a portrait of Charles V. ſurrounded with emblematical figures, in an oval, compoſed with taſte, very correctly drawn, and cut with great care. Upon a piece of a ruin, which ſerves as a tablet at the bottom, is this inſcription: "Inventvm ſcvlptvmqve ab aenea vico parmen ſc." But Vico was alſo an antiquary, and publiſhed a tract on medals, embelliſhed with engravings by himſelf, and a collection of thirty-ſix plates of engraved gems after the antique. This artiſt ended his days at the court of Alphonſo II. duke of Ferrara, but in what year his biographers have not recorded. Of his numerous engravings, the following will probably be found to poſſeſs the moſt merit.—Four medallions. Portrait of John of Medicis, in large folio, dated 1550. Portrait of Coſmo of Medicis, in his youth, in large folio. Portrait of Alphonſo, duke of Ferrara. A ſacrifice, in the antique taſte, dated 1542, in 4to. of his own compoſing. A plate in ſmall folio of the Three Graces. A Roſicrucian ſubject from the life of Virgil, inſcribed "Virgilium eludens meritas dat fœmina pænas, Romæ, 1542." "The Army of Charles V.

paſſing the Elbe," from a compoſition of his own, a large upright plate, in an oval ; "The Battle of the Amazons," the ſame, inſcribed "Bellum Amazonum," dated 1543 ; "Vulcan working at his Forge, with Venus on a Bed behind him." In the firſt impreſſions of this plate, Mars was repreſented with Venus, from Parmegiano. "The Combat of the Centaurs and Lapithæ," after Roſſo, in large folio, dated 1542 ; "The Diſpute of Cupid and Apollo in the Preſence of the Gods," from Baccio Bandinelli ; "The School of Baccio Bandinelli," with his portrait, after Parmegiano ; "The Converſion of St. Paul," after F. Salviati, all in folio ; "St. George and the Dragon," from Julio Carratinus, a very rare print, in folio ; "Judith with the Head of Holofernes," after Michael Angelo's celebrated picture in the Siſtine chapel, in folio ; "Jupiter and Leda," and a large folio print of a bacchanalian ſubject, both from the ſame maſter, marked Enea Vico, 1546. (This ſubject has been alſo engraven by Beatrizet.) "Chriſt taken from the Sepulchre," after Raphael, in folio. Another dead Chriſt, ſupported by Joſeph of Arimathea, with the Virgin and other females bewailing him, a middling-ſized upright plate, from Raphael ; "Lucretia ſtabbing herſelf," with a Greek inſcription ; "Venus and Cupid," (this has alſo been engraved by Marc Antonio) ; "The Annunciation of the Virgin," a ſmall plate from Titian. A ſet of vaſes from the deſigns of Polidoro da Caravaggio. A ſet of fifty plates, of dreſſes of different nations. And one of the Trajan column.

Martin Rota was a native of Sebinigo in Dalmatia, he ſtudied at Rome, where he paſſed his youth, but afterwards removed to Venice, and remained there till towards the cloſe of the ſixteenth century. Huber ſays he was born in 1561, but this muſt be a miſtake, ſince his print of "Jeſus Chriſt meeting St. Peter," after Raphael, is dated in 1568. It is uncertain by what maſter he was inſtructed in the art of engraving ; but his works prove him to have been a man of great abilities. He drew the human figure very correctly, and marked the extremities in a very maſterly ſtyle.

Rota worked entirely with the graver, which he managed with great delicacy, and without dryneſs, though his plates are not very highly finiſhed. Among his works is a ſet of portraits of the Roman emperors from Julius Cæſar to the emperor Alexander Severus, which he publiſhed at Venice in 1570. He commonly marked his prints with his name, and ſometimes with the ſmall wheel which will be found in our *Plate* II. of monograms, &c. of the *Italian Engravers*, and which conſtituted a ſort of pun upon his family name. His principal works are as follows.—"The Laſt Judgment," a middling-ſized upright plate, dated 1569, from Michael Angelo Buonarotti. This excellent engraving, which is juſtly conſidered as the chef d'œuvre of Martin Rota, has been copied very exactly by Leonard Gaultier ; the difference, however, is eaſily diſcovered by compariſon, the copy being much inferior to the original ; that is, ſuppoſing the original to be a good impreſſion. But a more ſtriking diſtinction is to be ſeen in the face of the portrait of Michael Angelo, which is introduced in a ſmall oval at the top ; it is turned towards his right ſhoulder in the original, and towards his left ſhoulder in the copy. "The Reſurrection," from his own deſign, dated 1577, executed in a very delicate ſtyle. Another "Reſurrection" executed in a very coarſe ſtyle ; "The Slaughter of the Innocents," from his own deſign, in ſmall folio ; "Paying Tribute to Cæſar," three figures, ſeen as low as the knees, in folio ; "The Martyrdom of St. Peter the Dominican," a middling-ſized upright plate from Titian. A "Mary Magdalen," after the ſame maſter, in 4to ; "Prometheus chained to a Rock," after the ſame ; "The Satyr Marſias flayed by Apollo ;" "Our Saviour appearing to St. Peter at the Gates of Rome," after Raphael, in folio ; "A Laſt Judgment," from his own deſign, a very fine plate, dedicated to the emperor Rodolphus II. dated 1573, in folio. Another "Laſt Judgment," alſo from his own deſign, which remained unfiniſhed at his death, but was compleated under the care of Anſelm Boodt. It is diſtinguiſhed from the former one, by two female figures in the middle of the picture, inſtead of an angel ; this latter is the moſt rare, but the former is the fineſt engraving. "The Battle of Lepanto, and Defeat of the Turkiſh Fleet," from his own deſign, dated 1572, in large folio, a very rare print, as are alſo the good impreſſions of all the plates of this maſter.

Jerome Porro was born at Padua in the year 1520. He is not mentioned by Strutt, and very little is known of the events of his life, except that he reſided for ſome years in the Venetian territory. He appears to have been a man of a mechanical turn of mind, and more remarkable for patient induſtry, than for ſuch talent as properly conſtitutes an artiſt. Huber ſays, he invented and conſtructed a ſort of ſailing car, large enough to contain thirty perſons, and there is yet preſerved at Parma an engraved curioſity from his hand, of which it is difficult to ſay, whether it exhibits more patience or want of taſte. The ſubject of this print is "The Paſſion of Chriſt," and the hatchings, which conſtitute the ſhading, are found, on near inſpection with a magnifying glaſs, to conſiſt of very delicate writing. Hence the chiaroſcuro is not effective, and the writing is not legible.

Among his other works, are a ſet of plates for an edition of the Orlando Furioſo, which was printed at Venice in the year 1548, and is now become very rare. A ſet of an hundred vignettes for "Les Impreſſi degli Uomini illuſtri de Camillo Camilli ;" and a ſet of letter-preſs engravings, neatly executed for a book, of the funeral ceremonies of the ancients, by Thomas Portacci, printed at Venice in 1591 ; this was the laſt, and perhaps the beſt, work of Jerome Porro.

About the ſame time lived Antonio Fantuzzi, or Fontuzzi, an obſcure Italian engraver, who etched a conſiderable number of plates in a coarſe ſtyle, reſembling that of Tempeſta. He ſtudied under Primaticcio, and marked his prints either with his initials, or the cypher which will be found in our *Plate* II. of the monograms, &c. of the *Italian Engravers*. Though his prints poſſeſs not much merit, rarity has conferred on them an imaginary value, and they are ſought after by the curious, particularly a bacchanalian ſubject, where Silenus is followed by a number of Satyrs, after Roſſi, dated 1543 ; "The Conteſt between the Muſes and Pierides," in large folio, after Primaticcio ; and, after the ſame maſter, "Alexander and Roxana," and "Alexander and Thaleſtris," dated 1543. A large print from the hiſtory of Pſyche, of Jupiter, Minerva, &c. in an oval ; and "Titan repoſing on the Surface of the Sea," in folio, after Bologna.

Now alſo lived Andrea Schiavone, ſurnamed Meldolla, a celebrated hiſtorical painter, who performed ſome etchings ſomewhat in the taſte of Parmegiano, and a few prints in chiaroſcuro, among which are, "The Finding of Moſes," in ſmall folio, after Parmegiano ; "The Flight into Egypt," in 4to. ; and "A Holy Family," in folio, after Parmegiano, in all of which the hatchings appear as if of white chalk on a blue ground ; in the "Reſurrection of Lazarus," the hatchings are of gold colour on a blue ground, and the ſame in "Chriſt laid in the Sepulchre," both of which are after Parmegiano ; "St. Peter and St. John," after the cartoon of Raphael, is executed in the ſame manner, as is alſo the “Rape of Helen,” in folio, from a compoſition by Schiavone himſelf; for an account of whoſe merits as a painter, ſee SCHIAVONE.

Paolo Farinato was born at Verona in the year 1522, and died in 1604. He learned the firſt rudiments of art of Antonio Badaia, but afterwards became the diſciple of Nicolo Golſino. His genius, which began to unfold itſelf at a very early age, inclined him to hiſtorical painting, and he continued, occaſionally, to practiſe that art until a late period of life. A picture from his pencil, of “The Miracle of the Loaves and Fiſhes,” adorns the church of St. George at Verona, and he painted ſeveral for the Eſcurial, where he paſſed ſome years.

Farinato's ſtyle of engraving was bold, free, and decided, and conſiſts almoſt entirely of etching: he ſometimes marked his plates, which are ſomewhat numerous, with his name at length, and at others with the initials P. F. or P. V. F., the V ſtanding for his native city of Verona.

His beſt productions in this art are, a figure of “St. John,” a ſmall upright, a ditto of “St. Jerome kneeling;” “St. Mary Magdalen, ſeated with a Book and Crucifix, &c.;” “The Holy Virgin with the Infant Chriſt and St. John,” in folio; “Angels bearing the Croſs,” a ſmall upright; “Venus and Cupid;” and “Venus at the Forge of Vulcan;” both in folio. They are all after his own compoſitions.

The three following engravings are by Horatius Farinato, who was the ſon and pupil of Paolo: he was of very promiſing talents, but died at an early period of life. Strutt ſays “he would have equalled the greateſt maſters;” but this may be ſaying a little too much. They are after his father's compoſitions, which may be one reaſon why they have generally been confounded with his works.

“The Invention of the Croſs, with St. Francis and the Holy Women,” a large folio print, marked P. F. inv. Ho. F. V. fecit. 1583. Another large folio, of “The Deſtruction of Pharoah's Hoſt,” marked Ho. P. F. inv. 1585, and “An Holy Family with St. John.”

Giacomo Batiſta Fontana was born at Verona A. D. 1524. He worked at Venice great part of his life, and died in the ſervice of the emperor. He deſigned as well as engraved, and we have ſeveral ſlight etchings by his hand, executed with the boldneſs and freedom of a maſter, though the drawing is by no means correct. Of theſe it may ſuffice to mention the following:—Several ſubjects from Virgil's Eneid, in folio, from his own compoſitions; “The Viſion of Ezekiel,” in large folio;” “The Martyrdom of St. Peter, the Dominican, in a Foreſt,” from the famous picture by Titian; (Martin Rota, and Le Fevre have alſo engraved from this picture.) “The Battle of Cadova, between the imperial Troops and the Venetians,” a middling-ſized plate, lengthways, from Titian; “Our Saviour on the Croſs,” in large folio; and twenty-eight ſmall plates from the hiſtory of Romulus, including a dedication to Ferdinand, Archduke of Auſtria, dated 1573.

Dominico Maria Fontana was born at Parma in the year 1543. Strutt has miſtakenly dated his birth in 1673. He learnt drawing in the ſchool of Bologna, and engraved chiefly after his deſigns. Le Compte and others have confounded this artiſt with Dominico Fontana, the famous architect. The following are ſome of his works:—“A Flight into Egypt;” the ſcene lies in a mountainous landſcape; “St. John preaching in the Deſert,” in large folio; “Our Saviour ſpeaking to the Women of Jeruſalem, on his way to Mount Calvary,” in folio, dated 1584; “Mount Calvary,” with a Latin and German inſcription; “The erecting of the great Obeliſk, before the Church of St. Peter at Rome,” with all the apparatus neceſſary for the elevation of ſuch an immenſe maſs, marked Dom. Fontana inv. Seb. Bonifacio ſc. 1586, a very rare piece, engraved on three large plates.

Veronica Fontana, who engraved ſmall portraits in wood with conſiderable neatneſs for that mode of art, was daughter to the above, and ſtudied the art of deſign under her father and Elizabeth Serani.

Chriſtofano, or Chriſtopher Bertelli, was a native of Rimini, in the duchy of Modena, and appears to have lived about the end of the ſixteenth century, though his engravings are not dated. He worked entirely with the graver, but in a ſtiff mannered ſtyle.

From whom he learned the art of engraving is by no means certain, and by no means important, as he neither invented a ſtyle of engraving, nor improved on thoſe already known. He engraved after Correggio and other Italian maſters; and the following are among his works: a Portrait of Octavius Farneſe, duke of Parma, in folio; “The Converſion of St. Paul,” a very grand compoſition, from Pordenone, marked “Per me Chriſtofano Bertelli,” in large folio; “The Virgin with the Infant Jeſus, and four Saints,” after Correggio, in folio; another of “The Virgin and Child, with St. George,” from the ſame painter; a folio print, repreſenting the different ages of man, marked Chriſtofano Bertelli, ſc.

Ferrando, or Ferdinand Bertelli, was of Venice, and contemporary with the preceding artiſt, to whoſe family he probably belonged; he worked after many of the Venetian maſters, but did not much diſtinguiſh himſelf, and we therefore only mention the following of his works: “Our Saviour healing the Sick,” marked Farinati pinx. F. Bertelli, exc. 1566, of large folio ſize; “Our Saviour on the Croſs,” after Julio Romano; “Venus repoſing,” after Titian, marked Nic. Bertelli, 1566. Specchio della Vita humana. In Venezia per F. Bertelli, 1566. Another, intitled “Omnium fere gentium noſtræ ætatis habitus, a F. Bertellio æneis typis excuſs. Venet. 1569,” in folio.

Lucas Bertelli, likewiſe a native of Venice, was a printſeller, but engraved ſome plates in the ſtyle of Cornelius Cort; among which are the following:—A portrait of Hippolita Gonzaga, a daughter of Ferdinand, ſigned Lucas Bertelli, exc. in 4to.; “The People of Iſrael tormented by Serpents,” after Michael Angelo; a folio print of “The Baptiſm of our Saviour,” ſigned as before, with four verſes at the bottom, beginning “Non iſti Chriſtiani latices,” &c.; another folio print of “The Magdalen waſhing our Savour's Feet;” “The Flagellation,” after P. Farinati, in large folio, inſcribed as before; “A Crucifixion,” in large folio; “The Deſcent from the Croſs,” where Nicodemus is holding the nails, a meritorious print, ſigned as before; “The Four Evangeliſts ſitting at a Table in the Temple, with their Attributes,” from Michael Coxie, in large folio; “The Laſt Judgment,” after J. B. Fontana; “An old Woman and Children, warming themſelves at a large Fire,” with eight verſes, after Titian, in folio. N. B. This engraver flouriſhed towards the cloſe of the ſixteenth century.

Fredericio Baroccio, was born at Urbino in the year 1528, and died at Rome A. D. 1612. He learnt the principles of deſign under Battiſta Franco at Venice, whom the ſuperiority of his genius very ſoon enabled him to ſurpaſs. He went very young to Rome; ſtudied with the pupils of Raphael; and, according to De Piles, was employed by pope Paul III. to paint ſeveral ſubjects in freſco. Baroccio painted both portrait and hiſtory with the greateſt ſucceſs, and particularly excelled in ſacred ſubjects; it is ſaid that he generally painted his Virgin Maries from his ſiſter, and Infant Chriſts from his little nephew.

He engraved ſeveral pictures from his own compoſitions, which, though ſlight, and not well managed with reſpect to the mechanical part, are nevertheleſs moſt admirable, on account of the expreſſion and excellent drawing diſcovered in them. His heads are very beautiful and characteriſtic; and the other extremities of his figures finely marked. Amidſt all the difficulties he appears to have met with, in corroding his plates with the aquafortis after he had etched them, and his unſkilfulneſs in handling the graver to harmonize and finiſh them, the powers of a maſter appear like the orb of ~~the~~ ſun, when ſeen through the thin clouds of morning. The following are among his beſt engravings, all of which are from his own compoſitions. A ſmall print of “The Virgin and Child,” which was never completely finiſhed at the bottom; “The Virgin and Infant Jeſus in the Clouds,” ſigned F. B. V. F. in 4to.; “The Annunciation,” a large upright plate, of which the good impreſſions are very rare; “St. Francis receiving the Stigmata,” a ſmall upright plate; “The extatic Viſion of St. Francis,” in which our Saviour and the Virgin appear to him, a large upright plate arched at the top, eſteemed the moſt capital of the engravings of Baroccio.

Battiſta da Parma, or Parmenſis, was a native of Parma, born A. D. 1530. Huber, without adverting to dates, ſays “he was probably a diſciple of Parmegiano;” now Parmegiano, as we have already ſtated, died in the year 1540.

The truth is, Battiſta ſtudied at Rome, but under what maſter it is not known; and here he practiſed the art of engraving in a ſtyle ſomewhat reſembling that of Cornelius Cort.

Among the moſt eſteemed of his productions are the following:—“The Virgin and Child appearing to St. John the Divine,” from Frederico Baroccio, ſigned Baptiſta Parmenſis fec. Romæ 1588, in folio; “Philippus II. Hiſpaniarum Rex, 1589,” in large folio; “Chriſt baptiſed in the River Jordan,” Bapt. Parmenſis dedicavit, in large folio; “The Chaſtity of Joſeph,” in large folio, dated 1592; and “Mount Calvary,” a very grand compoſition, marked as formerly.

Jacques, or Jacobus Parmenſis, was another artiſt, probably of the ſame family, from whoſe hand we have a print executed in the ſtyle of Caraglio, of “The Martyrdom of St. Peter and St. Paul,” and a middling-ſized print lengthways, from Parmegiano; it is executed with the graver, in a ſlight ſtyle, and has often been attributed to Caraglio, but the heads and other extremities are not ſo well drawn as we find them in the works of that artiſt.

Gaſpar ab Avibus, likewiſe called Gaſpar Patavinus, or Padovano, was born at Padua in the year 1530. He appears to have been the pupil of George Ghiſi Mantuanus, whoſe ſtyle he imitated, but never equalled. His prints are dated from the year 1560 to 1580, and ſigned in different manners, ſometimes with the monogram of Gaſpar, which will be found in *Plate* II. of thoſe of the *Italian Engravers*.

We ſhall notice the following of his productions: a print, in large folio, of “The Marriage of the Virgin Mary,” from Paul Veroneſe, inſcribed Gaſpar ab Avibus Citadelenſis fecit, 1577; “The Woman taken in Adultery,” marked with his cypher; “The Scourging of our bleſſed Saviour,” a large upright plate, ſigned Gaſpar ab Avibus Citadelenſis fecit, Lucæ Bertelli Formis; “Our Saviour crowned with Thorns,” marked as before, in large folio; “The Laſt Supper,” from Lamb. Lombard, in large folio; “Apollo on Mount Parnaſſus, with Pegaſus and the Muſes, Homer, and Virgil,” from L. Penni; a large volume in folio, in five parts, containing the portraits of the Emperors, Archdukes, Princes, &c. of the Auſtrian family. Each portrait is a whole length figure, ornamented with an appropriate border. Here Gaſpar has changed his uſual manner of engraving, and ſomething more of the ſtyle of the Sadelers appears in it: the figures, though ſtiff, are neatly engraven, and well proportioned.

Giovanni Battiſta Cavaleriis was born at Lagherino ſome time about the year 1530. He worked at Rome from 1550 to 1590. His ſtyle of engraving bears conſiderable reſemblance to that of Eneas Vico, the diſciple of Marc Antonio; though he has not, in every inſtance, attained the ſame degree of excellence.

Cavaleriis underſtood the mechanical part of his art very well; but his prints are defective both in chiaroſcuro and drawing, particularly in the extremities of his figures. He was a very induſtrious engraver, and, according to the abbé Marolles, his works amount to upwards of three hundred and twenty-ſeven; a great part of which, however, were but copies from the engravings of other maſters. He ſometimes ſigned his prints with his name, and at others with his cypher, which will be found in *Plate* II. of thoſe of the *Engravers of Italy*.

Among the moſt eſteemed of his works are the Frontiſpiece and Heads to the “Lives of the Popes,” dated 1588; the plates to a work on the “Life and Miracles of Apollinaris, firſt Biſhop of Ravenna,” in folio, which are coarſely etched, and ſlightly finiſhed with the graver; “Eccleſiæ Anglicanæ Trophæa,” in folio, from Nicolaum Circignano; “The Ruins of Rome,” from Jean Antonio Doſſius, in 30 plates; “Jeſus Chriſt teaching among the Doctors,” from his own deſign; “The Laſt Supper,” from his own deſign; “The Statue of the Virgin of Loretto;” “The Houſe or Chapel of Loretto, and the Miracles which were ſuppoſed to be done there,” 1569; “The Celebration of the Jubilee of 1585,” in the back-ground of which is a view of the cathedral church of St. Peter. (Here the engraver is called, for what reaſon has not been explained, Tridentinus.) And “A Naval Combat againſt the Turks,” for the book of Ciacioni, of folio dimenſions.

“The Virgin of Silence,” where the Virgin is reading, and the infant St. John making a ſign not to diſturb the ſleeping Chriſt, accompanied by St. Joſeph, from Michael Angelo, is in large folio; “The Converſion of St. Paul,” after a picture of Michael Angelo, in folio; “The Martyrdom of St. Peter,” in large folio, all ſigned with the engraver's name; “The Apoſtle St. Paul,” after Michael Angelo, in large folio; “The Animals returning from the Ark,” after Raphael, of the ſame ſize; “Moſes ſhewing the Tables of the Law to the People,” from the ſame maſter; “The Miracle of feeding the five thouſand,” in two large plates; “Jeſus Chriſt appearing to St. Peter at the Gates of Rome,” with the cypher of the engraver, dated 1569; “The Battle of Conſtantine againſt Maxentius,” a large upright, all from Raphael; “The Slaughter of the Innocents,” after Baccio Bandinelli, a grand compoſition, which was likewiſe engraved by Mark of Ravenna; “Suſannah and the Elders,” from Titian, in folio, dated 1586; “St. John preaching in the Wilderneſs,” from Andrea del Sarto; a large folio print of “The Deſcent from the Croſs,” from Daniel de Volterro. The ſame ſubject was engraved by Dorigny. “The Virgin ſeated on the Clouds, with the Infant Jeſus and Angels miniſtering to her,” from Livio Agreſti, in large folio; “The Elevation of the

Croſs," from the ſame maſter, ſigned "Opus Livio Agrelti Forlivenſis, Romæ incidabat, Joan. Bapt. de Cavalleriis," in large folio.

For an account of Paul Veroneſe, who etched ſome plates about this time, and is a diſtinguiſhed ornament of the Italian ſchool, ſee the article CAGLIARI.

Ceſar Vecellio was born at Venice ſome time about the year 1530, and died in the ſame city. He was the younger brother of the celebrated Titian, and probably the engraver of thoſe wood-cuts which are generally attributed to that great artiſt. We have by this maſter a ſet of prints in octavo, etched in a free ſpirited ſtyle, from the deſigns of Titian, of the coſtume, or various dreſſes, ancient and modern, of different parts of the world: they were publiſhed at Venice in the year 1590, entitled "De gli Habiti antichi et moderni di diverſe Parte del Mondo, Libri due fatti da Ceſare Vecellio." In the year 1664, another edition was publiſhed, more complete than the preceding, where the title is more fully explained, thus, "Raccolta di Figure delineate dal gran Tiziano, e da Ceſare Vecellio ſuo Fratello, deligentement e intagliate."

Joſeph Porta, otherwiſe called Salviati, della Grafagnano, was a native of Caſtelnuovo Grafagnano, born in the year 1535. He was the diſciple of Francis Salviati, whoſe name he aſſumed. He ſettled at Venice, where he painted, both in oil and freſco, with great ſucceſs, and performed ſeveral meritorious engravings on wood. M. Papillon ſays, that he has ſeen twelve prints by this maſter, executed on wood, of which the ſubjects were "The Prophets," and "The Sybils," "Pſyche finding Cupid aſleep," and "A Chemiſt in his Laboratory," a print ten inches by ſixteen. He continues: "But I alſo poſſeſs a print by this maſter, much ſuperior to the preceding, of "Jeſus Chriſt on the Croſs, accompanied by the Virgin, Mary Magdalen, and St. John," at whoſe feet is a little tablet, with the name of Joſeph Salviati. The characters are very admirably expreſſed, and the excellence of the deſign equals that of the execution." Porta's engraving of the Academy of Arts and Sciences, a very fine compoſition, in ſmall folio, proves that in this inſtance Papillon is no exaggerator. Andrea Zucchi, and many other Venetian artiſts, have engraved from the pictures of this maſter, who died at Rome in the year 1585.

Julius Sanuto, or Sanutus, was born at Venice A. D. 1536, but is very little known. Among the ſmall number of plates executed by this artiſt are the following: "The Birth of a monſtrous Child," ſigned Jul. Sanutus. Venet. fec. This print is executed with the graver in a coarſe heavy ſtyle, with ſingle ſtrokes, without any croſs hatching, and bears great reſemblance to a wood-cut. "Venus and Adonis," after Titian, from the gallery of the king of Spain, marked Giul. Sanuto exc. 1559; "The Fable of Apollo and Marſias," a very ſingular compoſition, from Correggio, engraved on three large plates; on the middle plate of which is introduced the Parnaſſus of Raphael.

Of Dominico Vitus it is only known that he was a native of Italy, born ſome time about the year 1536, and that he continued to engrave at leaſt till the year 1580.

He was an eccleſiaſtic, of the order of Val-Ombreuſe, a monaſtery ſituated in the Apennines, and was probably inſtructed in engraving by Agoſtino de Muſis, whoſe ſtyle he imitated, and not unſucceſsfully. He engraved ſeveral plates after contemporary painters, and likewiſe from the antique.

We have, by him, "St. Joachim holding a cenſer," from a deſign by Andrea del Sarto, dated 1580; "St. Bartholomew," inſcribed "Dom. Vitus Ordinis Valiſumbroſa Monachus excidit, Romæ, 1578;" a ſet of ſmall plates of "The Paſſion of Jeſus Chriſt," ſurrounded with borders of birds, beaſts, and fiſhes; ſeveral antique ſtatues, marked "Dom. Vitus fec.;" "Jupiter and Caliſto," in 4to.; and "A River God," from the antique, of the ſame ſize.

Raphael Guidi was born at Florence in the year 1540, and, judging from his works, appears to have been inſtructed in the ſchool of Cornelius Cort, or Agoſtino Carracci. He worked entirely with the graver, which inſtrument he handled with much facility. He drew correctly, and the extremities of his figures are very well expreſſed. Though Guidi cannot be ſaid to have equalled Carrache, yet his prints manifeſt that he was a man of very ſuperior talents. The following prints are by him, and will probably be found among his beſt performances; "King David playing on the Harp," from Joſephine, in folio (the ſame picture has been engraven by Eg. Van Panderen); "The Crucifixion," after Chriſtopher Schwartz, in folio; "Jeſus Chriſt laid in the Sepulchre," from F. Baroccio, dated 1598; "Æneas carrying his Father from the Burning of Troy," from the ſame; "Jupiter graſping his Thunderbolts," from Polidoro; and "Vulcan" from the ſame maſter, both in folio. In larger folio, and engraved with much freedom after Joſephine, is "The Fall of Icarus."

Bartolomio Paſſarotti was born at Bologna in the year 1540, and died in the ſame city A.D. 1592. It is very likely that he learned drawing in the ſchool of Thadeus Zucchero. Bartolomio was the moſt eminent of the numerous family of artiſts of his name, and excelled both in hiſtorical ſubjects and portraits. Huber claims for him the honour of having been the founder of the celebrated Academy at Bologna, where the Carracci ſo much diſtinguiſhed themſelves. He was a painter of great merit, and Ph. Thomaſſin, C. Cort, Aug. Carracci, and many other artiſts, have engraved after his pictures. He likewiſe produced many etchings from his own deſigns, and from thoſe of F. Salviati, and P. Perugino, of which the following are beſt known, and probably poſſeſs moſt merit.

"The Virgin and Child, accompanied by St. John," from his own deſign, in large folio; "The Viſitation of the Virgin," a rich compoſition, after F. Salviati; ſigned Bart. Paſſarotus fec. a very rare print, in large folio, and another large folio print of "The Marriage of Jacob and Rachael," from P. Perugino.

Marius Kartarus, or Mario Kartaro, was born in Italy ſome time about the year 1540, but the time and place of his death are unknown, and the events of his life are ſomewhat obſcure. Baſan ſays that "Marius Kartarus was an engraver, who flouriſhed in Italy about the middle of the ſixteenth century; Rodolphus Fuſeli calls this engraver Marius Cartari, who, in the year 1578, engraved at Rome the portraits of the twenty-four firſt Roman emperors, from Julius Cæſar to Heliogabalus. And Strutt thinks "that he was probably a German, though he reſided at Rome, and learnt the art of engraving in his own country; he copied ſeveral of the engravings of Albert Durer with ſome degree of preciſion: they are executed entirely with the graver; but his principal works are etchings in a coarſe, incorrect ſtyle, finiſhed with the graver. Some of them are very large, and in general from his own deſigns." Kartarus commonly marked his prints with a monogram, which will be found in our ſecond plate of thoſe of the *Italian Engravers*, and never with his name at length. The following are among his moſt diſtinguiſhed productions: "The Adoration of the Shepherds," in a very neat ſtyle, executed with the graver only; "Our Saviour crowned with Thorns," a large upright plate, alſo executed with the graver; "Diana and Endymion," a large plate lengthways; "Chriſt praying in the Garden of Olives," from Albert Durer, marked on a tablet 1567, Romæ, in folio; "St. Jerom ſeated in a Chamber," from the celebrated print of the ſame ſubject by Durer. "The Deſcent of Chriſt into Hell," from Andrea Mantegna, etched in his rough ſtyle, in folio; "The Laſt Judgment," in large folio, from the famous picture by Michael Angelo, in which print the oval at the top, that in the original picture contains the painter's portrait, is left blank.

Andrea Andreani, called Mantuano, was born at Mantua in the year 1540, and died at Rome in 1623. He learnt the elements of his art in the place of his nativity, but went afterwards to ſtudy at Rome. Andreani engraved on wood only, in the ſtyle diſtinguiſhed by the appellation of chiaroſcuro; which he performed by the help of two, and ſometimes three blocks, but never more. Among his own countrymen, he had Ugo da Carpi, and Antonio da Trento for models, whom he ſeems to have followed very cloſely in the early part of his time; but at length he carried the mechanical part of the art to a far greater degree of perfection. His great merit, as an artiſt, is acknowledged by all who are converſant in prints; his drawing is executed in a very maſterly ſtyle, and with great ſpirit; the heads of his figures, though ſlight, are characteriſtic and expreſſive; and he has diſplayed great judgment in the management of the various tints.

The number of prints by this maſter is very conſiderable, for beſides thoſe which he performed himſelf, he procured a great many engravings by other artiſts, retouched them when occaſion required, and, adding his cypher, ſold them as his own productions. This diſingenuous artifice, altogether unworthy of him, renders it very difficult to diſtinguiſh his works preciſely; for, after all, it is moſt likely that many prints are attributed to him, in the engraving of which he had no concern. He commonly marked his prints with one of the cyphers which will be found in our ſecond plate of *Italian Monograms*. The Abbé de Marolles miſtakenly calls this artiſt Andreoſſi; others have miſtaken him for Andrea Mantegna, who lived nearly a hundred years before him, and others again for Albert Altdorfer, on account of the ſimilarity of their monograms. We have endeavoured to exclude his adopted engravings from the following liſt of his works, and to ſelect the beſt of his own. A portrait of Albert Durer; "The Pavement of Sienna," after a drawing by Franceſco Vanni, from Domenico Beccafumi Saneſe, conſiſting of eight ſubjects, ſaid to be the moſt rare of all Andreani's engravings; "The Deluge," from Titian, a very large piece, on three plates: "The Army of Pharaoh paſſing the Red Sea," from the ſame; "The Adoration of the Magi," from Parmegiano, in ſmall folio; "The Purification of the Virgin," from Salviati, in folio, dated 1608; "The Virgin and Child, worſhipped by a Biſhop," half figures, from Al. Caſſolani, with the artiſt's cypher, and the words Andrea Mantuano, Pittore Saneſe, 1591, in large folio; "The Virgin, St. John, and Infant Jeſus, accompanied by a Saint," from Giac Ligozzio, in folio. Another folio print of "Our Saviour healing the Lepers," from Parmegiano; "Jeſus Chriſt healing the Paralytic," from Franceſſo de Nanto da Sahandia, in folio; "Chriſt departing from Pilate, who is waſhing his Hands," one of his moſt finiſhed productions, on two blocks engraved from a bas-relief of Govan. Bologna, in large folio; "Chriſt bearing the Croſs," after Al. Caſſolani, with the name of d'Andreani in Sienna, 1591, in folio; "The Entombing of Chriſt," a large folio print, dated 1591, from Giuſ. Scolari Vicentino, pittore excellente (Papillone mentions a Joſeph Scolari, an engraver on wood, to whom he attributes many prints in clair-obſcure). Another "Entombing of Chriſt," from Raphael da Reggio, a ſmall upright plate, half figures; "St. Peter preaching," marked with the name of Polidore, and the cypher of Andreani, 1608; "St. Sebaſtian, with a Biſhop, and the Virgin and Child, in Rays of Glory," marked Fredericus Barotius Urbinas, in large folio; an emblematical print, repreſenting the Chriſtian after his ſpiritual warfare in the preſent life, received as victorious into heaven, and crowned by Chriſt: it is ſigned Baptiſta Franco de Veniſe, and bears the cypher of Andreani, in large folio; a perſonification of human life, repreſented by a female figure aſſailed by the paſſions, ſigned Jac. Ligotus, inv. et Andreani 1585, Firenze, in large folio: there are different impreſſions of this plate, both with and without the chiaroſcuro. "The Rape of the Sabines," from a group by the ſculptor Govan. Bologna; three ſeveral views, dated 1584; another print of the ſame ſubject, from a bas-relief of the ſame maſter, on three blocks, dated 1585; "The Triumph of Julius Cæſar," from Andrea Mantegna, the original of which is at Hampton Court, it is cut on ten blocks of wood, including the title, and dated 1598; a large print of a ſcene in a play, intitled "Ortenſio," repreſented by the academicians, called Intronati, in the preſence of the grand duke Coſmo I. at Florence, from the deſign either of Marco Ricci, or Bart. Neroni.

Jacques, or Giacopo Palma, uſually called the younger, in contradiſtinction to his uncle Giacomo, who was a very eminent hiſtorical painter, was a native of Venice, born A.D. 1544, and died in the ſame city in the year 1628. Giacopo became the diſciple of Tintoretto, whoſe ſtyle he followed during the earlier part of his life, but he afterwards ſtudied with great care and attention the works of Titian and other great maſters, to complete his taſte. Palma has etched a number of free ſpirited plates in a ſlight ſtyle, to which he frequently ſigned his name at length, and ſometimes uſed the monogram of a palm-branch, croſſing diagonally the letter P, which will be found in our *Plate* II. of *Italian Monograms*.

The following are by him, and are his moſt eſteemed prints:—"Samſon and Dalilah," after Jac. Franco; and "Judith and Holofernes," both middling-ſized plates lengthways, marked with his name; "The Nativity," in ſmall 4to.; "A Holy Family, worſhipped by St. Jerome and St. Francis," half length; "St. John in the Deſert," in 4to.; "The beheading of St. John," the ſame ſize; "St. Jerome in Conference with a Pope," in 4to. very rare; "Pallas ſitting on a Trophy, holding a little figure of Victory in her Hand," in large 4to.; "Paying Tribute to Cæſar," the ſame; "The Woman taken in Adultery," the ſame; "Chriſt anſwering to the Phariſees, when they diſputed his Authority," the ſame; "Chriſt appearing to St. Thomas," half length figures; "Two Men in Tartarus," the ſame ſize; "An Eccleſiaſtic, and a naked Figure, with two Boys underneath," with the monogram of the artiſt; in 4to.

Dominico Pellegrino Tibaldi, who excelled in the three arts of painting, engraving, and architecture, was born at Bologna A.D. 1546. He was the ſon and pupil of Pellegrino, known by the name of Tibaldi da Bologna, after whoſe compoſitions he etched ſeveral ſpirited plates. The following ſhort liſt will probably be found to contain the beſt of Dominico's works on copper: "The Virgin of the Roſe," after a picture by Parmegiano, in the gallery of Dreſden, in folio; "A View of a Fountain at Bologna," from John de Bologna, ſigned Domin. Tibaldi. 1570, in large folio; "The Trinity," a grand compoſition, after Horace Samachini, in large folio; and a print repreſenting

“ Peace, laying the Inſtruments of War at the Feet of Jove.”

Camillo Procaccini was born at Bologna in the year 1546, and died at Milan in 1626. He very probably learned the principles of painting from his father Ercole Procaccini. Huber pronounces him the precurſor of the Caracci, and calls our attention to the ſublimity of his conceptions, and the grandeur of his taſte. He reſided chiefly at Milan, where he painted a great number of pictures, and died in that city at the advanced age of eighty. He amuſed himſelf much with etching, which he performed in a bold, maſterly ſtyle. The heads of his figures are often admirable, and the other extremities very finely marked. Among others, the following etchings are the production of his needle:—“ A Repoſe of the Holy Family,” in which Joſeph is repreſented in the front, a fore-ſhortened figure lying upon the ground, and leaning upon the ſaddle of the aſs, a middling-ſized plate, lengthways; another “ Holy Family,” in which Joſeph is repreſented giving an orange to the Infant Chriſt, a ſmall upright; another “ Repoſe,” where the Virgin is repreſented ſuckling the Infant Jeſus, in folio; “ St. Francis receiving the Stigmatics,” dated 1592, in folio; (Juſtin Sadler has engraved the ſame ſubject.) “ The Transfiguration of our Saviour,” a large upright plate, of which it is very difficult to find a good impreſſion.

Julius Cæſar Procaccini, the brother of Camillo, mentioned in the preceding article, was born at Bologna in the year 1548, and died at Milan in the year 1626. He learned the principles of painting of his father, but completed his ſtudies under the Caraccii. He excelled in hiſtorical compoſition, and his works are very much eſteemed. He etched for his occaſional amuſement, but we have never ſeen more than a ſingle ſmall plate by him, of which the ſubject is “ The Virgin and Child.”

Bernardino Paſſeri, or Paſſeri, was born at Rome ſome time about the year 1542, and reſided there moſt part of his life. In painting he poſſeſſed ſome talent, and appears to have imitated the Zuccheri, but the attitudes of his figures are, to a certain degree, forced and uneaſy. In the Abecedario he is called an univerſal engraver, but for what reaſon is not known, unleſs it means, that he occaſionally practiſed all the branches of that art which were then in vogue. It is certain that he has engraved a conſiderable number of prints, which, in general, he firſt etched, and afterwards finiſhed with the graver, in a bold, eaſy, and looſe ſtyle. His works prove him to have been a man of ability, but his drawing is not always correct, nor are the characters of his heads always beautiful, or well choſen. He often ſigned his name at length; and ſometimes uſed a monogram, which will be found among thoſe in *Plate* II. of the *Italian School.* The following are the names of a few of his works, which are by no means uncommon:—“ A Holy Family,” where the Virgin is repreſented with a Bohemian bonnet, dated 1583, in 4to.; “ The Life of St. Bruno,” repreſented on ſeveral middling-ſized upright plates, in 4to.; and a conſiderable number of Holy Families, Madonnas, and other pious ſubjects.

Ventura Salimbene, called Bevilaqua, was born at Sienna in the year 1555, and died in the ſame city in 1613. He learned the rudiments of his art of his father, Angelus Salimbene, who was the diſciple of F. Zucchero. He was half brother to Franceſco Vanni, whoſe ſtyle of painting he imitated; at Rome he chiefly worked in the library of the Vatican, and the church of St. John de Lateran. We have ſeveral ſlight etchings by this artiſt, in a bold, maſterly ſtyle, and among them the following, all from his own compoſitions:—“ The Marriage of the Virgin,” a ſmal upright plate, dated 1590; “ The Salutation of the Virgin,” in folio, 1591; a large folio plate of “ God appearing to the Virgin ſeated in the Clouds, ſurrounded by Angels;” “ St. Agnes,” a half-length figure in 4to.; “ The Baptiſm of our Saviour,” and “ Jeſus Chriſt appearing to St. Catherine of Sienna,” both in ſmall folio.

For an account of the merits of Antonio Tempeſta, as a painter, ſee the article Tempesta, Antonio. Fertile and vigorous in his invention, and various and verſatile in his artiſtical powers, he took up the pencil or the etching point with equal facility, and almoſt with equal ſucceſs. Though he delighted in cavalcades, battles, proceſſions, and ſuch other ſubjects as called forth his copious powers of compoſition, his prints are exceedingly numerous, amounting, according to Le Comte, to eighteen hundred, and according to Mariette, to no fewer than two thouſand!

Tempeſta’s ſtyle of etching, in perfect uniſon with the general character of his art, was bold and free; the lights are kept broad on his ſingle figures; his figures are often grouped with grandeur, and he poſſeſſes a certain ardent livelineſs of expreſſion, both in his human figures and animals.

From this aggregate of his merits, ſome deductions muſt, however, be made. The muſcles of his horſes, which frequently occur in his battles and hunting pieces, are generally overcharged; his draperies are not elegantly drawn; his lights and ſhades are not collected into broad maſſes, ſo as to give unity of effect to his chiaroſcuro, and his etchings are often coarſely corroded, ſo as to deſtroy the clearneſs and value of the middle tints.

Tempeſta did not always mark his prints with the ſame cypher. We have collected his various marks, and they will be found in our *Plate* II. of the monograms, &c. of the *Italian Engravers.* The following liſt is ſelected from the beſt catalogues of his works:—“ Our Saviour crucified between the two Thieves,” in large folio, very rare; a ſet of middling-ſized plates, lengthways, the ſubjects of which are taken from the Old Teſtament, and commonly known under the name of “ Tempeſta’s Bible;” a ſet of a hundred and fifty prints, from “ Ovid’s Metamorphoſis,” in 4to.; a folio print of “ Diana and Actæon;” “ The Entry of Alexander into Babylon,” of the ſame ſize; a ſet of twenty-four pieces, entitled, “ Vita S. Antonii Abbatis, &c.” in 4to.; “ The Labours of Hercules,” in thirteen plates of octavo dimenſions, compriſing a frontiſpiece and dedication; “ The Four Ages of the World,” repreſented by the manner of living at thoſe different periods; four hunting pieces, namely, a ſtag hunt, a hare hunt, a wolf hunt, and a wild-boar hunt, in octavo; another ſet of chaces; another ſet of four of field ſports; two ſubjects of battles between the armies of the ancients, in folio; two more, of modern battles; another battle, dedicated to the duke of Gravina, dated 1600; another ſet of ſix battles, with a frontiſpiece, inſcribed “ Facunda quam ſit—oliens ex. Tempeſtus f. de Wit ex.;” all of folio dimenſions.

Of the illuſtrious family of the Caracci, we have already written as painters, ſee the articles Caracci Lodovico, Agostino, and Annibal. It remains to add ſome account of their merits as engravers, and to point out their beſt productions in this art to the notice of connoiſſeurs and collectors.

Lodovico has left us a few ſmall prints from his own compoſitions. His practice was to etch his deſigns, and employ the graver in giving them a few finiſhing touches: hence his plates are ſlight, free, and maſterly; with the extremities of his figures tolerably well defined, and ſtill bette

underſtood

underſtood ; as is ſufficiently obvious to an intelligent eye. He generally marked his prints, of which we ſelect the following as the moſt worthy of notice, with the initials of his name, but not combined in a cypher. “ A Madonna and Child, ſurrounded by Angels,” in 4to.; “ A Holy Family, wherein St. Joſeph is leaning his Head upon his Hand ;” “ The Holy Virgin ſuckling the Infant Chriſt ;” “ A Holy Family, in which the Virgin Mary is reading a Book,” all in ſmall folio ; “ Samſon killing the Lion,” in 4to. ; Frontiſpiece to the poems of Ceſar Rinaldi, and a folio print of the armorial bearings of the family of Bonfigliovoli, in which the figures of Hercules and Mercury are allegorically introduced.

Agoſtino Caracci was the ſon of a tailor of Bologna, who, deſirous of educating his family in a ſuperior manner, intended Agoſtino for a ſcholar, but a ſtrong inclination for the purſuits of the fine arts becoming very manifeſt, the father was induced to alter his deſign, and placed his ſon under a goldſmith : here he learned the rudiments of engraving, for the Bologneſe goldſmiths of that time were accuſtomed to ornament their productions with engraving, which was often executed with a degree of taſte and beauty correſponding with the general exiſting ſtate of art.

From this purſuit, however, the great ſucceſs of his younger brother Annibal, as a painter, appears to have attracted him for a time, and he placed himſelf for inſtruction in that art under Fontana, then under Paſſeroti, and finally under his couſin Ludovico.

Under theſe maſters he attained a degree of excellence in the art of painting, of which we have already ſpoken, but was afterwards induced, from local circumſtances, with which we are unacquainted, to reſume the graver, and for further improvement went to ſtudy in the ſchool of Cornelius Cort.

The profeſſor Fuſeli ſays, it was “ *a ſingular modeſty* which prompted him rather to propagate the fame of others by his graver, than by ſteady exertion to rely on his own powers for perpetuity of name :” but he who has produced the engravings which we ſhall enumerate, even if he had done no more, muſt certainly have poſſeſſed ſome ſteadineſs of exertion, could ſcarcely, indeed, have been “ leſs aſſiduous than his brother,” and might ſurely rely on the art which he did practiſe ſo ſucceſsfully, for perpetuity of name.

The truth has been, that his great merit as an engraver remains unimpaired by time, and unimpeached by poſterity, while his picture of “ The Three Nymphs in the Garden Scene of St. Michael in Boſco,” was nearly “ in a ſtate of evaneſcence,” when M. Fuſeli was in Italy.

Strutt ſays that Agoſtino imitated the ſtyle of Cort “ ſo exactly, with reſpect to the mechanical part of it, that were it not for the great ſuperiority which appears in the drawing of the prints of Caracci, it would be difficult to diſtinguiſh them from each other : a ſtriking inſtance of which may be ſeen in “ The Holy Family with St. Jerome,” from Correggio, which was engraved by both artiſts.”

Agoſtino Caracci worked entirely with the graver, in a bold free ſtyle ; and his drawing of the naked parts of the figure are admirable. The heads are remarkably fine ; and the extremities are marked in the moſt accurate and maſterly manner. His draperies are frequently ſtiff, and croſſed with a ſquare ſecond ſtroke, which gives them an unpleaſing effect. But, perhaps, his greateſt defect is the prevalent fault of the age in which he lived, namely, the little attention paid to the chiaroſcuro. The lights are too much ſcattered, and left untinted, as well upon the diſtances, as upon the fore-ground and principal objects ; which not only deſtroys the harmony of the effect, but gives a ſlight unfiniſhed appearance even to the neateſt engraving. Baſan ſpeaks of him in theſe words : “ This excellent artiſt, equally verſed in the ſciences and fine arts, treated his engravings in ſo perfect a ſtyle, that one knows not which to admire moſt, the correctneſs of his drawing, or the beauty of the performance. All young artiſts ought carefully to obſerve, with what facility and perfection he expreſſed the extremities of his figures, and with what art he executed even landſcape with the graver.”

The engravings of Agoſtino are numerous, though their dimenſions, generally ſpeaking, are large. The following liſt will be found to contain thoſe of moſt merit and importance. His prints are marked either with the initial letters, or ſome contraction of his names, but not combined in a cypher.

Portraits and Hiſtorical Prints from his own Compoſitions.— Anthony Caracci, the father of Agoſtino and Annibal, a ſmall print, but very rare ; his own portrait ; Henry IV. of France, at the age of thirty-ſix ; the emperor Auguſtus, en medallion, with a reverſe ; buſt of Coſmo I., with ornamental figures ; a fine female head, cited by Malvaſia ; portrait of a ducheſs with a pearl necklace ; portraits of Jean Tomaſo Coſtanzo, the princeſs Chriſtiana of Lorraine, Ulyſſes Aldrovandus, Marc Antonio Raimondi, Titiano Vecelli, Anthony Carrachi, as St. Joſeph ; “ Adam receiving the fatal Apple ;” “ The Virgin and Child ;” “ The Virgin ſuckling the Infant Jeſus ;” “ A Repoſo ;” “ The Virgin in the Clouds, with the Infant Jeſus,” was engraved by Marc Antonio, after Raphael ; but Auguſtino, having got the plate into his poſſeſſion, added two fine heads of Cherubs ; “ The Virgin in Heaven, giving the Scapulary to a Saint,” a very fine engraving ; “ The Virgin ſitting on a Step near St. Joſeph and an Angel, accompanied by the Infant Chriſt and St. John,” a large folio print, very rare ; “ The good Samaritan,” in folio. (The impreſſions of this plate, without letters, are very rare ; and thoſe with the name of Bertelli are re-touched.) “ The myſterious Crucifix,” where a female figure repreſents Chriſtianity and another Judaiſm, in folio ; “ The Reſurrection of Jeſus Chriſt,” in folio ; “ Le Nome di Dio,” repreſenting the pope and ſenate of Venice ſupplicating the Virgin and ſaints to intercede for them, in an oval, ſurrounded with acceſſories, and ſubſcribed “ Luc. Bertelli formis,” but without the name of Auguſtino, who certainly engraved it, in large folio ; “ The Pea-hen, with Diana en Medallion ;” beneath is a landſcape, with the fable of Salmacis and Hermaphrodite ; and lower down in the plate are three ovals, with the diſpute between Neptune and Minerva, the Three Graces, and a buſt of Minerva ; theſe are all on one plate, in large folio ; the frontiſpiece to the book of Alde Manuce, entitled “ Vita di Coſimo de Medicis,” in folio. Another frontiſpiece, after Antonio Campi, for the book, entitled “ Cremona Fideliſſima,” in fol. (This is a very rare book, conſiſting of thirty-three portraits, engraved by Auguſtino.) Nine plates, from Taſſo's “ Jeruſalem Delivered,” publiſhed A. D. 1590. The reſt of the plates for this work were engraved by Giacomo Franco ; “ St. Francis receiving the Stigmatics,” a large folio print ; “ The Girdle of St. Francis,” a grand compoſition, repreſenting a ſaint diſtributing the girdle of his order to different Chriſtian ſects ; a large folio print of “ St. Jerome kneeling at the Entrance of his Cave.” There are impreſſions of this plate when it was about three parts finiſhed, which are extremely rare ; the remaining part is a mere ſketch, marked with a very free touch. An inſpection of this print ſhews with what eaſe and vigour Auguſtino managed his tool. There are impreſſions of the ſame plate, quite finiſhed, by F. Villamena, his pupil. Two landſcapes, in folio, with figures; “ Cupid conquering Pan,” inſcribed “ Omnia vincit amor, 1599;” “ Eternity in the Clouds, ſurrounded by female Figures,” in folio; “ Perſeus in the Clouds fighting with the Sea-monſter:” both this and the former one are theatrical ſcenes.

The following are from the Pictures of various other Maſters. —“ A Child blowing Bubbles,” from Goltzius, very rare, in folio; “ Jacob keeping the Flock of Rachael,” 1581, after Denys Calvart; “ Judith,” a half figure, after Laur. Sabbatius, both of the folio ſize; “ The young Tobias conducted by an Angel,” from Raphael da Riggio, (it is miſtakenly marked “ Raphael d'Urbain”), in large folio; “ The Preſentation in the Temple,” ſigned Horace Samacchini, pinx. in large folio; “ The Virgin and Child giving the Keys to St. Peter, accompanied by other Saints;” Id. pinx. in folio; “ The Adoration of the Kings,” ſigned Balthazar, Peruzzi pinx. very large, engraved on ſeven plates; the ſame ſubject repeated, where one of the kings is kiſſing the feet of the Infant Chriſt. There are impreſſions of this, both with and without the name of the painter, Marco del Moro; “ The Virgin and Child, with Mary Magdalene, St. Jerome, and an Angel holding a Book,” from Correggio, in large folio. This picture, known under the name of the Day of Correggio, which was in the academy at Parma, is at preſent in the muſeum at Paris. “ An Ecce Homo,” accompanied by the Virgin and other half figures, in large folio, from the ſame maſter; “ Our Saviour ſhewn to the People,” half figures, after Veſp. Strada; “ The Body of our Saviour, ſupported by an Angel,” half figures, the ſame ſize; “ The Crucifixion, or Mount Calvary,” in three very large plates, from Tintoret; “ The Body of our Saviour on the Knees of his Mother,” from a marble group by Michael Angelo, in large folio; “ The Nativity,” from Andrea del Sarto; “ The Virgin crowned in Heaven by the Trinity,” from Aug. Moſtaert, in folio; “ A Holy Family,” from Fred. Barroccio. Another “ Holy Family, with St. John preſenting a Scroll,” with the words “ Ecce agnus Dei,” from Raphael, in folio. Another “ Holy Family, with St. Michael,” from Laur. Sabbatini, in folio; “ The Virgin ſitting in a Creſcent with the Holy Infant,” from the ſame maſter, in folio. Another “ Holy Family,” placed high in the print, with St. Anthony and St. Catherine lower down, from Paul Veroneſe, in large folio; “ The Holy Virgin opening her Cloak to protect Two Monks,” in folio. Another large folio print of “ The Marriage of St. Catherine,” a grand compoſition. A very large upright print of “ The Martyrdom of St. Juſtinian,” on two plates, all from Paul Veroneſe; “ The Holy Trinity, in a radiance of Glory, between Two Columns,” from Titian, in large folio; “ St. Paul reſtoring a Saint to Life,” from Antonio Campi, inſcribed “ D. Pauli Miraculum in Neronis palatio factum;” “ The Virgin and Child ſurrounded by Angels,” from Julius Campi; “ The Virgin repoſing, with the Infant Jeſus and St. Joſeph,” from Berin Paſſerus, in folio; “ The Virgin,” a half figure, from Giacomo Francia; “ St. Sebaſtian,” in folio, from Françio Francia; “ The Virgin ſuckling the Infant Jeſus,” from Jac. Ligotius, in folio; “ St. Jerome,” half length, from Vann. in folio; “ St. Jerome contemplating the Virgin in Heaven,” in large folio, from Tintoret; “ The Temptation of St. Antony,” in large folio, a print which, being without the name of Auguſtino, has been miſtakenly attributed to C. Cort.; “ Mercury, and the Three Graces,” in ſmall folio; “ Wiſdom, accompanied by Peace, purſuing the God of War,” the ſame ſize, both from Tintoret; and “ Eneas ſaving his Father from the Deſtruction of Troy,” a very large upright plate, from Barroccio.

The etchings of Annibal Caracci, the younger brother of Agoſtino, and author of the Farneſe Gallery, are performed with all the firm confidence and fire of a maſter. They are held in high and deſerved eſtimation among artiſts and connoiſſeurs, and no collection of the productions of the Italian School ſhould be without good impreſſions of the following:—“ Chriſt crowned with Thorns,” from a ſimple and admirable compoſition of his own, wherein the elevated dignity, yet meek ſubmiſſion of the Son of God, is contraſted to the brutality of the ſcoffers, in a moſt affecting and wonderful manner. In the opinion of Strutt, and of the preſent writer, this is one of the very fineſt etchings of Annibal Caracci. It has been often copied, and in ſome inſtances tolerably well; the original is inſcribed “ A.C. inv. et fec. 1606.” “ A dead Chriſt on the Lap of the Holy Virgin,” commonly known among collectors by the name of the “ Chriſt du Capprarole;” “ The Adoration of the Shepherds,” called by the print dealers “ The little Crib,” from the circumſtance of one of the ſhepherds introduced, being leaning againſt a manger, nearly in the middle of the compoſition: this alſo has been copied ſeveral times. The above are both of 4to. dimenſions.

Of the ſame ſize are “ The Adoration of the Magi;” and “ Chriſt and the Woman of Samaria.” “ A Holy Family,” where Joſeph is ſeated, leaning againſt a column, holding a book, is a ſmall plate lengthways; “ The Virgin holding the Infant Chriſt and giving Drink to St. John,” is diſtinguiſhed by the name of “ The Virgin of the Porringer,” another ſmall plate lengthways; “ The Deſcent of the Holy Ghoſt,” a ſmall upright plate, nearly ſquare; “ Suſanna and the Elders,” a middling-ſized plate, nearly ſquare; “ Jupiter and Antiope,” a ſmall plate lengthways, dated 1592; “ Silenus and two Satyrs,” a ſmall circular plate, of about eight inches and a half diameter, the border of which is ornamented with vine branches and grapes: this is commonly called the “ Diſh” of Annibal Caracci, having been engraved for the bottom of a ſalver, belonging to cardinal Farneſe; “ The Virgin ſupporting the Infant Jeſus, who is aſleep,” in 4to.; “ The Virgin of the Nightingale,” where the Infant Chriſt is taking a bird from the hands of St. John, of the ſame ſize; “ St. Jerome of the Spectacles,” a half figure; a ſmall plate of “ St. Francis ſitting, holding a Skull on his Knees and a Crucifix in his Hand;” another, in quarto, of “ St. Francis kneeling at the Foot of a Rock, with a Diſciple before him;” “ Apollo playing the Lyre, with Pan, or Marſyas beſide him, biting his Fingers,” a very rare print, in octavo; “ An old Man ſpeaking to two other Figures,” of the ſame ſize: “ Venus aſleep, with Cupid obſerved by a Satyr,” in quarto; another “ Venus aſleep, with Cupid and a Satyr,” of the ſame ſize; “ The Triumph of Bacchus,” in quarto: of this ſubject Annibal engraved a duplicate plate, as is ſaid, with the view of inſtructing Lanfranc in the art of etching. “ Acis and Galatea watched by a Satyr,” in folio.

Franceſco Caracci, commonly termed Franceſchini, was the nephew of Agoſtino and Annibal, and was inſtructed in the arts of deſign by Lodovico. With ſuch opportunities and ſtrong natural talents, he in a ſhort time attained an extraordinary knowledge of the human figure, which he drew ſo correctly, as to aſtoniſh his learned relatives, and Strutt thinks he might have attained a reputation equal, if not ſuperior, to any of the Caracci: but his unfortunate propenſities to debauchery nipped all theſe fair promiſes in the bud. He died in an hoſpital at Rome, A.D. 1662, aged only 28 years.

Franceſchini etched with ability ſome few prints from the compoſitions of his uncle Annibal, among which are the following. He uſually marked his work with the monogram, which will be found in our *Plate* II. of the *Italian Maſters* :—"The Madonna and Child ſeated on a Cloud ;" "St. Charles Boromius kneeling before a Table, contemplating a heavenly Light ;" two plates of "Angels teaching the Leſſon of Mortality," of which our artiſt himſelf was ſo heedleſs ; a ſet of four plates of illuſtrious women of antiquity : namely, "Semiramis," "Lucretia," "Artemiſia," and "Portia." Theſe latter are after Lodovico Caracci, and are very rare, and all his prints are of ſmall dimenſions.

Of that diſtinguiſhed engraver Cherubino Alberti, who was living at the period now under our review, we have already detailed the biography, and deſcanted on the leading traits of his excellence, under the article Alberti Cherubino. His monogram will be found in our *Plate* II. of thoſe of the *Italian School ;* and we are now enabled to render our ſelect liſt of his performances ſomewhat more copious, by the addition of the following :—the Portraits of Pope Gregory XIII. in an oval, with acceſſory ornaments ; Pope Urban VII. companion to the above ; Henry IV. of France, alſo in an oval, with accompaniments ; and Pietro Angelo Bargeo ; all of folio dimenſions, and from pictures by Cherubino himſelf.

Hiſtorical Subjects from his own Compoſitions :—"Judith, with the Head of Holofernes, and a Sword," in folio ; "The Nativity," a grand compoſition, dedicated to Pope Clement XII. inſcribed "En Deus Omnipotens," &c. both in folio, and marked with his cypher ;" "The Flight into Egypt," where the aſs is led by an angel, accompanied by St. Joſeph and Elizabeth, in large folio ; another folio print of "The Virgin and Child with St. Joſeph," ſigned with Cherubino's cypher ; "The Body of our Saviour, carried through the Clouds by two Angels," inſcribed "Magnum pietatis opus," &c. in folio ; "The Virgin and Child in the Clouds, ſurrounded by Cherubims' Heads, and two Angels ſtrewing Flowers," entitled "Regina Cœli," in folio ; another folio plate, of "St. Catherine of Sienna ſtigmatized, and ſupported by two Angels," 1574, marked with the artiſt's cypher ; "St. Chriſtiana and St. Francis ſtigmatized, accompanied by two Angels," 1599 ; "St. Charles in the Clouds ſurrounded by Angels, proſtrating himſelf before the Virgin and Child," 1612, all of folio dimenſions ; ſix ſubjects for ceilings, of children, after the pictures by Alberti, painted at Tivoli ; ſix genii in the air, dedicated to Cardinal Viſconti ; the firſt is inſcribed "Ex picturis, quas Cherubinus Albertus in ejus Villa Tuſculana pinxit, has ipſemet incidit, 1607," in large quarto.

Hiſtorical Subjects from various other Maſters :—Standing figure of "Suſanna leaning againſt a Pedeſtal," on which is written, S. Suſanna Vir. & Mart. ; lower down, Alexander Albertus inv. dedicated to Cardinal Ruſtici, in large folio ; "Our Saviour on the Croſs," to the left is the Virgin, to the right St. John with extended arms, from Michael Angelo, in folio ; a large folio print of "St. Jerome ſitting meditating on a Croſs," from the ſame maſter, engraved at Rome, A.D. 1575 ; another in folio, of "St. Andrew bearing a Croſs," engraved in 1580, and taken from the Laſt Judgment of Michael Angelo ; two other figures, in folio, from the Laſt Judgment, one inſcribed "Nuda Veritas," the other, "Petit ad Æthera ;" theſe are very fine engravings, and dated 1591 ; the figure of Charon, accompanied by two others, and ſome heads, from the ſame Laſt Judgment, engraved A.D. 1575, in folio ; "Prometheus torn by the Vulture," painted for an angle of the Siſtine Chapel, in folio, engraved A.D. 1580 ; a group of four figures, namely, "The Body of Our Saviour ;" "The Virgin ;" "Nicodemus ;" and "Mary Magdalen ;" in folio. The original ſculpture by Michael Angelo, from which this engraving was made, was taken to Florence, and placed behind the altar of the cathedral, with the following inſcription : "Poſtremum Michaelis Bonarotæ opus, quamvis ab artifice ob vitium marmoris neglectum, eximium tamen artis canon. Coſmus III. Magnus Dux Etruriæ Romæ jam erectum hic. P. I. anno MDCCXXII." Three prints repreſenting "The Creation of Adam and Eve ;" "Adam and Eve chaſed out of Paradiſe ;" and "Adam and Eve ſubjected to Labour," Romæ, Polidorus de Caravag. invent. ; a large frieze, of "The Death of the Children of Niobe," in five plates ; another frieze, of "The Rape of the Sabines," with a Latin inſcription ; "The Triumph of Camillus," in the antique taſte ; "Pluto," a figure holding a flambeau ; "Fortune," with her left foot on a wheel ; "The Preſentation in the Temple," from Raphael : it was publiſhed after the death of Alberti, in folio ; "The Reſurrection of Chriſt," a grand compoſition, with an angel ſitting before the door of the ſepulchre, dated 1628, in folio ; "Jeſus on the Mount of Olives," where an angel preſents him with a chalice, dated 1574, and publiſhed in 1628, in folio, from Roſſo ; this, as well as the laſt, was publiſhed after the death of our engraver. "A Holy Family," in large folio, after Raphael, engraved in 1582 ; a folio print of "Jupiter careſſing Ganymede," from the Vatican, by Raphael ; two more from the Vatican, on the ſame plate, of "The three Graces ;" and "Venus quitting Juno and Ceres," 1582 ; "The Adoration of the Magi," a grand compoſition, after Roſſo, dated 1574 ; "The Transfiguration," marked with Alberti's monogram, from the ſame maſter, 1574 ; "St. Stephen ſtoned," an architectural deſign for a grand tabernacle, on two plates, Rome 1575, in folio, all from Roſſo ; "The Baptiſm of our Saviour," after Andrea del Sarto ; "The Miracle of St. Philip Benizzio," where thoſe who had deſpiſed his exhortations were ſtruck dead with lightning, from a picture by Andrea del Sarto, 1582 ; a folio print of "The Guardian Angel conducting the youthful Tobias," from Pellegrino Tibaldi, 1575 ; "Our Saviour in the Garden of Olives, with his three Diſciples," engraved by Perin del Vaga, and Ch. Alberti, in folio ; "The Nativity, or the Adoration of the Shepherds ;" over head is a glory of angels, inſcribed "Glia in Eccis," in large folio, on two plates, from Thadeus Zucchero ; another "Holy Family," where the Virgin holds the Infant on a cradle, from the ſame maſter ; "The Flagellation," from a picture by T. Zucchero, in the church of the Conſolation at Rome, in folio, dated 1575 ; "The Converſion of St. Paul," a grand folio print, from the ſame maſter, dated 1573 ; "The Body of our Saviour in the Arms of God the Father, ſurrounded by Angels, with the Inſtruments of the Paſſion," from the ſame ; "The Aſſumption of the Virgin," engraved in 1577, from T. Zucchero, and dedicated to pope Theani, in large folio ; another Aſſumption, a large print from T. Zucchero, engraved in 1571 ; "The Virgin crowned in Heaven," from the ſame maſter, engraved A.D. 1572.

We have already treated of the biography and merits of Lodovico Cardi, ſurnamed Civoli, both as an engraver and painter. (See the article Cardi Lodovico.) His monogram will be found in our *Plate* II. of thoſe of the *Italian School.*

Chriſtopher Lederer was born at Nuremberg in the year 1560. He travelled to Italy in his youth, for the ſake of ſtudying the arts to advantage; and here, for ſome reaſon which has not tranſpired, he changed his ſurname for that of Coriolano, or Coriolanus. He reſided at Venice for ſome years, where, according to Vaſari, he engraved on wood a ſet of portraits of celebrated artiſts, a work which other writers have ſtill more miſtakenly aſcribed to his ſon.

Now as theſe portraits firſt appeared in the year 1568, if Chriſtopher was born in 1560, as Huber reports, and Bartholomew not until 1590, they could not have been engraven by either of the Coriolani. Again, he is ſaid to have engraven for the anatomical work of Veſalius, of which the drawings were ſupplied by Titian, but as this celebrated book firſt appeared in 1542, Lederer's blocks muſt have been for ſome ſubſequent edition, if he cut them at all.

It appears much more certain that he engraved the figures for Ulyſſes Aldrovandini's work on natural hiſtory, and for another book, entitled "Ars Gymnaſtica," &c.

Bartolomeo Coriolano was the ſon of Chriſtopher, and was born at Bologna in the year 1590. He learned the rudiments of art in his father's houſe, but finiſhed his ſtudies in the Bologneſe academy.

In return for the dedication to pope Urban VIII. of a capital work which he engraved on wood, after the Caracci, Guido, and other great maſters, that pontiff beſtowed on him a penſion, and the order of knighthood. According to Papillon, our artiſt pretended to be a deſcendant of Caius Martius Coriolanus, the great Roman general, but this is moſt likely a mere joke, fabricated on the occaſion of his military, or equeſtrian title.

He likewiſe engraved in clair-obſcure, and his productions in that ſtyle are very much eſteemed by connoiſſeurs. He had a good taſte in deſign, his heads are finely characterized; and the other extremities of his figures are very well marked. In general he uſed no more than two blocks of wood; on the firſt he cut not only the outlines, but the darker ſhadows in imitation of hatching with a pen; the ſecond ſerved for the half tints; and with theſe two blocks, judiciouſly managed, he produced a pleaſing effect. He ſigned many of his prints with his name at length, and the addition of the word Eques, which is known to be ſynonimous with knight. The following are among his moſt eſteemed productions: "St. Jerome meditating before a Crucifix," a ſmall upright print from Guido; this is engraved on three blocks of wood, and inſcribed "Barthol. Coriolanus, Eques, ſculpſit, Bonon. 1637;" "Herodias with the Head of St. John," alſo in clair-obſcure, and from Guido; "The Virgin and Infant Jeſus, aſleep under Drapery," on wood, from Guido; the ſame ſubject, in clair-obſcure, very finely executed, both in 4to. and marked Barthol. fec. 1630; another "Virgin and ſleeping Chriſt," from F. Vanni, in clair-obſcure, not marked, in large 4to.; "Peace and Plenty," from Guido; "A Sybil ſitting, holding Tablets," both in 4to.; "The Fall of the Giants," a large upright print, on four ſeparate ſheets which paſte together, in clair-obſcure, "The Seven Wiſe Men tranſported to Bologna," in large folio.

Thereſia Maria Coriolano, was the daughter of this artiſt, and learned engraving of her father, and painting of Elizabeth Sirani. We only know of a ſingle etching by her, of "A Virgin and Child," half figures.

Giovanni, or Jean Batiſta Coriolano, was brother to Bartholomew, and was born in the year 1596, in Bologna; where he became the ſcholar of Valiſco, a painter of ſome eminence.

As a painter, Batiſta never acquired any great degree of reputation, but he engraved both on copper and wood, his works on the latter material being however greatly ſuperior to his engravings on copper. The following may be reckoned among his beſt productions: a portrait of Vincent Gualdi; another of Fortunatus Licetus; another of Joannes Cottinius, Patricius Verienſis, Coriolano, fe. all of quarto dimenſions; the ſtatue of the Virgin in a palm-tree, commonly ſtyled "Our Lady of the Palm," before which is a ſmall altar: "The Miraculous Image of the Virgin," from Guido; "Chriſt crowned with Thorns," from Lodovico Caracci; "A ſleeping Cupid," in chiaroſcuro, very rare, after Guido; a triumphal arch in honour of Louis XIII. in folio; "Paul Macii Emblemata," being a ſet of eighty-three prints, of which twenty-ſeven are by Coriolano, and the reſt by O. Gatti, and A. Pariſini.

Giovanni Luigi Valeſio, was born at Bologna in 1561. There were two other engravers of this name, who lived ſome time about the ſame period, and probably belonged to the ſame family; but as their productions have nothing remarkable to recommend them, we will paſs them over in ſilence. Giovanni frequented the Bologneſe academy, and has engraved ſeveral things in a good taſte. Moſt of his prints conſiſt of allegorical and emblematical deſigns, frontiſpieces for books, and other ornamental plates; ſome of which he marked with a monogram, which will be found in our *Plate* II. of thoſe of the *Italian Engravers*. The following are among his moſt eſteemed productions: "The Virgin with the Infant Chriſt ſeated on her Lap," a ſmall upright plate; "Venus threatening Cupid," and "Venus chaſtiſing Cupid," its companion, two ſmall upright plates; "Hymen with two Lions at his Feet," and "A Group of Genii," from Lodovico Caracci, in folio.

Jean Frederic, the ſon of Matthew Greuter, of Straſbourg, was born at Rome ſome time about this period. Our countryman, Strutt, has entered into rather a lengthened argument with the foreign writers reſpecting the date of Jean Frederic's birth, of which his merits as an artiſt do not appear to render him worthy. What does it ſignify when or where men are born, who are poſſeſſed of no greater talent or taſte than this engraver? or whether or not there was a Frederic and a Jean Frederic alſo?

The ſon of Matthew Greuter, of whom we have given ſome account in our GERMAN *School of Engraving*, reſided at Rome, being educated to the profeſſion of engraving by his father. Here he engraved a conſiderable number of plates with commendable induſtry, working with the graver only: but he neither drew well, nor poſſeſſed feeling for art that might in any degree ſupply the place of drawing; yet his prints, of which we ſhall only mention a few, are ſometimes ſought after by the curious. "Hercules in the Garden of the Heſperides," from Pietro da Cortona; "The Forge of Vulcan," after Lanfranc; and "A Battle," from Tempeſta, both in large folio. "The Death of St. Cecilia," after Dominichino, a large plate, nearly ſquare. An emblematical ſubject relative to the progreſs of Chriſtianity, a large folio print, from Romanelli; and "A Madonna and Child, with St. Francis kneeling," from a compoſition by himſelf, arched at the top, of folio dimenſions, and dated 1623.

He alſo engraved ſeveral portraits, and other ſubjects from Guido, Vouet, Stella, And. de Ancone, and other maſters.

Franceſco Vanni, a very celebrated hiſtorical painter, was born at Sienna A.D. 1563, and died in the ſame city in 1610. He was firſt the diſciple of Salimbini, afterwards of Paſſarotti, and at laſt of Giovanni de Vecchia; though in preference to all theſe, he adopted the ſtyle of Fred. Baroccio. We have four ſmall etchings by him: the ſpirit, beauty, and correctneſs of drawing that appear in thoſe prints, makes it to be regretted that he etched ſo little. The ſubjects of theſe etchings are as follow: "The Virgin contemplating the ſleeping Chriſt;" "St. Catherine of Sienna receiving the ſtigmata, or Brand;" "St. Francis receiving the Stigmata;" and "The Extatic Viſion of St. Francis," the ſaint is a half figure, and an angel appears above playing on the violin. Huber ſays that the beauty which is diſcoverable in this print cannot be too much admired. Agoſtino Caracci engraved from the ſame deſign, with ſome variations.

Giovanni Maggi, or Magius, was born at Rome in the year 1566, and is better known as an engraver than as a painter; we have by him many ſlight etchings, which are not worthy of any very great commendation. In 1618, he publiſhed a collection of all the principal fountains in Rome, which he engraved in conjunction with Domenico Paraſachi. He undertook to engrave, on a very large ſcale, the plan of Rome, with all the ſtreets and principal buildings, &c. but wanting money, the enterprize was never performed by him. We have by him, the portrait of a cardinal, as large as life; a landſcape, with figures, ruins, &c. inſcribed "J. Maius, v. et fec. 1595;" and "Figura della Vita Humana, Joh. Maius fec. 1600," in large folio.

Franceſco Villamena was born at Aſſiſſi, a city of Italy, in 1566, and died at Rome in 1626. He went to Rome under the pontificate of pope Sixtus V. and ſtudied the beſt pictures and ſtatues there. He ſtudied engraving under Cornelius Cort and his ſcholar Agoſtino Caracci, with whom he was contemporary. Villamena drew with conſiderable ability; he engraved in a bold open ſtyle, and produced a clear but not powerful effect; his lights, though broad, are too much ſpread over the whole engraving, which makes his prints appear unfiniſhed. But this defect was common to the artiſts of that age, and theſe faults in the prints of Villamena, are amply compenſated by the beauties with which they abound, particularly with regard to the expreſſion of the heads, and the excellency of the drawing. The extremities of his figures are alſo very finely marked. Some of the engravings of this artiſt are performed almoſt entirely with ſingle ſtrokes, without any croſs hatchings laid over them; and it was perhaps from them that Mellan originally took the hint, which afterwards became the marked peculiarity of his ſtyle. The number of Villamena's prints is very conſiderable: M. Mariette mentions three hundred and ſixty; and he marked them either with his name, initials, or monograms, which will be found in our *Plate* II. of thoſe of the *Italian School*, we ſhall mention the following, from his own deſigns; a portrait of cardinal Cæſar Baronius Soranus, in folio; and four other portraits of men of rank; "St. Thereſia in her Cell writing, under the Inſpiration of the Holy Ghoſt," in folio; "Mary Magdalen penitent in the Deſert, crowned by an Angel," in 4to.; "St. Francis praying before a Crucifix," in folio; a ſet of ſix groteſque little figures, one of which is a beggar, accompanied by two children; a ſet of five ſaints, three of which are from his own deſign, and the two others from Ferrau Franzoni, in ſmall folio; "St. James, appearing in the Air, to the Army of Ferdinand," a very grand compoſition; "A Man, angered by a Crowd of People, fighting in his own Defence;" a large print lengthways, commonly called The Boxers; a middling-ſized plate, in which is repreſented John Alto, the antiquary, ſtanding in one of the ſtreets of Rome. The following prints are

From various other Maſters.—"Moſes exalting the Brazen Serpent," from Ferrau Franzoni; "A Holy Family, with St. John, Elizabeth, and St. Ann," a middling-ſized upright plate from Raphael, dated 1602. Villamena repeated this ſubject, and dated the ſecond print 1611. "The Salutation of the Virgin," a large upright plate, from M. Arconio; "The Virgin and Infant Jeſus worſhipped by St. Francis;" "St. Bruno, with his Companions, doing Penance in the Deſert," a large plate lengthways from Lanfranco; "Chriſt taken from the Croſs;" a large folio plate, arched at the top, from Baroccio; another "Annunciation of the Virgin," a grand compoſition from Hipp. Andreaſius, in large folio; "The Preſentation in the Temple;" a midling-ſized plate lengthways, from Paulo Veroneſe; "St. Bernard, and the Virgin in the Clouds," after F. Vanni; "Alexander at the Battle of Arbella," from Ant. Tempeſta; a large plate, lengthways, repreſenting "Hercules holding the Globe, with the armorial bearings of Cardinal Arrigoni," from Albano; another ſubject of the ſame kind with the arms of Cardinal Barberini; the ſame ſubject with the arms of Spain, all which are of large folio dimenſions; the bible of Raphael in twenty plates, fifteen from the Old Teſtament, and five from the New, intitled "La ſacra Geneſi figurata da Rafaele, intagliata da Franceſco Villamena, dedicata al Cardinal Aldobrandino, Rom. 1626."

Leonardo Norſini, who aſſumed the name of Paraſole, from its being the family name of his wife, was born at Rome in the year 1570, and died in the ſame city, at the age of ſixty. He was an engraver on wood of ſome merit, and was much employed by A. Tempeſta. At the command of pope Sixtus V. he engraved the plants, &c. for the herbal of Caſtor Durante, the phyſician of that pontiff.

The figures in Norſini's engravings, after Tempeſta, are correctly drawn, and executed in a finiſhed ſtyle, for that mode of art.

His ſon, Bernadino Norſini, likewiſe engraved on wood; he frequented the ſchool of Joſephine, and began to make ſome progreſs in painting, when he died at an early age.

Iſabella Paraſole, the wife of Leonardo, was a woman of great ingenuity, and compoſed a book of patterns for lace and embroidery, of the prints in which ſhe engraved on wood. She likewiſe did a great number of plants for a herbal of prince Ceſi of Aquaſparta.

Jerminica Paraſole, a lady of the ſame family, equally diſtinguiſhed herſelf by engraving on wood; and there is by her hand a large print of "The Battle of the Centaurs," from A. Tempeſta; it is coarſely executed, though with much ſpirit; but the drawing is not correct.

Odoard, or Edward Fialetti, was born at Bologna A.D. 1573, and died at Venice in 1638. He learned the rudiments of deſign of J. B. Cremonini, but afterwards travelled to Venice, and finiſhed his ſtudies in the ſchool of Tintoretto. He was an hiſtorical painter as well as engraver, and his works in both arts are ſpoken of with the warmeſt commendation; Boſchini mentions thirty-eight pictures by Fialetti, which he painted for churches and other public buildings in Venice. He etched a great number of plates as well from his own deſigns, as from thoſe of other artiſts.

His etchings are executed in a ſlight, but maſterly ſtyle. He drew correctly, frequently ſelected or invented very graceful attitudes, and compoſed his figures with much taſte. If he had left no other teſtimony of his merit than his prints, they would have been ſufficient to prove that he was a man of very great ability. He generally marked his prints with a cypher, which will be found in our *Plate* II. of thoſe of the *Italian School*. We ſhall mention the following productions of his graver, as well worthy of the notice of the connoiſſeur. A long freeze from his own compoſition of tritons, ſirens, dolphins, and other marine chimera; “The Marriage of Cana in Galilee,” a middling-ſized plate lengthways, from Tintoretto; four ſubjects from Le Pordonone, “Venus and Cupid;” “Diana at the Chace;” “The God Pan;” and “A Man holding a Vaſe;” “The Paſtimes of Love,” a ſet of twenty ſmall upright plates, from his own deſigns; entitled “Scherzi d'Amor expreſſi da Odoardo Fialetti, pittore in Venezia;” a book with ſtudies for drawing, in folio, publiſhed at Venice A.D. 1608: a book of the coſtumes of different nations; and another of antique friezes, after Poliſilo Ziancalei.

Guido Reni, the celebrated hiſtorical painter, was born at Bologna in the year 1575, and died in the ſame city in 1642. He learned the elements of drawing of Denis Calaveart, whom he quitted, to ſtudy in the Bologneſe academy. But of his great talents as a painter we ſhall treat under the article RENI, and have only to notice him here as an engraver.

There are a great number of prints by his hand, which are etched in a bold, free ſtyle. His heads are beautiful and expreſſive, and the other extremities are drawn with all that taſte and judgment which might be expected from ſo great a maſter; though they are very ſlightly executed, their intrinſic beauty, and the vigorous but diſcriminating intention of the artiſt, which is every where apparent to the eye of taſte, have ſtamped a high value on them, which they juſtly deſerve. Simon Cantarini, called Il Peſareſe, copied the ſtyle of etching of Guido with ſo much preciſion, as ſometimes to deceive the eye of the unwary connoiſſeur; but in general, the extremities of the figures in the plates of Cantarini, are not marked with that admirable taſte ſo diſcernible in the works of Guido.

He ſometimes marked his plates with his name, or monogram, which is among thoſe of the Italian engravers in our *Plate* II. The following are among the productions of his hand, the whole number of which, according to Mariette, amount to two hundred and eighty-nine.

From his own Companions.—A buſt of pope Paul V. in oval, very rare; the profile of a man; another, with a long beard; “The Virgin with the Infant Jeſus, with St. Joſeph in the back ground,” in 4to. one of the fineſt engravings of Guido; “The Virgin with the Infant Jeſus aſleep at her Breaſt;” a ſubject which Guido has treated in three different ways; another “Virgin and Child, with a Book;” the only plate which Guido has executed entirely with the graver; three other holy families, repreſented in different ways; “St. Chriſtopher, with the Infant Jeſus on his Shoulders, going over the Sea;” “St. Jerome praying before a Crucifix, in his Cave,” in 4to.; “Cupid contemplating a female Figure, who holds a Compaſs and Tablet;” “Two Children carrying a third on their Shoulders,” in 4to.

The following are after other maſters: “A Glory of Angels,” after Lucas Cambiſi, in folio. This print is reckoned Guido's maſter-piece. “The Entombing of Chriſt,” a middling-ſized upright plate, from Parmegiano, a very fine print; “The Infant Chriſt ſitting on his Mother's Lap, laying his Hand on the Tabernacle, with St. Joſeph,” from Aug. Caracci, falſely attributed to Annibal, in 4to.; “The Virgin Mary ſuckling the Infant Jeſus,” from Caracci, in 4to., executed on a blank ground; “The Charity of St. Roch,” dated 1610, in large folio. Theſe are the principal engravings of Guido, of the whole of which Adam Bartſch of the library at Vienna has given a very good catalogue.

For an account of Franciſco Brizzio, the pupil and aſſiſtant of Agoſtino Caracci, ſee the article BRIZZIO; and for the biography of Horace Borgiani, who lived alſo at this period, ſee BORGIANI. The monogram uſually affixed by the latter to his engravings will be found in *Plate* III. of thoſe of the *Italian School.*

Raphael Scaminoſi, or Schiaminoſſi, was born at Borg S. Sepolcro in the year 1580. He was the diſciple of Raphael dall Colle. He performed ſome few engravings on wood; and there are a conſiderable number of etchings by him,—Florent le Compte ſays a hundred and thirty,—which are executed in a bold dark ſtyle. There is a coarſeneſs in them, which gives them a diſagreeable appearance at firſt ſight; but on examination, they will be found to poſſeſs great merit. His knowledge of drawing ſeems to have been very extenſive; and the characters of his heads are ſtriking and appropriate. His monogram is copied in *Plate* III. of thoſe of the *Italian School.*

The following are ſome of the beſt productions of his needle: “The Virgin and Child,” a middling-ſized upright, inſcribed “Raphael Schiaminoſſius, Pictor ex Civitate Burgi Sancti incidebat, A.D. 1613;” “St. Francis preaching in the Deſert,” from his own compoſition; a ſet of the twelve Apoſtles; a ſet of fourteen ſmall plates, lengthways, intitled “Myſteria Roſarii beatæ Mariæ Virginis,” publiſhed at Rome, 1609, all from his own deſigns; the fifteen Myſteries of the Roſary, in folio; “The Martyrdom of St. Stephen,” a middling-ſized plate, lengthways, from Lucas Cangiagi; “Mary Magdalen carried away by Angels,” after the ſame, in folio; “The Viſitation of the Virgin,” from Barroccio, in folio; a middling-ſized plate, lengthways, from the ſame maſter, of “A Repoſo;” “The Holy Virgin in the Clouds, with St. Cecilia, and another Saint,” from P. Veroneſe, in folio; “The Virgin Mary on a Globe, ſurrounded by Angels,” from B. Caſtelli, in folio; a ſet of twelve wood-cuts of the twelve Apoſtles; another ſet of portraits of the firſt twelve Cæſars, from Tempeſta, alſo engraved on wood.

Jean Lanfranc. This diſtinguiſhed artiſt was born at Parma A.D. 1581, and died at Rome in 1647. He firſt ſtudied under Auguſtino Caracci; but on the death of this maſter, went to Rome to complete his ſtudies under his brother Annibal, where he was knighted by pope Urban VIII.

His merit as a painter will be treated of under the article LANFRANC. We ſhall ſpeak of him here only as an engraver.

The mode of art which he practiſed was etching, and his etchings, though haſty productions, poſſeſs merit. He commonly marked his plates with his name, or initials, but not combined in a cypher; and his moſt eſteemed prints are mentioned in the following ſhort liſt: “The Triumph of a Roman Emperor,” in large folio; “An Emperor haranguing his Soldiers,” the ſame; the Bible of Raphael, from pictures in the Vatican, engraved in conjunction with Siſto Badolocchio, (of whom we ſhall next proceed to ſpeak,) and dedicated to Annib. Caracci, 1607, in 4to.

Siſto Badolocchio was of the family of Roſa, born at Parma in the year 1581, and died at Rome in 1647. He was the contemporary and fellow-ſtudent of Lanfranc. There are ſome pictureſque little etchings by him, in which we diſcover correctneſs of deſign, and facility of handling his tool. He marked his prints, of which thoſe that follow are held in moſt eſteem, Siſto B. “The Statue of the Laocoon,” from the antique, in large folio; “The Apoſtles and the Angels, with the Chandeliers of the Cupola of Parma,” from Correggio, ſix plates in folio; “A Holy Family, with St. John,” a ſmall upright plate of half figures only; Raphael's Bible, from the pictures of

Raphael in the Vatican, ſmall plates, lengthways, engraved conjointly with Lanfranc.

Octavius Leoni was born at Rome in 1582, and, under the inſtruction of his father, he acquired ſome degree of excellence as a painter. As an engraver, he is believed to have been ſelf-taught; for, excepting the hints which he might have borrowed from Boulanger and Agoſtino of Venice, he imitated none of his predeceſſors. There are a ſet of twenty portraits, chiefly of diſtinguiſhed artiſts, from his hand, engraved in a ſingular and ſtriking manner. The hair and draperies are executed with ſtrokes; the fleſh is done in round dots; and the dark parts of the eyes and ſharp ſhadows being aſſiſted with ſtrokes, which are managed in a ſkilful manner, produce a pleaſing effect. Theſe heads are finely drawn, and ſome of them finiſhed in a much higher ſtyle than is uſual with painters, when they take up the point or the graver. The following are among the portraits: Eques Ottavi Leonus, Lodovico Leonus, Johannes Franciſcus Barbeiri, Marcellus Provenzalis, Eques Chriſtopher Ronchalis de Pomeranciis, Eques Joſeph Ceſar Arpinas, Antonius Tempeſta, Thomas Salinus, Don Antonius Barberinus, Pierre Jacopo Martello, a poet, whoſe portrait is adorned with paſtoral alluſions.

Remigio Cantagallina was born at Florence in 1582, and died in the ſame city A.D. 1624. He for ſome time frequented the ſchool of the Caraccii, but afterwards learned (with his two brothers Antonio and Giovanna Franciſco) engraving of Julio Parigi. Remigio drew extremely well with a pen and ink, and ſometimes, with great good ſenſe, imitated this mode of art in his etchings.

His etchings are chiefly after his own deſigns, though he ſometimes engraved after other maſters; and it is no ſmall addition to the fame of this artiſt, that Callot and Della Bella were his pupils. The cypher which he commonly uſed is copied in *Plate* III. of the monograms of the *Italian School.* We ſhall ſpecify the following of his works: "The Aſſumption of the Virgin, wherein ſhe is crowned by two Angels," in 4to., after Callot; four ſmall landſcapes, dated 1609, from Roſſi; a ſet of ſix landſcapes; another ſet of twelve, in octagons, with the cypher of the artiſt; another ſet of ſix; another ſet of nine and twenty prints, the ſcenes of an opera; and the repreſentation of the fete given on the Arno, at the marriage of the prince of Tuſcany, from the deſigns of Julio Parigi, in folio, 1595.

We now approach two artiſts, both of them diſciples of Cantagallina, of a very different kind from any of their predeceſſors, of more enterpriſing ſpirit and more original powers, if not of more vigorous intellect, than the ſchools of Italy have yet preſented to our notice: but having already treated of the biography and profeſſional merits of Callot and Della Bella, (ſee the articles Bella and Callot,) before our claſſification of the engravers into the ſeveral ſchools of Europe was determined on, we can do little more in this place than add more copious liſts of their very eſtimable engravings.

The number of Callot's engravings, conſidering the ſhort period of his life, is not leſs wonderful than the various multitudes of figures by which ſome of them are peopled. The beſt catalogue with which we are acquainted is contained in the third volume of the Baron Heinnekin's Dictionary, from which we have extracted the principal, in conformity with our plan.

Subjects from Holy Writ, and the Monkiſh Legends.—"The Paſſage of the Red Sea," in 4to. of which connoiſſeurs are deſirous of poſſeſſing each of the two different ſtates in which the plate was printed. "Elias and the widow of Sarepta;" "Ecce Ancilla Domini," or "The Annunciation," after Matteo Roſelli, in 4to. This is a rare print, and is diſtinguiſhed from another of the ſame ſubject, called "The little Annunciation," as well by its being without the engraver's name, as by its Latin inſcription. "St. John preaching in the Deſert," 4to. "The Parable of the Huſbandman ſowing Seed," with a Latin inſcription, 4to. This plate is ſolely the work of the graver. "Ecce Homo," after Stradan, folio, engraven at the age of eighteen. "Chriſt bearing the Croſs," a ſmall oval, engraven on a ſilver plate. "The Crucifixion, with the Virgin Mary, St. John, and Mary Magdalen, embracing the Croſs," a ſmall and rare print. "The Entombing of Chriſt," after Ventura Salimbini, the work of the graver alone. "Our Saviour with the Diſciples at Emaus." "The Virgin Mary with the infant Chriſt," an oval. Another, wherein the Virgin is embracing our Saviour, 4to. Another of the Virgin, after Andrea del Sarto, wherein is introduced St. John and Elizabeth, 4to. Another, after P. Farinati, with the infants Chriſt and St. John, folio. "Our Lady, with three Ears of Corn," 4to. "A Holy Family," inſcribed "Minor ſervi et majoris, &c." 4to. Another Holy Family, after Sadeler, in 4to. entirely performed with the graver. "The Aſſumption with the Cherubim," 8vo. There is another of this ſubject, called "The little Aſſumption," in an oval. "Benedicite," another Holy Family, 4to. "The Triumph of the Virgin," folio, dedicated to Charles IV. duke of Lorraine, and Bar. folio; "St. John the Evangeliſt in the Iſle of Patmos," in 4to. nearly ſquare; "St. Francis:" of this ſubject there are two engravings, one known by the name of "The little St. Francis of the Tulip;" and the other termed "The Tree of St. Francis," at the foot of which are ſeveral monks at prayers, 4to. nearly ſquare; "The Temptation of St. Anthony," the firſt plate of this ſubject, (which is a large folio,) is dedicated to Monſ. Philippeaux de la Vrilliere, beneath it are Latin verſes with his coat of arms, and it is dated in 1635.

As Fuſeli has painted three pictures from the ſame fairy ſcene in Shakſpeare's Midſummer Night's Dream, ſo Callot, to ſhew that his imagination was far from being exhauſted on the ſubject of the temptation of St. Anthony, has engraved a ſtill larger plate from this celebrated legend, which is very conſiderably varied from that of which we have ſpoken; and, though not the beſt, the ſecond is by much the ſcarceſt print of the two; for the plate, having been materially damaged by accidental contact with ſome acid, a good impreſſion, before the accident, is now rarely to be met with. "The Martyrdom of St. Lawrence," a ſmall oval; "The Martyrdom of St. Sebaſtian:" this is a large and grand compoſition, in form of a frieze. "St. Nicholas preaching in a Wood;" "The Miracle of St. Manſuette.:" this is reported to be the earlieſt of Callot's etchings, it is in folio, and the ſhadows are expreſſed by broad and coarſe hatchings, and almoſt, if not quite, every line in it is re-entered with the graver. St. Manſuette was a biſhop of Tours, who is here repreſented as reſtoring to life the ſon of king Leucores, who had fallen into a river in reaching for his tennis ball. "The twenty-three Martyrs of Japan," in 8vo.; "The Infant Prieſt, or carrying the Hoſt," a ſmall plate, for which Callot himſelf is ſaid to have entertained ſo great partiality, that he occaſionally wore it, as ſome of the foreign orders of nobility are worn, ſuſpended from a button hole of his waiſtcoat. The proofs which were taken before the plate was perforated to admit the ribbon or ſtring are rare, and are eſteemed valuable among connoiſſeurs. "A Nun kneeling before a Crucifix," in 4to.: this piece is known by the name of "Santa Tereſa," but it appears from the inſcription that it is the portrait of Marie Victoire, the foundreſs of the convent of the nuns of the Annunciation, at Genes, who died Dec. 15, 1617. "The Poſſeſſed," or the Exorciſm, after And. Boſcoli, in folio, entirely the work of the graver. "The Courſe of Human Life," after Bernardino Poutti. This is a ſet conſiſting of four plates, which are vulgarly called Hell, or Purgatory. "Vita beatæ Mariæ Virginis Matris Dei, Emblemata delineata:" a ſet of 27 plates in 12mo. "Glorioſiſſima Virginis Deiparæ Elogia," conſiſting of nine plates of devotional ſubjects, 8vo. "The New Teſtament," conſiſting of twelve plates, including the title. N.B. The moſt valued impreſſions of this ſet, are thoſe which were printed before the inſcription that Fagnani inſerted underneath the engravings. "The Paſſion of Jeſus Chriſt," conſiſting of ſeven finely executed plates in 4to. "The Paintings in the Church of St. Peter at Rome," conſiſting of twenty-nine or thirty plates, in 8vo. of which the ſubjects are the Acts of the Apoſtles. Theſe are the plates of which we have ſpoken in our biography of Callot, as engraved at Rome, with the graver alone, under the direction of Philip Thomaſſin. "Vita Hiſtoria Beatæ Mariæ Virginis, Pariſiis," fourteen plates, including the title and tail piece. Theſe may be diſtinguiſhed from Callot's other plates, in honour of the bleſſed Virgin; by the inſcription "Attributa beatæ Mariæ." "Male and Female Penitents," ſix plates, of which the ſubjects are 1. The Title by Ab. Boſſe; 2. St. Jerome; 3. St. John; 4. St. Francis; 5. St. Mary Magdalen; 6. The Death of the Magdalen. "Salvatoris beatæ Mariæ Virginis ſanctorum Apoſtolorum icones," a ſet of ſixteen plates in 8vo. publiſhed at Paris in 1631. "Martyrium Apoſtolorum," a ſet of ſixteen finely engraved plates, in 12mo. "The four little Banquets," a ſet of four ſmall plates, of which the ſubjects are 1. The Marriage of Cana; 2. The Repaſt at the Houſe of the Phariſee; 3. The Lord's Supper; 4. Our Saviour with the two Diſciples. "The Life of the Prodigal Son," in 12mo. publiſhed by Iſrael in 1635. "Sulta d'alcuni miracoli, etc." after various maſters, forty-one plates in 12mo. "Lux Clauſtri," repreſenting, under various emblems, the ſweet ſerenity of a religious life, and conſiſting of twenty-ſeven plates with an hiſtorical title. "The ſeven Mortal Sins," on ſeven plates, 12mo.

Battles, Sieges, &c.—"A General on Horſeback," an army in flight, ſurmounted by a hat and feathers, and the truncheon of command, ſmall. "A Piſtol ſhot," a grand review of cavalry. "Deſcent of the Troops into the Iſle of Ré:" this engraving is of an oblong form, and is encloſed in an ornamented border. "The Siege of Ré," a ſet conſiſting of ſix large engravings in ornamented borders; the borders are engraved on ſeparate plates, and four plates of writing accompany the ſet. Theſe were engraved at Paris, under the patronage of the king of France. "The Siege of Rochelle," embelliſhed in the ſame manner, and alſo done under the patronage of the French king. The portraits of the king, and of Gaſton of France occur in the borders. "The Siege of Breda," a ſet conſiſting of ſix large engravings, and two double leaves of engraved writing, recording the events of the ſiege: theſe plates were engraved for the Infanta of Spain. "Battaglia de ri Teſſi et del re Tinta," a large engraving, which is uſually called "L'Evantail," or "The Fan," on account of its form. It is encloſed in a border, and repreſents a curious firework which was played off on the Arno. The words Teſſi and Tinta allude to the weavers and dyers (tiſſerand and teinturier) who at that time enjoyed great privileges at Florence. "The Heroic Actions of the Medici," after Ant. Tempeſta, engraved on fifteen folio plates, and without any etching. The impreſſions from theſe plates, which are found in the "Galeria Medicia," are not eſteemed the beſt. "The Great Miſeries, or Horrors of War:" theſe admirable compoſitions are a ſet of eighteen 4to. plates, and were publiſhed by Iſrael in 1633. They were followed by "The Leſſer Evils of War," on ſeven 8vo. plates, including the title, (which is by Ab. Boſſe,) publiſhed in 1636. "Military Exerciſes," on fourteen ſmall plates, publiſhed alſo by Iſrael. "Combat at the Barrier," a ſet conſiſting of eleven plates including the title. Theſe prints are of different forms and ſizes. They were originally publiſhed by Callot himſelf, at Nancy, in the year 1627, but have ſince undergone ſome alterations; the work is in 4to. "Naval Engagements:" theſe conſiſt of the victories gained by the grand duke of Tuſcany over the Turks, and are alſo in 4to. dated 1617. "Seven Tilting Pieces," in 4to. engraved at Florence, four only of theſe bear the name of Callot. "Jouſts and Tournaments," a ſet of five ſpirited prints in Callot's beſt manner, in 4to. of which the ſubjects are, 1. A plan of the Jouſts and Tournaments. 2. A Battle encloſed within oval liſts, inſcribed "Uno Degli abattiments; 3. Several ſquadrons in battle array, encloſed in a ſimilar manner, and inſcribed "Moſtra della Guerra, d'Amore;" 4. Parties of cavaliers racing in a circle; 5. Four triumphal cars characteriſtic of the quarters of the globe, drawn by appropriate animals, and inſcribed "Carra del Aſia," &c.; they were publiſhed at Florence, and are after the deſigus of Callot's firſt Roman maſter, Giulio Parigii. "La Guerra d'Amore," conſiſting of four 4to. plates, from the deſigns of the ſame maſter. They repreſent the ballets, &c. celebrated at Florence on the occaſion of the arrival of the prince of Urbino, by the grand duke and Tuſcan nobility on the plain of St. Croix.

Profane and Miſcellaneous Subjects.—"The Giants," a large folio plate, in which Callot has introduced an aſſembly of the heathen deities, Temple of the Muſes, &c. "The Giants ſtruck by Jupiter's Thunderbolts," in folio, of the oval form, and now very ſcarce. "Pandora," a folio plate. The gods are here repreſented as aſſembled on Olympus, with Jove armed with thunder on its ſummit. "Catafalque de l'Empereur Mathias," a folio plate, dated 1619, and inſcribed "Eſſeque celebrati in Fiorenza," &c. "A Gambling Houſe," a folio plate, the ſubject a night-piece, with gameſters; Callot afterwards repeated this engraving, reverſing the right hand to the left. "The Puniſhments," in 4to.; this is regarded as one of the chef d'œuvres of the maſter, not only on account of its intrinſic merits, but of the great number of figures contained in it, of the compoſition and grouping of which we have already ſpoken. Its ſubject is the execution of various criminals. In the moſt perfect impreſſions of this plate, a ſmall ſquare tower appears above the houſes, a little to the left of the middle of the print, and a very ſmall image of the bleſſed Virgin, is placed at the angle of a wall which forms the corner of a ſtreet, and is alſo near the middle of the engraving.

The following are generally known among collectors by the name of the three ovals; "The Adoration of the He-goat or the Sabbath;" "An Altar, with two ſmall Figures at Prayers;" "A veiled Female, ſtanding before the Throne of an Emperor." "Eſſeque della Regina d'Eſpagna," conſiſting of twenty-ſix plates in 8vo., after Ant. Tempeſta. Of theſe Callot himſelf engraved only eight, the remainder are by Tempeſta himſelf, or by anonymous artiſts; "The Whims or Fantaſies" of the noble Jacques Callot, fourteen ſmall plates of whimſical ſubjects, publiſhed by Iſrael in 1635; "Capriccie de varii figure di Jacobo Callot in aqua-forti," on ſixteen ſmall plates engraved at Florence; "The Caprices," which are copies of the above, engraved at

Nancy. Beneath the title of the latter is inſcribed "excud. Nancy," but the Florentine ſet is executed with ſuperior taſte and feeling ; "Varie figùre di Jacobo Callot," on ſeventeen ſmall plates, including an hiſtorical title ; "Balli di Stefania," on twenty-four ſmall plates, including an hiſtorical title : each plate contains three figures ; "Varie figure Gobbi di Jacobo Callot, fatte in Fiorenze," a ſet of ſixteen ſmall plates, generally called, in England, the Hunchbacks, or Pigmies. This is a droll ſet, and as the author may be ſaid to have here preſented us with a back view of nature, the title page is a figure who ſhews his poſteriors. Callot repeated this ſet with ſome variations. "Les Guerra di Callot," twenty-five plates in 8vo., which are much ſought after by connoiſſeurs. On a piece of drapery in the title page, is inſcribed "Capitano di Baroni ;" "March of the Bohemians," on four 4to. plates in form of friezes. Theſe are probably done from his lively recollections of the gang with whom he firſt travelled from Lorraine to Florence ; "Nobility, or the Faſhions of the Times," twelve plates in 8vo., on which are pourtrayed ſix of either ſex with very amuſing backgrounds.

There are four other ſimilar prints, but of a larger ſize, by Callot, which are very finely executed, and which conſiſt of the coſtume of the inferior orders : 1. A Woman in a Corſet trimmed with Fur. 2. A Villager ſpinning. 3. A Countrywoman walking with a Baſket on her Arm. 4. A Woman with her Face ſeen and Petticoat turned up. "Tragedia del Co. Bonarelli," on ſixteen quarto plates, with a portrait ; "The three Interludes of Florence," in 4to. after Giulio Parigii. Theſe repreſent a feſtival given at Florence during the carnival, and are rare, particularly the two latter ; the plates for "A Voyage to the Holy Land," conſiſting of forty-eight in 8vo. which Callot engraved for a Grey friar, with whom he had formed a friendſhip, and who publiſhed this voyage ; "The Twelve Months of the Year :" theſe twelve prints are rare ; they are after Jodogus de Momper, in 4to., and ſolely the work of the graver ; "The Four Seaſons," in 4to. extremely ſcarce. Theſe prints are copied from four engravings that the Sadelers engraved after Baſſan ; "The current Coin of Germany, Italy, &c." ten ſheets, engraved at Nancy for Gaſton of France, and publiſhed at Paris by Iſrael Silveſtre in 1662 ; "A Woman ſitting in a Field," a child in her arms, and another eating fruit, is ſeated under a tree, a ſmall engraving, and very rare ; two ſmall prints, called by the French collectors "Deux Filenſes aſſiſes," and "Deux Dames qui ſe prominent," are alſo rare ; "Two Females habited al Allemande ;" "A female Gardener with an Aſs ;" and "An old Man, accompanied by a little Boy," are ſmall plates, with landſcape backgrounds.

The following farcical ſubjects are executed on ſmall plates, in the ſame ſtyle as the celebrated "Beggars" by this artiſt, and with equal ſpirit, *viz.* "A comic Figure," (a ſort of Falſtaff, with a large belly and wearing a ſword) ; "Two Harlequins," who are dancing in groteſque attitudes ; and "A Buffoon," "A Scaramouch," and "A Pierrot," three plates with theatrical backgrounds ; "A Comb Merchant," another comic figure, bearing a pedlar's pack on his back, and holding a comb in his hand.

Topographical and other Landſcapes.—"View of the Louvre, with the ancient Tower of Neſle," a folio plate ; "View of the Pont-Neuf at Paris," ditto. Theſe are of the beſt of Callot's landſcapes. Another view of the Pont-Neuf was engraved by our artiſt in 1629, in which the ground was etched by Silveſtre. This is a 4to. plate, and the impreſſions which are (on account of their rarity) moſt in eſteem, are thoſe which were taken before Silveſtre touched the plate ; "The Parterre of Nancy," where many perſons are walking, a piece in the long and narrow form of a frieze ; "The Garden of Nancy," an extremely rare print, inſcribed Jac. Callot, inv. et fec. ; "La Carriere," the new ſtreet of Nancy, in which is introduced a carouſal and tilting-match. This is alſo in the form of a frieze, and the earlier impreſſions are without the name of Silveſtre ; "La petite Place de Sienne," in 4to. ; "The Great Fair of Madonna del Imprunetta," called in England "The Great Fair of Florence," on account of its having been engraven in that city. It repreſents a fair which is annually held in honour of the miraculous conception ; and is eſteemed one of the moſt capital, as it is one of the largeſt of the engravings of Callot, being in length twenty-ſix inches and ſixteen in height. It conſiſts of a bird's-eye view over a vaſt area, which is terminated by the church of the holy Virgin, and more remotely by diſtant mountains. Within the area thouſands of figures, grouped with appropriate taſte and ſkill, are engaged in all the varieties of buſineſs and entertainment which is preſented by an Italian fair held under a genial ſky. It perfectly ſuggeſts Milton's idea of

"The buſy hum of men,"

and is in truth a ſurpriſing production, ſuch as modern art, and modern attention almoſt would turn from in deſpair : yet ſo ſuperior was the patient attention of the public of two centuries ago, and the patient ſkill of our artiſt, that Callot *copied* this print, on account of the great demand for it, and even, as ſome authors have aſſerted, engraved a third plate of the ſame ſubject, with ſome ſlight variations.

The firſt plate, which was publiſhed in the year 1620, is diſtinguiſhed from the ſecond, by the words "*in Fiorenza,*" which appear below at the right hand corner of the margin of the plate, whereas in the ſecond plate, the words in the ſame part of the margin are "*fc Florentiæ—et excudit Nancij,*" which latter word has occaſioned it to be contradiſtinguiſhed among connoiſſeurs and dealers, by the title of "The great Fair of Nancy." The firſt plate may alſo be known to perſons of taſte and diſcernment, from the ſecond, by its ſuperior ſtyle of execution : there is a certain ſpontaneouſneſs, the reſult of original feeling, in the firſt, which could not be copied even by the author himſelf, without ſome ſymptoms of reſtraint. The ſcarcity of good impreſſions alſo makes it bear a much higher value than the copy : for as it was far leſs ſucceſsfully corroded with the aquafortis, the number of good impreſſions which the plate produced was much more limited.

A third plate of this ſubject is mentioned by Roſt and Huber, but the preſent writer has not ſeen it, nor does it appear to have been ſeen,—at leaſt it is not mentioned—by Strutt. Perhaps the copy by Savery may have led theſe authors into error on this point. The copy may eaſily be known from thoſe by the hand of Callot, by its inferior merits, and by its being reverſed. "La petite Foire," (the little fair) otherwiſe called "The Players at Bowls," is not properly the repreſentation of a fair, but of a village fete. Peaſants are dancing in a ring, and the muſicians are ſeated in a very large old tree, which has all the appearance of being a portrait. The players at bowls, are a group at the right hand corner of the print. Strutt ſays, that "this is one of the ſcarceſt of Callot's works, and it is very difficult to meet with a fine impreſſion of it, for the diſtance and other parts of the plate failed in the biting." It is an oblong folio, and the proof impreſſions, which, of courſe, are moſt ſought after, are before the name of Callot was engraven. A landſcape, in the front of which are two pilgrims. It is in 4to. and without the name of Callot. "A Stag Hunt :"

in the ordinary impreſſions of this plate, the ſmall and diſtant wild boar hunt is ſcarcely ſeen. It is a folio, and of the frieze proportions. "A double Rock in the Middle of the Sea:" on the top of this double rock are two eagles with a bannerol, and an inſcription in honour of Columbus, in 4to.; "The two jolly Mariners," a well executed plate, in 4to.; four landſcapes, lengthways, in ſmall 4to.; "The Grand Theſe," two emblematic plates in folio, dedicated to the duke of Lorraine; "A Vine Arbour," a ſmall 4to. plate, the ſubject of which is a fete before the door of a country public houſe, with an inſcription on the margin, ſignifying that this is the *laſt* plate engraven by the late Jacques Callot, to which the aquafortis was not applied till after his deceaſe; from which it may be preſumed that the death of our artiſt was ſomewhat ſudden.

The following *Portraits* are alſo from the graver or etching needle of this diſtinguiſhed engraver. Coſmo III. grand duke of Tuſcany, in an ornamented oval. François, grand duke of Tuſcany, ditto, in 4to., very rare. Charles III. duke of Lorraine, in 4to. rare. Louis de Lorraine, prince of Phalſbourg, on horſeback, 4to. Le Marquis de Marignan, a general in the ſervice of the emperor Charles V. 4to. Donatus Antellenſis, ſenator, commonly known by the name of "The Senator," in an oval, 4to. rare. Charles de Lorme, firſt phyſician to Louis XIII., in an ornamented oval, 4to. Giovanni Domenico Peri d'Archidoſſa, in an ornamented border, commonly known by the name of "The Gardener," in 4to.

The reader may perhaps be pleaſed to be informed that a ſmall portrait of Callot himſelf has been drawn and engraved by Michael Laſne. It has the following inſcription, "Jacobus Callottus Nobilis Lotharingus Calcographus."

The engravings of Della Bella are little leſs numerous than thoſe of Callot; though the largeſt of Callot's exceed the dimenſions of any of thoſe of his ſucceſſor. Their merits were in many reſpects very ſimilar. If with the elegant lightneſs of form and exquiſite taſte of Della Bella, we ſeem more in the fairy land of engraving, Callot poſſeſſed more perſpicuity, more firmneſs of outline, and greater powers of compoſition; yet they are twin brothers in point of excellence, and, to the preſent hour, unrivalled in their department of art, though it muſt be allowed that Monſ. Berthaud, the Pariſian, has of late years made ſome very near approximations toward the merits of Callot and Della Bella. We are enabled to add the following liſt of ſelect prints by the latter, to the ſcanty liſt of Strutt, which the reader will find affixed to our biography of Della Bella:— A portrait of Della Bella, dreſſed in the Perſian habit, drawn and engraved by himſelf. Other portraits of Sigiſmund Boldrini, a noble Milaneſe. Mount-Joy St. Denis, king at arms, with a grand funeral proceſſion in the back ground; a very rare print, in 8vo. Horace Gonzales, in an oval; likewiſe very rare. Ferdinand II. emperor of the Romans, in folio. Bernardo Ricci on horſeback, ſurnamed Il Tedeſchino; Ferdinand II.'s jeſter, in folio. St. Antonin, archbiſhop of Florence, kneeling on the clouds, Della Bella's earlieſt engraving.

Hiſtorical Subjects, &c.—"St. Anthony, mounted on a Monſter with two Heads, a Man's and a Woman's," inſcribed "Super aſpidem et baſilicum ambulatis;" a ſmall upright plate of "The Departure of Jacob with Rachael and her Flock;" "Jacob's Journey to Egypt in queſt of Joſeph," in 4to.; "The Battle of the Amalekites," of the ſame ſize; a ſmall upright plate of "St. John, leaning his right Hand on a Lamb;" a ſmall upright print of "The Virgin ſitting with the Infant Jeſus;" another "Virgin and Child;" another of "The Virgin ſuckling the Infant," on a white ground; "A Repoſo," in a circle; another "Repoſo," where, in the background, St. Joſeph is leaning againſt a tree, reading, in 4to.; "A Flight into Egypt," ſurmounted by cherubs heads; another ſmall upright print of the ſame ſubject, repreſenting "The Holy Virgin, with the Infant in her Arms, ſitting on an Aſs, led by St. Joſeph;" another "Holy Virgin ſuckling the Infant Chriſt," inſcribed Caracci inv. in a circle; "The youthful Saviour explaining the Sacred Writings to his Mother and St. Joſeph:" in the clouds is God and the Holy Spirit, a very rare little print, firſt etched, and afterwards finiſhed with the graver; a very rare print, entitled "Effigie del glorioſo Martyre Sto. Benedetto;" the diſcovery of the miraculous image of "Notre-Dame del Impruneta," near Florence; "The Church Triumphant," an allegorical figure, clothed in a prieſt's garment of white linen, and crowned with a tiara, with one foot on the earth and the other on the ſea; a ſmall folio print of "St. Proſper deſcending from Heaven;" a nearly ſquare print of the tyrant Phalaris, encloſing Perillus in the brazen bull, from Polidoro; an antique bas-relief of a female with her face covered, from the ſame maſter; a ſmall ſtanding figure of Lucretia, from Parmegiano; a ſmall plate, nearly ſquare, of three children holding above their heads a wooden diſh, on which are three verſes, from Guido; an antique bas-relief of a female, ſtanding, trying to ſtop a ball; a folio print in a ſquare ornamented border, of a ſoldier on horſeback, galloping away with a female, called "Clovis and Clotilda," very rare; a ſailor, of whom a beggar is aſking charity; a young ſailor, ſitting on a hillock half covered with his cloak, laying his hand on a dog's head, with other figures; a ſmall print of four Turks, half length; another of three, with a negro and a boy; the huntreſs holding a dog, a ſingular engraving, marked twice with S. D. Bella; an eagle, with extended wings, devouring a hen; above, in a circle, are two horſes eſcaping, and a multitude of ſpectators, in ſmall folio; "The Philoſopher's Stone," in large 4to. a very fine and large print; "The Fan," or a fête on the Arno, an oval print, which was long attributed to Callot; a perſpective view of the catafalque of the emperor Ferdinand, and of the interior decoration of the church, with the arms of the family of Medicis, in folio; a grand Theſes ſupported at the canonization of Francis Solanus Condelier, at Rome, a rare print, in large folio; a plan of the ſiege of Rochelle, ſigned Stefano Della Bella del. et fecit; a large upright print of the plan of the ſiege of Arras, done for cardinal Richelieu, ſigned as before; the Repoſoir, or feaſt of God, a large print, lengthways, of which it is very difficult to find a good impreſſion; a view of the Pont-Neuf at Paris, a large print lengthways: the firſt impreſſions of this plate were taken before the weathercock was added to the ſteeple of St. Germain l'Auxerrois; a folio print of the Caſtle of St. Angelo; on the foreground are groups of figures.

The following are in Sets.—Two landſcapes; two other landſcapes in the taſte of Silveſtre; ſix different views of the Pont of Livourne, in large folio; the four ſeaſons, repreſented in ovals; the four elements; eight marine ſubjects, in the ſtyle of Callot, entitled "Divers Embarquements, faits par S. D. Bella," dedicated to Lorenzo de Medicis; ſix prints of vaſes, in 4to. in a rich and exquiſite taſte, and very finely executed; ſix landſcapes, in circles; four very fine landſcapes, with figures, in folio; four views in Rome, namely, the temple of Antoninus Pius, the arch of Conſtantine, the temple of Concord, and the celebrated vaſe in the gardens of the Medicean palace, in which Della Bella has introduced his own portrait; three grand ſubjects of battles, 1. A naval combat before the iſle of Ré; 2. The deſcent of the Engliſh in the iſle of Ré; 3. The defeat and capture of general Lambay, with a plan of the battle: theſe three plates were drawn and engraved by Della Bella, for the book of Valdor, entitled "Triomphes de Louis le Juſte;" twelve prints of Moors, Hungarians, Aſiatics, and Africans, on horſeback, in circles, with very fine backgrounds, in 4to.; a ſet of ſixteen ſmall ſquare ſubjects, repreſenting warriors, hunters, fiſhers, and peaſants, &c. very rare, and attributed by ſome to Callot; another ſet of eighteen, intitled "Raccolta di rari capricci, nuove invenzioni di Cartelli et Ornamenti, poſſi in luce dal Sign. Stefano Della Bella," of different ſizes; another ſet of twenty-eight, intitled "Vues d'édifices et d'endroits publics, miſe au jour par Iſrael Silveſtre," in folio; more than half of theſe views in France and Italy are engraved by Della Bella; a ſet of twenty-two, intitled "Divers griffonemens et épreuves à l'eau forte, faites par Stef. Della Bella," of different ſizes: this ſet has often been reprinted and enlarged, and the good impreſſions are now become very ſcarce; a ſet of five of Death preying upon the human ſpecies of all ages, with fine backgrounds; and one entitled "La ſixième mort," a melancholy ſubject, began by Della Bella, under his unfortunate malady, and finiſhed by his pupil Galiſtrucci.

Antonio Franciſco Lucini was alſo of Florence, and born in the ſame year with his countryman Della Bella, from the ſtudy of whoſe works, and thoſe of Callot, he appears to have formed his ſtyle. His plates are marked with one or other of the monograms which will be found in our *Plate* III.

His principal works are a ſet of ſixteen very rare prints of the battles and aſſaults of the Turks during the ſiege of Malta, from the pictures by Mattia Perez de Aleſio, and a fete on the Arno, of folio dimenſions, after Della Bella, dated 1634.

Franceſco Cozza has been already noticed as an hiſtorical painter in freſco. (See Cozza.) His prints conſiſt of ſpirited etchings, in which the manual part is executed with more neatneſs than has often been attained by painters. In "St. Peter's Contrition," he has ſhewn much good drawing, though the print is ſlight. The other works we ſhall mention from his hand are, "A penitent Magdalen," and "A Roman Charity;" they are all from his own compoſitions, and of folio dimenſions.

Cæſar Baſſano, or Baſſanus, was born at Milan in the year 1584. Under whom he ſtudied has not been aſcertained. He worked entirely with the graver, and his ſtyle bears conſiderable reſemblance to that of Cornelius Cort.

The moſt conſiderable work in which he was engaged, and which he executed in conjunction with Falcini and Ciamberlanus, is a ſet of ſixteen plates, entitled "Il Santo Senato de Gieſa," a very rare work, which both Heinnekin and Strutt have omitted to mention. It conſiſts of heads of the Virgin Mary, Jeſus Chriſt, and the Apoſtles, ſelected and engraved from pictures of the very firſt celebrity.

The other known engravings of Baſſanus are, a portrait of Gaſpar Aſellius; an architectural Frontiſpiece for a work by Francis Piccolini, in folio; and "The Nativity," of the ſame dimenſions.

His coadjutor Ciamberlano, or Ciamberlanus, was originally a doctor of laws, but quitted the ſtudy of juriſprudence for that of engraving. The cypher which he affixed to his prints will be found in *Plate* III. of the monograms of the *Italian School of Engravers;* and we have already mentioned the leading events of his life under the article Ciamberlano.

The principal engravings by this artiſt are "A dead St. Jerome, lying on a Stone," after Raphael; a ſet of ten plates, after different maſters, in 8vo, conſiſting of devotional ſubjects; "Angels holding the Inſtruments of the Crucifixion, Paſſion, &c.;" another ſet of fourteen, in ſmall folio, after Raphael, of "Jeſus Chriſt and the Apoſtles;" "Jeſus Chriſt on the Mount of Olives, comforted by an Angel," from Al. Caſolani, in folio; "Jeſus Chriſt appearing to Mary Magdalen in the Garden," from Barroccio, in large folio; "Chriſt appearing to St. Thereſia with his Croſs," 1615, in folio; two ſubjects of Theſes, dated 1628, in large folio.

Giovanni Franceſco Barbieri.—Guercino da Cento is the name by which this juſtly celebrated painter is moſt commonly known; for an account of whoſe great merits as a painter, ſee the article Barbieri Giovanni Francisco. As an engraver, he has left but few memorials behind him; but thoſe are executed with great freedom and ſpirit, in a manner much reſembling thoſe admirable drawings of his with a pen, which are held in ſuch high eſtimation: "St. Anthony of Padua;" "St. Peter in Grief," both half lengths, inſcribed "Joan F. Barbieri f. Id.," in folio; "St. John," the ſame; "St. Jerome before the Crucifix;" a portrait of a man with a hat on, and a curled beard; portrait of a female with curled hair; and a buſt of a man in an eaſtern coſtume, all of folio dimenſions; are probably all the prints that Guercino ever produced.

Luciano Borzoni was born at Genoa in the year 1590, and died in the ſame city in 1645. He learned the elements of art of his uncle Philippe Bertolotto, and Cæſar Corte. His pictures poſſeſs much merit, are well coloured, and carefully executed. He painted with the ſame ſucceſs in oil as in freſco; and whilſt painting the ceiling of the church della Nunziata, he unfortunately loſt his life by a fall from the ſcaffold.

He left three ſons, all artiſts, among whom Franciſco Marie diſtinguiſhed himſelf moſt, by painting landſcapes and marine ſubjects.

Borzoni etched many of his own compoſitions with a conſiderable portion of taſte, among which the following will probably be found to poſſeſs moſt merit: a portrait of Guiſtiniani; "St. Peter delivered from Priſon;" "The Vulture preying on Prometheus;" all of which are in 4to. Some Holy Families, Madonnas, and other devotional ſubjects, conſtitute the remainder of his works on copper.

Veſpaſiano Strada was the ſon of a Spaniſh painter of ſome eminence, but was born at Rome in the year 1591, during the reſidence of his parents in that city, where he died at the age of thirty-ſix.

His works conſiſt of etchings from his own compoſitions, executed in a painter-like ſtyle; ſlight and rapid, but maſterly and free. Thoſe held in moſt eſtimation are "Pontius Pilate producing Chriſt to the People," half figures, in ſmall folio; the ſame ſubject, of the upright form; "St. Catherine adoring the Infant Chriſt," in 4to.; "Chriſt crowned with Thorns," in ſmall 4to.; "The Holy Family, with St. John," ditto; "The Holy Virgin ſupported by Angels." His plates are generally marked with the initial letters of his names.

Of Aleſſandro Algardi, a Bologneſe artiſt, who lived at this period, we have already treated. (See Algardi.) To the engravings we have mentioned by him, the collector ſhould add "The Cries of Bologna," conſiſting of eighty 4to. prints after Caracci, engraved by Algardi in conjunction with Simon Guillain.

The etchings of Spagnoletto (for an account of whoſe extraordinary talents as a painter, ſee the article RIBERA) are executed in a bold, firm, and free ſtyle: his chiaroſcuro is broad, powerful, and pleaſing; and he drew with admirable ſkill. His heads, hands, and feet, are marked in a maſterly manner; and among the former, thoſe of his old men, which he was fond of introducing into his compoſitions, are deſervedly admired.

In *Plate* III. of the monograms of the *Italian Engravers*, will be found the various cyphers with which he occaſionally marked his performances, of which the following are juſtly held in eſteem: "A dead Chriſt;" "The Martyrdom of St. Bartholomew," both of folio dimenſions; in ſmall folio, "A penitent St. Jerome, with an Angel blowing a Trumpet." (Note.—There are two plates of this ſubject, in one of which the angel is omitted.) Another St. Jerome, a ſmall upright, where a ſkull lies on the ground, and the ſaint is reading; a folio plate of "Bacchus made drunk by Satyrs," dated 1628; two ſmall heads of old men, one of them with the face covered; "Dante crowned with Laurel, ſitting in a Deſert;" "Don Juan of Auſtria on Horſeback," a folio plate.

The above are all from his own compoſitions; and we know of but one work of Spagnoletto that is after another painter, namely, "A Repoſe, during the Flight into Egypt," from Charles Saracenus, wherein angels are ſoothing the holy travellers with divine muſic.

Oliviero Gatti was of the Bologneſe ſchool, and apparently ſtudied engraving under Agoſtino Caracci. He was born at Parma in the year 1598; but the time or manner of his death have not been recorded.

Gatti worked chiefly, if not entirely, with the graver; and his prints have a conſiderable ſhare of merit. He attended but little to the textures of various ſubſtances, and hence his execution is ſomewhat dry; but he poſſeſſed that firſt requiſite of a good engraver,—ſound drawing.

His beſt prints are "St. Francis Xavier kneeling on the Sea-ſhore to take up a floating Crucifix," from his own compoſition, and of folio dimenſions; a half figure of "The Holy Virgin careſſing the Infant Chriſt," in 4to., after Garbieri; "St. Jerome embracing a Crucifix," a folio plate, after Auguſtino Caracci, dated 1602; an emblematic or heraldic ſubject from Lodovico Caracci, repreſenting an armed knight, ſurrounded by Jupiter, Hercules, Neptune, Apollo, and Pallas, and an armorial bearing ſupported by two river gods, of a folio ſize; and a ſet of four ovals, in 4to., after Pordenone, of which the ſubjects are "The Deity forming the World," "The Creation of Adam," "Abraham's Sacrifice," and "Judith with the Head of Holofernes."

Giovanni Baptiſta Vanni was celebrated to a certain degree in the three arts of architecture, painting, and engraving. He was born at Piſa in the year 1599, and died at Florence in 1660. He frequented different ſchools, and is believed to have learned etching of Julio Parigi.

His etchings are performed in a painter-like manner, with freedom and ſpirit, but are deficient in correctneſs; and are marked either with the initial letters, or ſome contraction of his names. Of theſe the moſt diſtinguiſhed are "The Dome of the Cathedral at Parma," after Correggio, engraved on fifteen plates, and dated 1642; "The Martyrdom of two Saints," alſo from a picture by Correggio; and "The Marriage of Cana in Galilee," a large folio print, engraved on two plates, after Paul Veroneſe, dated 1637, and juſtly reckoned the maſter-piece of Vanni.

Giovanni Baptiſta Mercati alſo produced ſome ſpirited etchings about this period. He was a native of Sienna, born about the beginning of the ſeventeenth century, but reſided for the greater part of his life at Rome. His prints are ſlight, yet manifeſt ſome taſte; and he etched both hiſtory and landſcape.

The following will probably afford the collector the moſt ſatisfactory ſpecimens of his powers: a ſet of fifty ſmall plates of the ruined edifices of Italy, in a ſtyle which might be ſuſpected to be borrowed from that of Silveſtre, if Silveſtre had then appeared; a ſet of four of the bas-reliefs which adorn the arch of Conſtantine, of the folio ſize, and circular form; "St. Bibian refuſing to ſacrifice to Jupiter," after Pietro da Cortona, in folio, dated 1626; and "A Holy Family, with St. Catherine," a ſmall folio, after Correggio, dated 1620.

Giuſeppe, or Joſeph Cremoneſe, was born at Cremona in the year 1600, and reſided at Ferrara. There is a picture of his, of St. Mark, preſerved at the church of St. Bennet, at Ferrara, which is mentioned with great praiſe in the Italian tour of Cochin. The following prints of mediocre pretenſions are engraved by this artiſt from his own deſigns:—"Samſon and Dalilah;" "David, with the Head of Goliah;" a kneeling figure of "St. Roch," all of folio dimenſions;" "David contemplating the Head of Goliah;" a biſhop of the order of St. Bernard; and, a ſtudy of a naked female; all of quarto ſize.

Pietro, and Jacques-Antonio Steffanoni, father and ſon, were born at Venice, the father in the year 1600, and the ſon in 1620. They went to Rome, where they engraved in conjunction with each other. There is a book, etched by Pietro, of inſtructions in drawing, conſiſting of forty plates; and ſome prints for a work of antique gems, by Fortunius Licetus. This book was firſt printed at Rome A.D. 1627, and reprinted by J. A. Steffanoni at Padua in 1664. We have, among others, the following etchings by the ſon, which poſſeſs ſome merit:—"The Virgin and Child, with St. John and ſeveral Angels," known by the name of "The Virgin of the Swallow," from L. Caracci; another "Virgin and Child, with St. John," half figures, from Aug. Caracci, both in quarto; a middling-ſized upright print, of "A Merchant and his Family reduced to Beggary;" two more ſubjects of Holy Families, from Aug. Caracci; "The Slaughter of the Innocents," from Guido; "The Miracle of St. Antony of Padua," from Lorenzo Paſſinelli, in large folio; and "The Martyrdom of St. Urſula, and her Companions," of the ſame ſize.

Jean Baptiſta Paſcalini, or Paſqualino, was born at Cento, a village near Bologna, A.D. 1600, and frequented the ſchool of Cyrus Ferri; though he does not appear to have made any meritorious progreſs in painting. He engraved a great number of prints from various Bologneſe painters, but particularly from his countryman Guerchino; whoſe bold ſpirited ſtyle in drawing with a pen he attempted to imitate with the graver, but he did not poſſeſs ſufficient command of that inſtrument to ſucceed, neither is it at all adapted to ſuch a purpoſe. The etchings of Paſcalini, according to Huber, always convey the idea of original compoſitions, but in this praiſe we cannot conſcientiouſly join. Thoſe among them which are entitled to moſt commendation, are "St. Felix, a Capuchin, kneeling before the Virgin and Infant Chriſt," in folio; "St. Diego," from L. Caracci, marked J. B. Centenſis; a large folio print of "The Death of St. Cecilia," from Dominichino; "The Aurora," a large print lengthways, on two plates, from the celebrated picture of Guido, which has ſince been finely engraven by Giacomo Frey, and alſo by Audenarde.

The following Subjects are from Guerchino:—A ſmall print of "Jeſus Chriſt dictating to St. John;" a large upright print

print of “The Reſurrection of Lazarus;” “Chriſt giving the Keys to Peter,” a middling-ſized upright; “Chriſt taken into Cuſtody in the Garden of Olives,” in folio; “The Apparition of the Angels, who ſhew to Mary Magdalen the Inſtruments of the Paſſion,” in large folio; “The Pilgrims on their way to Emaus,” in quarto; “The Incredulity of St. Thomas,” in folio; a ſmall folio print of “Orpheus playing on the Violin;” two Holy Families, both in quarto; “St. Charles Borromeus;” a middling-ſized upright, entitled “St. Felice Cappucino miraculoſamente reſſuſcita unfanciullo morto;” and “Tancred and Erminea,” dated 1620.

Of Andrea Camassei; the two Curtii, Francesco Berdini; Camille Congio, and Giulio Carpione, who all lived at this period, we have already treated: as, ſee theſe articles reſpectively.

Giulio, or Julius Cæſar Venenti, was born at Bologna in the year 1609. He learned drawing under Philip Brizio, who was of the ſchool of Guido, and one of the beſt of his diſciples. Venenti was a gentleman of fortune, and not profeſſionally an artiſt, yet the meritorious plates which he etched *con amori*, have been thought worthy of a place in the Italian ſchool. His etchings are performed in a ſlight ſtyle, are marked with one of the two monograms which we have copied in *Plate* III., and their ſubjects are—“The Guardian Angel,” in quarto; “Mithridates preſented with a Cup of Poiſon;” “Tancred and Clorinda,” all after D. M. Canuti; “The Virgin of the Roſe,” after Parmegiano, all in ſmall folio; and “The Holy Family repoſing,” after Annibal Caracci, in larger folio.

For the biography of Franceſco Grimaldi, ſurnamed Bolognese, ſee that article. His etchings are performed with painter-like freedom and ſpirit, and in thoſe of landſcape in particular, he diſcovers a ſounder knowledge of perſpective, than perhaps had yet appeared in Europe, and his trees are ably characterized.

Of his numerous plates, which are almoſt entirely from his own compoſitions, we ſhall mention as worthy of preference—a rich landſcape, with buildings, and fiſhermen on the fore-ground; another, in which the baptiſm of our Saviour is introduced, both in folio; two ditto, in larger folio, of mountainous ſcenes, with figures and ruined buildings; two ditto, of the upright form, after Annibal Caracci, in one of which is a river winding through foreſt ſcenery; four ditto, from the ſame maſter. His view of Caſtel Gandolfo is a well-known and juſtly admired production, which will long continue to be a favourite ſtudy with landſcape painters, and of which there has been a finely engraved copy produced in our own country by Vivares and Chatelain.

Agoſtini Metelli (the elder), was a native of Bologna, born A.D. 1609. He ſtudied ſucceſſively under Gabriel Ferrantini and Dentone, and, beſides his merit as an engraver, excelled in painting architectural ornaments both in freſco and in oil. He was invited to Spain by Philip IV., and died at Madrid in the year 1660.

His etchings are performed with no inconſiderable portion of taſte, and we believe are entirely of an ornamental character. His ſet of forty-eight friezes are after his own deſigns. Twenty-four plates of ornaments, are partly taken from the deſigns of F. Curti, and are partly engraven by the younger Metelli, of whom we are about to treat.

Gioſeffo Marie Metelli was the ſon and ſcholar of Agoſtino, and was born at Bologna in the year 1634. After acquiring the rudiments of art from the inſtructions of his father, he ſucceſſively frequented, for his improvement, the ſchools of Albano, Guercino, Del Torre, and Cantarini.

The plates of Gioſeffo conſiſt chiefly of etching, which he executed in a ſlight manner. His chiaroſcuro is feeble, his drawing incorrect, from haſte or negligence, and he gave no attention whatever to the art of expreſſing the textures of various ſubſtances; yet what he did, could only have been done by the practiſed hand of an artiſt, and this circumſtance combined with the intrinſic merits of many of the pictures after which he engraved, have made his prints (which are ſomewhat numerous) ſought after by the cognoſcenti.

The various monograms with which he occaſionally marked them, will be found in *Plate* III. of thoſe uſed by the *Italian Maſters*, and among his beſt works may be ranked the following:—A ſet of twelve large upright folio prints, from the moſt eſteemed pictures in the churches of Bologna; a ſet of twenty, from the hiſtory of Eneas, painted by the three Caracci, in the Favian palace at Bologna, in large folio; a ſet of forty, in ſmall folio, and of the upright form, of “The Cries of Bologna,” from Annibal Caracci; “The Adoration of the Shepherds,” a large upright folio, from Correggio; “The Martyrdom of St. Eraſmus,” from Pouſſin; “David and Goliah,” from Titian; “The Invention of the Croſs,” from Tintoret, all in large folio; “Lazarus at the Gate of Dives,” after Paul Veroneſe.

He alſo produced ſeveral plates from his own compoſitions, particularly “The four-and-twenty Hours of human Felicity,” which were publiſhed at Bologna in 1675, and to which he afterwards added two plates, ſo that the complete ſet conſiſts of twenty-ſix; and a ſet, of which we know not the preciſe number, called “Metelli's Collection of Proverbs,” publiſhed in the year 1678, both of which ſeries are now become exceedingly rare.

Pietro del Po was born at Palermo A.D 1610, and died at Naples in 1692. He travelled to Rome, and was much employed there in the adornment of churches, both as painter and architect, and alſo by the Spaniſh ambaſſador.

Del Po engraved a conſiderable number of plates which conſiſt of etching mingled with the work of the graver. The general ſtyle of his art appears to be ſtudied from that of Dominichino; and the moſt diſtinguiſhed of his prints are “St. John Baptiſt in the Wilderneſs;” “The Woman of Canaan;” and “A dead Chriſt on the Lap of the Holy Virgin,” all in folio, and after Annibal Caracci; “The Madonna and Child attending to the divine Harmony of Angels;” “St. Jerome on his Knees, conſoled by an Angel;” and a ſet of the cardinal virtues, “Prudence,” “Juſtice,” “Temperance,” and “Fortitude,” all in large folio, after Dominichino; “The Annunciation;” “The Nativity;” and “The Flight into Egypt,” in folio, after Pouſſin; “Achilles and Ulyſſes,” after the ſame maſter; “Venus and Cupid viſiting the Forge of Vulcan,” after Siſto Badalochio; and “Neptune in his Chariot,” after Julio Romano, of the octagon form; all of folio dimenſions.

Giacomo del Po, and his ſiſter Thereſa, the ſon and daughter of Pietro, alſo etched ſeveral plates, in a ſtyle reſembling that of their father, among which is “Suſanna ſurpriſed by the Elders,” after Caracci, a folio plate, engraved by Thereſa.

Simon Cantarini, ſurnamed Il Peſareſe, was born at Peſaro, a city of Urbino, in the year 1610. He learned the rudiments of art under Ridolſi, but afterwards became one of the moſt diſtinguiſhed of the pupils of Guido, whoſe ſtyle, both of painting and etching, he imitated with ſo much ſucceſs, that the works of the diſciple are not unfrequently miſtaken for thoſe of the maſter.

Cantarini died at Verona, at the early age of thirty-eight. He produced a great number of prints, which are for the moſt part of religious ſubjects, and of which Adam Bartſch has formed a catalogue which we believe is complete.

Among theſe are ſeven of what the Italians term Repoſos, during the flight into Egypt, three, of which the Holy Family is the ſubject, and four, of the Madonna and Child; they are after his own compoſitions, and of 4to. dimenſions.

The remainder that are worthy of ſelection from the works of Cantarini are, “The Beatification of the Holy Virgin;” two plates of “St. John Baptiſt in the Wilderneſs;” “The Martyrdom of St. Sebaſtian;” “St. Anthony of Padua on his Knees adoring the Infant Saviour ſurrounded with a Glory of Angels,” in folio; a ſmall print of “St. Anthony of Padua kneeling before an Altar, holding the Infant Chriſt in his Arms;” “St. Benoit curing the Demoniac,” from Louis Caracci, in folio; “A Guardian Angel conducting an Infant to Heaven;” “Jupiter, Neptune, and Pluto, doing Homage to Cardinal Borgheſe,” who is repreſented in heaven ſurrounded by genii, who diſplay the attributes of the four cardinal virtues, in large folio; this print has been miſtakenly called the Quos ego, and it is one of the fineſt engravings by Peſareſe, though long attributed to Guido; “The Rape of Europa,” in folio, a very fine print, and very rare; “Mercury and Argus;” “Mars, Venus, and Cupid, at the Foot of a Tree,” from P. Veroneſe, both in folio; “Venus and Adonis, with Cupid,” in 4to.; “Love and Fortune,” in 4to. (connoiſſeurs attribute this print to Peſareſe, though it is marked “G. Renus in. & fec.”); and a frontiſpiece to a book, repreſenting a coat of arms, ſupported by two angels, blowing trumpets; at the bottom is a river god leaning on an urn; a very ſpirited etching.

Giovanni Andrea Sirani was born at Bologna in 1610, and died in the ſame city A.D. 1660. He was ſucceſſively the diſciple of Cavedone and Guido, and imitated the ſtyle of the latter, both in painting and engraving, with ſucceſs. We have ſome maſterly etchings from his hand, which may be regarded as original works, ſince they are from compoſitions by himſelf; theſe he commonly marked with his initials, G. A. S. or I. A. S. The following are generally, and we think juſtly, eſteemed among his beſt productions:—“Judith, with the Head of Holofernes,” half length, in the background is an old woman, in folio; “The Virgin and Infant Chriſt ſitting on a Cuſhion, with St. John at her ſide,” in an oval (this is from Guido); a ſmall print of “St. Michael overpowering Satan,” a middling-ſized upright print of “A Sybil ſitting on a Bank, liſtening attentively to an Angel, who is placed behind a Pedeſtal,” from Guido; “The Rape of Europa,” (this print is attributed to Sirani, but it is not in his ſtyle); “Apollo flaying the Satyr Marſyas,” a ſmall upright plate in an oval; “Saturn ſitting on the Clouds,” in 4to.; “Cupid ſtanding on a Dolphin, ſhooting an Arrow into the Sea;” a bacchanalian ſubject of four children, one of whom holds a flaſk and goblet.

Elizabeth, was the moſt diſtinguiſhed of the three daughters of G. A. Sirani, who were all artiſts; and was born at Bologna in the year 1638; ſhe learned the rudiments of deſign and painting of her father, and her hiſtorical pictures are mentioned with the greateſt commendation. She died at the early age of twenty-ſix, as it is ſaid, by poiſon, adminiſtered by ſome that were envious of her great reputation. There are many etchings by her hand, executed in a ſlight, ſpirited ſtyle, but the extremities are finely marked; among which the following are the moſt eſteemed: a middling-ſized upright plate of “The Virgin of Grief,” ſurrounded with the Inſtruments of the Paſſion, and accompanied by Angels; “The Virgin with the Infant Jeſus, whom ſhe holds on a Cuſhion, with St. John,” in a circle: this very rare and excellent print was engraved by Elizabeth, at the age of nineteen, from a picture of her own, and is reckoned her beſt production; a ſmall half length of “The Virgin, with her Hands croſſed on her Breaſt;” “St. Euſtace,” magnificently habited, in the act of proſtrating himſelf, ſtriking his breaſt with his hand, in folio; “The Decollation of St. John,” on the foreground is a profile of Herodias, accompanied by two of her women: this print has been retouched in many parts with the graver, and is not executed in the ſtyle of Sirani: yet her name is affixed to it, and its authenticity may therefore be regarded as doubtful; “Lucretia ſtabbing herſelf,” dedicated to the prelate Palcotti.

Lorenzo Loli was born at Bologna in the year 1612. He was a favourite diſciple of Guido, who was accuſtomed pleaſantly to call him his gentleman of the bed-chamber; yet the improvement of a ſtudent is not always in proportion to the favour of his maſter, and Loli never attained any great degree of excellence as a painter; but there are many etchings by him executed in a free ſpirited ſtyle, from Guido, Sirani, and his own deſigns, of which the following are held in moſt eſteem:—“A Flight into Egypt,” in folio; “A Holy Family, with St. John and Elizabeth;” another “Holy Family, with St. Joſeph leaning on a Pedeſtal in the Background,” a ſmall upright; two plates of “The Madonna and Child,” one a ſmall upright oval; “The Aſſumption,” where the holy Virgin is repreſented as ſtanding on a creſcent, and angels worſhipping (this is a rare print, and one of the very beſt productions of Loli); “St. Jerome in his Cavern;” “Mary Magdalen meditating on a Crucifix and Skull,” both in 4to.; the latter is perhaps the only plate upon which this artiſt has worked with the graver; “The Holy Virgin in a Radiance of Glory,” in folio; “The Recompence of Study,” a ſmall plate, wherein Genius and the Sciences are repreſented as leaning on the horn of Plenty; “Hercules combating the Nemean Lion,” and “Perſeus and Andromeda,” both of the folio ſize; “The Infant Hercules ſtrangling the Serpents;” “A ſleeping Cupid;” “Cupid breaking his Bow;” three ſmall plates of infant bacchanalians.

Contemporary with this artiſt was Gaſpar Dughet (ſurnamed Pouſſin from his very diſtinguiſhed brother-in-law Nicholas). For the biography and general merits of theſe great artiſts, ſee the articles DUGHET and POUSSIN. Gaſpar etched a few plates with ſpirit, (though not equal to that of his pencil,) among which are a ſet of four landſcapes in circles, of a ſmall folio ſize; and another ſet of four, ſomewhat larger.

Jean Dughet, the brother of Gaſpar, received inſtructions both from him and Nicholas Pouſſin, yet never attained to eminence either in painting or engraving.

The following prints from his hand are admitted into the portfolios of the curious, much more on account of the original pictures by Pouſſin, whence they are taken, than from their intrinſic merits as etchings; namely, “The ſeven Sacraments,” from the ſet of pictures painted for the Commandeur del Pozzo, which differ in many reſpects from thoſe which were in the royal collection of France, and are now in the marquis of Stafford's gallery; theſe are in folio, ſo large that each ſubject is engraved on two plates. “The Judgment of Solomon;” “The Birth of Bacchus;” and “Mount Parnaſſus,” are alſo in large folio.

Pietro Teſta, ſometimes called among the Italians Luccheſini, from the place of his birth, was born, of indigent parents, in the year 1611, and poverty appears to have attended him through life, notwithſtanding his merits. From his youth he manifeſted a violent inclination to purſue the fine arts, and it is ſaid, travelled from Lucca to Rome in the habit of a pilgrim. Here, regardleſs of external appearances, and even of the ordinary means of ſubſiſtence, he employed his time in drawing with the utmoſt aſſiduity from the antique ſtatues, relievos, and ruins, and in ſtudying from the celebrated pictures with which that great metropolis abounded.

Under ſuch circumſtances, and entirely unknown to the great, Teſta was ſoon reduced to diſtreſs; according to one of his biographers, his ſituation was moſt miſerable, having ſcarcely wherewithal to cover his nakedneſs, or ſatisfy the cravings of hunger, and in this ſituation he was found by Sandrart, ſitting among ruins, abſtracted from all around him, and copying an antique bas-relief.

Struck with ſuch meritorious raggedneſs, and naturally benevolent, Sandrart took our young enthuſiaſt home with him, provided him with food and raiment, employed him to make copies of the great works in the Juſtinian gallery, recommended him to other employ, introduced him to the ſchools of Dominichino and Pietro da Cortona, and would in other reſpects have rendered him a ſocial being, as well as a great artiſt, but for Teſta's natural averſion to company and converſation, which was ſo great, that even his patron could ſeldom obtain a word from him.

His propenſities to art, ſolitude, and ſilence, which, with Sandrart's friendſhip, conducted him to the high degree of excellence which he attained, occaſioned alſo his death. In reaching for his hat, which the wind had blown into the Tiber, as he ſat drawing alone, upon the banks of that river, he unfortunately fell in, and was drowned in the thirty-ninth year of his age.

The following ſummary is partly copied from the juſt eſtimate which Strutt has formed of the merits of this artiſt. He drew with great taſte, and marked the extremities of his figures in a very maſterly manner. The character of his heads are finely expreſſed, and the female faces are often very beautiful. When the extravagance of his fancy did not hurry him beyond the bounds of nature, his outlines are correct and elegant. The draperies of his female figures eſpecially, are ample, flowing, and eaſy, and the forms of the naked parts beneath are accurately and ſufficiently indicated, without academical oſtentation. Yet, though his compoſition is frequently grand, and many of his figures highly graceful, it muſt be owned that awkward and conſtrained attitudes are ſometimes introduced.

His ſtyle of etching is maſterly and free, bearing ſuperior reſemblance to that of Antonio Tempeſta, and every where animated by the wild energy of his nature; but his light and ſhades are not collected into broad maſſes, and of courſe his chiaroſcuro, like that of moſt of Italian engravers of the age of Teſta, is deficient in force.

The monogram with which our artiſt uſually marked his engravings, is copied in our third plate of thoſe of the *Italian Maſters*. His prints, in general, of which Mariette poſſeſſed ninety-two, are held in high requeſt by artiſts and connoiſſeurs, and among them the following are diſtinguiſhed. They are all of folio dimenſions, and ſome of them very large.

"The Sacrifice of Abraham;" "Angels miniſtering to the Holy Family," an emblematical ſubject, in which the Infant Saviour is embracing a croſs held by angels, very large; a large upright print of "Our Saviour crucified between the Two Thieves;" "The Martyrdom of St. Eraſmus," inſcribed "S. Eraſme ora pro nobis;" "St. Jerome at Devotion;" "St. Roch and Two Biſhops praying for a Ceſſation of the Plague;" "The Sacrifice of Camma," who having drunk of a poiſoned cup at the celebration of her marriage with Sinorix, the aſſaſſin of her firſt huſband, preſents him with the cup, a large print; "Thetis plunging Achilles into the Styx;" "Achilles dragging the Body of Hector round the Walls of Troy;" "The Death of Cato;" "The Sacrifice of Iphigenia," an allegorical print in honour of pope Innocent X. with his medallion on a monument; "Socrates, at a Table with his Friends;" "The Study of Painting," dedicated to cardinal Francotti; "The Lyceum of Painting," inſcribed "Il Liceo della Pittura," (with a dedication); "The Paſſions explained;" "Merit recompenced, and Parnaſſus triumphant;" "The Triumph of Love;" and "The Triumph of Bacchus."

Jean Cæſar Teſta was born at Rome in the year 1636, and paſſed for the nephew of Pietro, whoſe ſtyle of engraving he imitated. The following five are all we know of his works. A ſmall quarto portrait of his uncle, entitled "Petrus Teſta Lucenſis, Pictor ac Inciſor celeberrimus. Ceſar Teſta ſc." "The Death of Dido, with Iris plucking off the Fatal Lock;" "The Centaur Chiron teaching Achilles to play on the Lyre, and throw the Javelin;" "The Emperor Titus conſulting the Prophet Baſilides on his Expedition againſt Jeruſalem," from a picture by P. Teſta, in the church of St. Martin du Mont, at Rome; all of large folio dimenſions: and a very large and very rare print of "The Laſt Communion of St. Jerome;" from a picture by Dominichino, which has ſince been engraved by Farjat and Giacomo Frey.

Hyacinth, or Jacinto Gemignano, or Jeminiani, was born at Piſtoia in the year 1611, from whence he travelled to Rome, and became the diſciple of Pietro da Cortona. Here he reſided for many years with great reputation. He afterwards returned to Piſtoia, and died there at the age of ſeventy.

His plates are not numerous, and conſiſt almoſt entirely of etchings, performed in a ſlight manner, and from his own compoſitions, of which the following are the chief.

A ſet of twelve, in quarto, of groups of children variouſly occupied; "Cleopatra diſſolving the Pearl," in folio, and another folio plate from the reign of Semiramis, entitled "Semiramis jurat non niſi deviato hoſti religaturnum capillos."

Giovanni Batiſta Bolognini was born at Bologna A.D. 1611, and died in the ſame city in the year 1688. He was inſtructed in the principles of painting by Guido, and ſoon became one of his beſt pupils. He painted in the ſtyle of his maſter, and his works are held in very great eſteem.

We have many ſpirited etchings by Bolognini, from the compoſitions of Guido, which are executed in a ſlight ſtyle, reſembling that of his maſter, but inferior in merit; among theſe, the following will probably be found moſt worthy of the collector's notice. "A Crucifixion," with St. John and the two Maries, ſtanding at the foot of the croſs, in folio; "Bacchus and Ariadne," a large print, lengthways, engraved on three plates; "St. Peter receiving the Keys;" and "The Murder of the Innocents," all of folio dimenſions.

Salvator Roſa, (for an account of whom as a painter ſee Rosa, Salvator,) was born at Rinella, in the environs of Naples, A.D. 1615, and died at Rome in 1673. His etchings, though bold, preſent not the diſcriminating and characteriſtic ruggedneſs of his pencil. His drawing is incorrect; the heads of his figures are occaſionally characteriſtic, but generally mean, but his chiaroſcuro is broader and better than is to be found in the generality of the etchings of the Italian painters. Yet it is to be obſerved that, in point of executive power and feeling, his prints are far from being always alike. In his "Alexander viſiting Diogenes," his line is dry and inexpreſſive, while in his "Meditation of Democritus," and his allegorical print commonly known by the title of the "Genius of Salvator," he has entered much more into the detail of forms, and expreſſed the ſubſtances of the bones, reptiles, &c. which lie ſtrewed about, with taſte and with truth.

The cypher with which this great maſter marked his etchings, which amount to between eighty and ninety in number, all from his own compoſitions, will be found in our *Plate* III. of thoſe of the *Italian School.*

The following liſt of his prints will be found nearly, if not quite, complete :—An octavo book, containing 60 plates of banditti, in various military and other dreſſes, ſome ſingle figures, and others in groups ; a ſet of ſix, conſiſting of tritons, nereids, and other marine monſters, in the lengthened proportion of friezes ; a ſet of four, in ſmall folio, of "Apollo and Daphne," "Glaucus and Scylla," "Ceres inſtructing Phytali in the Art of Agriculture," and "Jaſon and the Dragon ;" of the ſame ſize are two plates of "St. William doing Penance," and "A Soldier ſleeping on his Shield." "Plato with his Diſciples in the Garden of Academus," "Diogenes throwing away his Cup," "Democritus meditating," "Alexander viſiting the School of Apelles," and "Alexander viſiting Diogenes," are of the ſame large folio dimenſions : in the laſt, Salvator Roſa has committed a great and palpable blunder, for Diogenes is deſiring Alexander not to intercept the rays of the ſun, yet is himſelf placed between the ſun and Alexander ; an academy of philoſophers, which is inſcribed "Ingenius liber Pictor," and "The Genius of Salvator Roſa," are alſo in large folio ; and in ſtill larger folio are "The Execution of the Tyrant Polycrates," a very grand compoſition ; "The Diſcovery of Œdipus on Mount Cytheron ;" "The Death of Regulus ;" and (of the upright form) "The Fall of the Giants."

Carlo Sacchi of Pavia, whom Strutt, by miſtake, has called a native of Batavia, etched a few plates of ſmall importance about this period. He was born in the year 1616, ſtudied under Roſſo, and died in his native city in 1706. "The Adoration of the Shepherds," from Tintoret, and "The wiſe Men's offering," from Paul Veroneſe, two large uprights, are among his beſt productions.

Now alſo lived Luigi, or Aloyſius Scaramuccia, who obtained the addition of Perugino, from the place of his birth. He ſtudied under Guido, and, as an hiſtorical painter, attained ſome eminence, but never reached beyond mediocrity as an engraver. Among his beſt prints are, "Chriſt crowned with Thorns," a folio plate after Titian ; "Venus and Adonis," after Annibal Caracci ; and a large folio print after Lodovico Caracci, from the legendary hiſtory of St. Benedict : The devil, it ſeems, had cauſed a large ſtone, which was to be uſed in building a certain church, to be immoveable, and the ſaint broke the ſpell by the fervency of his prayers.

Of Benedetto Caſtiglione, an artiſt of very ſuperior powers, who engraved ſeveral large plates at the period now under our review, we have already treated. (See CASTIGLIONE, GIOVANNO BENDETTO.) His monogram may be ſeen in *Plate* III. of thoſe of the *Italian Engravers*, and the following taſteful productions from his hand, may with advantage be added to thoſe contained in our former liſt :—"The Genius of Caſtiglione," a folio print, which is generally placed as a frontiſpiece to collections of his works ; a ſet of ſix heads, of which one is the portrait of the artiſt ; "Tobit going forth to bury the Dead, with an Effect of Night," in folio ; another from the hiſtory of Tobit, which appeared without a name, and is in clair-obſcure, is alſo aſcribed to Caſtiglione ; "The Adoration of the Shepherds ; a night-ſcene with "The Interment of St. Peter and St. Paul ;" another night-piece, with the effect of torch-light, of which the ſubject is "Philoſophers viſiting a Cemetery," all of folio dimenſions ; two of the proportions of a frieze, of which one is "Pan inſtructing Apollo on the Flute," and the other "Silenus with his Flute, and a Shepherdeſs playing the Tympanum ;" "A Combat between two marine Horſes ;" "A drunken Silenus, with three Satyrs ; a bacchanalian ſubject, with a ſatyr on the ſtatue of Priapus ; a menagerie of hens, turkey cocks, and drakes ; a landſcape, inſcribed "Gio. Benedetto Caſtiglione. Gen. fec. 1658 ;" another landſcape in form of a frieze ; "A ſhepherd Boy watering his Flock ;" "Shepherds riding and on foot, conducting their Flocks ;" "A Capuchin Friar, marked with the letter T, diſcovering the Body of St. Jerome," in folio ; and eleven ſmall vignettes of various ſizes, finiſhed with the dry point.

Bernardino Capitelli was born at Sienna in the year 1617, and received inſtructions both from Caſolani and Rutilius Manetti, but never attained to any conſiderable eminence. In his ſtyle of engraving, he mingled etching with the work of the graver, but his execution is coarſe and heavy, and his outline incorrect. Among other plates of leſs importance, he engraved the life of the patron ſaint (Bernard) of his native city, on 12 ſmall plates ; "The Miracles of St. Anthony of Padua," a folio plate divided into compartments ; "A Repoſo," from his maſter Rutilius Manetti ; "The Marriage of St. Catherine," after Correggio ; and "Ceres drinking at the Cottage Door," after Elſhiemer, from the ſame picture which count Goudt has engraven in a very ſuperior manner.

Giacomo Piccini, or Piccina, was born at Venice A.D. 1657. Under what maſter he ſtudied is not known, but he worked chiefly with the graver, in a ſtiff laboured ſtyle, without much effect ; and the outlines of his figures are exceedingly incorrect. His brother William was likewiſe a Venetian engraver, and engraved the portraits for the "Conchilia Aleſte," of J. B. Fabri. Giacomo, on ſome of his plates, ſtyles himſelf engraver to the king of France. The moſt conſiderable works he executed were a ſet of 30 portraits of the principal Venetian painters, affixed to an account of their lives by Carlo Ridolfi, publiſhed at Venice in 1648 ; moſt of the plates for a book, entitled "Le Glorie degli Incognita ;" a portrait of Alexander Farneſe ; "Diogenes, with his Lanthorn, ſitting at the Entrance of his Tub," from P. Liberi ; "A Holy Family," from the ſame painter ; "Judith with the Head of Holofernes at her Feet," from Titian ; and "A Holy Family," in a landſcape, from the ſame, all of folio dimenſions.

Giovanni Battiſta Galeſtrucci was born at Florence A.D. 1618. He learned the rudiments of painting of Franciſco Furini, and was elected a member of the Academy of St. Luke at Rome, A.D. 1652. He is mentioned as a painter, but is much better known as an engraver. He engraved in a neat, correct, and maſterly ſtyle, and was for ſome time the pupil of Della Bella, after whoſe death he finiſhed ſome plates which had been begun by that maſter. His ſtyle bears ſome reſemblance to that of Podeſta. There are a great number of prints by his hand, which in general are marked with the cypher, which will be found in our *Plate* III. of the monograms of the *Italian Maſters*, and of which Jean Jacques Roſſi has given a catalogue.

Of theſe the moſt conſiderable are, a ſet of antique gems, in four volumes quarto, with explanations by Leonard Agoſtino, publiſhed at Rome in the years 1657 and 1659 ; ſeveral ſets of antique bas-reliefs and friezes, from Polidoro

Caravaggio, which appeared under the title of "Opere di Polidoro de Caravaggio;" "John Baptiſt beheaded in Priſon," from Battiſta Ricci; "Paris receiving the Apple," and "The Caduceus of Mercury," from Annibal Caracci, both in quarto; and the Mauſolea of the family of cardinal Mazarin; a ſet of ſix prints in folio, from the Abbe Elpidus Benedictus.

Giovanni Franceſco Venturina was born at Rome in the year 1619, where he ſtudied and reſided for many years, but afterwards removed to Florence. To judge from the ſtyle of his works, it would appear that he was the diſciple of Galleſtrucci, or at leaſt worked under his direction, after his removal to Florence. From the deſigns of that maſter, he has executed a good number of prints in a neat pleaſing ſtyle, from which we ſelect the following, as affording the moſt ſatisfactory ſpecimens of his talents: "Diana and her Nymphs ſporting," from Dominichino; "The Pulpit of St. Peter," from Bernini, in folio; a ſet of bird-eye views of palaces and gardens in and about Rome; and a ſet of fountains, from Roſa of Tivoli, being a continuation of the fountains in Rome, engraved by Falda. He alſo engraved after Polydoro Caravaggio, and other painters.

Giovanni Batiſta Bonacini, or Bonacina, was born at Milan about the year 1620, and worked in his native country, and at Rome. His prints are executed in a ſtiff laboured ſtyle, entirely with the graver; and he appears to have ſtudied in the ſchool of Cornelius Bloemart; but he never arrived at any ſuperior degree of excellence. Of his works we ſhall only mention the following: four portraits, in folio, of pope Clement IX., Guido Viſconti, Ermes Viconti, and Giovania Battiſta, Count Truchi; "The Alliance of Jacob and Laban," from Pietro de Cortona, in folio; "The Virgin with the Infant Jeſus, and St. Martin kneeling before him," from the ſame maſter, which is eſteemed a capital print, in large folio; another "Holy Family, with St. John and St. Catherine," a middling-ſized upright plate, from Andrea del Sarto; and a medallion of pope Alexander VII., with an explication, from Bernini, in folio.

Flaminio Torre was born at Bologna A.D. 1621, and died at Modena in 1661. He learned the principles of painting from Cavedone, and completed his ſtudies in the ſchool of Guido. His chief excellence was in copying the pictures of the moſt celebrated maſters, which he did ſo very exactly, as to render it nearly impoſſible to diſtinguiſh the copy from the original. He etched ſeveral plates in a good ſtyle; and he had copied the pictures of the Caracii, in the palace of count Fana, at Bologna, for the purpoſe of engraving them, when, at the age of forty, he died at Modena, whither he had been invited by the duke; and they were afterwards engraved by Metelli from Torre's copies. From among the prints of Torre we ſelect the following, as moſt worthy of attention: "The Virgin and Child, accompanied by St. Francis and St. Jerome," a middling-ſized upright, from Lodovico Caracci; "The Patron Saints of the City of Bologna," a large upright plate, from Guido; and "Pan conquered by Love," a ſmall upright, from Auguſtino Caracci.

Pietro Franciſco Mola merits a diſtinguiſhed place both among the painters and engravers of the Italian ſchool. He was born, according to ſome authors, at Codra, a village on the frontiers of the Milaneſe, in the year 1609: whilſt others affirm that the place of his birth was Lugano, and the time 1621. From his childhood his talents were promiſing, and his father, who was a painter and architect, ſeconding theſe early diſpoſitions toward the fine arts, placed him firſt in the ſchool of Joſephine, and afterward in that of Albano, at Rome.

When he quitted the latter, he travelled to Venice, and ſtudied the works of Titian, Tintoretto, Baſſan, and Paulo Veroneſe, with great aſſiduity, and with ſo much advantage, that it is ſaid Guerchino became jealous of his progreſs, and that this jealouſy occaſioned his return to Rome, where queen Chriſtina allowed him a penſion, and where he was patronized by the popes Innocent X. and Alexander VII.

His friends ſeemed to multiply as his merits increaſed. He accepted an invitation to France from Louis XIV.; but during an altercation which he had with prince Pamfili, reſpecting the value of a ceiling which he had painted, he was ſeized with a violent paroxyſm of headache, and expired in about ſix hours.

For an account of his peculiar merit as a painter, ſee the article Mola. His etchings, though ſlight, are performed "with a maſter's hand and poet's fire." To a vigorous ſtyle of handling, he added correctneſs of drawing. He occaſionally etched, as he painted, both landſcape and hiſtory: his heads in the latter are beautifully characteriſtic, and carefully drawn; and in the former, his trees and his various grounds, &c. are touched with conſiderable taſte.

"The Madonna ſuckling the Infant Saviour," a ſmall upright, from his own compoſition; "A Holy Family, with Angels preſenting Flowers to Jeſus Chriſt," in folio, from Albano; "Joſeph diſcovering himſelf to his Brethren," in ſmall folio; and another "Holy Family with Angels," a folio print of the upright form, from his own compoſition; will be found among the beſt etchings of Franciſco Mola.

Of the latter print, collectors ſhould, if poſſible, obtain the impreſſions as the plate came from the hand of Mola; for it was afterwards worked upon with the graver by ſome unſkilful perſon, who has much impaired the freedom and beauty of the etching.

Giovanni Baptiſta Mola, born in the year 1622, was brother to Franciſco, and was alſo the diſciple of Albano. He etched a few plates, the ſtyle of which bears a diſtant and inferior reſemblance to that of his brother, as may be ſeen in a 4to. print, after Albano, of "Cupid drawn in his Chariot."

Carlo Ceſio, or Ceſius, was born at Antrodoco, a village in the late territory of the Roman pontiff, in 1626, and died at Rieti A.D. 1686. He ſtudied as a painter under Pietro da Cortona, but is much better known by his engravings than by his pictures. His plates are chiefly etched and harmonized with the graver in a free and maſterly manner. He drew correctly; and the extremities of his figures are in general finely marked, though ſlight, and in the broad, bold ſtyle of a painter.

Among the number of Ceſio's engravings, which is conſiderable, the following will probably be found moſt worthy of ſelection: the frontiſpiece, in 4to., to "Diſcorſi della Muſica;" and "The Holy Family," in an oval, both from his own compoſitions; two folio prints of "St. Andrew proſtrating himſelf before the Croſs," after a celebrated picture painted by Guido in conjunction with Dominichino; and "The Woman of Canaan," after Annibal Caracci: the Farneſian Gallery, conſiſting of forty-one plates, after the ſame maſter; the Pamphilian Gallery, conſiſting of fifteen plates, after Pietro da Cortona, of which the ſubject is "The Hiſtory of Æneas;" "The Life of St. Auguſtin," after Lanfranc, conſiſting of four very large and four ſmaller folio prints, engraved from pictures which adorn the church of St. Auguſtin at Rome.

Andrea Podeſta was born at Genoa in the year 1628, and became the diſciple of Andrea Ferrari. Strutt ſays, that "as a painter it does not appear that he greatly diſtinguiſhed himſelf; but ſeveral ſpirited and maſterly etchings, which he produced, prove him to have been a very ſkilful artiſt. The heads of his figures are finely characterized, and the other extremities are well expreſſed."

Among the beſt of Podeſta's prints, which in general are marked either AND. P., or *And. P. in et ſec.*, are the following: four Bacchanalian ſubjects, in large folio, after Titian, one of which is from the celebrated picture of "Bacchus leaping from his Car to greet Ariadne," which was lately in the collection of the earl of Kinnaird, and from which Mr. Bone has executed a moſt exquiſite copy in enamel; "Love cultivating the Arts," an allegorical print in folio, dedicated to Guido; and a pair from "The Life of St. Diego," after Caracci, alſo in folio.

For an account of Carlo Maratti as a painter, ſee the article MARATTI. He was born at Camerino, in the marquiſate of Ancona, A.D. 1628, and died at Rome in 1713. Strutt ſays, with great juſtice of his etchings, that "they are executed in a free and ſpirited ſtyle; much neater, and better finiſhed, than thoſe of painters uſually are. The characters of the heads of his figures are finely expreſſed;" and their graceful airs have been the ſubject of frequent commendation.

His engravings are ſomewhat numerous, and are held in great eſtimation. No collection of the works of the Italian maſters ſhould be without good impreſſions of the following:—A ſet of ten, from the Life of the Holy Virgin, after his own compoſitions, in quarto; "Heliodorus driven from the Temple," after Raphael, a large folio print, arched at the top, and engraven on two plates; "The Flagellation of St. Andrew," after Dominichino; "Joſeph diſcovering himſelf to his Brethren," after Franciſco Mola, of folio dimenſions; "St. Charles Borromeus interceding for thoſe afflicted with the Plague at Milan," a large upright, from Pietro Perugino; and (of the ſame form) "Chriſt diſcourſing with the Woman of Samaria," after Annibal Caracci; beſides ſeveral plates of the Madonna and Bambino, of various ſizes.

Giovanni Batiſta Cavazza was born at Bologna in the year 1620. He was ſucceſſively the diſciple of Cavedone and Guido, and painted ſeveral pictures for the churches of his native country. He likewiſe engraved ſome ſubjects for his amuſement, among which are the following:—"Chriſt on the Croſs;" "The Reſurrection of Jeſus Chriſt;" "The Death of St. Joſeph;" and "The Aſſumption of the Virgin;" all of folio ſize.

Dominico Maria Canuti was born at Bologna A.D. 1623, and died in the ſame city in 1684. This extraordinary artiſt, by the force of his own natural genius, acquired ſo much knowledge of deſign and colouring, that Guido beheld his works with aſtoniſhment, and received him among his pupils with pleaſure.

Beſides his pictures, we have a good number of etchings by his hand, in the ſtyle of Guido, whom he ſurpaſſed in neatneſs, finiſhing, and boldneſs, if not truth, of fore-ſhortening, which has ever been held one of the difficulties of art; though, in the general excellency of his drawing, and the ſpirit of his outline, he has not equalled that great artiſt. He commonly marked his prints with his name, or initials, among them the following will probably be found moſt worthy of ſelection:—Three portraits of Ludovico, Auguſtino, and Annibal Caracci, in 4to.; "The Virgin ſeated in the Clouds, with Chriſt ſtanding by her," a ſmall upright print, from his own compoſition; "St. Roch;" and "St. Francis praying," a ſmall upright plate, from Guido, marked "Doms. Ma. Canuti fec."

Laurentio Paſinelli was born at Bologna in the year 1629, and died at Parma in 1700. His inſtructors in the rudiments of art were Andrea Barone and Simon Cantarini, but he alſo frequented the ſchool of Flaminius Torre. From Bologna he went to Turin, and from thence to Mantua and to Venice. At Mantua he was employed by the duke in the adornment of his caſtle at Monmirola, but at Venice, ſtruck with the ſuperiority which he perceived in Paul Veroneſe, his ſtyle of painting, and his notions of art in general, underwent a complete revolution. He afterwards returned to Bologna and eſtabliſhed a ſchool.

In Cochin's Italian Tour, he ſpeaks highly of Paſinelli's picture of "The Reſurrection" in the church of St. Francis, and his few prints are ſought after with juſtifiable avidity by the connoiſſeurs. They are chiefly from his own compoſition, and to the beſt of our knowledge "St. John preaching in the Wilderneſs," (a very fine etching,) and "The Martyrdom of various Saints," in one compoſition, afford the beſt ſpecimens of his talents in this art; both are of large folio dimenſions.

Of Luca Giardano, who was now living, we have already treated pretty much at large (ſee the article GIARDANO). His *fa preſto* attended him in his voluntary offerings to engraving, as well as in his devotions to the ſiſter art. Yet his taſte allowed him to delineate the heads, hands, and feet in his etchings in a good ſtyle, and hence his works on copper are of a maſterly character, though they poſſeſs not the ſeverity of the higheſt claſs of hiſtorical or epic compoſitions. His "Deſtruction of the Prieſthood of Baal in the Preſence of Elijah and Ahab," and "St. Anne received into Heaven by the Holy Virgin," which are both of folio dimenſions, will at leaſt juſtify thus much of approbation, as would alſo the following ſubjects from the Life of Chriſt, which are all in ſmall folio, and from his own compoſitions. "The Holy Virgin and Infant Chriſt;" "St. Joſeph and St. John;" "The Penitent Magdalen;" "Jeſus Chriſt diſputing with the Doctors;" and "The Woman taken in Adultery."

Horatio Brun, or Brunette, was born at Sienna A.D. 1630, but reſided chiefly at Rome. He worked principally with the graver, imitating, though not very ſucceſsfully, the ſtyle of F. de Poilly. "The Golden Age," "The four Seaſons," "The Prodigal Son guarding Swine," a ſet of animals, all in folio, and an allegorical print of ſtill larger dimenſions, which has been called "Numa Pompilius, and the Nymph Egeria," are among the beſt of his engravings.

Lorenzo Tinti was born at Bologna in the year 1634, and was a diſciple of Andrea Sirani. He was a painter of ſome merit, and he engraved many prints, among which is the frontiſpiece to the Herbal of D. Hyacinthe Ambroſini, which was printed at Bologna in 1666. He worked for ſome time at the court of Modena, where he engraved the pompous funeral of Francis I. duke of Modena, from Franciſco Stringa. He alſo engraved from the celebrated maſters of the Bologneſe ſchool, and from the pictures of Elizabeth Sirani.

Franciſco Vaccaro, or Vaccari, was born at Bologna A.D. 1636. He ſtudied under Albano, and wrote a treatiſe on perſpective, for which he engraved the plates, and dedicated the work to counſellor Beccatelli. He likewiſe engraved a ſet of twelve perſpective views of ruins, fountains, and edifices in Italy. He continued to flouriſh as an artiſt until the year 1670, after which we hear no more of him.

Gioſeffo Zarlatti was born at Modena A.D. 1635, and learned the rudimental principles of art of J. B. Spezzini, a Genoeſe painter. He was an engraver of merit, and executed ſome plates in a very ſpirited and pleaſing ſtyle. His heads were generally beautiful, and his attitudes elegantly choſen. It is to be regretted that he died early, and engraved but little; nor are we able to ſpecify any of his works.

The name of Bartoli, (for whoſe life ſee BARTOLI,) ſhould have been honoured with a more ample liſt of his beſt productions than we were able to give at the time of publiſhing the third volume. The collector will probably be highly gratified to poſſeſs the following.

Various Antiques.—A ſet of thirty-three, intitled "Admiranda Romanorum Antiquitatum ac veteris Sculpturæ Veſtigia;" with remarks by Bellori under each; a hundred and thirty-eight prints in folio, intitled "Romanæ magnitudinis Monumenta;" a ſet of fifty-two, intitled "Veteres arcus Auguſtorum triomphis inſignes;" a ſet of ſeventy-eight in large folio, intitled "Colonna di Marco Aurelio, con brevi note da Gio. Pietro Bellori;" a ſet of one hundred and twenty-eight prints, intitled "Colonna Trajana, di Alfonzo Ciacconi;" and another ſet, conſiſting of one hundred and thirty-two, intitled "Sepolcri antichi Romani ed Etruſchi, trouvati in Roma;" the aqueduct which conducts the water from Civita Vecchia, with various views in and about Rome, in four large prints; a grand ſepulchral urn of ſtone, from the Capitol; two ſubjects from the Aldobrandini Marriage, intitled "Nova Nupta in geniali Talamo;" ninety-four in folio, intitled "Le Pitture antiche delle Grotte di Romæ del Sepolcro de Naſoni, intagliate da Pietro Santi Bartoli & Franceſco Bartoli ſuo figlio, Romæ," 1680 and 1706; a folio print, intitled "Antiquiſſimi Virgiliani Codicis Fragmenta & Pictura;" and a hundred and nineteen pieces, intitled "Le Antiche Lucerne Sepolchrale;" a collection of old pictures, correctly copied, from coloured drawings made by Bartoli, Paris.

After various Italian Maſters.—A ſet of friezes, from the Bible, on the chimney-pieces of the Vatican, by Raphael, in twelve ſmall pages; another ſet of the ſame, in fifteen leaves; another ſet, from Raphael, intitled "Leonis X. admiranda virtutis imagines;" a ſet of forty-three, of ornaments and figures, intitled "Parerga atque ornamenta in Vaticani Palatii Kiſtis," by Raphael; a ſet of four, of the divinities in cars; "Jupiter drawn by Eagles;" "Mars by Horſes;" "Diana by Nymphs;" and "Mercury by Cocks;" the hiſtory of Conſtantine in friezes of different forms, from the Vatican. "Giove che fulmina di Giganti;" (Jupiter accompanied by all the Gods, deſtroying the Giants,) from the celebrated picture by Julio Romano, at the palace of T at Mantua, in nine leaves; "The Hiſtory of St. Peter," from Lanfranc, in folio.

Various ſeparate Subjects from Italian Maſters.—"The Adoration of the Kings," from Raphael, (engraved on three plates,) of large folio; one of the fineſt productions of Bartoli; "The Infant Jupiter nouriſhed by the Goat Amalthea," from Julio Romano; "Hylas ſtolen by the Nymphs;" "Sophoniſba preſented to Maſſiniſſa;" "The Continence of Scipio," all of folio ſize, from the ſame painter; "St. John ſhewing Chriſt in the Deſert," from P. F. Mola; "The Birth of the Virgin," from Albano; "The Marriage of the Virgin," from a picture by Nicolo Beretoni, in the church of St. Lorenzo in Borgo; "Daniel in the Lion's Den," after an altar-piece by P. de Cortona; "The Virgin in Heaven with the Infant Jeſus, and Saints," from L. Caracci, all of folio dimenſions; "The Mother and Wife of Coriolanus proſtrate at his Feet;" "St. Charles Borromeus brought by an Angel to the Tomb of Vetallo," both from Ann. Caracci.

The following are from his own Deſigns.—An oval, in 4to. of "St. Stephen receiving the Crown of Martyrdom;" "St. Bernard chaining Satan;" a large folio print of the theatre erected in the cathedral of St. Peter, for the canonization of St. Peter of Alcantore, and "Mary Magdalen," engraved conjointly with Falda; the ſepulchral monument of pope Urban VIII. inſcribed "Petr. Sanct. Bartolus del et ſc.;" and an ancient mauſoleum, from Tivoli, with the figure of a lion, from P. de Cortona, in large folio.

The grand catafalco, or funeral proceſſion of Sobieſki, king of Poland, after Sebaſtian Cipriani, in large folio, was engraven by Franceſco Bartoli, a Roman by birth, and the ſon, pupil, and ſucceſſor of Pietro Sante, who ſometimes worked on his father's plates, but was inferior to him in talent and reputation.

Giovanni Baptiſta Falda, a very excellent engraver of landſcape and architecture, was born, in the year 1640, at Valduggia, in the Milaneſe, from whence he travelled, for profeſſional improvement, to Rome. Whoſe diſciple he was does not appear; but he executed his plates in a clear neat ſtyle, bearing no ſmall reſemblance to that of Iſrael Silveſtre. He drew and engraved a great number of views of palaces, churches, gardens, &c. in Rome and its environs, which he enriched with ſmall figures, drawn and engraved with great taſte. And in the year 1676 he engraved a very large view of Rome on twelve plates. His works are numerous, and deſervedly held in high eſtimation. Among them the following will be found to deſerve the particular notice of the connoiſſeur. Two fine views of the ſquare of Navonne, intitled "Fontana in Piazza Navonna," and "Altra Veduta in Piazza Navonna," erected by Bernini, in folio. Two other views, in large folio, of the Baſilico at the Vatican, and the fountain of the Baſilico. A very large view, lengthways, of St. Peter's, with twelve of the moſt celebrated edifices in Rome, on the ſame plate, very rare. A view of the interior of St. Peter of the Vatican, with the beatification of St. Francis of Sales, in large folio; and a very large view of the caſtle and bridge of St. Angelo, from Bernini.

Matteo Thommaſo Piccioni was born at Ancona A. D. 1637, and became a member of the Academy of St. Luke in the year 1655. Piccioni holds a diſtinguiſhed rank among thoſe artiſts who worked in Moſaic, and executed in that ſtyle the pictures of the cupola of the chapel of St. Peter at Rome, in conjunction with Fabius Chriſtoferi and Horace Manenti. He etched ſome few plates, among which are the following, all of folio ſize. "St. Luke painting the Virgin," from a picture by Raphael; "The Adoration of the Shepherds," from Paul Veroneſe; "A Holy Family," from the ſame painter; "The Virgin with the Infant Chriſt, who is repreſented ſleeping, and St. John at his ſide," from Andrea Camaſſei; and "The Infant Moſes carried by his Mother in the Ark of Bulruſhes," from the ſame painter.

Dominica Maria Bonarera was born at Bologna about the beginning of the laſt century: he learned the principles of drawing and etching of his uncle, D. M. Canuti. Among his works, thoſe that he executed after Titian for an edition of the anatomical work by Veſalius, for the uſe of ſtudents, are the moſt eſteemed, many of which, after being etched, were finiſhed with the dry point. A monogram, which was common to him and Dominic Barriere, will be found in our *Plate* III. of thoſe uſed by the *Italian Engravers*; and the following are ſelected from the catalogues of his works, as thoſe moſt worthy attention; "St. Ann teaching the young Virgin Mary to read," from Dom. M. Canuti, in folio; "St. Thereſia with the Infant Chriſt;" "The

Martyrdom of St. Chriſtiana," all of the ſame ſize, from Canuti; "St. John baptizing Chriſt in the River Jordan," from Albano, in large folio.; "St. John preaching on the Banks of the Jordan," from L. Caracci; "Lot with his Daughters," from Ann. Caracci; and the dome of the cathedral church at Parma, repreſenting "The Aſſumption of the Virgin, with the Apoſtles and Angels," from Correggio, all in large folio.

Ambrogio Beſozzi, or Bezutius, an eminent painter and engraver in aquafortis, was born at Milan A. D. 1648, and died in the ſame city in 1706. He ſtudied for ſome time under Gioſeffo Danedi, called Montalti, but afterwards went to Rome, where he ſtudied from the antiques and the moſt celebrated pictures, and laſtly, in the ſchool of Ciro Ferri. His greateſt merit conſiſted in painting bas-reliefs, friezes, and other architectural decorations; but he etched ſome few plates, and among them the following. A portrait of Correggio, in profile, of 4to. ſize; and the apotheoſis of a princeſs, the buſt of whom was engraved by Bonacina, and the remainder by Beſozzi, from Ceſare Fiori, in folio.

Girolamo, or Jerome Roſſi, or de Rubeis, the elder, was born at Rome A. D. 1640. He learned the principles of art under Simon Cantarini, and J. B. Buoncone. He executed a few ſlight but meritorious etchings from various Bologneſe painters, among which are the following. A portrait of pope Pius V., from Scipio Gatana, in an oval; "Two Cupids playing together," a ſmall upright plate from Guercino; "The Virgin and Child, accompanied by St. Francis and St. Jerome," a middling-ſized upright plate, inſcribed "Hieronimus de Rubeis pictor delineavit incidit;" "St. Charles Borromeus kneeling before a Croſs," from Antonio Caracci, a rare print; and "St. Nicholas before the Virgin," from Francis Bonavilla, both in large folio.

Girolamo Roſſi, or de Rubeis, the younger, was born at Rome A. D. 1685, and was probably a relation of the above-mentioned artiſt. He always reſided at Rome, and engraved a conſiderable number of prints, after different Italian painters. He worked in a ſtiff heavy ſtyle, with the graver alone, without much effect or correctneſs of drawing, and engraved a conſiderable number of portraits of the cardinals of his time; forming a ſeries, which has ſince been continued by Pazzi and others. Roſſi likewiſe engraved ſome portraits of painters for the Florentine gallery. His beſt hiſtorical works are, "The Virgin and Child," from Correggio; "La Zingara, or the Repoſe in Egypt," where the Virgin is dreſſed in the Egyptian faſhion, from a picture by Ann. Caracci, both in folio; and "The Martyrdom of St. Agapita," a large plate, lengthways, from J. Odazzi.

Giovanni Batiſta Teſtana, was born at Genoa in the year 1649, and reſided chiefly at Rome, where he engraved many plates from the pictures of various Italian maſters. In conjunction with William Vallet and Stephen Picart, he executed the portraits of the heroes of antiquity, for Jean Angelo Canini, from antique gems and medals. He engraved in a very pleaſing ſtyle, not unlike that of Mellan. The following prints afford ſatisfactory ſpecimens of his talents. Two heads, of Socrates and Alexander; and another pair of Aſpaſia and Cleopatra, in 4to., for the work of Canini; "The Guardian Angel," in large folio, from Pietro da Cortona; and "The Baptiſm of Conſtantine the Great," from Aug. Caracci, of the ſame ſize.

Gioſeffo Teſtana was born at Genoa in the year 1650. Whether he was the brother, or how he was related to the above-mentioned artiſt, we are unable to aſcertain. He reſided at Rome, where he engraved many plates in the ſtyle of Giovanni Battiſta. He was employed in a work which appeared at Rome in 1680, under the title of "Portraits of Cardinals now living," and from the reſt of his works the following may be ſelected as affording ſpecimens of his abilities both in portrait and hiſtory. A portrait of brother Jerome Comitibus, from P. de Cortona, in folio; "St. Margaret of Cortona kneeling before a Crucifix;" a ſubject of a Theſes, repreſenting a Hydra, and Religion hovering in the air, holding a portrait of pope Alexander VII. On a little ſtreamer is the following inſcription; "Accedite et illuminamini," both from Cortona, of folio ſize; and two portraits, Flavius Card. Chiſius, after M. Morandi, and Aloyſius Card. Homodeus, Joſ. Teſtana del. et ſcu. both in 4to.

Crecentius de Hunufris, or de Onofriis, was born at Rome in the year 1650, and died at Florence ſome time about the cloſe of the ſeventeenth century. He was the pupil of Gaſpar Pouſſin, and painted a great number of landſcapes in the ſtyle of that maſter.

He alſo engraved landſcape in a very good taſte, and we have an engraving by him, from a picture by Carlo Maratti, of "Diana at the Chace," for the prince Livius Odeſcalchi, which is executed with freedom, and in a purity of ſtyle ſuperior to moſt of the landſcape engravings of that day. This, and a landſcape with a waterfall; an Italian landſcape with water and figures, (both in folio,) and two heroic landſcapes, one with Jupiter and Mercury, the other with Apollo in the clouds, both in large folio, afford excellent examples of the talents of this artiſt.

Giovanno Gioſeffo dal Sole, was a native of Bologna, and became both a painter and engraver of ſome eminence. He received his firſt inſtructions of D. M. Canuti, and afterwards became the pupil of Lorenzo Paſinelli. He ſucceeded in engraving both hiſtorical ſubjects and landſcapes; and died at Bologna A.D. 1719, aged ſixty-five years. We have ſeveral etchings by him, from his own compoſitions, among which are, "Jupiter and Juno preſenting Mars with a Buckler," from a cieling by Paſinelli, painted for General Monteculle, in folio; and "St. Francis Xavier preaching in the Indies," a large upright plate, from the ſame maſter.

Vincent Victoria, or Vittoria, was born at Valencia A. D. 1658. He travelled whilſt very young to Rome, and frequented the ſchool of Carlo Maratti, where he made great progreſs. He poſſeſſed conſiderable knowledge of anatomy, and his portraits are particularly eſteemed. Victoria is likewiſe celebrated as an antiquary and a connoiſſeur in works of ancient art; and poſſeſſed an excellent cabinet of gems, medals, and various antiquities; he was honoured with the titles of antiquarian to the pope, and firſt painter to the grand duke of Tuſcany. Among other literary productions, Vittoria is the author of "Obſervazioni, ſopra la Felſina pittrice de Malzaſia," a work which the celebrated J. P. Zanotti has endeavoured to refute. The portrait of our artiſt may be ſeen in the collection of thoſe of the great painters of the Florentine ſchool. He died at Rome A. D. 1712, aged 51 years. Among many prints that he etched, in a ſlight ſtyle, the following are the beſt, "The Virgin and Child in the Clouds, with John the Baptiſt, St. Francis, and other holy Perſonages below," from Raphael, inſcribed "Vinc. Victoria del. et ſculpt." rare; "The Laſt Supper," and "The Reſurrection," both in large folio, from Ciro Ferri.

Giovanni Giroiamo Frezza, was born at Canemorde, near Tivoli, in the year 1660. He learned engraving at Rome, under Arnold de Weſterhout, and executed a great number of prints, after various Italian maſters, in a neat careful ſtyle, finiſhed highly with the graver; but without any force of chiaroſcuro, or boldneſs of execution. Sometimes Frezza imitated that ſtyle of Mellan, which conſiſts of ſingle courſes of lines, yet not very ſucceſsfully, and we are obliged to ſay of his numerous productions, that the extremities of his figures in general are but poorly marked, and his drawing, though not very incorrect, is ſometimes heavy. Among his engravings the following are held in moſt eſteem. The Veroſpian gallery, conſiſting of ſeventeen folio plates, including the title, from Albano, publiſhed at Rome in 1704; “The Virgin ſitting under a Tree feeding the Infant Chriſt,” from L. Caracci; “A Holy Family, with the Infant naked in the Arms of the Virgin,” from Carlo Maratti, both in folio; “The Aſſumption of the Virgin,” dedicated to pope Clement XI.; and “The Judgment of Paris,” dedicated to the marquis Pallavicino, both from the ſame maſter, of folio ſize; “La Zingare,” or the Repoſe in Egypt, where the Holy Virgin is repreſented in Egyptian attire, from Correggio, in large folio; a middling-ſized upright plate of “The Deſcent of the Holy Ghoſt,” from Guido, very rare; “Polypheme on a Rock, and Galatea on the Water with Nymphs,” a folio print; “Polypheme hurling a Rock after Acis and Galatea,” in two plates. A ſet of ſix, including the title, from pictures in the chapel of St. Ann, in the church of the Madonna, at Monte Santo, from Nicolo Beretoni, in folio. The firſt and ſecond plates for the Crozat collection, one repreſenting “Venus,” the other “Pallas,” from antique paintings, in large folio, and the celebrated Centaurs (known by the name of Furietto), done by Ariſteas and Papias of Aphrodiſium; and preſerved in the muſeum Clementinum, from drawings by P. Battoni, and N. Honophri, in large folio.

Gioſeffo Diamantini was born at Romania A. D. 1660, and ſpent the greater part of his life at Venice, where he died in the year 1722. Heinnekin, who has left us a catalogue of his etchings, ſeems to ſay of this maſter, that his greateſt praiſe was having inſtructed Roſa Alba Carriera. Yet, according to Strutt, who profeſſes, however, to have ſeen but few of his works, “Diamantini etched in a free maſterly ſtyle, with a fine point; the deſigns are ſpirited; the actions of the figures are often very graceful, and the heads and other extremities of them drawn in a ſuperior ſtyle.”

He was honoured with the title of chevalier, and hence he often marked his prints, “Eques Diamantinus in. f.” The following are among the beſt of his works, almoſt all from his own compoſions. “Hagar in the Deſert,” in an oval, of quarto ſize; “A Holy Family, with St. John,” in folio; “The Marriage of Canaan,” from Paul Veroneſe, in folio; “The dead Body of Chriſt, ſupported on the Tomb by an Angel,” in an oval, dedicated to Gregorio Fab.; “Dido on the Funeral Pile, with Diana or Iris in the Air,” in an octagon; “Venus, Ceres, and Pomona,” dedicated to D. D. Ferdinand; “Mercury and Flora in the Air,” dedicated to D. Aloyſis Piſani; “Night purſued by Phoſphorus, or the Morning Star,” dedicated to Marc Angelo Flavio Commeni; “The Sphere, or Aſtronomy,” dedicated to Angelis, all of folio ſize; “Saturn, or a river God, with two Cupids,” of octagon form; a middling-ſized upright print of “The Fall of Phaeton;”. a ſmall octagonal print of “Mercury and Argus;” “Venus and Adonis,” an octagon; another “Venus and Adonis,” in quarto; a ſmall octagon of “Jupiter and the Republic of Venice;” a ſmall upright print of “Time, or a river God ſitting, and a Child, with his Eyes banded, lying near him, accompanied by a Muſe;” a middling-ſized upright print of “Time and Flora, crowned by a Genius;” “Strength, or Hercules ſitting by a Nymph, accompanied by Plenty,” in an octagon; a ſmall upright print of “Mars and Venus;” two more ſmall uprights of “Diana and Endymion;” and “The Sacrifice of Iphigenia;” “Boreas ſtealing away Orithrea,” in a folio octagon; a ſmall oval print of “Juſtice and Peace;” four ſmall upright emblematical ſubjects; two large ſquare ditto; and two other emblematical ſubjects, one a large hexagonal plate, and the other an oval.

Gioſeffo Niccolo Naſini was born at a ſhort diſtance from Sienna, A.D. 1660. He learned the rudiments of art from his father Franciſco Naſini, but was ſent to Rome at the age of eighteen, and entered the ſchool of Ciro Ferri, under whom he ſtudied two years, and acquired not only great command of the pencil, but a fine taſte for deſign. He was recommended by his maſter to the grand duke Coſmo III., for whom he copied the pictures of Pietro da Cortona, in the Pitti palace; in which he ſucceeded ſo well, that the duke rewarded him very handſomely. He was likewiſe honoured with knighthood by the emperor Leopold, and had many other favours conferred on him by the great.

The ſtyle of Naſini bears ſome reſemblance to that of Paul Veroneſe. He died at Sienna in 1736, aged ſeventy-ſix. We have one ſmall upright etching by this artiſt, repreſenting “The Virgin with the Infant Chriſt and St. John,” from a compoſition of his own.

Cæſar Fantetti was born at Florence A.D. 1660. The time of his deceaſe has not been recorded, and of the events of his life it is only known that he worked at Rome after various Italian maſters.

He engraved, in conjunction with Pietro Aquila, the paintings in the Vatican, known under the name of Raphael's Bible; the firſt thirty-ſix, and the fortieth, are etched by him, and the remaining fifteen by P. Aquila. Fantetti alſo engraved “Chriſt praying in the Garden of Olives,” in folio, from L. Caracci; “Charity, with Two Children,” from Ann. Caracci; “Latona inſulted by Niobe,” in large folio, from the ſame painter; “The Death of St. Ann,” of the ſame ſize, from Andrea Sacchi; and “Flora ſurrounded with Cupids in the Air,” from Ciro Ferri; in an oval of folio ſize.

Franciſco Bruni was a native of Genoa, and an engraver. He was born in the year 1660, and died in 1726, but we are not acquainted with the particulars of his life, and we only know of the following print by him, “The Aſſumption of the Virgin,” in large folio, from Guido.

Lodovico Mattioli was born A.D. 1662, at Crevalcone, in the principality of Maſſeran, and died at Bologna in 1741. At an early age he was ſent to ſtudy in the ſchool of Carlo Cignani. He drew with a pen in a very pleaſing ſtyle; and etched from his own compoſitions and thoſe of the Caraccii, and other great maſters, but eſpecially after G. M. Creſpi, with whom he contracted a very intimate friendſhip. Among the etchings of Mattioli, the following will be found moſt worthy of notice: a landſcape, with ruins and figures, in quarto; “The Annunciation,” from L. Caracci, of the ſame ſize, a very rare print; “The Circumciſion,” in folio, from the ſame; “The Nativity,” from Aug. Caracci, of the ſame ſize; “The good Samaritan,” from Ann. Caracci; “The Death of St. Joſeph,” from Franceſchini; “The Martyrdom of St. Peter,” from Creſpi; a figure of “St. Anthony,” and another of “St. Vincent Ferreri,” all of folio ſize, from Creſpi; “St. Luke,” a note of invitation engraved by Creſpi, and re-engraved by Mattioli. And the figures for the poem of Bertoldo con Bertoldine, in twenty ſheets, were drawn by Creſpi, and engraved under the direction of Mattioli.

William da Leone was born at Parma in the year 1664. He etched, from his own deſigns, two ſets of animals, which are executed in a ſpirited ſtyle, and with ſome taſte; we are able only to ſpecify, in addition to theſe, the following engravings by Leone; two landſcapes, with animals, in quarto, and "Venus blinding Cupid," from Titian, in folio.

Luca Carlevariis, ſurnamed Zenobio, was born at Udino, in Italy, A.D. 1665, and died at Venice in 1729. He excelled in painting landſcapes and marine ſubjects. He likewiſe engraved a ſet of views of Venice, conſiſting of one hundred large plates lengthways, which were publiſhed in 1705. His prints are ſlight, but bold and ſpirited etchings; and give us clear ideas of the places they are intended to repreſent. We can only ſpecify the titles of the following two: a view of the church of St. Nicolas de Caſtello, at Venice; and one of St. Marie Formoſa, at the ſame place, both in folio.

Of the family of CRESPI we have already ſpoken, as ſee that article. Gioſeffo Maria employed a long life of upwards of fourſcore years, in the practice of the various arts of which imitation is the baſis, in the courſe of which he etched ſeveral plates, which do credit to his general reputation, and which we omitted to mention in vol. x. Among them we venture to recommend the following as moſt worthy of the notice of the connoiſſeur.

A grand compoſition, in large folio, of "The Maſſacre of the Innocents;" two folio plates in the manner of Rembrandt, of which "The Reſurrection" is the ſubject; "The miraculous Crucifixion of Piſtoia;" "St. Anthony," alſo in the manner of Rembrandt, and of the oval form; a folio plate of "Two Shepherds," one of them aſleep, and the other making the ſign of ſilence. A ſet of five, in the taſte of Salvator Roſa, of various mechanical occupations; and a very rare portrait of Michael Angelo Tamburini.

Pietro da Pietri, or Pitri, was born A.D. 1665, according to ſome authors, at Rome; others place his birth at Premia, in the Milaneſe territory. He learned the principles of art of Joſ. Ghezzi and Carlo Maratti, who employed him in copying ſome of the principal works of Raphael, and other celebrated Italian maſters. He died at Rome in the year 1716.

Notwithſtanding that Pietri employed great part of his time in copying, we have ſeveral meritorious hiſtorical pictures by him from his own compoſitions; thoſe eſpecially, which he painted for the church of St. Clement at Rome. He etched ſome few plates, and among them the two following will probably be found moſt worthy of notice. "The Aſſumption of the Virgin," a middling-ſized upright; and "St. Lawrence the Juſtinian," a ſmall upright, both from his own compoſitions.

Franceſco Antonio Lorenzini, known by the name of brother Antonio, was born at Bologna A.D. 1665. He was an eccleſiaſtic of the order of St. Francis; but turning his mind to the arts, he firſt ſtudied painting under Lorenzo Paſinelli: being, however, better pleaſed with etching, he was induced to throw aſide his pencils for the love of aquafortis and copper.

In 1699 he travelled to Florence, where he engraved great part of the plates for the gallery of the grand duke of Tuſcany, in conjunction with Theodore Ver-Cruys, Coſmo Mogalli, and Fichianti; and during his abſence from Bologna, he was agreeably ſurpriſed by finding himſelf elected a member of the Clementine academy. Lorenzini was a very induſtrious man, and left a great number of prints from different maſters: which, however, it muſt be acknowledged do him no great credit as an artiſt; among them the following are the beſt: "Moſes ſtriking the Rock," a large plate lengthways, from Baſſan; "St. Anthony of Padua performing a Miracle," from Paſinelli; "The Martyrdom of St. Urſula and her Companions;" "St. John preaching in the Deſert," all of large folio ſize, from Paſinelli; "Jeſus Chriſt in a Glory," with other figures, from L. Caracci; "The Virgin and Child," half figures, from Aug. Caracci, both in folio; "The Beatification of St. Dominic, accompanied by Jeſus Chriſt, the Virgin, and Angels," from Guido, a large circular plate; "St. Philip Neri kneeling before a picture of the Virgin, ſurrounded by Angels," from Carlo Maratti; "St. John in the Clouds, ſurrounded by Angels," from Correggio, both in large folio; "The Annunciation," from Paul Veroneſe, in large folio; "The Baptiſm of our Saviour," of the ſame ſize; "The Reſuſcitation of Lazarus," on three large plates, all from Paul Veroneſe; "Jeſus Chriſt on the Sea with St. Peter," from L. Cordi; "The Conſtruction of Noah's Ark," from Jac. Baſſano; "Venus with Two Cupids," from Carlo Cignani; "St. Auguſtino in the Air, ſurrounded by Rays of Glory," from Tintoret, all of large folio ſize; "Joſeph ſold by his Brethren," after Andrea del Sarto, in two large folio leaves; "Joſeph in Egypt;" "Saul and David with the Head of Goliah," from Guerchino; "The Pilgrims at Emaus;" "St. Peter delivered from Priſon," both from the ſame painter, all in folio; "The Holy Women at the Sepulchre," from P. de Cortona, a circular print; and "St. Margaret of Cortona, to whom the Virgin appears in the Clouds," from Gab. Caliari, in large folio.

The monogram of Antonio Baleſtra will be found in our *Plate* III. of thoſe uſed by the *Italian Engravers*. Of the leading events of his life we have already treated. (See BALESTRA.) His ſtyle of etching was bold and maſterly, though ſlight; and his moſt eſteemed prints are, a warrior's head, and two ſoldiers, both ſmall plates; "The Holy Virgin ſeated in the Clouds, with the Infant Jeſus and St. John, the Heads of three Cherubs appearing above;" "The three Angels viſiting Abraham;" a vignette inſcribed "Verona fidelis," all ſmall uprights, and rare. His portrait of the architect Michel San Michell, ſurrounded with allegorical alluſions, and marked with the engraver's monogram, is in ſmall folio.

Benedetto Lutti was an eminent painter of Florence, who ſometimes amuſed himſelf with etching, and whoſe works are generally and juſtly eſteemed. He was born in the year 1666, ſtudied under Antonio Domenico Gabbiani, and died at Rome in 1724.

Strutt ſays of this artiſt, that his merits procured him, from the elector of Mentz, the honour of knighthood, accompanied by a preſent of a croſs enriched with diamonds, but ſpecifies only two of his etchings, both of which are become extremely rare. The ſubjects of theſe etchings are, a landſcape after Guercino, in ſmall folio; and "The Crucifixion, with St. John and Mary Magdalen at the Foot of the Croſs," a ſmall upright, from a compoſition by Lutti himſelf.

Coſmo Mogalli was a native of Italy, and the diſciple of Giovanni Battiſta Foggini, a Florentine ſculptor. He was born at Florence in the year 1667, and died in the ſame city in 1730. He worked in conjunction with Antonio Lorenzini, (of whom we have recently treated,) and other engravers, on the plates from the Florentine gallery, for the duke of Tuſcany. We likewiſe have by him many plates for a book of Etruſcan antiquities, publiſhed by Thomas Dempſter, at Florence, in 1724.

The following prints, from the Florentine gallery, are from the graver of the elder Mogalli, *viz.* "A Holy Family, or the Repoſe in Egypt," from Albano, a circular print in folio; another "Holy Family," from Correggio, of the ſame ſize;" "The Supplication of Marſias," from Guercino, in large folio; "Eve preſenting the Apple to Adam," from Gabr. Caliari, in folio; "The penitent

Magdalen tranſlated to Heaven by an Angel," from Caracci, in large folio; "Adam and Eve diſmiſſed from Paradiſe," from Caliari, in folio; "St. Benedict inſtituting his monaſtic Order," from P. Veroneſe; "Jeſus Chriſt at the Table with the Pilgrims of Emaus," from Palma the elder; "The Marriage of St. Catherine," from Fra. Bartolomeo, all in large folio; "Virtutes Amor et Numen," an allegorical figure from Riminaldi, in folio; "David and Bathſheba," from Fr. Salviati; this and all the following are in large folio; "The Annunciation," from And. del Sarto; "The Adoration of the Shepherds," from Titian; a bacchanalian dance by four figures; and Philip II. king of Spain, alſo from the ſame painter.

Nicolas Mogalli was the ſon of Coſmo, and alſo an engraver. He was born at Florence in the year 1723, from whence, either for improvement or patronage, he travelled to Rome, where he engraved, with moderate ſucceſs, from the cabinet of Portici, and the plates, after the deſigns of Caſanova, for "Les Monumenti antichi inediti ſpiegati et illuſtrati da Giovanni Winkelmann," a folio work, which was publiſhed at Rome in the year 1767.

Jacques Maria Giovanni, or Juvanus, was born at Bologna in the year 1667, and died at Parma in 1717. He was the diſciple of Antonio Roli, and became a painter of ſome eminence. He alſo practiſed engraving and etching, and executed many large works from L. Caracci and Correggio. The moſt conſiderable work he engaged in was a cabinet of medals for the duke of Parma, in ſeveral folio volumes. His prints are of very unequal merits. As far as they can be ſpoken of generally, they are executed with tolerable care and ſkill, but are deficient in chiaroſcuro, and more or leſs ſo in drawing. The beſt of them are engraved from the pictures of the cloiſters of St. Michael in Boſco, painted by L. Caracci, and other celebrated maſters of his ſchool, on 19 plates in folio; the cupola of the church of St. John of the Benedictines at Parma, repreſenting "The Aſcenſion of our Saviour," &c. &c. on 12 plates, from thoſe juſtly famed pictures by Correggio, which can now only be known by the engravings, the paintings themſelves being no longer in exiſtence; the Holy Virgin in a landſcape, with the Infant Chriſt in her arms, with St. Jerome and Mary Magdalen, the latter of whom is kiſſing the feet of the child (a ſubject commonly known under the name of "The Day of Correggio"); the Virgin ſeated on a pedeſtal with the Infant Chriſt, known by the name of "St. George," who is the principal figure, and by ſome eſteemed the chef-d'œuvre of Correggio; "St. Sebaſtian faſtened to a Tree with his Hands behind his Back," in folio, from Caracci; "Jeſus Chriſt giving the Communion to his Apoſtles," from Franceſchini, a very excellent print of large dimenſions, and of the upright form.

Andrea Procaccini was born at Rome in the year 1667, and was the pupil of Carlo Maratti. He became a painter of ſome celebrity, and was choſen by pope Clement XI. to paint the twelve prophets of the Old Teſtament, for the church of St. John de Lateran. In 1720, he was invited to Spain, with the title of painter to the Royal Cabinet. Here he painted ſeveral pictures for the royal palace, and died at St. Ildefonſe, A.D. 1734. We have ſeveral engravings by this maſter, both from his own compoſitions, and thoſe of other painters, among which the following few are ſelected as moſt worthy of the notice of the collector:—"The Diſciples at Emaus," from Raphael; "The Aſcenſion of our Saviour;" a large group of figures, with a youth carrying his father on his ſhoulders, both from Raphael; "The Birth of Bacchus;" "Diogenes throwing away his Cup;" and "Clelius and his Companions paſſing the Tiber," all from Carlo Maratti, and of folio dimenſions.

Giovanni Dominico Picchianti was born at Venice A.D. 1670, and was the ſcholar of J. B. Foggini, a ſculptor of ſome eminence. The productions of Picchianti have no great ſhare of excellence to recommend them, for he worked in a coarſe ſlight ſtyle, and his drawing is rather mannered than correct. He engraved many of the plates from the pictures in the grand Florentine gallery, in conjunction with Lorenzini, Ver-Cruys, and Mogalli; and likewiſe ſome portraits, among which are, thoſe of an unknown female, from Raphael, in folio, a whole length of Sebaſtian del Piombo, from Titian, and cardinal Bentivoglio, from Vandyke; thoſe of cardinals Louis de Roſſi and Julius de Medicis, on the ſame plate, are from Raphael, and all are of large folio ſize.

The beſt hiſtorical works of Picchianti are, "The Virgin ſitting on a Chair," or the celebrated Madonna della Sedia of Raphael; a half figure of "The Virgin, with the Infant Jeſus, and St. John," from Caracci, in folio; "Paying Tribute to Cæſar," commonly called "Il Chriſto della Monetta," from Titian; "The Virgin and Child," from the ſame painter; and "Agar returning to the Houſe of Abraham," from P. de Cortona, all of large folio dimenſions.

Franciſco Antonio Meloni was a native of Bologna, and born in the year 1670. At an early age he appeared fond of painting, and was accordingly placed under Franceſchini; but time diſcovered that his diſpoſition was not formed for the attainment of excellence in that art, and he then took up the graver with much better ſucceſs. He engraved chiefly from the pictures of his maſter, and other Bologneſe painters; but the latter years of his life were ſpent at Vienna, where he died in the year 1713. The following are reckoned among his beſt engravings:—"The Adoration of the Shepherds," a middling-ſized upright plate, from Carlo Cignani; and "Aurora," from a ceiling at Forli by the ſame maſter, both in folio.

Of the merits of FRANCISCO and PIETRO AQUILA we have already treated. (See thoſe biographical articles reſpectively.) But of artiſts ſo diſtinguiſhed it has been judged proper to ſubjoin, in this place, liſts of the principal works on which their reputation has been founded. The beſt of thoſe by the elder Aquila are "Saint Roſalie," from his own compoſition, in folio; "Mars binding his Arms to a Tree," in large folio; "Cardinal Caſini as a Capuchin," in folio; "Cardinal Joſeph Maria of Thomaſis," from P. Nelli, of the ſame ſize; "The Laſt Supper," from Albano, inſcribed "Unus ex vobis, &c." in large folio; the firſt vaulted roof of moſaic in the church of the Vatican, from Ciro Ferri; two cupolas, one in the chapel of the Holy Sacrament, the other in the church of St. Sebaſtian of the Vatican, from P. de Cortona; another cupola, from the ſame maſter, painted in the church of St. Philip of Neri, all large circular prints; a group of heroes, to whom Minerva preſents a crown of laurel, and Mars a ſword, a folio print, from And. Bonfigli; "The Battle of Conſtantine and Maxentius," from And. Camaſſei; and "The Triumph of Conſtantine," both very large; "The dead Body of Chriſt acroſs the Knees of his Mother, accompanied by Mary Magdalen and St. Francis," from Caracci, in large folio; "The Arrival of the Body of St. Helena announced by a Biſhop to the Virgin," in folio; "The Repoſe," where the holy Virgin is repreſented ſeated under a tree with the infant, and in the back-ground St. Joſeph on his aſs; "St. Peter's Bark," from Lanfranc, in large folio; a very large folio print of "Our Saviour in a Glory, with St. Ambroſe, the Virgin, and St. Charles Borromeus, kneeling," from a grand altar-piece by Carlo Maratti; the vaulted ceiling of St. Francis Xavier at Naples, painted by Paul de Mattheis, and engraved on three large plates, repreſenting that ſaint overturning Idolatry, Hereſy, and Mahometaniſm; "Venus in the Air, ſhewing *Æneas* his Arms faſtened to a Tree," from Pouſſin.

The following are by Pietro Aquila, from his own deſigns: "The Adoration of the Kings," in folio; "The Flight into Egypt," dedicated to B. C. de Vingtimilliis, in large folio; "A Holy Family, where St. John kiſſes the Feet of the Infant Chriſt," half figures, in folio; "A Combat of two Lions," inſcribed "Spe ſuſcitat Iras," in folio; a portrait of Livio Odeſcalchi, with ornaments, in large folio.

From other Italian maſters, Pietro has engraven "St. Luke," with the inſcription "Ferax cum feriunt," &c. after Lazaro Baldi, in folio; "The Sacrifice of Polixenes," from P. de Cortona, in large folio; "A Sacrifice of the Nymphs of Diana on their return from the Chace;" "The Rape of the Sabines;" and "The Triumph of Bacchus," four very much eſteemed prints, all from the ſame maſter, in large folio; a large ſubject on two plates of "The Battle between Alexander and Darius," from the ſame maſter; "Moſes defending the Daughters of Jethro, at the Fountain," from Ciro Ferri; "Moſes ſtriking the Rock," both in large folio; "The Holy Virgin appearing to St. Aleſio, who is repoſing on a Bed, crowned with Stars," a large circular print; "The Veſtals cheriſhing the ſacred Fire, by the Orders of Auguſtus," a large upright print, all from Ciro Ferri; "The Holy Virgin in Heaven with five Saints, canonized by Pope Clement X." from Carlo Maratti, in large folio; "The Triumph of Chriſtianity, repreſented by Religion ſitting on the Clouds, receiving the Homage of the four Quarters of the World," in large folio; "The Virgin ſitting to St. Luke for her Portrait," in folio, all from Carlo Maratti; "Death and the Holy Virgin, with the Apoſtles," from J. Morandi, in large folio; the Bible of Raphael, inſcribed "Imagines Veteris ac Novi Teſtamenti, a Raphaele Sanct. Urbin. in Vaticano pictæ Jo. Jac. de Rubeis ſumitibus," in fifty-five leaves. Ceſare Fantetti drew and engraved the firſt thirty-ſix ſubjects, and the fortieth; all the others are by P. Aquila. The Farneſe Gallery, with the ſtatues and ornaments, and a deſcription in verſe by J. P. Bellori, in twenty-five leaves, of large folio ſize; a room in the Farneſe palace, with the ornaments and inſcriptions, in thirteen plates, of folio ſize; "The Aſſembly of the Gods," painted in the garden of the prince Borgheſe near Rome, called "The Villa Pinciana," entitled "Deorum Concilium ab Equite Joanno Lanfranco Parmenſi, tum Spirantibus ad vivum Imaginibus, tum monocromatibus atque Ornamentis Artis," &c. on nine large folio plates.

Marco Ricci, the celebrated painter of landſcape and ruined edifices, (for whoſe biography and general merits, ſee the article RICCI,) performed ſome etchings about this period, of which the beſt are a ſet of twenty-three, entitled "Varia Marci Ricci Pictoris præſtantiſſimi Experimenta ab ipſomet auctore inventa delineata atque inciſa et a me Carolo Orſolini Veneto inciſore," &c. anno 1730, printed on folio paper, but of different ſizes and ſhapes. They are feeble in chiaroſcuro, and though not entirely taſteleſs, diſplay no great knowledge of the art of engraving.

Antonio Maria Zanetti was of a noble Venetian family, born in the year 1680, and died in his native city in 1757, according to Huber; but according to Strutt, he lived ten years longer. He acquired what is often termed a competent knowledge of drawing, at a very early age; and before he was fifteen, engraved ſome figures and ſome heads, which he dedicated to Dr. Mead, the celebrated Engliſh phyſician.

The works of Zanetti conſiſt of etchings and engravings in chiaroſcuro; and, in the eſtimation of our countryman Strutt, they "prove him to have been a man of *great genius* and *ſound judgment.*"

"Aſſiſted by his relation A. M. Zanetti the Younger, and other artiſts, he engraved and publiſhed a large number of prints, taken from the drawings of Parmegiano, Raphael, and other great painters, which he purchaſed at the ſale of the Arundelian Collection. They are divided into two ſets; and both together conſiſt of eighty-nine prints on copper and wood, with the portrait of Zanetti, engraved by Faldoni, from a painting by Roſalba."

We come now to what muſt be a reproach either on his "genius," or his "judgment," or on both. Strutt adds, that "in order to render this collection the more valuable, he burnt the wooden blocks from which the chiaroſcuros were printed, and deſtroyed the copper-plates, after he had taken off ſuch a number of impreſſions as he thought proper, which, we are informed, was by no means very large."

Now no principled engraver deſires that his works ſhould ever become rare from any other cauſe than the extenſive demand for them among the public; and the ſubſtitution of nominal for intrinſic value, is an expedient worthy only of traffickers in art, and which "great genius" and "ſound judgment" would equally diſclaim.

Zanetti reſided for ſome time in London, and engraved here a ſet of twelve ſtudies of heads, figures, &c. from his own drawings, which he tinted in a ſpirited ſtyle, and which, according to Strutt, do him great honour.

He alſo engraved in aquafortis another ſet of twelve plates, of which the ſubjects are animals and figures, after Caſtiglione; a ſet of the ſtatues which adorn the library and palace of St. Mark at Venice; and a ſet conſiſting of eighty plates of the engraved gems of antiquity. His cypher will be found in *Plate* III. of the monograms of the *Italian Engravers.*

Zanetti the Younger was nephew to him of whom we have juſt cloſed the account, and was born at Venice A.D. 1720; but the year of his demiſe has not been mentioned. He engraved in the taſte and ſtyle of his uncle, whom he aſſiſted in his work after the ſtatues at the palace of St. Mark, as well as in that after the drawings by Raphael, &c. which once formed part of the Arundelian Collection. And in the year 1760 he publiſhed an excellent work, adorned with eighty plates, engraved by himſelf, and intitled "Varie Pittore a freſco de principali Maeſtri Veneziani," &c.

Franceſco Fontibaſſo was born at Venice A.D. 1681. He learned drawing in the Roman academy, and ſtudied for a time under Seb. Ricci, whoſe ſtyle of painting he imitated with no inconſiderable degree of ſucceſs, in the pictures which he painted for the Duodo palace, and the church of St. Salvador. In the year 1769 he travelled to Peterſburg, with the view of bettering his fortune, where preſumptively he died, for we do not hear of his return.

He etched ſeveral plates with mediocre, but painter-like ability, among which are a ſet of ſeven whimſical ſubjects from his own compoſitions, in ſmall folio; and "The Holy Virgin appearing to St Gregory at prayer," an upright of the middle ſize, from Seb. Ricci.

Carlo Carloni, or Carlone, was born at the village of Scaria, in the Milaneſe territory, A. D. 1686, and died at his native place in the year 1775. He was of a numerous family, of whom the greater part were artiſts. His father was a ſculptor, and intended Carlo for that profeſſion; but finding he had more inclination to become a painter, placed him under Julio Qualio, under whoſe inſtruction he ſoon became remarkable for talent and induſtry, and occaſionally both painted and engraved. In his pictures he produced a rich and agreeable effect, and made ſome advances toward combining the merits of the Roman and Venetian ſchools. Of his engravings, of which we cannot ſay quite ſo much, the following are held in moſt eſteem: “A Holy Family, wherein St. John is kiſſing the Feet of the Infant Saviour;” and “The Miraculous Conception,” both of 4to. ſize; “St. Charles Borromeus adminiſtering to the Sick, during the Plague at Milan,” in folio; three plates of ceilings, in 4to., in one of which is a group of children with flowers; and the death of a ſaint, of folio dimenſions.

Andrea Zucchi was born at Venice in the year 1680, where he engraved a ſet of twelve plates of Venetian habits, and many other ſubjects for the libraries. In 1726, he was invited to Dreſden to paint theatrical ſcenes and decorations; and on his return to his native city he engraved moſt of the plates for the collection publiſhed by Loviſa, conſiſting in the whole of fifty-ſeven plates, from the moſt celebrated pictures at Venice; but his talents as an engraver never roſe above mediocrity. Among his beſt productions are, “The Angel Raphael conducting the young Tobias,” in large folio, from Titian; “St. John the Evangeliſt,” of the ſame ſize, from the ſame painter; “St. Barnabas Veſcova, St. Peter, St. John, and other Saints,” from the picture which D. Varotari painted for the church of St. Barnabas; “St. John the Baptiſt,” from P. Veroneſe; “The Martyrdom of Paul Erizzo,” from P. Longho; “The Nativity of the Virgin,” from a picture by Nic. Bambini; “Manna gathered in the Deſert,” from Joſeph Porta, a circular print; “Cybele on her Car drawn by Lions,” from a freſco by Tintoret; and “Eneas ſaving his Father and Son from the Conflagration of Troy,” after Seb. Ricci; all of large folio dimenſions.

Franceſco Zucchi was the younger brother of Andrea, under whoſe inſtruction he ſtudied the elements of art. In the year 1750, he was invited to Dreſden to paint for the electoral gallery, but was interrupted by the war, which obliged him to return to his native country, where he worked chiefly for the bookſellers. He engraved ſeveral of the plates from the pictures in the Dreſden gallery; among which the following will probably be found on the whole to deſerve a preference; the portrait of Eſpagnol, from Rubens; ditto of a woman who reſembles the firſt wife of Rubens, both in folio; ditto of Jacques Antonio Murani, from Jean da Antona, in an oval of folio ſize; “St. Helena worſhipping the Croſs,” from Bettini Cignarolli, in folio; “The Martyrdom of Religion,” an allegorical ſubject, in folio; “Religion and the Sciences contemplating the Portrait of a Cardinal,” in folio; and “Apollo with his Lyre,” ſurrounded with ornaments, of large quarto ſize.

Lorenzo Zucchi was the ſon of Andrea, and was born at Venice in 1704. When his father was invited to Dreſden, in the year 1726, Lorenzo accompanied him, and having been inſtructed in the elements of engraving, he continued to practiſe it in that metropolis with ſucceſs, and was honoured with the title of engraver to the court of Dreſden. Moſt of his productions are from the Dreſden gallery, and among them the following have been thought the moſt worthy of notice.

Portraits.—Herman Charles Keyſerling, count of the holy Roman empire, from Anna Maria Werner, in large folio; John Frederick, prince of Sapieha; Bonaventura Roſſi, painter to Auguſtus III.; Louis de Silveſtre, firſt painter to Auguſtus III.; L'Abbate Pietro Metaſtaſio, Poeta, &c. all of large folio ſize.

Various Subjects from the Dreſden Gallery.—“The ſeven Sacraments,” from Joſeph M. Creſpi; “The Martyrdom of St. Peter and St. Paul,” from Nic. del Abbate; (P. Tangi likewiſe engraved this picture, which engraving, as well as that of Zucchi, will be found in the collection from this gallery;) “St. Catherine receiving the Crown of Immortality,” after a copy by Eraſmus Quellinus, from Rubens; “A grand Sacrifice to Venus,” from G. Laireſſe; “The Supplication of Marſyas,” from J. B. Langetti, all of large folio ſize; and “The Archangel Michael precipitating the Dragon,” from Steff. Torelli; “St. Joſeph, with the Infant Chriſt in his Arms,” from Joſ. Angelli, in the gallery of the count de Bruhl; two landſcapes, entitled “Soggiorno paſtorale, and “Campagne aperta,” from Joſ. Roos; “The laſt of the Cæſars,” two half figures, one of which repreſents Titian, marked Tizianus f. L. Zucchi delin. et ſculp. engraved in the ſtyle of Pitteri; and “David with the Head of Goliah,” from L. Jordane, all of folio dimenſions.

Jerome Ferroni was born at Milan in the year 1687. He painted the death of St. Joſeph, for the church of St. Eſutorgio, and afterwards travelled to Rome, where he worked ſome time in the ſchool of Carlo Maratti, after whoſe pictures he etched the following ſubjects, in the ſlight ſpirited ſtyle of a painter, but with great taſte; “The Sun ſtanding ſtill at the Command of Joſhua;” “Deborah ſinging the celebrated Canticle, after the Victory over Siſera,” and “The Death of Siſera,” all in large folio; “The Chaſtity of Joſeph,” in quarto; and “Judith beheading Holofernes,” in folio.

Giovanni Antonio Faldoni, was born at Aſcolo in the year 1690. He learned painting under Antonio Luciani, and likewiſe practiſed engraving. Faldoni worked chiefly, if not entirely, with the graver, frequently imitating the ſtyle of Mellan with no inconſiderable degree of ſucceſs; on the whole, he merits the encomium of having been an artiſt of ability. His beſt prints are the portraits of the doges of Venice, the procurators of St. Mark; various antique ſtatues, making part of two volumes in folio, of Venetian antiques; part of the deſigns of Parmegiano, for the collection in two folio volumes publiſhed by Zanetti; a portrait of Antonio Maria Zanetti, from Roſalba, in folio; Marco Ricci, from Roſalba, in folio; “Sebaſtianus Ricci Bellunenſis Pictor, ſuæ ætatis facilé primus, annum agens LX.” in folio; “A Holy Family in a Landſcape, with Angels miniſtering,” from S. Ricci, in large folio; “The Conception of the Virgin,” from the ſame maſter; “The Nativity of our Saviour,” from P. de Cortona; “David playing the Harp before Saul,” from Joſ. Camerata the elder; “David flying from the Anger of Saul,” from the ſame maſter, all of folio ſize.

Antonio Baldi was a native of Cava, in the kingdom of Naples, and was born in the year 1692. He ſtudied the rudiments of painting under Solimene; and learned engraving of Magliar. He eſtabliſhed himſelf as an engraver at Naples, and engraved for the moſt part after Solimene, but occaſionally from his own compoſitions. The following are ſome of his beſt engravings; the portraits of the emperor Charles VI. in an oval of folio ſize; Don Carlos, king of the Two Sicilies, of the ſame ſize and form; Nicholas Cyrillus, a phyſician; Maria Aurelia Carraccioli, a nun; St. Ignatius of Loyola, in an oval, with acceſſories; and Raphael Manca, accompanied by an angel, alſo in an oval; “The Communion of St. Mary the Egyptian,” inſcribed

“ Divæ Mariæ ;” “ St. Philip of Neri, in Heaven before the Trinity,” inſcribed “ Cui nomen dedit alma Trias ;” “ St. Emigde, interceding for the Neapolitans,” inſcribed “ Divo Emigdo in terræ motum, et Neopolis Patrono ; and “ St. Gregory the Martyr, with the Subjects of his Miracles,” all of folio dimenſions.

Andrea Magliar was born at Naples in the year 1692. He engraved from the pictures of Solimene and other maſters, but is very little known, and we are not able to ſpecify any of his works. His ſon, Gioſeffo Magliar, was the diſciple of his father and of Solimene; and great expectations were formed, from the early ſpecimens which he gave of his abilities, but he died young. There is a print by him, of “ Chriſt appearing to St. William,” of folio ſize, from Solimene, which certainly is a work of conſiderable promiſe.

Giovanni Dominico Campiglia, was born at Luques in the year 1692. At Florence he became the pupil of Thomaſo Redi, and Lorenzo del Moro ; and at Bologna he ſtudied in the ſchool of Gioſeffo del Sole. He drew moſt of the ſtatues, buſts, and portraits of the Florentine gallery, and compoſed the typographical ornaments for that work. Campiglia was invited to Rome, where he did the drawings of the ſculptures of the Capitol, the firſt volume of which appeared in 1741. He has etched a great number of plates, with ſome taſte, and among them the following portraits ; Giovanni Lorenzo Bernini, Julio Romano, Salvator Roſa, Leonardo da Vinci, and Giovanni Antonio Razzi ; all of folio dimenſions.

Giovanni Batiſta Tiepolo, was born at Venice in the year 1697, and died at Madrid A.D. 1770. In his youth he frequented the ſchool of Gregory Lazarini, and after having worked at Milan, and in other parts of Italy, he travelled to Germany, and painted, in the epiſcopal palace of Wurzburg, the hall, the ſtaircaſe, and two altar pieces. He afterwards went to Spain, and painted in conjunction with Mengs, who became jealous of him ; but for the detail of his merits in this art, ſee the article TIEPOLO.

Tiepolo engraved fifty-ſix ſubjects in a very ſuperior ſtyle, exceedingly neat, and with taſte, correctneſs, and ſpirit, from which the following are ſelected. “ The Adoration of the Kings,” in folio, from his own compoſition, which is generally regarded as his chef-d'œuvre. A ſet of fancy ſubjects, conſiſting of twenty-four plates, in quarto. And another ſet of fancy ſubjects, in ten plates, ſmaller than the foregoing. All from his own compoſitions.

Govanni Domenico Tiepolo was the ſon of the preceding artiſt, and was born at Venice A.D. 1726. He learned the principles of drawing and painting of his father, and in 1745, painted the figures of the cupola of the church of St. Fauſtin, and St. Jovita at Breſſe.

He alſo occaſionally took up the etching point as his father had done, working ſometimes in a ſtyle which bears reſemblance to the etchings of Caſtiglione, and on other occaſions in that of his father. His beſt prints are, a ſet of twenty-ſeven ſmall plates, lengthways, repreſenting, in ſeries, “ The Flight of the Holy Family into Egypt ;” a ſet of twenty-ſix heads, of the ſame ſize, executed in the ſtyle of Caſtiglione ; “ The Way to the Croſs, or the Hiſtory of the Crucifixion of our Saviour,” in fourteen plates of quarto ſize ; “ The Miracle of St. Francis ;” “ The Miracle of St. Jerome,” both in quarto ; “ The Republic of Venice receiving the Riches of Neptune,” an allegory, in folio ; “ The Virgin in the Clouds appearing to St. Thereſia, and two other female Saints ;” and “ St. Ambroſe preaching to the People,” both in large folio. The whole after the deſigns of the elder Tiepolo.

Lorenzo Tiepolo, brother to the above-mentioned artiſt, was alſo a painter, and etched in a ſtyle, and with a degree of taſte which appears hereditary, from the deſigns of his father.

Giulio Giampicoli, or Jampiccoli, was born at Venice A.D. 1700. We are ignorant under what maſter he learned engraving, but his ſtyle greatly reſembles that of the ſchool of Wagner. He mingled etching with the work of the graver, and engraved both hiſtory and landſcape with ſucceſs ; the following few may be reckoned among his beſt productions. A ſet of thirteen landſcapes, from Marco Ricci, in large folio. A ſet of paſtoral ſubjects in four plates, each being inſcribed with ſix Italian verſes ; and four landſcapes after Marco Ricci, and F. Zuccarelli, in large folio.

Franciſco Polanzani, or Polanſani, was born at Andale, near Venice, A.D. 1700, and reſided at Rome. The moſt conſiderable work we have by him, is a ſet of twenty-two plates, of which the ſubjects are from the life of the Virgin, either after Pouſſin, or, more probably, from Jacques Stella (to whom Baſſan attributed them). The following may alſo be reckoned among his beſt productions. The buſt of a female, from C. Cignani. A buſt of a blind muſician, from Marco Benefiali. “ Mater amabilis,” from Joſ. Nogari. Two other ſubjects from the ſame maſter, an old Man with a Bag of Money ; and an Old Woman with a Hand Granade, all of quarto ſize. And “ An Old Woman warming herſelf over a Chafing-diſh ;” from the ſame painter, in folio.

Giovanni-Batiſta Pittoni, was born at Vicenza in 1690, and died at Venice A D. 1767. He was the nephew and diſciple of Franciſco Pittoni, the Venetian painter, and his hiſtorical pictures are held in conſiderable eſteem. There are ſome few etchings by this painter which are much valued by connoiſſeurs, and are marked ſometimes with his initials, or at others Batiſta P. V. F. and ſometimes with his name at full length, but we are unable to ſpecify any of them.

Antonio Luciani was a native of Venice, and born A.D. 1700. He ſtudied painting under Jacques Piccini, though he is better known as an engraver than as a painter. Luciani engraved from the works of Tiepolo, Caſſana, Bombelli, and others, but his works are held in no very high degree of eſtimation, and it may therefore be ſufficient to ſpecify the two following prints by him. The portrait of cardinal Sforza Pellavicini, from Pietro Avogrado ; and that of the Jeſuit Tambarini, from the ſame painter, in folio.

Dominico Roſſetti was born at Venice in the year 1700. The prelate Giovanni Franciſco Barbarigo, being very fond of this artiſt in his youth, took him to Verona, where he purſued his ſtudies for ſome time. He practiſed architecture, as well as engraving both on copper and wood, and when ſome years had elapſed, and his reputation was eſtabliſhed, Roſſetti was invited to Duſſeldorp, by the elector palatine, to engrave “ The Triumph of Alexander,” from G. Laireſſe, on twelve large plates, which is become exceedingly rare, becauſe, before many impreſſions had been printed, the elector had the plates gilt. This artiſt alſo engraved ſeveral of the plates for the collection of prints taken from the moſt capital pictures at Venice, which was publiſhed by Domenico Loviſa, and among which the following will probably be found moſt worthy of the notice of the connoiſſeur.

“ Pope Alexander III. recognized by the Doge of Venice,” after Paolo Veroneſe ; “ The Ambaſſadors ſent by the Venetian Senate to the Emperor Frederic Barbarouſſa,” after the pictures of Carlo and Gabriel Cagliari, which are preſerved in the hall of the grand council chamber at Venice.

Another print, of which the ſubject is taken from the ſame embaſſy, after Tintoret, whoſe picture is alſo preſerved in the ſame public hall; “The great Victory gained by the Venetians over the Imperialiſts,” from the ſame maſter; “The Pope beſtowing his Benediction on the Doge Zanii, previous to his Battle with Barbarouſſa,” after Franceſco Baſſano; “The Emperor Barbarouſſa proſtrate before Pope Gregory VIII.,” after Frederico Zucchero, and another with the Italian title “Othone vien licenziato dal Pontefice e dal Doge perche vada al trattar la pace con l'Imperadoſe ſuo Padre,” alſo after Zucchero.

The portrait of Thomaſo Sennachio, (a celebrated phyſician,) after S. Bombelli, is alſo engraved by Roſſetti; and all the above are of large folio dimenſions.

The names of ſome few of the engravers of Italy, who run their obſcure and unintereſting careers about this period, have been purpoſely omitted, as being altogether unworthy of our records. Indeed, when we reflect on the advantages poſſeſſed by the artiſts of Italy, compared with thoſe whoſe inferior fortune it is to exiſt in the other countries of Europe, we cannot but feel ſome ſurprize that in the courſe of the century through which we have juſt laboured with due obedience to chronologic order, ſo few engravers who are juſtly entitled to rank high in their profeſſion, ſhould have appeared in that highly favoured country. While France, Germany, and the Low Countries, with inferior opportunities, preſent a reſpectable diſplay of talent in this art, and are even brightened with ſome rays of original genius, the hiſtory of Italian engraving is little better than a dull record of creeping mediocrity.

If the reader participates in our ſurpriſe, he will perhaps be led to reflect whether this effect may, with more juſtice, be aſcribed to dearth of that particular kind of genius combined with patient aſſiduity which is required to excel in this art? or to paucity of Italian patronage? or that no philoſophical view was then and there taken of the principles and practical energies of engraving, though painting and the art of the ſtatuary were abundantly honoured with the literary attentions of their Italian profeſſors and critics? or laſtly, how far it was owing to the circumſtance of engraving being leſs ſtudied and practiſed in Italy, as a diſtinct profeſſion from that of painting, than in the north of Europe?

The name and the works of Piraneſi, which we now approach with all the refreſhing pleaſure with which wearied attention is inſpired by the appearance of a worthy object, may ſhed ſome ſalutary light on the diſcuſſion of theſe queſtions, or will at leaſt prove that the genius of Italian engraving had not fled for ever to leſs genial climates.

Giovanni Batiſta Piraneſi, was born in the Roman territory early in the eighteenth century; Huber ſays in the year 1707, and died in the city of Rome in 1778. He was at once architect, antiquary, draughtſman, and engraver, and in all, but more particularly in the latter art, evinced the moſt vigorous and original powers. He appears to have had no tutor, at leaſt none has been mentioned by his biographers, and excepting a ſound mathematical foundation, with which books or a maſter muſt preſumptively have ſupplied him, he built his ſtyle of engraving on his own ſtrong and keen obſervation of nature. In his practical knowledge of perſpective, as in his treatment of ruined edifices, he had no predeceſſor, and though he will always have numerous imitators, he has yet met with no rival in Italy, nor even in Europe, ſave and except our own Edward Rooker, and another, whom, with ſtill more propriety, *we Cyclopedians* may call our own.

The authors of the French Encyclopedie ſay of Piraneſi, that he was the beſt draughtſman of ruins, and the moſt pictureſque engraver that the country produced. This is no cold praiſe, though not warm enough for the ardour of the ſubject. His profeſſional induſtry was unremitting, yet his mind and his hand have ſo far outſtripped time, that though we know this, we remain in aſtoniſhment at the vaſt quantity of his works, which, when their number and magnitude are taken together, exceed the productions of any other engraver whatever. A pile of more than twenty large folio volumes, replete with taſte and intelligence, ſeems too much to have been produced by the labour of a ſingle individual, even after we have made ourſelves acquainted with the rapidity of his powers; yet all theſe are etched from drawings made by himſelf, and ſome of theſe drawings, of which the ſubjects are the Greek temples at Pæſtum, and which atteſt the vivid feeling and maſterly powers of execution which Piraneſi poſſeſſed in that branch of the art, are now in this country, having been purchaſed within theſe few years in Italy, by Charles Lambert, eſq. of the Inner Temple.

Towards the middle period of his life, or rather before, our engraver became a member of the Roman academy of arts, but on account of ſome feuds, with the merits of which, if any merit attached to them, we are not acquainted, he was expelled by the voice of the majority of academicians. After ſome few years, however, had elapſed, and animoſity was cool, motives were explained, or miſtakes were diſcovered, and Piraneſi was honourably invited by his brother artiſts to return. He was, about the ſame time, perhaps to give the greater eclat to his return, created a Roman knight, but was always better known by his name than his title.

Of many irrefragable proofs that might be adduced to render idle the ſophiſms of thoſe who aſſert that engraving is not an *original* art, Piraneſi is one, having never, to the beſt of the preſent writer's knowledge, engraved after any other pictures or drawings than were the production of his own hand, which ſometimes preſent us with the magnificent remains of ancient Italy, and are ſometimes the ready offſpring of a mind ſtored with architectural wonders.

Wherefore, unleſs thoſe arts which are capable of independent exiſtence, might juſtly loſe their claim to originality, by condeſcending to copy, where the general and inſeparable intereſts of art and ſociety require ſuch condeſcenſion, no man, and no privileged body of men, ſhould ſay of engraving that “it is not an original art,” for no man of ſenſe denies originality to a picture, becauſe a ſketch or cartoon of the ſame ſubject has previouſly exiſted, nor to the art of the ſculptor, becauſe he models in clay before he chiſels in marble.

Though the human figures which he introduced into his landſcapes, are extravagant in their attitudes, and ill drawn, they act the parts which they were intended to act; they ſerve to ſhew that the ſcenes he has repreſented were inhabited (if not by whom), and they are a ſcale whereby he induces the ſpectator unwittingly to meaſure the relative magnitude of thoſe edifices which were the real and the oſtenſible objects of his art. In his characteriſtic treatment of thoſe edifices, and of the vaſes and other ornamental remains of antiquity, his line, varying as occaſion admitted or required, was peculiarly expreſſive of ſtone, bronze, ſtucco, brick, and all the various materials of which Greek and Roman ſculpture and architecture conſiſt, diſcriminating with exquiſite obſervation and inimitable ſkill, whether thoſe materials retained their original ſharpneſs of workmanſhip, or were mouldered by the hand of Time; or ſtained by the weather; or ſplit and cracked by the froſt, by Vandal barbarity, or other ſudden caſualty; and whatever his ſubject, he always ſeems to have worked with eaſy vigour, with unlimited freedom of hand, and as if "out of the abundance of his heart."

Trees do not often occur in the prints of Piraneſi, but when they do, they in moſt inſtances too much reſemble ſea-weed: yet the wild raggedneſs and unexpected forms which characterize both theſe and the clouds which float over his landſcapes—and even his ill-drawn figures—have a certain air of enterprize, which accords with the forceful and chivalrous character of his chiaroſcuro, and rather augments than diminiſhes, the general ſentiment of romantic magnificence, which many of his compoſitions, and more eſpecially the large frontiſpieces which fold into his large folios, inſpire.

In ſome of the latter, all the grand architectural forms of Egypt, Greece, and Italy, appear to be aſſembled, as if by magic, and the mind of the ſpectator is led to wander, in poetic reverie, through irregular avenues of obeliſks, ſarcophagi, pyramids, columns, and triumphal arches. In others, which are of ſubterraneous character, the author appears to have penetrated the cemeteries of departed greatneſs, and here, monſtrous and forbidden things, are crawling and twining their ſlimy convolutions among mouldering bones, broken ſculpture, and mutilated inſcriptions, and an air of dankneſs and dilapidation, and ſepulchral gloom, is diffuſed through the cavern, as if Time and Envy were beckoning to Oblivion, to break down what remained of the trophies of the brave, and obliterate the wiſdom of the wiſe.

In his technical proceſs, Piraneſi was the firſt engraver who made free and abundant uſe of the ruler, as may be ſeen in his interiors of St. Peter's cathedral, his antique vaſes, and ſuch other ſubjects as required it, or as admitted it only in certain parts; for he ſometimes artfully contraſted, in the ſame plate, the wildeſt ſallies of the etching-point, in the broken or weather-ſtained parts of his lights, with ruled paſſages in his ſhadows, where the utmoſt regularity and perſpicuity were preſerved. Thought always accompanies his deeds, even where he ſeems moſt careleſs. The reflex lights of a bright climate might ſeem, to the inconſiderate in a humid one, to partake of flimſy tranſparency. In the works of Piraneſi, they ſhew the juſtneſs of his obſervation. If he was ſtimulated by an adventurous ſpirit, he was reſtrained by judicious caution, which ſat ſo eaſy on him, that he exerted it without the leaſt ſeeming effort. In ſhort, with the ſkill and conduct of a brave general, it was his to vary and adapt his mode of execution, and qualify his proweſs, by the nature of the occaſion which called it forth: he uſed the graver with boldneſs when he did uſe it, but uſed it only as an auxiliary to his etching. He knew that this was the main body of his native force, on which he could moſt depend. He doubtleſs felt that he was here the Alexander of his art, and that none could here, with any hope of ſucceſs, diſpute with him for the palm of victory.

To ſpeak of the works of this artiſt in detail, would fill a volume: it muſt therefore here ſuffice to ſay, that among the beſt of them will be found the frontiſpieces or title pages to his large volumes of Italian antiquities, conſiſting, for the moſt part, of very rich compoſitions, formed of the fragments and monuments of antiquity. Several views of the Coliſeum and arches of Conſtantine and Septimius Severus, at Rome; the pyramid of Ceſtius, with other Roman antiquities; the tomb of Cecilia Metella, on the Appian way; the fountain of Bernini, with the ſurrounding edifices; the façade of the Baſilicum of St. Mary, with other buildings; ditto of St. Lorenzo on the Tiburtinian way; (an admirable mixture of regular with irregular mode of execution, in the treatment of the architecture;) interior and exterior views of the Pantheon of Agrippa; a very large and magnificent view of the Sybil's temple at Tivoli; another view of the ſame temple, ſomewhat ſmaller; another, with the caſcade at Tivoli; the bridge and caſtle of St. Angelo; the Ponte Mola; the ſquare of the Capitol; the ſquare of Monte Cavallo; the grand fountain of Trevi, and the temple of Jupiter Tonans; all of large folio dimenſions, and ſome of them ſo large as to fold into his imperial folios.

Franciſco Piraneſi was the ſon of Giovanni Battiſta, and was born at Rome in the year 1748. He became an engraver of landſcape and ruined buildings, in which he imitated the ſtyle of his father, but, like other followers, was always behind, though his engravings of this kind poſſeſs ſo much merit, that were his father's works annihilated, he would be entitled to hold rather an high rank in his profeſſion. Franciſco did not, however, confine the exerciſe of his talents to landſcape and architecture, but engraved ſeveral plates of the celebrated ſtatues of antiquity. He drew the human figure better than his father, but in his treatment of the antique was ſtill an imitator, following, with much devotion, the ſtyle of engraving of Pitteri, of whom we ſhall preſently ſpeak.

Among the beſt of his prints are views of the Coliſeum, the Pantheon, the baths of Salluſt, the baths of Diocleſian, and the temple of Iſis at Pompeia, all in large folio; and in very large folio, the illumination of the chapel of Paulina, in St. Peter's cathedral; and among his ſtatues the following are entitled to reſpectful notice, *viz.* the ſitting Jupiter of the Muſeum Clementinum, the Venus de Medicis, the group of Cupid and Pſyche, from the gallery of the Capitol, and Oreſtes recognized by Electra, miſtakenly called by ſome the young Papirius and his mother, from the original ſculpture in the Villa Ludoviſa, all of large folio dimenſions.

Laura Piraneſi, was the ſiſter of the preceding artiſt, with whom ſhe equally diſtinguiſhed herſelf by engraving: the following views are by her hand, *viz.* the Capitol of Rome, the bridge of Salario, the temple of Peace, and the arch of Septimius Severus, all of 4to. ſize.

Giovanni-Marco Pitteri, was born at Venice A. D. 1703, and died in the ſame city in 1767. He ſtudied engraving for a ſhort time under Joſ. Baroni, whom he ſoon quitted for J. A. Faldoni. The works of this admirable artiſt are executed in a very remarkable ſtyle, with ſingle courſes of lines, though very differently diſpoſed from thoſe of Mellan and his followers. They run perpendicularly from the top to the bottom of the plate, and the ſhadows are expreſſed by ſtrengthening them as occaſion required. The effect he has produced in this new mode of engraving is far more pleaſing and harmonious than could have been expected, eſpecially where, by partially notching his lines, he has imparted ſtony character and richneſs, to ſuch parts of his prints as required it. This artiſt, being always occupied with engraving, never travelled out of his native place.

Among his works, the following are moſt worthy of notice.

Whole-length Portraits and Heads, all in large Folio.—A buſt of himſelf, from Piazzetta; a buſt of J. B. Piazzetta, a Venetian painter; Charles Goldini, a Venetian comic poet; John Mocenigo, a Venetian nobleman; Joſeph Nogari, a Venetian painter, with his hand on the hilt of his ſword; and a young lady reſting her head on her hand, all from the ſame painter; count de Schulenbourg, field-marſhal of the republic of Venice, from C. F. Ruſca; cardinal Quirini, marquis Scipio Maffei, Clara Iſabella Fornari; and a ſet of heads on ſixteen plates, which are preſumptuouſly entitled God the eternal Father! our Saviour, the Virgin Mary, the twelve apoſtles, and St. Paul, all from

Piazzetta, according to Huber, but, according to Strutt, the latter are from his own deſigns.

Various Hiſtorical Subjects.—“ Chriſt expiring on the Croſs,” with the effect of night; “ Religion and Hereſy,” an allegory, both from Piazzetta; “A Holy Family,” from Pietro Longhi, in large folio; ſeven folio upright plates of the ſacraments; ſix large folio plates repreſenting chaces in the neighbourhood of Venice, from the ſame maſter; “ St. Peter delivered from Priſon by an Angel,” after Eſpagnoletto; “ The Martyrdom of St. Bartholomew,” from the ſame maſter, both in folio, for the Dreſden gallery; “ St. Catherine of Sienna,” after J. B. Tiepolo; “ The Penitent Magdalen,” from the ſame, for the Dreſden gallery; “ The drunken King,” after D. Teniers; and two ruſtic ſubjects, after the ſame painter, (the Shoe-maker, inſcribed “ Ne ſutor ultra crepidam,” and the Miller, inſcribed “ Sudat rotator ſua ſorte contentus,”) all in large folio.

Comte Pietro de Rotari was born of a noble family at Verona in the year 1707, and having a natural turn for the fine arts, together with the means of indulging it, became ſucceſſively the pupil of Robert van Audenarde and Antonio Baleſtra. He ſtudied with commendable aſſiduity, and travelled in queſt of improvement, or of diſtinction as an artiſt, to Venice and to Rome, and afterwards to Vienna, Dreſden, and Peterſburg, in the latter of which cities, after a reſidence of eight years, he ended his career in 1764.

His engravings conſiſt of ſlight, ſpirited, painter-like etchings, which are much ſought after by the curious, and are executed from his own compoſitions, or from thoſe of his maſter, Baleſtra. From among theſe, the following will probably be found moſt worthy of ſelection. The portrait of Filippo Baldinucci writing; “ St. Francis adoring the Crucifix,” a middle-ſized upright oval, from his own compoſition; “ The Education of the Holy Virgin,” of the ſame ſize; the head of an old man with a beard. Another head of an old man looking upwards, both in 8vo.; “ The Three Angels entertained by Abraham;” “ David with the Head of Goliah;” “ St. Jerome;” and “ The Interview between Venus and Eneas,” all of 4to. ſize; and, of ſomewhat larger dimenſions, three monks of the order of St. Francis, after Baleſtra. The count alſo arrived at ſome eminence as a painter of portraits and hiſtory.

David Antonio Foſſato was born at Morco, a bailiwick of Luggaris, in Switzerland, in the year 1708; but reſided at Venice with an uncle, who was a merchant, and wiſhed Foſſato to become one alſo, but finding he had more taſte for the arts, he gave up this deſign, and placed him under Vincent Mariotti, a good deſigner of architecture, and a maſter in perſpective, with whom he made great progreſs. He afterwards travelled to Vienna with Daniel Gran, under whom he executed ſome very fine pictures, particularly a very ſuperb ceiling for the Imperial library. He worked with great ſucceſs, both in oil and freſco, in moſt of the towns of Rome and Germany; and likewiſe amuſed himſelf with the point. Among his beſt productions in that way, the following may be reckoned. A ſet of twenty-four folio landſcapes of Venice and its environs, from M. Ricci, with a dedication to count Algarotti; “ Diana and Caliſto,” from Solimene; “ The Family of Darius before Alexander,” from P. Veroneſe; “Jupiter thundering againſt the Vices,” from the ceiling of the council-chamber; “ The Servant of Abraham with Rebecca,” half figures, from Ant. Bellucci; and “ The Vocation of St. Peter to the Apoſtolate,” from the ſame painter, all of folio dimenſions.

George Foſſato was born A. D. 1710, and was probably of the ſame family with the preceding artiſt. We are ignorant of whom he was the pupil; but he worked ſome time at Milan, and from thence went to Venice, where he ſettled.

He etched the edifices which the celebrated architect Palladio erected at Padua, Vicenza, and other towns and cities of Italy, which was publiſhed by Paſinelli at Venice, during the years 1740 and 1745, in French and Italian, of large folio ſize. The etchings are well executed, and do honour to the taſte and intelligence of our artiſt.

Jacques Leonardis was born at Parma A. D. 1712. He learned the rudiments of art of M. Benville, (a portrait painter,) and J. B. Tiepolo. He engraved from the moſt celebrated pictures in Venice, and, with commendable regard to the public deficiencies, commonly made choice of thoſe which had not already been engraved; though he generally ſucceeded ſo well in copying the characters and effects of his originals, that he need not to have been either afraid or aſhamed of following other engravers, by working after the ſame pictures. The beſt of his productions are, “ Cupids playing,” after Julio Carpioni; “ The Rejoicing of Silenus,” from the ſame painter; “ Neptune in a Car drawn by Tritons,” from Seb. Conca; “ The Rape of Europa,” from the ſame maſter; two ruſtic ſubjects, one repreſenting “ A Village Fair;” and the other “ A Crowd of Beggars at the Gate of a Town,” from J. M. Creſpi; two comic ſubjects repreſenting “ The Diverſions of the Carnival at Venice,” from Tiepolo; “ The Golden Calf,” from Tintoret; and “ The Laſt Judgment,” from the ſame maſter, all of large folio ſize.

Michael Sorello was born in Spain, but in what year is uncertain. He ſettled at Rome A.D. 1750, and ſtudied engraving under Giacomo Frey, (for an account of whom ſee GERMAN *School of Engraving*,) and worked very much in the ſtyle of that very diſtinguiſhed maſter. The moſt conſiderable work we have by Sorello is a ſet of eight prints, engraved from the tapeſtry of the Vatican, after Raphael; he likewiſe engraved, after other Italian maſters, ſeveral meritorious plates for the Muſeum Florentinum. From the maſs of his works, the collector may, with advantage, ſelect good impreſſions of the following, for his Italian portfolio:—“ The Nativity,” where a ſhepherd, accompanied by his dog, is among the principal figures, from Coroï; “ The Purification of the Virgin;” and “ St. Peter proclaimed Chief of the Church,” from Carlo Maratti, all in large folio; and “ The Deſcent of Chriſt into Hell,” in ſmall folio; “ The Reſurrection,” dedicated to Antonio Colona; “ The Diſciples at Emaus,” in large folio; “ Chriſt repreſented as a Gardener,” or, the “ Noli me Tangere;” “ The Converſion of St. Paul,” from C. Maratti; the frontiſpiece for the Monologium Græcorum, after Seb. Conca; and an “Annunciation of the bleſſed Virgin,” from Feliſe de Caſtro, (a Spaniſh painter,) both in large folio.

Paul Pilaja, or Pilaia, was a native of Italy, and appears to have been born about the year 1718. The circumſtances of his life have not been recorded, but he ſeems to have worked at Rome. He engraved the prints for a book entitled “ Storia di Volſena,” by the Abbé Adami, with the portrait of the author, after the Cavalier Odam; which book, according to Gandellini, was printed at Rome in the year 1737. He alſo engraved, in folio, the ſtatue of the prophet Elias, from Aug. Cornachini, erected at St. Peter's cathedral; the portrait of pope Benedict XIII. from J. B. Brughi, a Roman painter; “ The Martyrdom of the Capuchin St. Fedele da Simaringa,” from Seb. Conca, both of folio ſize; “ The Miracle performed by St. Thoribio, archbiſhop of Lima, while preaching to the

Indians," in large folio; "Liberality" with two children, in folio; and "Clodius, diſguiſed as a Woman, diſcovered at the Houſe of Cæſar," both from the ſame maſter, in large folio.

Niccolo and Antonio Billi were brothers, and born at Rome ſome time about the year 1719, or 1720. Of the family of this name, which were long known at Rome, as printſellers, and ſome of whom were engravers alſo, we ſhall mention only theſe brothers, who engraved many portraits and devotional ſubjects at Rome, and various plates for the volumes of the antiquities of Herculaneum, at Naples, executed in a ſtiff ſtyle, without much taſte. Niccolo engraved many of the plates for the Muſeum Florentinum, and among his productions are alſo the portraits of Fredericus Zuccharus, drawn by Campiglia; John Holbein, "ſe ipſe pinxit." Pietro Leonardo Ghezzi; John Maria Morandi; the cardinal Pompeo Aldrovandini, all in folio; the cardinal Joſeph Spinelli Dom. Dupræ pinx.; "The Infant Jeſus," in an oval, of 4to. ſize, from J. Conca; "St. Philip of Neri, kneeling before the Virgin," from S. Conca; "A Holy Family," half figures, from Caracci, in 4to; and "The Flight into Egypt," from Guido, in large folio.

Carlo Gregorio, or Gregori, was born at Florence in 1719, and died in the ſame city A.D. 1759. He learned engraving at Rome under the direction of Giacomo Frey, and worked for the greateſt part of his life in his birthplace, after the celebrated painters of Florence. Part of the plates from the cabinet of the marquis Gerini, and ſome of thoſe in the Muſeo Fiorentino, are by him, of which collections they conſtitute the beſt and greateſt part. Among his productions the following may alſo be mentioned with approbation, *viz.* the portraits of Franciſco Maria, grand duke of Tuſcany, from Campiglia; his ducheſs, Eleonora Vincentina of Gonzague, from the ſame painter; and Sebaſtian Bombelli, painted by himſelf, all in folio; the ſtatue of the Virgin, brought to Bologna by angels, from a deſign by dal Fratta; St. Catherine Jannen, from F. Bartolozzi, all of folio ſize; "L'Iſtoria di Ceſare, a cui nell Egitto molte Nazoni preſentarono vari donativi—Soldano d'Egitto," from Alexander Allovi, detto il Cruppino; "Opus Bernardini Barbatello, detto Poccetti, quod in facello S. S. Nerei & Achillei in Atrio Templi S. Magdalenæ de Pazzis Florentia adſervatur;" fourteen ſubjects from the Lives of the Saints, at the church of St. Magdalen at Florence; theſe were engraved in conjunction with his ſon Ferdinand, in large folio; "The Virgin and other holy Women at the Sepulchre," from a picture by Raphael, in the cabinet of lord Scarſdale, in folio; St. Padio, a biſhop of Florence, from Sig. Betti, in 4to; St. Bonizella Cacciaconti, a half figure, from Ant. Bonfigli, in 4to.; and the mauſoleum of the princeſs Elizabeth Charlotte of Lorraine, from Joſ. Chamant, in folio.

Ferdinand Gregori was the ſon of Carlo, and born in the ſame city A.D. 1740. He learned the principles of drawing and engraving in his father's houſe, after whoſe death he travelled with Vincent Vangeliſti to Paris, to finiſh his ſtudies under Wille. He afterwards returned to his native country, and publiſhed ſeveral meritorious works, among which were a print of "The Death of St. Louis Gonzaga," after a deſign by J. B. Cipriani; and a portrait of Carlo Gregori, drawn and engraved by Ferdinand; "The Virgin ſuckling the Infant Jeſus," from Carlo Maratti, in folio; "A ſleeping Venus," from Guido, in large folio; "St. Sebaſtian faſtened to a Tree," a half figure, from the ſame painter; "Venus diſcovering Cupid mounted on a Dolphin," from J. Caſanova, both in folio; two marble groups from Cellini, a Florentine ſculptor, after the deſigns of Allegranti, in large folio; "A Holy Family," from a painting in freſco, by Andrea del Sarto, in ſmall folio, with a very good effect; and "St. Stephen ſtoned," from Louis Cardi, (whoſe picture has a grand character, which is very well preſerved in the engraving,) of folio ſize.

Antonio Joſeph Barbazza, was born at Rome A.D. 1720. The life and works of this artiſt are very obſcure, and we can only ſpecify, that he was a member of the Bologneſe Academy, and travelled to Spain in 1771. His pictures are leſs numerous than either his drawings or engravings, which are much eſteemed by connoiſſeurs. Among his prints, four large heads from nature, in the ſtyle of pen and ink drawings, are juſtly intitled to high praiſe for their truth and originality; a group of muſicians, among whom is a caricature of M. Perez, of muſical celebrity, in 4to.; the plates for the book of father Bianchini, intitled "Iſtorica Eccleſiaſtica," in 4to.; and ſome plates for the work of Monaldini, who publiſhed new editions of Virgil, and other of the claſſic authors of antiquity.

Jean Elias Morghen was a native of Germany. He was born in the year 1712, travelled to Italy in his youth, and remained there during the greater part of his life, reſiding for the moſt part at Florence. He made all the drawings, and engraved moſt of the plates, for the work which was executed under the patronage of the marquis Gerini, after the pictures of Franceſchini and other celebrated maſters, which decorate the ducal palace of Tuſcany. He alſo engraved and publiſhed, in 1767, "The Antiquities of Pæſtum," on ſix plates, after drawings by Antonio Joleg.

Philip Morghen was the ſon and pupil of Jean Elias, and was born in Italy, probably at Florence, in the year 1740. He went, either for profeſſional improvement or employ, to Naples, where he executed a great number of the plates for the antiquities of Herculaneum, including the portrait of the king of Naples, which ſerves as a frontiſpiece to the work.

Philip alſo engraved a ſet of twelve folio plates of ſtatues at Florence, called the Apoſtles of Bandinelli, and thirty-one views of ruined edifices in and about the city of Naples.

His ſon, or his nephew Raphael Morghen, who has ſignalized himſelf by the production of Da Vinci's Laſt Supper, and other meritorious works, and who ſtill lives and engraves at Florence, will become the worthy theme of future hiſtorians of the Italian ſchool of engraving.

Franceſco Londonio (whoſe name and merits appear to have been unaccountably overlooked by our countryman Strutt) was born at Milan A. D. 1723. He began his career in art with the ſtudy of hiſtorical painting, but ſoon abandoned the heroiſm and duplicity of man, for the honeſty of the brute creation, and particularly attached himſelf to the painting and etching of domeſticated animals, in both of which arts he was eminently ſucceſsful.

In the year 1769 he travelled to Rome, Genoa, Naples, and other parts of Italy, and during his ſtay in the latter city, he made occaſional journies to the ſurrounding villages, and ſtudied nature with great attention, particularly thoſe ruſtic and unſophiſticated actions and ſcenes, which were congenial with the ſimplicity of his own habits and feelings. Here he paſſed the greater part of his time in etching and engraving, and here, as is believed, he died of an apoplexy in the year 1783.

Londonio engraved a great number of rural and paſtoral ſubjects, conſiſting for the moſt part of peaſantry and cattle, with the accompaniments of pictureſque banks, trees, and water, in a ſtyle which, though original, and evidently the offspring of his own obſervation and feeling, bears ſtrong reſemblance to the beſt etchings of Berghem and Viſſcher;

uſing the graver and dry-point, with great propriety, only as occaſional auxiliaries to his etching-needle.

The works of this artiſt compoſe ſeven ſets, conſiſting in the whole of ſeventy-two plates, of which the ſubjects are the rural occupations of Italian peaſantry, &c. One of theſe ſets is dedicated to cardinal Pozobonelli; another to the earl of Exeter, and the reſt to different noblemen and gentlemen who had befriended their author, who were moſt of them Engliſhmen. Londonio ſometimes printed his plates on blue paper, and heightened his lights with white chalk, by which means he produced an agreeable effect.

A picture by this artiſt, of a Milaneſe peaſant at the entrance of a hut, with goats, is now in the collection of the moſt noble the marquis of Stafford, at Cleveland houſe. His pictures are rare, and this is probably the only one in England: it has no very powerful chiaroſcuro, but is painted with exquiſite feeling, and great dexterity of pencil.

Gioſeffo Camerata was born at Venice A. D. 1724. He ſtudied engraving under John Cattini, and travelled to Vienna in 1742, where he learned miniature painting, which he ever after occaſionally practiſed. In the year 1751, he was invited to Dreſden, to engrave for the great work from the Electoral gallery in that metropolis, but the war breaking out he returned to Italy. When peace was proclaimed, he once more travelled to Saxony with the electoral prince; ſoon after which he was elected one of the profeſſors to the Dreſden academy.

This laborious artiſt engraved a great number of plates, many of which were from his own deſigns; among them are the portraits of Marco Foſcarini, procurator of St. Mark, and doge of Venice; Simon Cantarini, another procurator of St. Mark, both of folio ſize; Sebaſtien Bombelli, in quarto; a whole length of Thereſa Zamelli, a celebrated dancer, dreſſed in the Turkiſh ſtyle; and a large head of Mademoiſelle Abuzzi, in folio.

For the *Dreſden Gallery*, Camerata engraved two parables from the New Teſtament, after Feti; "David with the Head and Sword of Goliah," in folio; "A Holy Family," after Julius Cæſar Procaccini; "St. Roche relieving the People afflicted with the Plague," after Camillio Procaccini; "The Charity of St. Roche," after Caracci; "The Aſſumption of the Virgin," from the ſame painter, all of large folio ſize; "The Woman taken in Adultery," after Biſcaino, in folio; "The Chaſtity of Joſeph," from S. Cantarini, in folio; and the Old and New Teſtaments, after And. Vaccari, in large folio. Of his works of ſubſequent date, the following are to be preferred:—"A Holy Family," after Procaccini, in folio; "The Penitent Magdalen," from a picture by P. Battoni, in the Dreſden gallery, in large folio; "A ſleeping Shepherd," from J. M. Creſpi; "St. George refuſing to ſacriſice to the Idol," from Count Rotari, both in large folio. Two half length figures with long beards, after Dietrich; and a Magdalen, in miniature; from Vander Werff, of the ſame ſize as the original. This was Camerata's laſt engraving.

Joſeph Canale was born at Rome in the year 1728, and became a profeſſor of the academy at Dreſden, and honorary member of that of Bologna. He ſtudied engraving under the direction of that juſtly celebrated maſter Giacomo Frey, and alſo frequented the ſchool of Cavalier Beneſiali. At Dreſden much of his time was taken up in making the drawings from the pictures which were to be engraven both by himſelf and others, for the publication of "The Dreſden Gallery."

Canale had many pupils who did him honour; and his engravings are very numerous. Among them the following are ſome of thoſe which are held in moſt eſteem.

Portraits.—Maria-Mattia Perini, a half figure from Marco Beneſiali, in quarto; Maria-Antonia Walburgis, electoreſs dowager of Saxony, from a painting by herſelf in crayons; the archbiſhop Bonaventura Barberini; Maria Joſephini, queen of Poland, after Rotari; the profile of the prince Xavier, after Caſanova, all in folio; and the ſepulchral monument of cardinal Spinola at Rome, in large folio.

Hiſtorical Subjects.—"Imagina miraculoſa della S. Virgine Maria tranſportata nella Baſilica Lateranenſe," in ſmall folio; "The good Engliſhman," after Signora Roſalba, from the Crayon cabinet at Dreſden, the ſame ſize; "The Philoſopher," after Eſpagnolet; "Glory," after Dominichino; "A Sybil," after Angelica Kauffman; "Paris on mount Ida," after Vanloo; "Adam and Eve diſmiſſed from Paradiſe," after Albanus; "Chriſt and St. John," after Vander Werff; "Chriſt appearing to St. Thomas," after Mat. Preti, for the collection from the Dreſden gallery. (This plate was only etched by Camerata and finiſhed by Jean Beauvarlet.) "A Turkiſh Woman," half length, from Dietrich; and "Spring," a half figure, from the ſame maſter, of which the laſt three plates are of folio dimenſions.

Bartolomeo Crivellari was born at Venice A. D. 1725. He became the diſciple of Wagner, and worked under his direction, from the pictures of Gherardini, Tiarini, Tiepolo, and others, and he likewiſe engraved ſome plates for the Inſtitution at Bologna, but attained no very high degree of eminence in his art. Among other engravings by this artiſt are the following: Portraits of Chriſtian, prince royal, and elector of Saxony; and Mary-Ann, archducheſs of Auſtria, both of folio ſize. Three ſubjects from the life of St. Peter of Petronius. Four from Nicolo del Abatte, in folio: *viz.* 1. A Company of Card Players. 2 A Group of Drinkers, diverting themſelves, both half figures. 3. A Company of Muſicians. 4. Another Group of Muſicians, with a young Female playing the Harpſicord. "The Canonization of St. Alexander Saul," after Matteo Bartoloni; "A young Man and Female ſeated on a Couch," from Julio Romano, in ſmall folio, from the gallery of the king of Pruſſia.

Gaetano Gandolfi was a native of Bologna, and the contemporary and fellow ſtudent of Crevellari. He engraved, after Nicolo del Abatte, "The Nativity," with "The Adoration of the Shepherds," inſcribed "Opus hoc inciſumque expoſuit," &c. from a picture in freſco, at the palace Leoni at Bologna, in large folio, which latter engraving poſſeſſes ſo much merit as to make us regret that he engraved ſo little, and that we do not know more of this artiſt.

Giovanni-Baptiſta Broſtoloni or Bruſtoloni, was born at Venice in the year 1726. He always reſided in the place of his birth, and was probably a pupil of Joſeph Wagner. We are only able to ſpecify the following engravings by him. The portrait of pope Benoit XIV. in an oval, a vignette with the ſame portrait; "St. Thereſa in Rapture," in folio. A ſet of twenty views of Venice, etched after Ant. Canale, in folio. Another curious ſet of twelve large plates, from the ſame maſter, repreſent the ceremonies made uſe of at the election of the doge of Venice, and at his allegorical marriage with the ſea.

Benigne Boſſi was born, according to Baſan, at Porto d'Arciſato, in the Milaneſe territory, A.D. 1727. At the age of ten, his father took him to Nuremberg, where he learned the elements of deſign; and from thence, on the death of his father, he travelled to Rome, and ſtudied under Pompeus Battoni, Hutin, Dietrich, and Mengs. The latter adviſed him to practiſe etching, which he did till his death. The ſeven years' war, of which Saxony was almoſt the continual ſeat, obliged Boſſi to return to Italy, and in 1760 he was received at the court of the duke of Parma, where he lived honorably, occupied with letters and the arts. The following are among the beſt of his works. A portrait of the engraver Boetius of Dreſden; "The Preſentation in the Temple," (publiſhed at Dreſden); a ſet of heads and other ſubjects on forty ſmall plates, etched with taſte and in a very ſpirited ſtyle; a ſet of vaſes, and a maſquerade, after Petitot; four ſubjects of trophies; the Attributes of the Four Seaſons, incloſed in circular wreaths; two ſubjects of children, in ſmall folio; a ſet of twenty-nine etched, and waſhed in with water colours to imitate the original drawings by Parmegiano; the cities of Piedmont; allegorical figures for an Epithalamium; and the celebrated St. Catherine, who was related to the houſe of Sanritali, engraved the ſize of the picture, and a very capital print.

Antonio Baratti was born at Florence in the year 1727. He worked for the collection of prints after the beſt pictures in the cabinet of the marquis Gerini, of which Mariette has given a deſcription, and of which the firſt volume was publiſhed in large folio, A. D. 1759, at Florence. He likewiſe engraved after various Italian maſters, and among others the portrait of Jean Bettini Cignarolli, after Della Roſa; of 4to. ſize.

Pietro Campana was born at Soria A. D. 1727. He learned engraving of Rocho Pozzi, and worked moſt part of his life at Rome and Naples. We find ſeveral of his engravings in the cabinets of Florence and Herculaneum; among which the following are moſt worthy of dſtinction: "St. Francis of Paul," a half figure; "Charity," in a ſmall oval; "St. Peter delivered from Priſon by an Angel," after Matt. Preti, from the Dreſden gallery, in folio; the portrait of Pietro Berretini da Cortona, from the Florentine cabinet; and Bernardino Barbatelli, detto B. Poccetti pittore Ferretti, both in folio.

Carlo Orſolini was born A. D. 1724, in the city of Venice, where he generally reſided, and where he carried on a conſiderable commerce in prints. He engraved for the Florentine Gallery, and among the beſt of his prints are "St. Jerome meditating," inſcribed "poſt multas lachrymas," &c. from Ant. Baleſtra, a much admired plate, in large folio. Four others from legendary ſtories of the ſaints Aloyſius, Staniſlaus, Francis, and Bernard, and the High-prieſt, all of folio dimenſions.

Bernardino Belotti, ſurnamed Il Canaletto, was alſo born at Venice in the year 1724, and died at Varſovie in 1780. He was called Canaletto from his very diſtinguiſhed uncle Antonio Canaletti, by whom he was inſtructed, and whoſe ſtyle he ſucceſsfully imitated. After viſiting Rome and other cities of Italy, he travelled to Germany, where he obtained the title of count Belotti, and made ſome ſtay at the courts of Vienna and Dreſden.

The ſubjects of his prints, which conſiſted for the moſt part of etching, are landſcapes, generally views, (or portraits of celebrated places,) which he treated in a pictureſque taſte, and which have been held in deſerved eſteem.

The moſt remarkable of theſe are, a ſet of ſix views of Vienna, &c. in folio; two other ſets, each conſiſting of ſix architectural ruins in quarto; and a very large plate, entitled "The generous Turk," the whole of which were executed during his ſtay at Vienna.

Thoſe which he engraved at Dreſden are larger and more numerous. Among theſe we ſhall diſtinguiſh views of the port Wilſdruffer Thor, with the ramparts, theatre, and public library; the gallery of Zwinger, with the bridge at the entry of Oſtra; interior of the Zwinger, with the pavilions and galleries; the Catholic church with part of the electoral palace; the bridge over the Elbe, with a profile of the Catholic church; the gallery and gardens of count Bruhl; the church of the holy Virgin, &c.; the picture gallery at the above church, &c.; the ſquare before the grand guard-houſe; the old market at the ſide of the church of St. Croſs; the church and ſtreet of St. Croſs; the ruins of the belfry of the church of St. Croſs, which fell on the 22d of June 1763, at the bombardment of Dreſden; the ruins of a part of the ſuburbs of that city, before the port of Pirna; and two views of the new town and palace of Holland, with the equeſtrian ſtatue of Auguſtus II.

Views in the Neighbourhood of Dreſden.—The town of Pirna, on the ſide of the gate called Oberthor; the ſuburbs of the town of Pirna, before the waterman's gate; Pirna before the gate of Dohna; the façade of the caſtle of Sonnenſtein on the banks of the Elbe, in the back-ground the city of Pirna; the ramparts of Sonnenſtein, with the priſons, &c.; the fortreſs of Sonnenſtein, from the road to Kœnigſtein; the rock and fortreſs of Kœnigſtein on the ſouth ſide; the rock and fortreſs of the ſame city on the weſtern ſide, with the caſtle of Lilienſtein in view.

Views in Warſaw.—The abode of the Bernardin monks, as it preſents itſelf from the gate of Cracow; Warſaw, from the palace of Sapieha, to the end of Szolle, and from thence to the caſtle of Villanova, with part of the town of Prague; the city of Warſaw, from the palace of the Ordinate to the royal caſtle.

Dominico Cunego was born at Verona in the year 1727. He learned the principles of drawing and painting in the ſchool of Franceſco Ferrari, but feeling a ſtrong deſire to become an engraver, he copied, without any previous inſtruction, various prints by the moſt celebrated engravers. His earlieſt engravings, (after theſe preparatory ſtudies,) were the medals for the book of the marquis Giacomo Muſeli Veroneſe.

He afterwards went to Rome with Mr. Adams, the Engliſh architect, where he engraved certain Roman antiquities, and, we believe, ſome of the ruins of Diocleſian's palace at Spalatro, after Cleriſſeau; beſides many other plates from celebrated Italian paintings; and moſt of the prints for the Schola Italica of Gavin Hamilton. Strutt ſuppoſes that he viſited England, but this is perhaps a miſtake into which he may have been led by the circumſtance of Cunego's having engraved for Boydell's collection, and for the Meſſrs. Adams. When he was about ſixty years of age, he was invited to Berlin, to work perhaps as preceptor, in an academy of engraving, eſtabliſhed by an individual named Paſcal; where he engraved a great number of portraits both in the line manner, and in aquatinta, after Cuningham; but this eſtabliſhment not ſucceeding, he returned to Rome in 1789; in which metropolis, as is believed, he died within theſe few years. In the following liſt will be found mentioned all his works that are of any importance.

Portraits engraven after Cuningham.—Frederick II. king of Pruſſia, a whole-length figure, with the two favourite leverets of the king, in aquatinta; another portrait of king Frederick; two portraits of Frederick William, prince royal of Pruſſia; Frederica Charlotte, princeſs of Pruſſia, repreſented walking in a garden; and Frederick-Louis-Charles, Frederick-William, and the princeſs Frederica, whole-length figures, all of large folio ſize.

Subjects for the Schola Italica of Hamilton.—"The Creation of the Waters," in ſmall folio; "The Creation of the Sun and Moon," in large folio; and "The Creation of Adam," in folio, all from Michael Angelo, in the Siſtine Chapel; "Fornarina, the Miſtreſs of Raphael," after a picture by that maſter, at the palace Barberini, ſmall folio ſize; "Galatea on the Water," from Raphael, in the Farneſe Palace, in large folio; "The Daughter of Robert Strozzi, a Florentine Nobleman," from Titian, in folio; "The Rape of Ganymede," after Titian, in ſmall folio; a head, with a long beard, after Baſſan; a buſt of St. Jerome; St. Hieronymus, from Guido; buſt of an old man after the ſame painter; a fine head of a Mary Magdalen, after the ſame, in ſmall folio; a half-length portrait of an old man, after Guercino; "The Infant Prodigy," after a picture by the ſame maſter, in the palace Lancellotti, at Rome, all of folio ſize; "The Birth of St. John the Baptiſt;" and "Providence," ſurrounded by children, both of large folio ſize, after L. Caracci; "Galatea on the Sea," after a picture by Auguſtino Caracci, in the Farneſe Gallery; "Apollo and Silenus," from Annib. Caracci; "A Penitent Magdalen lying on Thorns," after the ſame; "A young Man and Woman in Converſation," after Giorgione; "Apollo ſupporting the wounded Hyacinthus," after Dominichino, at Rome; "The Death of St. Cecilia," from the ſame maſter; and "Two Nereids, accompanied by three Cupids," from Albano, all of large folio dimenſions.

Subjects after various Maſters.—Benedictus Joſephus Labre, Bolonienſis, And. Bleg. pinx. in large folio; Clement XIV. (Ganganelli) Gio. Dom. Campiglia pinx. in folio; Frederick Chriſtian, prince royal of Poland, and elector of Saxony, drawn and engraved by Cunego, at Verona, alſo in folio; Eques Antonius Raphael Mengs, ſe ipſum pinx.; "The Virgin with the Holy Infant in her Arms," A. R. Mengs pinx. both in quarto; five large plates, from the pictures of Raphael Mengs in the library of the Vatican; "St. Baſil celebrating the Greek Maſs," after P. Subleyras; one of the altar-pieces of St. Peter's at Rome, executed in Moſaic, large folio ſize; "Juno with the Ceſtus of Venus;" and "Hebe preſenting the Cup to Jupiter," (companions) of folio ſize, both after Gavin Hamilton; the l'Allegro and Il Penſeroſo of Milton, folio ſize; "Innocence, with a Lamb," a very intereſting print, with much of truth, ſincerity, and ſimplicity of character and expreſſion, and which does honour both to the painter and engraver; "Briſeis taken from the Tent of Achilles, who is regretting her Loſs;" "Achilles mourning over the dead Body of Patroclus;" "Achilles dragging the dead Body of Hector at his Chariot Wheels;" "Achilles delivering the Body of Hector to Priam;" "Andromache mourning the Death of Hector," all of large folio ſize, from Gavin Hamilton; "Brutus ſwearing to revenge the Death of Lucretia," in folio, from the ſame painter; a half length of "The Virgin and Child," from J. B. Cignaroles; the ſame ſubject from Coreggio; "A Magdalen," from the ſame painter; "The Apoſtle St. Andrew," after Guido Cagnaci; "St. Thomas of Villanova," from Ant. Cavazoni; "A Philoſopher with a long Beard," from Cellani; "The Sick healed," after L. Caracci, all of folio dimenſions; "Chriſt bearing the Croſs," a very grand compoſition, after Raphael, in large folio; and "Chriſt laid in the Tomb," a very large upright plate, after Eſpagnoletto; "The Godhead in the Heavens, attended by Angels," from Dominichino, in folio; "The Annunciation," from the ſame painter, in large folio, from the chapel of Nolfi; "The Viſitation;" "The Nativity;" "The Circumciſion," all in large folio ſize; "The Adoration of the Kings;" "The Preſentation in the Temple;" "The Flight into Egypt," of folio ſize, in a circle; "A dead Chriſt, with the two Maries and Angels," in large folio; and a very large upright plate of "The Virgin in a Radiance of Glory, ſurrounded by Angels, and crowned by the Holy Trinity," all from Dominichino; "Rinaldo aſleep on the Car of Armida, which is drawn by winged Dragons;" "Guerchino da Cento pinx. Romæ in Ædibus Coſtaguti, Dom. Cunego ſculpſit," of very large folio ſize; "Time diſcovering Truth," a fine compoſition, executed at Rome in the palace of the marquis Coſtaguti, in ſix large plates independent of the general plan of the ceiling; "The Laſt Judgment," from the Siſtine Chapel of the Vatican, after Michael Angelo, a very large plate; the corners of the ſame chapel from the ſame painter; an antique tomb, on which is repreſented a bacchanalian bas-relief, found in the Villa of Caſali, in 1767, in folio; and thirteen views of antique edifices and celebrated ruins in Italy, after Cleriſſeau, on large plates, engraved with boldneſs, but very inferior, in taſte and ſtyle, to the beſt repreſentations of ſuch ſubjects, by Piraneſi and Rooker.

Giovanni Battiſta Cipriani ſhould not be left unmentioned among the Italian engravers of this period. Of his biography we have already treated. (See CIPRIANI.) He etched ſeveral plates with conſiderable ſpirit, and a ſimplicity of ſtyle in his handling, which borders on dryneſs, of which ſome are from his own compoſition, and ſome from thoſe of other maſters.

Among theſe are ſeveral portraits of diſtinguiſhed characters, who lived in the time of Cromwell, of which four heads of Milton, which being taken at different periods of his life, from infancy to age, form an intereſting phyſiognomical ſeries, are particularly worthy of notice. They are rare, and intrinſically valuable prints, of 4to. or rather ſmall folio ſize, in ovals, and are done from originals which were in the poſſeſſion of T. B. Hollis, eſq. and which, therefore, have every claim to authenticity.

He alſo etched, "The Deſcent from the Croſs," after Vandyke; "The Death of Cleopatra," after Benvenuto Cellini; and "The Deſcent of the Holy Ghoſt," after Gabbiani; and, from his own deſign, "The Mother and Child," in folio, and ſome others.

Gioſeffo Zucchi was born at Venice A.D. 1730, where he worked for ſome time in conjunction with Amiconi and Wagner, engraving for the ſame ſets of rural and hiſtorical prints, in which appear the names of Wagner and Bartolozzi. He afterwards went to Florence, where he painted the ornaments of the principal pleaſure houſes and villas in that city and its neighbourhood, from which prints were engraved. Of theſe he himſelf engraved two, and in many of the other plates he etched the figures. He alſo engraved after different maſters and from his own compoſitions, many other ſubjects, among which are the following:—A half figure of a man, with a furred hat on, in 4to.; rural converſation; "The Paſſage through the Red Sea," in large folio, ſuppoſed to be after Bourguignon; "The Virgin and Child crowned by Angels," after Guido, in 4to.; "Joſeph ſold by his Brethren;" "The Rape of Europa," after Peſareſe; "The Maſk of Vice taken from Hiſtory," after Balt. Franceſchini; "Virtue ſeizing Love by the Wings," from the ſame maſter, all of quarto ſize; "Offerings to Ceres," after P. Cortona, in folio; "The Choice of Hercules," after the ſame painter, in folio; "The Three Graces," one of whom plays the lyre, while the other two are ſinging, after P. Cortona, of quarto ſize; and "Eneas deſcending to Hades," after Solimene, in ſmall folio.

Gioſeffo Zucchi, the younger, was born in the ſame city A.D. 1732, and was probably related to the fore-mentioned artiſt. He came to London in queſt of profeſſional employment as an engraver; and here he became acquainted with Angelica Kauſſman, with whom he travelled to Rome, and afterwards married. The engravings that we know of, by this artiſt, were all executed at London, from which it appears, that after he had once ingratiated himſelf into the good graces of Angelica, he engraved no more.

The ſubjects of Zucchi's prints are as follow:—"The Muſe Erato," after Angelica Kauffman, in folio; "The Muſe Urania;" "The Symbol of Simplicity;" "Calypſo invoking Heaven and Earth to witneſs her Affection for Ulyſſes," in large folio, from Ang. Kauffman; "The Judgment of Hercules," from P. Cortona; "An Offering to Ceres," both in large folio; "Eneas and Dido taking refuge in the Grotto," after Guido; "The Virgin with the Holy Infant in the Clouds, ſurrounded by Angels," from the ſame maſter, in folio; "The Virgin and Child with St. John, between two Saints," Bartolomeo pinx.; "The Denial of St. Peter," from Guercino; "Jupiter and Europa accompanied by Nymphs;" and "Jupiter and Europa on the Waves of the Ocean, accompanied by Cupids," all of folio dimenſions.

Giovanni (or John) Volpato, was born at Baſſano, in the Venetian territory, in the year 1738, and in his early youth practiſed embroidery, which he learned of his mother, but afterwards applied himſelf to the ſtudy of engraving, which he followed for ſome time without any maſter, urged by the force of his own inclination, or attracted by ſuch beauties of the art, as he ſaw in the printſhops of Baſſano.

He made a journey to Venice for the ſake of obtaining information on what had now become the ſettled ſubject of his ſtudies. Here, for ſome reaſon that has not tranſpired, perhaps from youthful affectation, perhaps from diffidence, he publiſhed his firſt plates under the aſſumed name of John Renard, and here he was firſt made known to the celebrated and benevolent Bartolozzi, who intereſted himſelf in the welfare of the young artiſt, and imparted to him the information of which he came in queſt.

Volpato now felt more confidence; no longer withheld his name from the public, and ſoon produced engravings after Amiconi and Piazetta, which obtained him approbation and encouragement, and were followed by others after Maiotto, Zuccarelli, and Marco Ricci.

From Venice our engraver travelled to Rome, where his abilities ſoon eſtabliſhed him as a reputable engraver, and where his largeſt and beſt works were performed. A ſociety of amateurs, very fortunately for him, had about this time conceived the project of patronizing the firſt engravers of the country, in the production of a ſet of large plates after Raphael's pictures in the Vatican; and among thoſe who were engaged, none diſtinguiſhed himſelf more by his induſtry, nor perhaps by his talents, than Volpato, who continued for many years to enrich the public with large plates, which have obtained him much praiſe from the critics and connoiſſeurs of the continent, and which are engraved after the very fineſt pictures that have been produced ſince the revival of art.

This was a noble race for an engraver to run, and his pupil and ſon-in-law Raphael Morghen is now following with ſuperior brilliancy in the ſame courſe.

The works of Volpato have been the ſubject of eulogium with Roſt, Huber, and ſome other of the German, French, and Italian writers upon art, but, in the eſtimation of the preſent writer, are deficient in richneſs and variety, and are more the reſult of mechanical care and patient induſtry, than of taſte and feeling. His lights eſpecially, when compared with thoſe of Gerard Audran, Giacomo Frey, ſir Robert Strange, or his countryman Schiavonetti, of whom we are about to ſpeak, are either papery, or cold and metallic. There is no playfulneſs of pencil; no evidence of a mind that glows and moves through its work with painter-like felicity, but the ſpectator is perpetually reminded of the rigid and undeviating courſe of the graving-tool; and though the chaſte forms and pathos of Raphael will always give a certain value to the works of Volpato, and even afford ſome argument in favour of the dryneſs of his ſtyle, poſterity will not place him in the very firſt rank of engravers.

Indeed, ſo dead was our artiſt to the more exquiſite ſuſceptibilities of his art, or ſo eager for the obtainment of profit, that (like thoſe in our own country who have converted Macbeth into a burletta) he joined with Du Cros, and his little ſchool of petty colourers, in a ſcheme for painting over with water colours, his ſmaller ſets of engravings from the gallery of Caracci at the Farneſe palace, and the Loggio and Stanzas of Raphael at the Vatican, beſides ſome ſets of prints on a larger ſcale, of views in Rome and its environs.

Now, in works of this kind, the addition of colour, eſpecially if ſome of the pigments employed be opaque, (as is the caſe in the coloured prints of Volpato,) inevitably deſtroys the beauty of the engraving, which in its turn mars that of the colours. It is, therefore, a mode of mutual deſtruction in art, which is juſtly regretted by thoſe who know, or who believe, that the art of engraving is capable of becoming, of itſelf and without extrinſic addition, an appropriate vehicle for rendering every perfection that painting has yet attained.

In England we are but emerging from the miſtakes into which coloured works of this kind, aided by the cupidity of dealers, had plunged the national taſte, and we therefore may at leaſt ſtand excuſed, if we dwell upon the misfortune to art that muſt enſue when a diſtinguiſhed profeſſor joins his efforts with thoſe of the miſtaken ſons of commerce, to break down the natural barriers between one art and another, and obliterate the delicate lines of demarcation which the finger of ſcience has traced upon the orb of the intellectual world.

"According to an ancient fable, which has an excellent moral, the bluſtering muſic of Pan did for a while ſeem ſucceſsfully to ſilence the chaſte harmony of Apollo; and as the ſenſes of the vulgar, we know, are powerfully aſſailed by red, blue, and yellow, however "idly ſpread," it may yet be ſome time before the multitude are ſufficiently informed, entirely to diſcard coloured engravings; but as even the tea-gardens have at length ſhut out coloured ſtatues, we cannot deſpair. Though the gaudy bubble may float awhile in the denſe atmoſphere with which faſhion has ſurrounded and chilled the ſphere of Britiſh engraving, it will ſooner or later burſt; and though ſome few, perhaps more than a few, ſhallow and inaccurate obſervers may for a time be pleaſed to their coſt, all mechanical modes of picture-making will eventually ſink into contempt, and painting and engraving will triumph as diſtinct and ſeparate arts.

"As we frequently hear the uninformed talk as if they conceived the higheſt effort of painting was merely to copy nature as nature appears to them, ſo it is very common to hear unreflecting people ſpeak of engraving, as if it were no other than an art of copying that of painting; which, though a great miſtake, is yet a very pardonable miſtake on the part of thoſe who have been led into it, when we conſider the ſtate in which the art of engraving has hitherto exiſted, and the difficulties, and the degradation, under which, in this country, it has hitherto laboured.

"Now engraving is no more an art of copying painting, than the Engliſh language is an art of copying Greek or Latin. Engraving is a diſtinct language of art; and though it may bear ſuch reſemblance to painting in the conſtruction of its grammar, as grammars of languages bear to each other, yet its alphabet and idiom, or mode of expreſſion, are totally different; if Engliſh be made the vehicle of the ſame thoughts which have previouſly been imparted to us by painting, it affords the means of affecting our minds in the ſame manner; this ſimilar affection of the mind has led to the miſtake, and little doubt may be entertained but that Engliſh would have been inconſiderately called an art of copying Greek, if we had never read any other Engliſh than tranſlations from the Greek.

“ The pretenſions of engraving, as of all the arts denominated fine, are ſimple, chaſte, unſophiſticated. Art ever diſdains artifice, attempts no impoſition, but honeſtly claims attention as being what it is. A ſtatue is to be looked at as being a ſtatue, not a real figure; a picture, not as a portion of actual nature; a print, not as a *copy* of painting.

“ Engravings, therefore, ſuch as thoſe of Volpato, are no more copies of Raphael's original pictures, than the ſame compoſitions, if ſculptured, or modelled in low relief, would be copies. In both caſes, they would be, not copies, but *tranſlations* from one language of art into another language of art.

“ But abſurdity bloſſoms luxuriantly, when engrafted on an original ſtock of error; and this vulgar and erroneous notion, that an engraving is a copy of a painting, has been aſſiduouſly cultivated by the avarice or ignorance of the dealers in prints, who always follow and pamper the taſte of the mob, be it ever ſo depraved, provided it be profitable. That graſs was green, and that ſoldiers' coats were red, was known to the moſt ignorant of the gaping multitude, and has given wings to credulity, and currency to empiriciſm. Neither is it of the ſmalleſt importance whether ignorance or the unprincipled love of gain have contributed moſt to the production of this effect, ſince the public taſte in either caſe has equally ſuffered. It is error ſufficient to call for animadverſion here, if the print-ſellers, (poſſeſſing, or poſſeſſed by, this miſtaken notion, and with the view of making the copy, in their own vulgar eſtimation, approach nearer to its original,) have cauſed colours to be literally and barbarouſly added to engraving: for to colour a legitimate engraving is not leſs palpably abſurd to an eye of taſteful diſcernment, than it would be to colour a diamond, which, as every one knows, would but obſcure the native brilliancy and beauty of the ſtone. And if a good engraving muſt thus ſuffer by being coloured, ſo neither can bad ones be thus converted to good pictures: at the utmoſt, nothing better than a ſort of mule production, (ſuch as thoſe by Volpato and Ducros, which have ſuggeſted the introduction of theſe remarks) can thus be generated, though with much more of the aſs than the horſe in its conſtitution.” Landſeer's Lectures.

Again, theſe obſervations acquire force in a compound ratio to the merits in point of colouring, of the pictures from which coloured plates may be engraven. For example, Fyt, Teniers, and Vandyke, are among the number of thoſe painters who are juſtly eſteemed inimitable for the beauty and harmony of their colours, and dextrous management of their pencils. If children could be brought, even in the way of copying, to pencil and colour like Fyt, Teniers, and Vandyke, thoſe maſters would loſe their high reputation, and this part of the painter's art would be in conſequence ſo depreciated, as to become of very little value. To pretend, therefore, to emulate the merits of a finely coloured and beautifully pencilled picture, ſo as to meet the eye, and merit a place in the cabinet, of a man of taſte,—and to do this on prints, by the ſcore or by the hundred,—is little leſs ridiculous than to talk of a machine for playing on the violin or organ, or of a mill for making verſes.

We ſhall notice the works of this popular engraver, nearly in the order in which they were produced.

While at Venice, and under the tuition of Bartolozzi, he engraved

Portraits of the doge Foſcarini, and the procurator Paſcal, of folio ſize, after Bartolozzi; a ſet of four from the Old Teſtament, in folio, from drawings by Bartolozzi, after the original pictures by Amiconi, of which the ſubjects are, 1. “ The Finding of Moſes;” 2. “ Laban ſearching for his Idols;” 3. “ The Servitude of Abraham,” and 4. “ Moſes erecting an Altar to the Lord.” Eight converſational ſubjects, in ſmall folio, after Maiotti; “ The Orgies, or Feaſt of Bacchus,” an hiſtorical landſcape, done for Wagner, after Zuccarelli; “ A Philoſopher proſtrate before an Altar, ſurrounded by Ruins,” from the ſame maſter, both in large folio; an Italian landſcape, with fiſhers; another landſcape, and peaſants; all from Zuccarelli; and two landſcapes after the elder Brand, all of large folio ſize.

Plates engraved at Rome.—“ The Four Sibyls of the Church of St. Mary of Peace,” after Raphael, in large folio; “ The Marriage of Alexander and Roxana,” from the ſame painter; “ Modeſty and Vanity,” after L. da Vinci, in ſquare folio; “ Perſeus delivering Andromeda,” from P. de Caravaggio; “ Our Saviour praying on the Mount of Olives,” from Coreggio, in large folio; “ Mary Magdalen waſhing the Feet of Our Saviour at the Table of Simon the Phariſee,” after P. Veroneſe; “ The Marriage of Cana,” after Tintoret, both of large folio ſize; and “ The Gameſters,” after M. A. de Caravaggio, in folio; all of which were for Hamilton's collection.

The Pictures of the Vatican, by Raphael, engraved in the line manner on a very large ſcale.—“ The School of Athens;” “ The Diſpute on the Holy Sacrament,” or “ Theology;” “ Heliodorus chaſed from the Temple of Jeruſalem;” “ The Progreſs of Attila arreſted at the Appearance of St. Peter and St. Paul;” “ St. Peter delivered from Priſon;” “ Mount Parnaſſus;” and “ The Burning of the City of Rome.” “ The Miracle of the Maſs of Bolſenna,” belonging to this ſet, is by Raphael Morghen, the ſon-in-law and pupil of Volpato.

Subjects from various Italian Painters, all very large.—“ The Deſcent from the Croſs,” from a painting by Raphael, in the Borgheſe palace; “ The Holy Virgin,” named “ La Saggiola of Florence,” from the ſame painter; “ The Holy Virgin of St. Mark,” after Fra. Bartolomeo; “ The Marriage of the Virgin,” from Guercino; “ Piety, or the Virgin of Pity;” and “ Aurora,” both from pictures by Guercino, in the Villa Ludoviſi; “ Day,” and “ Night,” which form a ſet with the Aurora, by the ſame painter; “ The Crucifixion,” from a picture by Guido, in the church of St. Lorenzo, in Lucina; “ The Venus” of Paolo Veroneſe, from the gallery of the Colonna palace; two ſubjects, with children, from Mola; a pair from the firſt navigator of Geſner, after F. Gianni; another pair, after the ſame painter, taken from Geſner's Idyllia; two landſcapes from Claude Lorraine, of which the originals were in the Colonna palace; a ſet of ſix, or rather three pairs, after Gavin Hamilton, of which the ſubjects are, 1. “ The Death of Lucretia;” 2. “ Innocence,” a plate of conſiderable merit and beauty; 3. “ Juno;” 4. “ Hebe;” 5. “ Il Penſeroſo;” 6. “ L'Allegro,” and the two prophets and two ſibyls, from Michael Angelo's pictures in the Siſtine Chapel.

The following are of ſmaller Dimenſions.—A ſet of thirty-ſix, in ſmall folio, from the antique ſtatues, with the dimenſions, &c. an elementary work for ſtudents in the arts; a ſet from the Farneſe gallery, conſiſting of three larger and three ſmaller plates, coloured; a ſet of eight views at Tivoli, coloured by Ducros and his aſſiſtants; another ſet of twenty views in Rome and its vicinity, coloured in the ſame manner, both folio books; another of fourteen ditto; another ſet of forty, from the Muſeum Clementinum; another ſet, printed on four large ſheets, from Raphael and Julio Romano.

It is much to the honour of modern Italy, that we have to cloſe our catalogue of its ſchool of engravers with the mention of two ſtars, than which no brighter have ſhone in the hemiſphere of the art.

Luigi, or Lewis Schiavonetti, was born at Baſſano, in the Venetian territory, in the year 1765. His father was a ſtationer, whoſe moderate circumſtances enabled him to give to his eight children, the eldeſt of whom was Lewis, a uſeful but limited education. From his infancy he had a taſte for drawing, and while his companions were at play, he was often ſeen kneeling on a ſtool in his father's ſhop, copying prints. By theſe, and ſuch other means as he poſſeſſed, he attained ſuch proficiency, that Julius Golini, (an able painter, to whom ſome of theſe early attempts were ſhewn,) undertook to inſtruct him in the art of drawing.

At the age of thirteen, Lewis was placed under his care, and the high opinion which he had formed of the boy's genius, was confirmed by the rapid progreſs he made, while his amiable diſpoſition endeared him ſo much, that Golini loved him as his own ſon. After three years, however, of uſeful inſtruction on the one part, and docile attention on the other, his tutor, unfortunately for our young artiſt, was attacked by a mortal diſeaſe. Lewis attended him during his illneſs with filial aſſiduity, received with becoming reverence his dying counſel and admonitions, and had the heart-piercing grief to ſee his maſter expire in his arms.

Being now left to purſue his own courſe, or aſſiſted only by ſuch advice as could be obtained in a town where Golini had been the only painter, he turned his views towards count Remaudini, who, though ennobled by this title, is proprietor (as it ſhould ſeem) of an extenſive typographical and chalcographical concern, and has inſcribed on marble how much he feels himſelf honoured by having publiſhed ſome of the works of Bartolozzi and Volpato.

The works of theſe diſtinguiſhed artiſts gave freſh impulſe to young Schiavonetti's ardour for improvement, and becoming acquainted about this time with one Lorio, an indifferent engraver, who was barely competent to teach the mechanical proceſs of the art, he applied to him for inſtruction. Unable to ſupport himſelf and family by his graver alone, Lorio officiated as ſacriſtan to a church, and could offer our artiſt no better accommodation for a ſtudy than the ſacriſty afforded, but which, his circumſtances not allowing him to apply elſewhere, he was obliged to accept.

Schiavonetti remained with this maſter about twelve months, when, finding he had exhauſted his fund of inſtruction, and feeling an averſion to ſtudying occaſionally among dead bodies, he reſolved to alter his ſituation. A copy which he had executed in the line manner, of a Holy Family, from Bartolozzi's print after Carlo Maratti, gained him employment from count Remaudini, and attracted the notice of another printſeller of Baſſano, of the name of Suntach; and between theſe rival printſellers it is probable that Schiavonetti might have long continued to exiſt on ſuch patronage as conſiſted with their views of profit, but for the kinder and more advantageous notice of ſome Venetian noblemen, and the occurrence of thoſe circumſtances which ended in his migration to England.

As theſe circumſtances have been detailed in print, in ſuch a manner as to ſtigmatiſe a certain naturalized ſubject of theſe realms with the reproach of having taken mean and ſelfiſh advantage of the yielding ſimplicity of Schiavonetti, and the credulity of Bartolozzi, with the view of converting to his own uſe and profit the abilities of the former, and the hoſpitality of the latter; and as the accuſed party has publicly required time for the collection of ſuch documents as might exculpate him from the charge, which documents he has not yet produced:—in ſuch a ſtate of evidence, it may be ſufficient to ſay of our engraver, that, after enduring ſome further difficulties and diſappointments, and after reſiding awhile under the roof, and receiving the inſtruction, of Mr. Bartolozzi, he, in concert with his brother Nicholas, commenced an independent eſtabliſhment.

From Bartolozzi's houſe at Northend, he removed to Sloane-ſquare, and from thence to Brompton, where he continued, to the hour of his death, to cultivate and improve the talent that Providence had beſtowed on him, uncheered by the ſunſhine of patronage:—or cheered, or chilled, by ſuch patronage only as conſiſted with the purblind views of commercial ſpeculators, and expoſed to the thouſand nameleſs wrongs,

> "That patient merit from th' unworthy takes."

Some time about the year 1792, he entered into a partnerſhip with certain printſellers, of which he had ſoon reaſon to repent; and the partnerſhip being diſſolved, and himſelf in poſſeſſion of ſome few engraved plates, he diſmiſſed a younger brother to the continent on a printſelling miſſion, which alſo ended in diſappointment: for, the wretched vacillation of Pruſſian politics, and the inroads of French ambition, ſoon ſwept away the younger Schiavonetti from Berlin, which had been fixed upon as the head-quarters of their commerce.

During the ſhort interval of peace between this country and France, he availed himſelf of the opportunity of viſiting Paris, with the twofold object in view,—of improving his natural talent, of which he never loſt ſight,—and, obtaining ſuch free acceſs to the gallery of the Louvre, which was then thrown open to the public, and ſuppoſed to contain the fineſt pictures in Europe, as might enable him to gratify himſelf with the pleaſure and advantage of ſelecting one or more ſubjects to engrave, ſuited to his own abilities. This is a gratification in which engravers of genius are but too rarely indulged. The difficulties and delicacies of ſolicitation, the demands of commerce, and the purblind ſtate of Engliſh patronage, (which, with all its benevolence, and all its power, has not yet emancipated itſelf from the miſtakes and the fetters of trade,) are bars which, in this country, none have been able to overleap: yet, nothing is more mentally obvious, than that other men can only judge of the talents of an engraver by what he *has done*, while the feelings of the engraver himſelf, if he has any, inform him, at the ſight of a gallery of fine pictures, what latent germs of genius or talent he may poſſeſs, adequate to the taſk of tranſlating ſuch of them as are painted with a ſpirit congenial to his own; what elements from the intellectual chaos of his untried powers may be called into exiſtence; how far, through his means, the boundaries of the art itſelf may be extended.

The ſhortneſs, however, of that lucid interval, marred, in ſome degree, the excellence of our artiſt's deſign, and compelled him to compromiſe with the madneſs of Europe, and his own untoward fortune. One of the ſubjects which he fixed upon was the Madre Doloroſa of Vandyke: but the return of war left him no alternative but to endeavour to ſatisfy himſelf as well as he could with a copy by another hand. The copy did not turn out very correct; yet, from this indifferent copy, aided by Bolſwert's print from the ſame original, and his own ſtrong recollections of Vandyke's picture, has Schiavonetti produced an engraving of very extraordinary merit, though on a much ſmaller ſcale than he had originally projected. What he intended to have engraven on an ample ſcale, for himſelf and the public at large, he was compelled by circumſtances, which legiſlators and patrons would do well to attend to, to engrave ſmall, and part with to the proprietors of the French national muſeum.

A very few years before his death, he formed an intention, which he communicated to his friends, of returning to Italy, or at leaſt of removing to a more ſoutherly climate; not that any ſerious apprehenſions were then entertained on the ſcore of his delicate health, but becauſe he felt the weight of taxes, and the want of encouragement: and, perhaps,—obſerving how well the quackeries of mountebank pretenſion ſucceeded in this metropolis, and feeling how ill merit in his profeſſion was rewarded,—he thought there was leſs of ſolid appreciation among us, than really exiſted. What delayed his departure, or altogether withheld him from going, the preſent writer can only conjecture; for he was ſhortly after diſappointed of engraving a large plate from Mr. Devis's picture of "The Death of Lord Nelſon,"—not becauſe the fifteen hundred guineas, which he required for the performance of the taſk was too much,—but becauſe the ſum which Mr. Bromley aſked was too little. Perhaps he lingered here, and only delayed his departure on account of the continental war, and conſequent difficulties of emigration; or, perhaps, he had reaſon latterly to entertain a better opinion of the taſte and appreciation of the Britiſh public than he had before conceived, and began to find himſelf and his talents more an object of attention than his modeſty had allowed him to ſuſpect.

That he did not go, is, on the whole, to be regretted, as the ſoft air and genial climate of Italy would probably have lengthened his life; and with length of life, his reputation would have increaſed, and the public at large have been proportionably benefited: for it has been juſtly ſaid of his latter productions, that they were marked by a wonderful degree of improvement, and that, had his life been prolonged, the fruits of this improvement would probably have been multiplied in abundance. The circumſtance of his premature death gives, therefore, freſh cauſe to lament that the patrimony and the acquiſiiton of genius are unalienable, and can never be bequeathed; and that talents, however rich, and however verſatile, muſt inevitably periſh with their poſſeſſor.

He died at his houſe at Brompton, of a pulmonary complaint, which had for ſome time been gradually undermining his conſtitution, on the 14th day of June 1810, and was attended to his grave, in Paddington church-yard, by a long and numerous proceſſion of artiſts and amateurs, who loved and honoured his merit as an artiſt, and his probity as a man.

In his perſon, Schiavonetti was rather tall; the fine proportion in the diviſions of his figure gave him a graceful movement; his manners were gentle; in his addreſs there was ſweetneſs and affability; and perſuaſion hung on his lips. He was dignified without auſterity, and meek without inſipidity. His whole deportment was manly. His amiable modeſty of character, equability of temper, and promptneſs to oblige, won the good will of all who ſaw and converſed with him. In company with his brother artiſts, he ſeemed unconſcious of his own ſuperiority: though fitted to rank with the higheſt, he exacted no diſtinction of notice, but kept himſelf on a level with the loweſt; and by the deference with which he ſpoke his opinions, made every one feel at eaſe in his ſociety. This urbanity of manners, is but too commonly an extrinſic accompliſhment; but in him it was the unaffected expreſſion of innate goodneſs of heart, and liberality of mind. It was not the varniſh of a coarſe material, but the poliſh of a fine one. Many acts of his private life might be adduced in ſupport of what is here ſaid in his praiſe:—one may be ſelected that exhibits a trait illuſtrative of his whole character. As ſoon as he began to derive profit from his profeſſion, he devoted a portion of it to the ſupport of his poorer relatives in Italy; and of late years he conſtantly remitted to his aged parent a ſtipend ſufficient to enſure him comfort and reſpectability.

The ſame energy and elegant ſimplicity, which was obſervable in the perſonal character of our artiſt, predominated alſo in his engravings. He poſſeſſed, in very high perfection, that firſt requiſite both in painting and engraving, freedom blended with accuracy of delineation. This power, united to the grace and dignity which characterized his ſtyle, enabled him to treat every ſubject on which he exerciſed his talents, with a truth, diſtinctneſs, and propriety of expreſſion, rarely to be found in the works of other artiſts. By a varied choice of models, and a bold and independent habit of thinking, in particular, by fixing his attention ſtrongly on the merits of the beſt works of our countrymen Strange and Sharp, he enfranchiſed his mind from the dogmas of ſchool diſcipline, (which is ſaid without any particular reference to his early tutors,) and ſtood forth an original, and if not a ſelf-taught, a ſelf-reformed engraver. In the works of common artiſts, we ſee only the labour of the hand; but in his, the hand is manifeſtly directed and controlled by the mind. What is their ultimatum, was only his inſtrument: he handled it with perfect command; he thought over it with nice diſcrimination; and as ſtagnation in the world of art, as well as in the phyſical world, engenders corruption, and as *manner* is the corruption of *ſtyle*, Schiavonetti has entitled himſelf to all the praiſe that Mr. Cromek (from whoſe memoir of this artiſt our account is partly extracted) has beſtowed on him, for the dignified eaſe with which he kept far aloof from that mechanical ſameneſs on all occaſions, which we denote by this term, and for always preſerving that ſuperintending mental delicacy, that ſtore of knowledge, and that fine ſtate of nerves, which enabled him to vary and adapt the language of his art to the peculiar beauties and merits of the various originals, which from time to time he had to tranſlate. Some of his leſs informed critics have praiſed the *beauty* of his manual execution. It *is* beautiful; but to ſay ſo, is like praiſing the perſonal beauty of Lucretia. Dazzled by the ſun-beams which glitter on its ſurface, they fathom not the depth, and know not the navigable benefits, of the current. But perhaps poſterity will but gradually learn to appreciate his merits as they deſerve.

That his powers were not leſs verſatile than vigorous, may be ſeen by comparing his etchings with his chalk engravings, and both with his exquiſitely finiſhed plates in lines; of which latter, owing to the bad taſte that has hitherto prevailed ſince his arrival in this country, the number is unfortunately ſmall.

His principal *engravings in the Chalk manner*, are, two, of "The Five Senſes," which, with the frontiſpiece, form a ſet of ſix plates, in ſmall folio, all from his own deſigns; "The Meſſiah hurling Thunder," after R. Weſtall, R. A. for Boydell's edition of Milton, large 4to.; "The Body of Tippoo Sultân recognized by his Family, after the Capture of Seringapatam," from R. K. Porter, in large folio; a ſet of the Cries of London, in large 4to.; three, of a ſet of the ſacraments, after R. Weſtall; "Puck, ſeated on a Muſhroom," after ſir Joſhua Reynolds; a ſet of four folio plates, from the deſigns of Benazech, of "The Sufferings of Louis XVI. during his Captivity in the Temple;" "Queen Elizabeth receiving News of the Death of Queen Mary of Scotland," after R. Weſtall; "The red Slippers," from the ſame painter; two folio plates for Boydell's Shakeſpeare, of which, one in particular, "The two Gentlemen of Verona," after Angelica Kauffman, is a very capital print. The name and talents of Schiavonetti were but little known when he undertook this plate, and he engaged to engrave it for the low price of two hundred and eighty guineas. It is to the credit of the late Mr. Boydell, that he voluntarily increaſed this ſum to three hundred. The portraits of Albert Rubens, after Rubens, in folio; the queen of Pruſſia, after Tiſchbien; and the duke of York, after J. Boyle, both in folio; Mrs. Damer, after Coſway, in 4to.; and the right honourable W. Pitt, and lady Cawdor, in ſmall folio, after Edridge.
